SIR,—I am surprised that the Cycle Manufacturers' Trade Protection Association should continue to attempt to upset the decision that motor manufacturers and agents have arrived at—to have nothing to do with the proposed amalgamation with the cycle trade, and to adhere to their determination, to which they are pledged, to hold only one motor-car show annually, and that at the Agricultural Hall. Nearly all the principal motor manufacturers and agents belong to the Automobile Mutual Protection Association, Limited, and on their behalf I say that the interference of the Cycle Manufacturers' Trade Protection Association in these matters is unwarrantable in the extreme.

Members of the motor trade are perfectly capable of managing their own affairs in a manner they consider best conducive to their interests and they are fully cognisant of the insidious designs of members of the Cycle Manufacturers' Trade Protection Association, which underlie their seeming beneficence. It ought not to be necessary after the rebuff which that Association received at the recent meeting held at the Inns of Court Hotel for me to write this letter, but it has been made necessary for me to do so, and to state plainly and in set terms that the members of the Motor Trade have come to the irrevocable decision to keep themselves separate and distinct from the Cycle Trade and to have none of it, and that the continued efforts on the part of the Cycle Manufacturers' Trade Protection Association to divert our members from their decision is only waste of time which could undoubtedly be better devoted to affairs with which the said Association is more directly concerned.

I notice from some of the trade journals that the new president of the Cycle Manufacturers' Trade Protection Association states that "with the experience which the Association has had they could be of very great service to the automobile trade." I can but thank Mr. Bowden for his desire to assist us, but would suggest that he defer such assistance until he is asked for it. I have no doubt that he makes a most excellent president for the cycle makers, but the automobile trade have men amongst them in whom they have far greater faith than they have in the gentleman who is so eager to give them the benefits of his ripe experience.—Yours faithfully, GEO. R. HELMORE, Secretary.

The Automobile Mutual Protection Association, Limited.

THE DUST TROUBLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As one of the great faults in motor-cars has been that the occupiers of the back seats get smothered in dust, I have devoted considerable time to experimenting with a view to reduce the nuisance. I find the amount of dust is governed by the following factors—speed of car, size of tires, clear way under the car. A high car will throw less dust than a low one, and less of the dust thrown will settle on the occupants. Also, the more air that is allowed to go under the car the less the suction behind, so less dust will settle on the back. I therefore removed the apron on my car and substituted one of perforated metal. I found this improve matters considerably. I then carried the exhaust in a large-bore copper pipe across the back of the car and bored holes about one inch apart in the lower part of it. I can now travel any distance over dusty roads and the back of the car and passengers are scarcely soiled, while other cars travelling over the same roads at the same time and at the same speed are smothered. Another unexpected advantage is that the motor keeps much cleaner, less dust settles on it as the air in front of the forward axle is clear of dust, and, as it is allowed free vent, there is no suction behind the apron, the motor running in clear air. This improvement is very marked. Mr. Brooke, here at Lowestoft, carried out the alterations to my car, and will undertake similar work for motorists generally.—Yours truly,

E. ESTCOURT.

EXPERIENCES WITH A WERNER MOTOR-BICYCLE AND TRAILER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I enclose photo of Werner motor-bicycle with trailer attached, which I hope will be of interest to your readers, as it shows what this remarkable little engine will do. I have found that with this combination it is possible to take any passenger at full speed on the level and that only very slight pedalling is required up the longer hills. Certainly I had a little trouble at first in getting a start on up-grades, and this was sometimes very awkward; for instance, if I stopped to look at a sign-post at the bottom of a hill, we generally had to walk up that hill before I could get enough way on to start.

However, as may be seen from the photograph, I have now fitted one of Mr. Simkiss' clutches, and with this we can get a start on almost any gradient. The trailer is an ordinary cycle one, and was made for me by the Glencoe Cycle Company, of Coventry, and stands the work admirably.

Taking it all round I have found the Werner a very efficient machine; the only trouble I have experienced being with the carburettor, in which I found it impossible to keep an even flow of oil from the tank when full—it would come through too fast, and when lower, not fast enough, and this caused not only the mixture

to vary continually, but the petrol to be consumed in a much shorter distance than it should be. However, I eventually overcame this to some extent, by taking the tank off when I found that one of the holes in the petrol cock had been partially stopped up, and also that the tank was not airtight around some of the studs which clip it to the frame. After having these soldered up I got much better results. The belt seems to form a fairly satisfactory drive, but has to be continually tightened—especially to take hills with trailer—but this is easily and quickly done, by carrying a belt punch, and one soon gets into the knack of knowing how much to cut out. Care should be taken to frequently dress the belt with castor oil, or it becomes dry and rotten and will break when tightened. On one occasion mine got into this state and kept breaking, and I had to shorten it, till, through being too tight, it insisted on turning turtle and running the wrong way up, which soon finished it. As this was in the dark, and kept me from getting home, it was rather unpleasant,

Some friends of mine are using small jockey pulleys which they have rigged up, but, of course, this must entail some loss of power, though not so much as is lost through a slipping belt. As regards side-slip, I believe all motor-bicycles are liable to this, as much and *no more* than the ordinary bicycle; but one naturally feels more nervous on account of the extra weight and speed. However, it is only in towns, where one gets greasy tram lines and traffic combined, that there is any real trouble, and it is my opinion that if you could only keep the engine pulling at all times all would be right. It is when you have to switch off and the bicycle is driving the engine or when you have to apply your brake that you must look out for squalls. I certainly think that the front drive is the best, but am rather inclined to favour the engine being placed somewhat lower down than in the Werner, as I believe it would be better in grease. As regards steering, however, the present position could not be improved—one can easily ride hands off at a fair speed, and, by slowing a little, I have filled and lighted a pipe with ease.—Yours faithfully,

E. S. COLLINS.

OVER THE AUSTRIAN ALPS BY MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the *Motor-Car Journal* of September 21st, you quote from an article by Herr Lajos in the *Allgemeine Automobil Zeitung* in which he says that "last summer" he accompanied Count Stephen Gyulai on the first journey ever made by a motor-car over the Stelvio. "Last summer" is presumably the summer of 1900. On September 4th, 1899, I saw a motor-car descending the Pass from the Italian to the Austrian side, and was told that the same car had made the trip in the other direction the day before. The car I saw was not, to the best of my recollection that shown in your supplement, nor were the occupants of the car dressed as they are in your pictures. The Stelvio being the highest carriage road in Europe, and so formidable to motor-cars, it is a matter of some interest to know who really was the first to take an automobile across it. If Herr Lajos' trip was taken in 1900, he was certainly preceded by one year by some other automobilist.—Yours faithfully,

C. N. WILLIAMSON.

MOTOR-CAR ON FIRE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In the article *re* above in your last issue it is stated that the fire might have happened to any motor-vehicle. In this I think you are wrong. Had the car been fitted with a pressure-feed motor, and had the same leakage occurred as undoubtedly did occur, the worst that would have happened would have been the loss of petrol on the road. My opinion is that a gravity-feed motor is more dangerous than a pressure-feed one—even if the pressure-feed motor has lamp ignition and the gravity-feed one electric. The loss of room above the frame must also be a drawback. I require all the room I can get when touring. The fire you reported last week is what I have been foretelling to all my friends that have gravity-feed motors. After eight years' experience with motor-vehicles, I consider that the proper place for the petrol tanks is below the frame of the car.—Yours truly,

E. ESTCOURT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The burning up of the Napier car in the Uxbridge Road last week brings, somewhat forcibly, before us the relative safety of pressure and gravity feeds; had the motor of the particular car been fitted with pressure feed I fail to see how the accident would have happened. I have heard it repeatedly said that gravity is fitted on the score of safety, but have never been able to get a satisfactory explanation why this is so; as the matter is now suggested it would be interesting to have other views on this point. In a gravity-feed car the petrol tank is fitted right in the body, and some of the pipes must necessarily be above the floorboards, with the result that in the event of a

leak the body and floorboards may become saturated, and not discovered until the vapour is ignited by the sidelights, short circuit, or other unforeseen occurrence. A pressure-feed car would have the tanks underneath, also all the pipes and joints, with the result that any spirit leaking would only drop on the road, and so not come in contact with any inflammable material. Again, when the car is put away, the pressure feed having the tank lower than the float, the pipes empty themselves, whereas in the gravity type the pipes are always full owing to the tank being at a higher level than the float; this cannot be right. The question of the one working better than the other may be put on one side altogether, as it is only a matter of method in getting the spirit to the float; after that the conditions are the same. It is interesting to note that the latest Napier cars are governed on the throttle, but in justice to my firm—Messrs. J. W. Brooke and Company, Ltd.—I would like to point out that this method is not altogether new, as we have been experimenting on throttle governing for some time past, and are fitting the perfected arrangement to our new three-cylinder 10 h.p. cars.

MAWDSLEY BROOKE.

"AERIAL NAVIGATION."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I had not intended occupying your space further on the above subject, but really "Automan's" remarks of last week call aloud for refutation, and cannot be permitted to pass unanswered, especially as it is so easy an undertaking. It really matters very little whether "Automan" "accepts my definition" of a gravity vessel, as there is a host of *bona-fide* authorities who do—and as he—in his first comments on my original letter to your contemporary—confesses to being no authority on the subject. And now "Automan" undertakes to "enlighten the public." That is a large order under the circumstances.

I can see that "Automan" is still uninformed about the successful and important steam and sailing-flight experiments of Professors Langley, Hargraves, Lilienthal, and Chanute that I quoted, and which I certainly do wish the "uninitiated public" to believe, the initiated portion know already—for instance, that Professor Langley's Steam "Aërodrome," measuring 15 ft. by 14 ft., made three-quarters of a mile of free true horizontal flight, sustained and propelled by steam power alone, and then subsided gradually and safely.

One can now easily understand how it is that "Automan" talks about the "barren field" of the aviationists, and that he "can see no valid reason why man—recognising the futility of an attempt to construct a flying machine, the motive power of which should have the same relation to its weight as a bird's wing-power has to its weight" (why this roundabout way of expressing it?)—should not employ hydrogen gas to counter-balance the difference.

Now, is it possible that "Automan" is ignorant of the fact that both steam and petrol motors that are even relatively lighter than the birds (for a given power) have been made and successfully worked? Where can "Automan" find a bird having one horse-power per seven pounds of weight, and where does the "futility" come in now?

One of the best informed and soundest authorities on this profound subject that ever lived, the late F. W. Brearey, B.Sc. (late Hon. Sec. of the British Aeronautical Society), wrote:—"A total misapprehension of the principles of flight is displayed whenever a balloon is recommended to take off part of the weight of any mechanical arrangement." To effectually drive home this vital truth to the most sceptical, I cannot do better than quote the recent dicta of another authority, Mr. George Griffith, who holds sound views on aeronautics, particularly as his views are in entire accordance with my own. Mr. Griffith, when writing of the second of the series of grave *con-temps* of M. Santos Dumont's trials, under the heading of "The Futility of using Inflated Airships," says:—"If you make your gas-envelope sufficiently rigid (to be forced through

the much denser air) you have to add so much weight that the lifting power of the gas is (virtually) reduced quite two-thirds. Again, if you are to have a motor powerful enough to drive such a gas-envelope through the air, its weight increases enormously with every horse-power that it develops. And here comes in the hopeless contradiction against which every aerostat has come to grief. Several years ago Professor Langley, in a lecture at Boston, stated—with absolute truth—that ‘if you only hit the air hard enough it is a solid.’ What he meant was that if you could get the propellers of the real flying machine of the future to revolve at a sufficient speed, the airship would be as safely supported on the air as the steamship is on the water. It is exactly that fact which has brought M. Santos Dumont to grief.”

I protest against the vessel of M. Santos Dumont being called a “gravity balloon.” That is a contradiction of terms, and so an absurdity. In conclusion I must remark, and I do not say it in malice nor discourtesy, that “Automan” is one with only a superficial knowledge of the science of aeronautics, and as such is not qualified to “enlighten the uninitiated public”; moreover, it is undesirable that he should attempt it. All those really devoted to the cause (including myself) are anxious that the public should be rightly informed about it, and so develop a rational interest.—Yours faithfully,

SIDNEY H. HOLLANDS.

FURIOUS DRIVING AND THE SPEED LIMIT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in this week's *Journal* that you did not appear to answer the summons at Grantham, for furiously driving your car, and that your reason was not to waste time and money in defending the case, as it was useless to give evidence. I am quite of the same opinion, and that is why I did not defend my case at Oxted the other week. I was quite sure we were not travelling at twelve miles an hour, and could have proved it, but I knew the Bench would not listen to my evidence. On the day that I was stopped by seven policemen, all in a row, we had been four hours covering thirty-five miles, and continually running all the time. These seven policemen were half way down an incline, and just before we reached them they rushed out of the hedge and told us to stop, which we did. I may say my car is only geared to fifteen miles per hour. There was another car just in front of us, which was going slower even than ours, but its owner was also summoned and fined. I think it is scandalous that motorists should be treated in this way.—Yours truly,

H. SEAL.

MR. C. A. SMITH, of Cobham, writes:—“‘Beware of the Police.’ Permit me to inform you that there is no truth in your correspondent's statement (in last week's issue) that the telephone has been fitted up between Esher and Cobham for the use of the police. The story that a large wagon to barricade the highway is kept at Cobham is also a fabrication.”

THE Fire Department of Washington, U.S.A., is to be equipped with five electric vehicles.

UNDER the name Robur, a carburetted alcohol, for use of motor-cars, is being introduced by a French firm, who are, it is said, establishing dépôts for its sale all over France.

THE Leader Automobile and Engine Company has been incorporated at Toronto with a capital of £50,000 to manufacture automobiles, etc. |

At the last meeting of the Lanark County Council the Chairman read a communication from the Secretary for Scotland to the effect that the speed of light locomotives on highways in Scotland should be raised to a maximum of twelve miles an hour. A discussion ensued, and eventually a resolution was adopted that they send a recommendation to the Secretary for Scotland suggesting that the maximum speed be only ten miles an hour.

THE JULIEN RADIATING COIL.

A NEW radiating coil for use in connection with the water-cooling of petrol motors has lately been devised by M. Julien, and put on the market by M. Establie, of 11, Quai de Valmy, Paris. From the illustration it will be seen to consist of a flattened copper tube helically wound round and soldered to a central supporting rod. The helical coil is about 8 in. in diameter, the tubular ribs being nearly 1 in. apart. Thus, instead of the water circulating through tubes to which radiating ribs are fitted, it flows through the ribs themselves, the radiating surface to which the water is exposed being thus considerably increased. The apparatus is being made in four sizes. For

engines of 4 h.p. the cooling surface is equal to three-fifths of a square metre, and weighs only eleven pounds; the distance the water flows in the coil is 16½ feet. For 6 h.p. engines the coil has a cooling surface of nine-tenths of a square metre, the weight being fifteen pounds. For engines of 8 h.p. and 12 h.p. the cooling surface is increased to one and a fifth and one and a half square metres respectively, the weight being nineteen pounds for the 8 h.p. coil, and twenty-four pounds for 12 h.p. The new coil is easily fitted, and is said to give excellent results in practice.

THE *Canadian Engineer*, of Toronto, has sent us a copy of a useful chart of the metric system of weights and measures they have lately issued.

IN addition to a new 6 h.p. motor, we hear that Messrs. De Dion, Bouton and Company, of Puteaux, are bringing out a single cylinder engine of 8 h.p. for next season.

WE have received a copy of the first issue of *Locomotion*, a new French weekly devoted to automobilism and all forms of locomotion. Messrs. Baudry de Saunier and Gaston Sencier are the editors.

MR. W. I. C. ELLIOTT, of Sydney, the Australian agent of De Dion-Bouton, Ltd., has lately successfully made the trip from Newcastle to Moree, New South Wales, a distance of 311 miles, in a 4½ h.p. De Dion voiturette.

MR. A. L. DYKE, of Linmar Building, St. Louis, U.S.A., has just introduced a new “jump spark” coil, designed to operate with or without a vibrator. The vibrator, which is enclosed, and has no screws to adjust or work loose, is arranged inside the case. The coil is very compact, being only 3¼ by 3¼ by 5½ inches, with four wires leading from same.

LAST week several newspapers published a paragraph stating that “the residents of the busy thoroughfare of Hough Lane, Leyland, were greatly alarmed when a blazing motor-car dashed along the road driven by Mr. James Sumner. The car was quickly stopped, but two young girls had a marvellous escape of being burned to death. The car, which was worth £200, was badly damaged by fire.” Mr. C. E. Taylor, of Leyland, writes to us to say that there is no truth in the report whatever. The car in question is a Locomobile, and all that happened was the flooding of the burner, and a blaze through the chimney. As to the car being damaged, this is utterly false, as the paint work was not even singed, and the car sustained no damage whatever.

THE DE DION-BOUTON CARBURETTOR.

THE new type of De Dion carburettor, illustrated in the accompanying figures, consists of a bronze body, secured to the frame through a clamp cast integrally therewith. In order to understand its operation, it will suffice to examine the arrows which indicate the path of the air drawn in by the motor. Arrow 1 indicates the path of the air which passes around the nozzle D, and which there mixes with the petrol issuing from this nozzle. Arrow 2 indicates the path of the supplementary air supply, which mingles with the carburetted air in the tube L. It will be seen that to obtain a perfect mixture it suffices to regulate the passage of the supplementary air supply, indicated by arrow 2, by turning more or less the valve B by means of the lever I.

FIGS. 1, 2, AND 3.

The following is the nomenclature of the different parts of the carburettor: A, body of bronze provided with a tube connection *l* for admitting the air, and a tube connection *l'* for leading the carburetted air in the cylinder. The bottom of this body is removable, and has a hole drilled through it for any surplus petrol which may condense there to flow off. B, cylindrical valve capable of turning in body A. By means of this valve the air arriving through tube *l* is throttled more or less, in order to obtain good carburation. It terminates at its lower end in a tube of smaller diameter, surrounding the nozzle D for part of its length, while a prolongation of its upper part receives the adjusting lever I. C, annular float of brass composed of two concentric shells united by flanged and soldered heads. The annular form permits to utilise the inner space for the mixing chamber. D, brass nozzle, permitting the petrol to issue through an orifice at a suitable rate. E, petrol admission piping, serving also as a guide for the automatic valve. At the lower end of this pipe is a removable cap *b*, on which rests a spring *r* supporting a metal gauze strainer intended to arrest any impurities in the petrol. Just above the cap is fastened, by means of a pipe union, the pipe leading to the petrol tank. F, adjustable petrol admission valve, by means of which the level in the float chamber can be regulated. It is composed of a brass rod with four longitudinal grooves for permitting the flow of the petrol. Its lower extremity is provided with a needle point of nickel, and its upper end is drilled and tapped to receive the adjusting screw, which is locked by a check nut. G, the float lever, by means of which the petrol supply to the float chamber is cut off automatically. It forms a double-armed lever, with arms in the proportion

of two to one. The float resting on the long arm transmits its ascensional force to the valve suspended from the short arm, which the drawing shows closed. H, float chamber, composed of a brass tube united with the main casting A and soldered to a bronze bottom, which receives the fitting E. This chamber is fastened to the fitting E by a nut which facilitates disconnection. I, operating lever fastened to the cylindrical prolongation of air valve B passing through the screw cap K, the latter retaining the valve B in the chamber A.

CONTINENTAL NOTES.

BY "AUTOMAN."

IT is not to be wondered at that across the Channel our friends get peculiar ideas of our customs and manners. In a letter to a French contemporary, by a correspondent sent over to England to write up sport on this side of the Channel, there appears an account of a visit to the General Post Office in London, where the correspondent, gathering his information from the last edition of a Guide to London, asks to see the lawn tennis on the roof. It is astounding to think that there should exist a guide book to London containing the amazing piece of news that on the top of the General Post Office building a lawn tennis ground has been established for the use of the employees. In another place, in the same contemporary, we are told of the daily tricycle rides of King Edward the Seventh, and of a spill which took place the other morning in the gardens of Buckingham Palace when His Majesty, wanting to turn too quickly, fell over on one side. It is not explained how His Majesty was clever enough to ride a tricycle in Buckingham Palace Gardens whilst he was enjoying his automobile in Germany.

THE use of alcohol for motor-cars does not seem to make much progress. We hear of it being used experimentally, and for contests where a special prize is offered, but there does not seem to be anybody who uses it for private purposes, and, unless it can be made very much cheaper or very much more efficient, there does not seem to be the slightest probability of its coming into use.

MOTORPHOBIA, in its worst form, is appearing in first one district in France and then another in the most unexpected manner. Fortunately it is confined to silly correspondence to the papers and meetings at which absurd resolutions are passed. The latest comes from Yvetot, France, where the Council for the Arrondissement passed a resolution the other day that the circulation of automobiles should be confined to the main roads exclusively, and that there should be a tax of £1 per h.p. on all motor-cars.

THE columns of the *Journal* are not sufficient in number for me to describe all the flying machines which are being invented, designed, or manufactured; every day brings news of some fresh candidate for the honours of the air, but it is a sign of the times that in nearly every case a modification of M. Santos-Dumont's scheme is the subject of the labours of the new candidate. Certainly the public experiments of the Brazilian will have the effect of leading to a complete testing of his favourite scheme, and we shall soon know definitely what can be done with gravity navigable balloons. M. Santos-Dumont himself will be ready again, probably, to-morrow. The keel of his air-ship is repaired, and the motor, which has been back to the maker, has been delivered again with certain modifications. It seems that the pitching of the balloon upsets the float in the carburettor, making it liable to flood, and also deranges the oiling arrangements, so that the float has been dispensed with, and in future each cylinder will be lubricated separately. Next Sunday there is an important race meeting at Longchamps, the happy hunting ground for M. Santos-Dumont's trials, so that the public who are witnessing the races may possibly also see an aerial race round the Eiffel Tower.

TALKING of navigable balloons, I may mention that it is just fifty years since Henri Giffard set out from the Hippodrome in Paris on a navigable steam balloon. His balloon was slightly lighter than the air, and thus raised itself; it was then propelled by fans. It came down near Trappes, in the Commune of Eancourt. The experiments were abruptly stopped owing to the gas company being too busy dispensing its product for lighting purposes, and refusing Mr. Giffard the gas he required to raise his machine from the ground.

THE air seems to have a great attraction for automobilists; whilst Messrs. Rolls and Butler were ballooning on our side of the Channel, Messrs. Maurice Farman and George Leys were up in the air in France. At the same time a party in a fast motor-car driven by Marcel Cohen were chasing the latter balloon overland. They were not, however, able to follow it quick enough on account of the varying direction of the currents of the air, and arrived at the Brosse Railway station just after Farman and Leys had taken the train back to Paris.

broad arena, the bright sunlight showing up the vivid colours and contrasts for which the Spanish ladies are remarkable; they will see in their mind's eye a brilliant procession of toreadors and picadors marching round the arena, and saluting the Alcalde. They will remember the arena being cleared, the gates all closed, and amidst the sound of trumpets they will see a little door open and a bull come trotting out, pawing the sand and sniffing the air, dazed by the sudden change from the pitch dark pen where he has been confined all day to the bright sunlight and waving colours which surround him.

NO ONE can fail to be impressed by such a magnificent scene, but here the enthusiasm of the Briton ends, and gives place to the memories of the horrid spectacle of wretched horses finished up by the bull, after having been rushed up towards him in the most cowardly and cruel manner. There is neither sport nor skill in the performance, which consists of brutal butchery, the object of which is solely to tire the bull, so that he may not be too much for the toreadors. Mr. Deutsch, the hero of the prize for the aerial journey

A 20 H.P. AUSTRIAN-DAIMLER CAR, BUILT BY MESSRS. BIERENZ, FISCHER AND CO., VIENNA.

Cliche de

[Allgemeine Automobil Zeitung.]

RICHARD REITH, who was second at Deauville on his 16 h.p. tricycle, has issued a challenge to either Jarrot or Edge. The challenge is for a race of a distance of ten miles at the least and for one hour at the most.

AN unfortunate accident occurred at the manoeuvres in Holland, through the firing of the brake of the car in which General Snyders, Commander-in-chief of the manoeuvres, was returning home. The carriage also contained the German, Russian, and Norwegian Attachés, and was driven by the Baron Van Aspech (who is a captain on the Dutch staff). Coming down a steep hill at Kouwberg, the brakes fired, and the car ran away and charged a wall at Maestricht, with the result that the driver was killed and the other officers sustained more or less serious injuries.

THE latest sensation in France is the automobile bull fight. To anyone who has witnessed, as I have, a bull fight in Spain, the thought of it will bring back the magnificent scene and the

round the Eiffel Tower, has made a laudable though unsuccessful attempt to do away with the cruel butchery I have alluded to. Last Sunday at Biarritz he organised a bull fight, wherein the picador took his seat on a motor-car driven by Mr. Deutsch's *mecanicien*. The motor-car had its wheels armoured, and drove into the arena amid great applause from the public. Amidst trumpet calls the bull arrived on the scene, but he seems entirely to have misconstrued the situation; a motor-car was too much for him, and, instead of chasing and attacking it, he allowed himself to be ignominiously chased round the arena, his only endeavour being to get out of the way of the horrid thing. Once only, and more by accident than purpose, he turned on it, but immediately received a prick from the picador, and continued his ignominious flight.

IN order to prove to intending purchasers the value of their Boron generators, the Boron Battery Company, of Liverpool, announce that they are prepared to charge accumulators for any local motorist gratis.

HERE AND THERE.

WE hear that the German Daimler Company are adopting a new form of magneto-electric ignition on their 1902 cars.

A PUBLIC service of motor-cars is about to be started at Portsmouth and Gosport.

LOCOMOBILE steam-cars are becoming very popular in Huddersfield, there being over a dozen in use in that town.

ONE of the latest recruits to the ranks of motorists is Viscount Fincastle, V.C., the heir to the Earl of Dunmore, who has just purchased a $4\frac{1}{2}$ h.p. De Dion voiturette.

WE are glad to learn that Mr. Pat Drummond, of Stirling, who met with a nasty motor-cycle accident recently, is making good progress towards recovery.

MESSRS. DE DION BOUTON, LIMITED, of 14, Regent Street, S.W., inform us that they have made arrangements for supplying the De Dion voiturettes and cycles on the deferred payment system.

AN exciting scene took place at Todmorden recently. William M'Carthy, a notorious horse thief, stole a valuable horse and trap at Halifax, and drove away at a furious pace. A hue and cry being raised chase was given by the police in vehicles and by numerous bicyclists. Finally a motor-bicyclist succeeded in running the thief down after a sixteen miles chase, and a desperate struggle ensued before he was secured.

SIR EDWARD BRADFORD, the Commissioner of the Metropolitan Police, has issued a notice calling the attention of the public to the bye-law requiring the display of a light on vehicles between one hour after sunset and one hour before sunrise within the administrative counties of London, Middlesex, Surrey, Kent, Essex, and Hertford, and the boroughs of Kingston-on-Thames, Richmond, Croydon, and West Ham.

THE Kaiser has presented to the Imperial Agricultural Society a beautiful china vase made at the Royal porcelain factory, which is to be offered as a prize to whomsoever shall devise the best spirit-driven motor-car. His Majesty's idea is to increase the use of raw spirit and to encourage farmers in that branch of agriculture. The motor-cars are to be delivered by March 1st, and intending competitors must enter their names before December 1st.

THE Westinghouse Electric and Manufacturing Company, of Pittsburg, U.S.A., has lately completed an electrical vehicle of novel construction. In each of the hubs of the four road wheels is a motor, the hubs being enlarged to about fifteen inches in diameter and lengthened to about twenty inches. The body of the vehicle resembles a double-decked tramcar, having seats lengthwise in the inside and two long seats back to back on top. It will carry fifty people, and will be used in Lincoln Park, Chicago.

At Bow Street Police Court last week, H. F. Lowe, described as an engineer's assistant, was committed for trial on a charge of obtaining £30 from Mr. Paul Hensel, a merchant, of Rochester Row, and £10 from Mr. Schordorf, of West Norwood, by fraud. It was alleged that the prisoner misled the gentlemen named, as well as other inventors, by telling them that he was a patent agent, and by that means obtained from them money for the purpose of getting patents for their inventions at home and abroad.

THE Congregational Church in Stratford, Conn., is ordinarily lighted by electricity. When on a recent Sunday morning it was dark and cloudy the church committee were in a quandary, for no current was available. After many suggestions, it was finally decided to resort to the old-time kerosene lamps which had formerly done service. At this moment, however, Mr. F. C. Beach rode up to the edifice in his automobile and offered his services. Mr. Beach backed his machine, which is propelled by electricity, up near a window in the rear of the church, connected the storage batteries with the feed wire and soon had the darkened interior of the structure brightly illuminated.

THE motor-car has lately made its appearance at Grahams-town, Cape of Good Hope.

MR. W. G. D. GOFF, of Waterford, has ordered a 16 h.p. Panhard, of which he expects early delivery.

To "pull up" for sheep and cattle upon the highway may, says the *Field*, almost be said to be an unwritten rule of the road.

A PATENT has recently been taken out in France, by Messrs. Panhard and Levassor, of Paris, for a method of placing the circulating pump inside the water-tank.

THE first book on the motor-car in the Hungarian language has just been published in Budapest. It is from the pen of Herr M. Herzfeld, and is entitled "Az Automobil."

THE Dutch Automobile Club is organising a series of trials of heavy haulage automobile wagons to be held between Haarlem and Rotterdam towards the end of October.

THE Tramways Committee of the Leeds Corporation have passed a resolution authorising the Lord Mayor to order a motor-car for the use of the staff, at a cost not exceeding £276.

SIR CHARLES LEGARD will move a resolution at the next meeting of the Sherburn (Yorks) District Council in favour of the registration and numbering of motor-cars.

MESSRS. DE DION BOUTON, Limited, ask us to state that genuine De Dion Bouton motors with water-cooled cylinders are made only in $3\frac{1}{2}$ h.p., $4\frac{1}{2}$ h.p., 6 h.p., and 8 h.p. sizes.

THE Bexhill Motor Company have just published an amended time service for October. It is satisfactory to note that the company is making no material decrease in the number of cars to be run throughout the winter months.

THE fire brigade authorities of Melbourne, Vic., have, after satisfactory trials, purchased a steam motor-car from Messrs. Thompson and Co., the Melbourne firm of motor-vehicle manufacturers. The vehicle will be used as a hose cart.

WE learn that the War Office has placed an order with Messrs. De Dion Bouton, Limited, for a De Dion motor to be used for experimental purposes in connection with steerable balloons.

ON Saturday last motor-cars were used to convey a bridal party to and from St. James's Church at Tunbridge Wells. The wedding was that of Mr. F. W. Burstow, of Brighton, and Miss Mary Jones, of Tunbridge Wells. The cars were beautifully decorated for the occasion.

IN addition to the grant of letters patent in France and Belgium, the Electric Ignition Company of Birmingham have now succeeded, after much delay, in securing a patent in Germany for the E.I.C. sparking plug, the demand for which is steadily growing.

ON another page we reproduce a photo taken at Leamington of the procession of cars organised on the occasion of the hearing of the summonses for furious driving against Messrs. Iden, Bamber, and Stanton, of Coventry. The cases were reported in our last issue.

WESTON MOTORS, of 14, Mortimer Street, W., inform us that a Weston steam car manufactured by Messrs. Grout Brothers, of Orange (Mass.), won the first prize in Class A, in the hill-climbing competition, in the New York to Buffalo endurance test. The ascent was up Nelson's Hill, which is 2,372 feet in length, the gradients running from 12.76 per cent. at the start to 16.15 per cent. at the steepest point, and then easing at the top to 10.64 per cent.

THE Holt Viameter, a gradient and distance meter for motor-cars, an illustrated description of which was published in our issue of April 27th, 1900, is now being marketed by the Viameter Company, of 31, Kirby Street, Hatton Garden, E.C. The apparatus is made in several forms, one showing gradient and mileage, another showing gradient only, one—the recording viameter—giving a complete analysis of a motor-car journey, showing on a chart the distance traversed, the gradients, and the time taken over any portion, and one showing mileage only.

ON this page we give an illustration of a steam delivery wagon on the Milwaukee system, which is being introduced by Messrs. Shippey Brothers, of King Street, Cheapside, E.C., for the rapid conveyance of produce to market.

THE Western section of the Scottish Automobile Club propose to hold a Club run to Lanark on the 12th inst. Mr. John Stirling has kindly invited the members of the Club to tea at his home, Fairholm, Hamilton.

MR. F. W. THOMAS, 6, Lewis Street, Halifax, is the owner of a motor-car with which he is prepared to accustom any horse within a reasonable distance of his town to the sound of the automobile.

ACCORDING to figures given by the *County Gentleman*, the number of coaches running out of London has steadily declined during the last few years. From 1897, when 16 ran daily, the number has fallen annually till this year finds only 11 regularly on the road.

SINCE its first appearance on the Drury Lane boards "The Great Millionaire" has been much improved, from the spectacular point of view. The motor-car scene dispenses with the cinematograph and becomes a reality, in which the two cars race around the stage, and the villain and his companion drive over the cliff in full view of a horror-stricken house.

IN our last issue we mentioned that the Bradford Motor-car Company has purchased a large number of Pieper voituresses, and were offering the first dozen at a temptingly low price. Readers of the *Journal* can apparently scent bargains when they are about, for Mr. House, of the Bradford Company, tells us that in four days they had no less than forty-nine enquiries.

COMMENTING on the success attained by the London and Tunbridge Wells motor-car service, the *Gardener's Magazine* says:—"It is obvious that the advantages of such a service will be considerable, and the fruit will require much less handling, as the automobile will take it almost from the farm to the market; whereas, in the present case, it has to be brought to the railway, then conveyed to London, and recarted from the London goods station to the market."

WHILST Sir John Dickson-Poynder's motor-car was being driven in the vicinity of Hartham House, Wilts, on Sunday evening, it by some means failed to round a sharp curve, and was overturned. The occupants were Mr. D. H. Clutterbuck, Miss Clutterbuck, and the Rev. Mr. Harford. Miss Clutterbuck, Mr. Harford, and the driver were thrown out. Mr. Clutterbuck, who is one of the survivors of the famous charge of the Light Brigade, was, however, pinned beneath the car. When extricated it was found that he had received a somewhat serious injury to his hip, besides sustaining a severe shaking.

THE country round Frensham was looking at its best on Saturday and Sunday, when the English Motor Club made the Pond Hotel its meeting-place. The accommodation has been considerably increased and greatly improved by the alterations made recently. Eleven cars and four motor-cycles eventually

reached the Hotel, the total muster in horse power running into the respectable figures of 165. From this it may be correctly gathered that some big cars supported the fixture, amongst them being Mr. Edge's 50 h.p. Napier and Mr. Jarrott's 40 h.p. Panhard. On Sunday many extended the run to the South coast.

Le Velo, which compiles a monthly list of casualties, fatal and otherwise, throughout France, states that in July last, 53 people died from accidents caused by horses, and 613 were injured. Railways were responsible for 16 deaths and 112 injuries. Cycles accounted for 6 fatalities and 104 injuries; motor-cars for 5 and 51 respectively. In other words, of the fatalities dealt with, 66.25 per cent. were due to horses; 20 per cent. to railways; 6.25 per cent. to motor-cars, and 7.50 per cent. to cycles. Of the injuries recorded 69.65 per cent. were caused by horses; 12.75 per cent. by railways; 11.81 per cent. by cycles, and 5.79 per cent. by motor-cars.

THE General Automobile Company, Limited, was registered on September 12th, with a capital of £100 in £1 shares, to acquire the goodwill, assets, and contracts obtained by W. C. Bersey on behalf of the company, and to carry on the business of dealers in, factors of, and letters on hire of motor-vehicles,

mechanical, electrical, and general engineers, financial and general agents, promoters, etc. The subscribers are:—W. C. Bersey, 94, Long Acre, W.C., engineer, 1 share; F. T. Bersey, Mayfair House, Brockley, engineer, 1 share; F. H. Clingo, 100-4, Long Acre, W.C., engineer, 1 share; D. Farman, 104, Long Acre, W.C., engineer, 1 share; W. A. Ware, 93, Long Acre, W.C., coachbuilder, 1 share; E. Wareham, 88, Greyhound Road, N., clerk, 1 share; W. Prickett, 17, Gresley Road, Whitehall Park, N., clerk, 1 share. No initial public issue. Registered without articles of association.

MESSRS. SHIPPEY BROS. STEAM PRODUCE DELIVERY VAN.

THE Bromley Autocar Company, Limited, has been formed, with a capital of £7,500, to acquire the good-will and undertaking of the business at present carried on by Messrs. H. Hicklin and A. E. Draper, under the name of the Bromley Autocar Company, at Bromley, Kent. They will also purchase from Mr. F. H. Dougal, of Westerham, the motor-bus now running between Bromley and Bigginhill. In addition to the sale of motor-cars, it is intended to make ample provision for the increasing trade and business of repairing and hiring out and storing motor-cars. A further important object of the company is the establishment of regular services of motor-omnibuses between Bromley and the outlying towns and villages. Besides a service to Croydon, it is proposed to run frequent services of motor-omnibuses between the following places: Catford, through Bromley to Farnborough and Pratts Bottom, and also from Bromley to Chislehurst, Sidcup, Bexley Heath, and other places, as may be found necessary. A successful service to Hayes, Keston, and Biggin Hill (Westerham) has for some time past been running. Another profitable source of income to which the company proposes to turn its attention is the incorporation of a service of motor-wagons for the purpose of bringing fruit from different districts of Kent to London.

THE AUTOMOBILE MANUFACTURING COMPANY.

In the Vacation Court, on Wednesday, the Automobile Manufacturing Company, Limited, figured in two cases, which were heard together. In the one they sought to restrain defendant Jordan from selling or disposing of stock, and defendant Rogers from advertising business and premises. In the other case they were defendants, along with Jordan, Moore and others being plaintiffs, and asking for the appointment of receiver and manager. After hearing the arguments of counsel, his lordship said he was satisfied that in the account given of this transaction there were circumstances which, in his opinion, required further investigation. Then, again, he was not satisfied with the way in which Mr. Rogers came into the transaction. Mr. Rogers was a director of companies, among others a restaurant company in the Strand; he had no connection with automobiles as a business man, and he seemed to drop from the clouds and make an offer to buy. He should have felt more satisfied if there had been more explanation of the transaction. He was further struck with the haste displayed in executing the conveyance, which was stamped without being fair copied. He was not satisfied that there was a bona-fide exercise of the power of sale by Jordan, or that Rogers was an independent purchaser. These were points which might further be cleared up at the trial. He thought the right thing was to order that a receiver and manager should be appointed to act until the further order of the court, or until the hearing of the action.

THE WAR OFFICE MOTOR-VEHICLE TRIALS.

WITH reference to the forthcoming competition for self-propelled lorries for military purposes we are informed that the following firms have signified their intention of entering vehicles:—

Mr. James Austin, 461½, King Street, E. Toronto.
Messrs. Bayleys, Limited, 42, Newington Causeway, E.C.
Messrs. Brown and May, Limited, North Wilts Foundry, Devizes.
Messrs. Foden, Sons and Company, Limited, Elworth Works, Sandbach.
Messrs. G. F. Milnes and Company, Limited, Balderton Street, Oxford Street.
Messrs. Panhard and Levassor, 14, Regent Street, S.W.
Mr. Charles D. Phillips, Emlyn Works, Newport, Mon.
Herr Fritz Scheibler, Aachen.
The Straker Steam Vehicle Company, Limited, 9 Bush Lane, E.C.
The Wantage Engineering Company, Limited, Wantage, Berks.
The Thornycroft Steam Wagon Company, Limited, Homefield, Chiswick.
The Creek Street Engineering Company, Deptford, S.E.
Mr. Charles Innes Baillie, Ballygunge, Grove Hill Road, Denmark Hill, S.E.
Mr. J. E. Liardet, 16, Hyde Park Gate, S.W.
Lieutenant F. N. Baker, R.A., Leith Fort, Edinburgh.
Mr. Frank L. Beamond, Mere Green, Sutton Coldfield, near Birmingham.

The trials commence on 4th December next, and will take place in the vicinity of Aldershot.

A COLLISION CASE.

At the Newmarket County Court, Mrs. E. Foreman sued H. M. Beddington, tenant of Kirtling Tower, for £28 10s. 6d. in respect of damages caused through a cart belonging to the plaintiff and defendant's motor-car coming into collision. Dr. Cooper appeared for the plaintiff, and Mr. Cababe for the defence. Luther P. Foreman, husband of the plaintiff, said that he was driving a cart, laden with building materials, and belonging to his wife, along Upper Station Road, on the afternoon of August 31st, and was proceeding at a slow walking pace, when he saw defendant's motor-car coming towards him at a great speed. He held up his hand and shouted; but the speed was not checked. When the car came abreast of his cart a horn was blown, causing his horse to jump, and the car then ran into some scaffold poles which projected over the back of the cart. The cart and the horse were upset. The car was going at forty miles an hour. Mr. Beddington was laughing when witness, after recovering consciousness, went to him; and at a subsequent interview admitted that he was travelling at forty miles an hour. Several witnesses for the plaintiff gave evidence that Foreman held up his hand when the motor-car was approaching, and gave various estimates of the speed, some saying it was about forty miles an hour, and others from twenty to twenty-five miles. For the defence, Mr. Beddington, a friend who was with him in the motor-car, and the engineer, Felix Standard, said that the time taken for the journey from Kirtling Tower to the scene of the accident was about half an hour, and that the speed on entering the town was reduced to eight or nine miles an hour. They did not see Foreman hold up his hand. When they were passing Foreman's cart, Mr. Beddington sounded the horn to warn a trap in front, and Foreman's horse swerved. The cart came across the road, and the motor-car struck the poles which projected from the back of it for fourteen or fifteen feet. At the time of the impact the brakes were on, and the motor-car was not travelling at more than two or three miles an hour. The jury returned a verdict in favour of the plaintiff for the full amount claimed.

REFUSING TO STOP.

At Llanrwst, Walton Wigg, a motor-car driver, was summoned for refusing to stop his motor-car at Glan Conway, on September 4th, when appealed to by Mr. J. W. Jelf Pettit, one of the magistrates, because his horses were becoming restive. The defendant pleaded guilty. Mr. Pettit, in his evidence, said that on the day in question he was driving a large party, and when at Glan Conway his leaders became restive. He held up his hand to the defendant with a view of warning him to stop, but as he needed both his hands, he then shouted. Defendant did not ease his pace. The Chairman (to defendant): You are fined £1 and costs. We could have fined you £10 and costs. You are getting off very cheap.

FURIOUS DRIVING CASES.

At Penrhyndeudraeth (Merioneth) Police-court, A. Dubois, of London, stated to be secretary to the Belgian Legation, was charged with having driven a motor-car at an unreasonable speed through Harlech towards Barmouth. Defendant did not appear, neither was he represented. The police officer said the car was going at over twenty miles an hour. Fearing for the safety of hundreds of school children on the road, he raised his hand for it to stop, but defendant, who was accompanied by two others, took not the slightest notice. A fine of £5 and 24s. costs was inflicted.

At Lancaster Castle, William Laurence, manager of Vint's travelling choir, was summoned for furiously driving a motor-car between Dock Acre and Carnforth, he being timed to cover three-quarters of a mile in sixty seconds, and six miles (Carnforth to Lancaster) in just over six minutes. The Bench expressed their intention of stopping furious driving, and imposed the full penalty of £10 and costs.

At the West London Court, D. C. Willoughby appeared to answer an adjourned summons for driving a motor-car on the evening of August 28th in the High Road, Chiswick, at a greater speed than twelve miles an hour. Mr. Pierron appeared for defendant. According to the evidence of Police-sergeant Hardy, the defendant drove the car at the rate of fifteen to sixteen miles an hour, colliding with a bicycle and causing the rider to fall off. The defendant gave evidence that the maximum speed of his motor-car was eighteen miles an hour. The magistrate thought the speed of the car was not material, because in a road which was not congested it might be safer than even twelve miles an hour. Mr. Lane adjourned the summons again for the defendant to call two gentlemen who were with him on the car.

At Huntingdon, J. Cuthbert Pain, of London, was fined £3 and costs for furiously driving a motor-car, and Edward Trotman, of Long Acre, W.C. (who did not appear), was also fined £5 and costs for a similar offence. The defendants, it was said, drove at a rate of over twenty-four miles per hour.

At Abingdon, Henry Bland, of Coventry, was summoned for driving a motor-car at a greater speed than twelve miles an hour in the parish of Radley, on the 28th ult., and for an infringement of the regulations requiring lights on vehicles. Defendant did not appear. Police-constable Ponsford stated that defendant drove past him about 10 p.m. Witness rode hard after him on a bicycle, but could not get near the car until defendant pulled up at Kennington. He refused his name and address, and persisted in driving into Oxford after his light had gone out. Witness estimated that defendant drove about 800 yards at the rate of twenty miles an hour. A fine of £5 was imposed for the furious driving, with 10s. costs, and £1 inclusive for driving without a light.

At Llandrindod, Alfred Wilkinson, motor-car driver, was summoned for furiously driving a motor-car. He denied the charge. Police-constable Lloyd said that on September 2nd, about seven o'clock at night, he saw defendant driving a car along the High Street at a furious rate. Defendant was going seventeen to twenty miles an hour. Defendant denied that he was driving furiously. He was only going at the rate of eight miles an hour. He had driven 13,000 miles last summer, and never received a complaint. The Chairman said the case had been proved, but as it was the first offence he would be dealt leniently with, and fined 10s. and costs, with a warning as to the pace in future.

At Coventry, George Bonfield, of Bridport, was summoned for driving a motor-cycle at a furious rate, and pleaded not guilty. Evidence was given by Police-sergeant Northover showing that on September 4th at 7.30 p.m. he was on duty in the market place and saw Bonfield riding a motor-cycle at a furious rate, going considerably over twelve miles an hour. There were a number of people about at the time, and they had some difficulty in getting out of the way. Defendant cross-examined the witness at some length, and pointed out to the Bench that he was not stopped on the day of the offence. He also explained to the Bench the working of the motor-cycle, maintaining that it was easy to be deceived as to its pace, owing to the working of the engine. The pace was not above ten miles an hour. Defendant was fined 6s. 6d. and 13s. costs.

At Knaresborough Petty Sessions, Edwin Midgley, of London, and Frank Murgatroyd, of Idle, were charged by Police-constable Sweeting with furiously driving motor-cars on the York Road near Allerton. Both defendants were fined 40s. and costs. Captain Haigh, of Harrogate, was charged with a similar offence, but after hearing the evidence the Bench dismissed the case.

At Crediton, Jules Mayer was charged with furiously driving a motor-car at a greater speed than fourteen miles an hour. Defendant did not appear. The solicitor for the prosecution stated that the motor-car, in which were five persons, ran through Crediton at a terrific pace. Near

New Bridge, the car collided with a trap. The pony was thrown down, and, like the trap, injured. The driver of the car never stopped to see what damage was done. George West, of Exeter, said he was driving a pony and trap, near the Three Horse Shoes. He should imagine the car was proceeding at forty miles per hour. The pony caught sight of the approaching car, and swerved a little. The car immediately ran into it, the trap was capsize, and he was thrown out. He (witness) hurried to Exeter and found the car at the New London Inn Yard. He heard a lady and gentleman conversing about the accident, and asked for the name, but they refused to give it. He only secured the information when he brought a policeman. Police-constable Rowland, Newton St. Cyres, said he saw the car going through the village at twenty miles per hour. He afterwards saw Mr. Mayer, who admitted colliding with the trap. The Bench came to the conclusion that the driver, on account of his not taking any notice of the accident, was conscious that he was exceeding the rate of speed allowed, and therefore inflicted the full penalty of £10 and costs.

At King's Heath, Paul Auriac, of Birmingham, a Frenchman, who said he was a motor mechanic at the Warwick Tyre Company's works, was fined 40s. and costs for furiously driving a motor-car on the Bristol Road, Selly Oak, on August 25.

At King's Heath, Claud May, of Moseley, was summoned for driving a motor-bicycle at a furious pace through King's Heath, on the 14th ult. Police-sergeant Davis stated that defendant travelled along High Street at the rate of fourteen miles an hour, at least. A large number of people were about at the time. A fine of 20s. and costs was imposed.

At the Spittlegate Petty Sessions, held at Grantham, Jules Mirronneau, of Carlton House, Worksop, Notts, was fined £10, including costs, for driving a motor-car at a greater speed than twelve miles per hour along the Great North Road, on September 19th. Evidence was adduced showing that defendant drove a motor-car through the village of Colsterworth at a speed of over twenty-five miles per hour. The defendant's solicitor said the pace was impossible, as the car was only geared to twenty miles per hour.

At Ashford, a gentleman named Wells, of London, who did not appear, but sent a clerk with a letter, was summoned for furiously driving a motor-car. Edward Webb, a police officer, stationed at Bra-bourne, gave evidence that he timed the defendant's motor-car over a measured quarter of a mile, and he did the distance in forty seconds, or a rate of twenty-two miles an hour. George Thomas Smith, another constable, gave similar evidence. They also stated that the defendant said some constables would take a sovereign to square these matters, but he supposed he must not attempt to bribe them or they would split on him. The defendant's clerk said he was instructed to say that he only made that remark jokingly. The Chairman said they had decided to convict, and fined defendant £5 and 13s. costs.

At Stirling Sheriff Court, a charge of furious and reckless driving on the part of James Hawthorn, a driver in the employment of the Thames Valley Motor Company, London, occupied three hours; the evidence being of a most contradictory and conflicting nature. It appeared that a motor-car had been engaged by David Thomas, a J.P., of Ashburton, Canterbury, New Zealand, and in it, along with members of his family, and with Hawthorn as driver, he had been touring in Scotland. On the 6th ult., the party was in Killearn district, and it was alleged that on the Stockiemuir Road, through reckless management of the motor-car, they ran into a two-horse dog-cart belonging to Colonel Blackburn, of Killearn, doing damage to the amount of £11 or £12, and putting the occupants, Mrs. Blackburn, Miss Mary Blackburn, and Miss Lilian Blackburn, into jeopardy. The defence was a general denial of the averments of the prosecution, with an allegation that the dog-cart was on the wrong side of the road. The Sheriff remarked upon the contradictory nature of the evidence, but held there was sufficient testimony to prove the charge.

A fine of £5, with the option of thirty days, was imposed. Notice of appeal was given.

At Staines, on Wednesday, J. Da Costa, of Hatton Garden, London, was summoned for driving at a greater speed than twelve miles per hour at Chertsey. The police evidence was to the effect that defendant covered a distance of 176 yards in twenty-two seconds, or at the rate of over sixteen miles per hour. Defendant, who was driving a tricycle with trailer and two passengers, stated that he was travelling up-hill when the policeman stopped him. Defendant cross-examined the policeman and his witness, and drew the magistrate's attention to contradictions in their statements. Mr. Parry, a motor expert, testified that it was impossible for the tricycle and trailer to mount a hill at the speed alleged by the police. The magistrate gave defendant the benefit of the doubt and dismissed the summons.

Five motorists were prosecuted at Ashford, Kent, for driving at an excessive speed along the highway. The motor-cars were timed over a measured course, and the speeds averaged from nineteen to thirty miles an hour. Thomas Lewin, of London, who failed to appear, was fined £10 and costs, and Harold Norfolk, of Blackheath; William Crawley, Westbourne Grove, W.; and Mr. and Miss Edwards, of Ashford, were fined £5 and costs each. The Bench intimated that future offenders would be more heavily fined.

At Rugby, Arthur Grosdy, of Beauchamp Hall, Leamington, was fined £10 and costs for driving a motor-car at a furious rate. Defendant pleaded guilty, but said he was only going sixteen miles an hour, and should not have travelled at that speed if he had not been pushed for time. Evidence was given to the effect that the car was going at the rate of thirty miles an hour.

At the Eastern Ainsty Petty Sessions, at York Castle, Chas. Loraine Barrow, of Askham Richard, was summoned for furiously driving a motor-car on the highway. The defendant did not appear. Police-sergeant Hutchinson deposed that on Sunday afternoon, the 8th ult., he was on duty on the York and Tadcaster Road, when he met the defendant, who rode half a mile in sixty seconds. The Bench said they would have to put down furious driving, and defendant would be fined £10 and costs.

At York, Ernest Jennings, of Fairfield, Clifton, motor-car driver, was summoned for furious driving. Police-constable Russell spoke to seeing the defendant driving on

the Boroughbridge Road at from twenty to twenty-five miles an hour. The defendant, who admitted that he had previously been convicted of furious driving near Peterborough, was fined £10 and costs.

At Hereford, C. P. Levilly, of Great Portland Street, London, was fined £5 and £2 13s. costs, for driving a motor-car at a greater speed than fourteen miles an hour on August 3rd. Three witnesses deposed that the pace was quite twenty miles, and that the driver paid no attention to horses on the road.

At Brighton, F. Bartlemie, of Hove, was summoned for driving a light locomotive at a greater speed than was reasonable and proper. According to the evidence of Superintendent Hale and other witnesses, about 10.45 p.m. on Saturday, the 14th ult., defendant was driving the car in question on the King's Road. The witnesses estimated the speed at about twenty miles an hour. At the time there were several hundred people and cabs in that neighbourhood. The car proceeded along the King's Road at a very fast rate, and crossed over to its wrong side in turning up Ship Street. One witness said that the car was going so fast that it looked "like a flash of lightning." The defence was that the car was provided with four different speeds and that it was being driven on "second speed," a rate of about 8½ or 9½ miles an hour. It was a very noisy car and appeared to be going faster than it really was. The Deputy Stipendiary fined defendant £10 or in default fourteen days' imprisonment. Mr. C. W. FREEMAN, 35, Finsbury Pavement, while driving a motor-car in the City was asked by Police-constable Morse why he brought his

THE LOCOMOBILE IN CHINA TOWN, SAN FRANCISCO.

"stink pot" to the City. Protesting naturally against the policeman's impudent interference he was threatened with immediate arrest, which the sapient constable subsequently commuted to a summons for driving to the common danger. Sir James Ritchie, after hearing evidence at the City Summons Court, dismissed the case, with a remark that he was satisfied no offence had been committed by the motorist.

At Swainsthorpe Petty Sessions, Mr. S. F. Edge, of London, was summoned for driving a light locomotive on August 16th on the road leading from Norwich to Bramerton, at a greater speed than twelve miles an hour. The defendant, who did not appear, addressed a letter to the Chairman of the Bench. The first witness called was William Mitchell, farmer, of Kirby Bedon, who said that at about a quarter to nine in the morning he was on the Kirby Road. Looking up the hill towards Norwich he saw a cloud of dust. Presently he saw that it was a motor-car. It came flying down the hill and passed at a very rapid pace. Police-constable Powles, stationed at Trowse, said that between half-past eight and nine o'clock he was in his yard adjoining the house next the road, when he saw a motor-car going in the direction of Kirby Bedon. He believed the car was travelling twenty miles an hour. On the evening of the same day he was on duty in Trowse Street when he saw a motor-car coming from Kirby. It was then going fifteen or sixteen miles an hour. On the following Saturday the defendant, hearing that inquiries about him were being made, went to the County Police Station in Norwich and gave his name and address. Fined £5, with £1 12s. 9d. costs.

At the Cinque Ports Petty Sessions, at Margate, Charles Higgins, of Margate, was summoned for driving a motor-car at a greater speed than twelve miles an hour. Defendant pleaded guilty. P.C. Hayward said he saw the defendant driving a motor-car through Vicarage Street at the rate of twenty miles an hour. He put up his hand and stopped him. The defendant said that something had gone wrong with the clutch and he was obliged to put on speed to get up the hill. Defendant was fined 40s. and 10s. costs; in default, one month's imprisonment.

At the Rotherham West Riding Police Court, Ernest Hardy Pickford, of Rotherham, was summoned for driving a motor-car at a furious rate at Bramley on the 7th of September. Police-constable Ward stated that on the date in question he was standing at a certain point on Bramley Hill. He saw a motor-car passing Welcliffe House, and a cloud of dust arising. He started his watch, and timed it from point to point. It travelled the distance in thirty seconds, which was at the rate of 25½ miles per hour. In answer to questions, witness said he stood at the point for half-an-hour, waiting for motor-cars, and he started his watch as soon as he saw this one. For the defence, Mr. Gichard pointed out that it was a very difficult thing for anyone to take time in the manner it had been done by the constable. Mr. Pickford had not purchased the car for the purpose of attaining high speeds. It was only made to attain a speed of sixteen miles per hour, and it was impossible to drive it at that rate uphill. The Chairman announced that the case would be dismissed. The constable was doing his duty in bringing the case forward, but they thought he had made a slight mistake in the time.

At the Tewkesbury County Police Court, Frederick Yates, of Trowbridge, was summoned for furiously driving a motor-car in the parish of Leigh. Police-constable Robinson stated that he stopped the car, which was going at twenty miles an hour, by laying his bicycle across the road. Defendant being asked why he drove so furiously said it did not matter on a country road. A fine of £2 and 14s. 6d. costs was inflicted.

GEORGE NORTIER, 21, a motor-car driver, of French nationality, was charged on remand, at Marlborough Street, with driving a motor-car to the common danger. It was alleged that the defendant on the 14th ult. drove a motor-car along Davies Street, Berkeley Square, W., at a rapid pace, and knocked down a lad. Constable Garrod, 334 C, who took the accused into custody, said he should think the man was going at the rate of thirteen or fourteen miles an hour. He did not hear the accused blow his horn. The boy was so injured that he had to go to a hospital. The defence was that the accused blew his horn three times, that he was only going at a slow pace, and that the accident was unavoidable. Mr. Plowden said the defendant appeared not to have sounded his horn, and had thus shown negligence. He would have to pay forty shillings.

At Margate, Mr. Jack Lawson was summoned for driving a motor-car at an excessive speed at Margate. The case has several times been adjourned for the defendant to appear, and on the application of his solicitor it was now heard in his absence. Mr. Elliott (sanitary inspector of Margate) said the car was going more than 30 miles an hour. It was not more than 15 seconds going 220 yards. P.S. Morgan also corroborated. Mr. Armstrong said there was no case, as it had not been proved that the car belonged to defendant. The Bench thought it was not a question of ownership but of driving, and the defendant was fined £6 2s., including costs.

At the Doncaster West Riding Police Court, Adam M. Singer, of Hove, was summoned for driving a motor-car over 12 miles an hour at Bentley on the 8th ult. Sergeant Pearson said that on the date mentioned, about 4.15 p.m., he saw the defendant approaching from the direction of Doncaster, driving a motor-car at a furious rate. He shouted to the defendant that he was going too fast and must stop. He had measured the distance from a given point, and found defendant had travelled 820 yards in 1 minute 20 seconds. Mr. Baddiley said the defendant held a French certificate for driving motor-cars. The Bench imposed the maximum penalty, viz., £10, and ordered defendant to pay the costs also.

At Farnham Petty Sessions, Count Seilern, of Frensham, was summoned for driving his motor-car at an excessive speed on August 3 and 4. Mr. Crundwell prosecuted on behalf of the police, and Mr. Fleming, barrister,

appeared for defendant. Mr. Fleming said it would be in the recollection of the Bench that he obtained an adjournment of the summonses a fortnight ago on the ground that two of the defendant's witnesses, Count de Pret and Mr. Goldsmith, were unable to attend. He was still in the same difficulty, and was now instructed by the defendant to say that he would not defend the cases, because he was of opinion that if he went into the witness-box and gave evidence he would not be believed. Mr. Fleming afterwards stated that he was instructed by the Count to withdraw from the cases. The evidence was, therefore, taken shortly. The police stated that the defendant drove his motor-car at Farnham on the first-named date at a speed of over 30 miles an hour, and on the second at over 15 miles an hour. A fine of £10 and costs was imposed in each case.

At Doncaster, Rupert Beckett, a justice of the peace, was summoned for driving a motor-car at excessive speed. Police witnesses stationed on the Great North Road alleged that defendant was travelling from twenty-five to thirty-two miles an hour. The defence was that a spring broke and the defendant was unable to properly regulate the speed of the car. The magistrates imposed a fine of £10, and allowed a second summons to be withdrawn.

THE French Minister of Agriculture has given his support to a public competition for motors worked by alcohol, which is a national product, in contradistinction to petrol, which is imported. There will be four classes, namely:—(1) Fixed engines; (2) portable engines; (3) automobile engines; (4) launch engines.

FORAIN, the French caricaturist, is unlucky in his auto-mobiling experiences. It may be remembered that he started in the tourists' section of the Paris to Berlin contest, and that when Rheims was reached at the end of the first day's stage he had already dropped out of the running. He tried to catch up afterwards, according to his own account, but he was not seen again on the road to Berlin. Now the artist has had a bad spill in the suburban woods of Marly. He was driving a voiturette, with a friend by his side, in a lane with many deep ruts. A wheel of the car stuck in one of the latter. By tugging at the steering wheel the car left the rut, but ran into a clump of trees on the side of the road and upset. Forain and his friend were thrown out violently. The artist crawled from under the car uninjured, except for a few scratches, but his fellow-traveller, who was thrown to some distance, was hurt in the shoulder.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. III.]

LONDON, SATURDAY, OCTOBER 12, 1901.

[No. 136.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

WE believe that Mr. George Peacock, 84, Bathurst Street, Sydney, is the first motorist in Australia to appear in a police court for "furious" driving. He was summoned for driving at a speed of more than eight miles an hour. Constable Archinal stated that he saw the defendant drive the motor-car into the Domain through Macquarie Street. Noticing the excessive speed at which the car was travelling, he took out his watch and timed it, calculating that it covered a distance of a mile and a half at the rate of about eighteen miles an hour. Defendant, who pleaded not guilty, said the vehicle had recently been undergoing repairs, and he was giving it a trial. He was not aware that he was travelling at the speed deposed by the constable. A fine of 10s. and 5s. 6d. costs, or three days' hard labour, was imposed. Evidently one touch of the policeman will make the whole world kin—so far as the motoring section of it is concerned. Alas! that in such a country as Australia the antiquated prejudice of English county justices should flourish and prosper.

The "Good Girl" Misbehaves.

ON Friday last we had the pleasure of a short conversation with Lord Kingsburgh at the Automobile Club, and learnt that he was going on the following Tuesday to bring his Delahaye car home from Stirling, where the "Good Girl!" had been since her mishap in the Glasgow trials. Apparently the young lady, after her rest, was somewhat lively, for we learn that the Lord-Justice-Clerk of Scotland has experienced a nasty motor-car accident. While he was driving a party of friends along the high road near Dunning, the vehicle collided with a bulky cart and tumbled down an embankment, throwing the occupants out in various directions. One gentleman had an arm fractured, but the other occupants fortunately escaped without injury.

A Wall of Despair.

COMMENTING on the cases recently before the Grantham Court a correspondent in a Spalding paper records a conversation with a local motorist who has come to the belief that "there's no pleasure in motoring nowadays. When you see a policeman in uniform you must slow down to four miles an hour; and if you run up to the legal limit you are in fear and trembling lest the man you have just passed on the road should be an officer in plain clothes. Life's a misery on a motor-car, and I'm open to sell mine to the first customer." This is a very despairing way of putting the matter, but it is scarcely an exaggeration, with the present haphazard system of speed calculation practised by the police.

Wellingborough adopts Motor Dust Vans.

AT the last meeting of the Wellingborough District Council, the General Purposes Committee reported that they had considered designs and specifications of motor-vans as follows:—Messrs. Coulthard, motor and van £560, trailer £95—£655; Messrs. Bayleys Limited, van £700; Messrs. Simpson and Bibby, motor and van £600, trailer £50—£650. After hearing the report of the assistant surveyor, the Committee were of opinion that the motor van and trailer of Simpson and Bibby is the machine best adapted for the use of the Council. On the motion of Mr. James, the report was adopted, with the suggestion that the Chairman of the Council, the Chairman of the General Purposes Committee, and the assistant surveyor first inspect one of the vehicles at work.

The Speed of Motor-Cars in Scotland.

AT the meeting of Helensburgh Town Council on Saturday last Bailie Bryden moved that a memorial be presented to the Secretary for Scotland calling attention to the danger to the public safety arising from his Lordship's new regulation extending the driving speed of light locomotives on highways to twelve miles per hour, and respectfully suggesting that within burghs and populous places the speed should be restricted to eight miles per hour. Councillor Watson seconded, and the motion was unanimously agreed to.

The Width of Roads.

LITTLE has been said in the many discussions on roads which have lately taken place, as to the influence which the width of roads should have upon the matter. A speed which would be rather hazardous on a road fifteen feet wide might be perfectly safe on a main thoroughfare of twenty-five feet in width. This is a point which should be remembered by the public, and one which should induce motorists to utilise their influence to secure widening of the roads wherever possible. Thousands of miles in the Highland counties are not fifteen feet wide, and in England many long roads could be widened with increased safety to those who use them.

Motor-Cars in the Australian Postal Service.

WE learn from Melbourne that a trial has been made by the Federal Postmaster-General of clearing letter pillar-boxes by means of a motor-car. St. Kilda and Caulfield districts were chosen for the experiment. There are about forty pillars in the district, and the usual mail horse van takes three and a-half hours to cover the ground and complete the work. The motor-car did the distance and work easily in an hour and a-half, and that during the heaviest street traffic of the day. It is probable that in a very short time motor-cars will be utilised for this work in Sydney and all other large centres in Australia.

A Novel Advertising Car.

ALTHOUGH the motor car has now become quite a recognised form of locomotion, and no longer attracts the attention of the passer-by, as was the case a few years ago, yet it can still be made an excellent advertising medium. Our illustration shows an automobile that the Kannenbeer Supply, Limited, have now running in London. The vehicle is a $4\frac{1}{2}$ h.p. De Dion voiturette, the special carriage work having been carried out by the Grosse Berliner Motor-Wagen Gesellschaft, of Berlin: The huge jug is of aluminium, painted to represent the firm's special package, while the "label" is formed by a shaped sheet of glass serving the purpose of a window through which the

driver can see where to steer. Even the side lamps take the form of miniature jugs. The driver sits inside the jug, which, however, can be taken off and a nicely upholstered seat substituted for it. Naturally, the Kannenbeer car is the centre of attraction wherever it goes.

Queries.

A SILLY person has written to a half-penny daily journal with regard to motor-omnibuses in London, and, repeating the statement that 14,000 passengers can be carried by 'buses in an hour past a specified point, he asks "how many of this mass of human beings will be destroyed or incapacitated should the new motor service come into vogue?" This sort of innuendo is part of the campaign of prejudice which automobilism has to encounter. Has there been an accident yet? Are ordinary 'bus accidents unknown? Is not all travel associated with risk? Is it not better to wait and see the results before lamenting over an anticipated catastrophe which is not likely to happen? These are a few questions which should be asked in conjunction with the foolish query that suggested this paragraph.

Omnibuses.

It is not generally known that France was the first country to run omnibuses on a systematic plan. Just as in automobilism she went well ahead at the start, so in omnibuses she became a pioneer. It was in 1662 that omnibuses ran from specified points at specified times in Paris; and not till 1800 was a similar attempt with horse-drawn vehicles made in London. Even then the scheme failed, and the century was nearly half through before anything like modern regularity was reached. Among the many attempts made, those of Gurney, Dance, Church, and Hancock, with their steam coaches, deserve recognition.

Motor-Cars V. Trams.

ALREADY great rivalry is arising in the United States between the automobile and electric tramway companies—a rivalry which, ere long, will find a counterpart in the motor-car and tramway competition in this country. At present the invested wealth in the trolley and tramway companies will be thrown into the scale against the motor-vehicle, but public convenience will soon demand a fair field for the latter. The vehicle that runs on a made-up track is at a disadvantage compared with the car that can be brought alongside the pavement for the convenience of passengers.

Golliwogg.

GOLLIWOGG has attained fame among small children, and those of a larger growth have laughed immoderately over his antics. Now he comes before us in an "Auto-Go-Cart," which has been published by Messrs. Longmans, Green, and Company. In a charmingly printed volume Miss Florence Upton gives us some capital pictures, and Miss Bertha Upton's rhymes fit in well with their pretty childish character.

"This is a most progressive age,
And with it we must move;
That even toys are up-to-date,
My master-piece shall prove."

Having thus reflected Golliwogg selects his party of girls for a ride on a fearfully designed vehicle, which words fail to describe. They start off on their journey when

"Sun! Moon! and Stars! What means this shock,
This sudden growth of the wings!
Do auto-carts behave like this?
Such peaceful-looking things!"

Having picked themselves up they recommence their journey, when they are arrested by the police, who

"Drive them, tied with yards of rope,
Into a darksome cell;
For scorching means a heavy fine,
Imprisonment as well."

How Golliwogg escaped will interest the children, and their adventures in a storm will remind motorists of that watery day when they returned from the Automobile Club's run to Southsea. Encounters with highwaymen, tire troubles, and explosions are, among other disasters, recorded, but Golliwogg had the true "motor spirit."

"He laughed about the accident,
And joked about the rain,
Till voting was unanimous
To take the trip again."

The book will be a capital one for presentation to the youngsters of motorists in the coming Christmas season.

An Early Steam Omnibus in Scotland.

IN 1834 a steam carriage was run between Glasgow and Paisley, but the Road Trustees of that date looked askance at the innovation, and on July 29th of that year they caused an unusual amount of "road metal" to be laid down on the hill at the Halfway House, with the evident intention of making it a stiff pull for the carriage. Their object was gained, but at the loss of life. The carriage came along in the usual manner, but

the hill was too much for it, and the boiler burst. A drawing of this incident may be seen in room No. 10, in the Memorials of Old Glasgow Section, at the Art Gallery in the Glasgow Exhibition, and the engine of the carriage itself is exhibited at the entrance to the same room.

A New Indicator.

THE difficulty of taking indicator-diagrams with explosive motors is well known, and an ingenious device for obtaining instructive records with such, though they are hardly indicator-diagrams in the usual sense of the word, deserves notice. It consists merely of a cylinder attachment to an ordinary indicator, driven by clockwork instead of the usual cord from the piston-head or similar part. The diagram thus shows a series of vertical lines showing the pressure at commencement of stroke, and the extreme pressure during same, together with the number of strokes, and some illustrations of its use published in the *Revue Industrielle* show clearly the way in which the effects of throttling, defective valve area, and the like are brought out upon the diagrams. The inventor, M. Mathot, has adapted it specially to automobile and similar high-speed engines by the introduction of a pair of cylinders and roll of paper, which enable diagrams of considerable length to be taken.

Roads Again.

MOTORISTS are so generally regarded as selfish people in their constant appeal for an improvement of the roads that it is gratifying to read in several journals, wholly unconcerned with our sport, a spontaneous backing up of the agitation set on foot by automobilists. It is not only the motorist who deplores the condition of some of our main roads, but owners of horses have long complained with good cause of the narrow paths and sudden turns of many of our highways. Now that the motorists are a growing as well as a moving force in the country some improvement should be made. We can claim it, for we have no horses' hoofs to destroy the surface, and that, it must be confessed by all, is the great cause of wear and tear on our roads.

The Last of the Dog.

CANINE existence is becoming precarious and irksome. A County Court judge having ruled that dogs have no right on the pavement, they have only the roadway in which to indulge in their interesting evolutions. The adoption of the bicycle, with its noiselessness and speed, has added to the risks of dog life, while the dog seems to retaliate by adding to the number of cycle accidents. The same thing will probably happen in the case of the motor-car. Motorists have long been familiar with the erratic conduct of dogs, which dart from the pavement to the rear and the front of the motor

with a rapidity of motion and a noisesomeness of manner that is decidedly vexing. Until dogs, too, are educated to recognise the virtues of the motor-car they may have a hard time. In fact, as regards the motor-car and the dog on the roadway it will be a case of the survival of the fittest.

Motor Talk.

A FAIR correspondent in one of the daily papers writes complaining of a grievance in connection with motor-cars that is rather amusing. She refers to "the motor-car conversation." Golfers, anglers, and other sportsmen have a habit of recounting their exploits over and over again, and she has discovered that there are motorists who treat all their friends at dinner or elsewhere to observations on speed and the incivility of drivers of restless horses. The subject of the conversation may be changed half a dozen times, but the motorist generally brings it back to automobilism, with the result that this fair lady

and her friends are wearied. The grievance is a really sad one. Why do not the ladies become motorists, and then pay the troublesome man-motorist back in his own coin? In such case the lady would undoubtedly win.

Horse Dealings.

MANY stories of dubious dealings in connection with horses are retailed in club-gossip and newspaper columns. We heard the other day of a purchaser of an automobile whose coachman was indignant with the seller of the vehicle because no commission was allowed him on the

purchase. He had been in the habit of receiving a present when his master bought a new horse, and he did not appreciate the absence of such a "tip" in the case of the motor-vehicle. In another instance a coachman set to work a motor-car had so many mishaps that the owner went to the firm from whom the vehicle had been bought and complained. "Had I given him £5," said the dealer, "all would have been well." The employer—to test the affair—instructed the dealer to send a bank-note to the coachman, and the motor then ran smoothly enough. The man was dispensed with soon after. It would be interesting to learn how many mishaps have been due to such a cause. We believe these are isolated cases, but that they have been reported should be a useful warning to buyers and sellers.

An 1,850 Mile Tour.

COUNT BOOS-WALDECK, an enthusiastic Austrian *chauffeur*, has recently made an extensive tour on his 20 h.p. Austrian Daimler car. Leaving Vienna early one morning in August, Munich (260 miles) was reached the first day. The journey was continued *via* Cannstatt, Heidelberg, Cologne, and Brussels to

MR. C. CORDINGLEY AND PARTY ON HIS NEW NAPIER CAR.

Ostend, which was reached in five and a half days from the time of leaving Vienna. After a short stay at the Belgian seaside resort the tour was resumed to Marienbad, the route chosen being *via* Paris, Chalons, St. Johann, Saarbrücken, Arnstein, and Hundsbad; altogether the tour extended to 2,975 kilometres, or, roundly, 1,850 miles. On another page we reproduce a photo of Count Boos-Waldeck's start from Vienna.

A FRENCH ARTIST'S SOLUTION OF THE DUST TROUBLE.
(*Le Français*.)

Some Sensible Pleas.

IN appearing before the Commissioners in an endeavour to keep them from passing a law making it obligatory for every motor-vehicle in Washington, U.S.A., to be defaced with a large licence number, the Committee of the National Capital Automobile Club recently summed up a very able attack upon the proposed law in these words: "In conclusion we state that from our standpoint the enactment of such a law would be an intrusion upon the rights of citizens, indefensible in its purposes, and wholly unwarranted by any existing condition. The horseless vehicle is a godsend to the healthfulness and cleanliness of the city, in avoiding the noise and jar incidental to the movement of horse-drawn vehicles, and to the heretofore enormous expenditure for city roadway. Could you do away with the horses' hoofs, their sharp shoes, and steel tires, the pavement would last indefinitely when constructed with even a tithe of its present strength and cost. We submit that such section ought not to become a law in anywise affecting motor-vehicles used for private purposes. We hold ourselves in readiness not only to demonstrate the truth and correctness of the propositions set forth, but challenge the supporters of this obnoxious measure to show any good cause or sufficient reason for its enactment."

The Cost of Motor-Cars.

THE demand of the general public is always for lower prices, but the public does not fully appreciate the fact that a lower price must necessarily mean a lower quality of material and workmanship, which will result in untold annoyances and troubles to the user, and, consequently, a higher cost in the end. The duties of an automobile are so severe that satisfaction can only be expected if both material and workmanship are of the best—and these are always expensive. There are, we find, many members of the general public who are hugging the belief that motor-cars at present prices bring their manufacturers a net gain of several hundred per cent. Such a belief, however, is entirely unfounded, the profit is in most cases only a very reasonable one, and manufacturers who are determined to maintain a high standard of quality have been inclined to advance their prices rather than reduce them. It is of the greatest importance to the industry in general that a high standard of quality be maintained. Cheapness of construction will lead to dissatisfaction, and the lasting injury that may be done by dissatisfied customers is certainly a more serious consideration than the loss of a few customers who cannot discriminate between the good and the cheap, or who abstain from buying because prices are too high, according to their ideas.

Photography and Automobilism.

AUTOMOBILISM is responsible for many hundreds of amateur photographers, and must be regarded as a valuable asset to the photographer. Every season thousands of films and plates are exposed from the seats of motor-cars, and an even larger number are directed towards moving motor-vehicles. The automobilist can thus obtain a photographic record of pleasant trips, while the local amateur snapshotter can amaze his friends with his wonderful photographs of cars travelling at any speed from ten to sixty miles an hour. But what startling monstrosities are perpetuated in the name of amateur photography! The hood of the car is often out of all proportion to the head of the driver, and the actual number of really satisfactory photographs is comparatively small. When they know that the glass eye of the camera is upon them automobilists have a habit of "sitting still and staid," so that all sense of actuality is entirely lost. If there is much in automobilism that puzzles the ordinary mortal, there is infinitely more in photography to confound the average automobilist. We once heard of a motorist—who has since developed into a photographic critic—unrolling a roll of exposed films before the electric light in order to see the outlines of the pictures he had taken, and then sending the whole roll to be developed!

Ingenious.

A SUGGESTION has been made in the United States which is characteristically American. The owner of an automobile complained to the makers that it had faults and inconveniences which caused him trouble. They retorted that his was an exceptional case, and hinted that he and not the machine was to blame. That caused him to think, and the result of his ruminations has been the formation of an "Owners' Information Bureau." All owners or users of American automobiles manufactured in 1900 or 1901 are invited to write to him giving their experience (a) with the machine and (b) with the manufacturer. These letters will be classified and printed, each writer forwarding 25 cents with his contribution. In that way it is hoped to get a thoroughly reliable criticism of all American vehicles. The idea is ingenious, and doubtless will be encouraged by the lawyers, who will recognise in its carrying out a splendid source of libel actions.

BOILERS on all steam motor-vehicles in Chicago will in future be subject to inspection, and will fall within the jurisdiction of the City's boiler inspector's department.

A WEEK-END IN FRANCE.

HAVING received an invitation from my brother-in-law to join him in a little run on his $3\frac{1}{2}$ h.p. De Dion voiturette to Caudebec-en-Caux, to see the "Mascaret," or tidal wave of the Seine, I bestirred myself, got through my work, and with a little effort caught the ten o'clock boat train from London Bridge for Newhaven on Friday, the 27th ult. A little under two hours and we were safely on board the Brighton Company's s.s. "France," and had cleared the harbour.

It was about 3.45 p.m. when I had cleared the Customs at Dieppe with my few belongings. This over, I made my way to the street and found my brother-in-law in waiting. It was but the work of a few seconds to stow myself comfortably on the car, and away we went right through the Grande Rue and then to our left up the Route de Rouen, well known to readers of Du Maurier's "Trilby." This stiff gradient negotiated in fine style, we soon found ourselves at St. Aubin-sur-Seie, where we completed our party by taking on board our wives. It would have been impossible to have had finer weather, the sun shone out

we had a clear run down of ten kilometres into Caudebec. The moon was then shining brilliantly, and the scenery of the last stage was something to remember; it equalled in grandeur and picturesqueness the finest Swiss scenery. To attempt to describe it is beyond my pen. It was close upon nine o'clock when we drew up at the Hotel de la Marine, Caudebec. A few minutes served to put "Diana" into the garage, and then we sat down to dinner, which we enjoyed to the full, for our appetites were distinctly keen after the long spin we had had. Saturday opened as fine as the previous day, and we spent the morning exploring the old parts of the town. We found ourselves fully repaid, for there are some quaint old Norman houses hidden away in Rue de la Cordonnerie and the Rue de la Boucherie that must be seen to be appreciated. The church is also interesting and worth visiting. After lunch we went for a short spin along the banks of the Seine as far as St. Maurice, and the opinion formed by us was that the scenery was equal to, if not grander, than that of the Rhine.

Sunday was the day that the "Mascaret" was supposed to be the finest of the year, but it failed them, as the wind was not favourable, consequently it was disappointing; still, the sight was

Cliche de

COUNT BOOS-WALDECK STARTING FOR AN 1,850-MILE TOUR. (See page 579.)

(Allgemeine Automobil Zeitung.)

brilliantly, and, tempered as it was with a pleasant breeze, I do not think it could have possibly been more auspicious for our start. Add to this that the roads were perfection, and I think we had all we desired. The clock was chiming the half hour after four o'clock when we made a start. Our next place was Bacqueville, a distance of thirteen kilometres; we did not stop here, but went right through on to Doudeville (twenty-three kilometres). There we stopped a few minutes to see that all was well, and then off to that quaint old-world Norman village Yvetot, a further eleven kilometres, making thirty-four kilometres we had travelled. Here we rested for about half-an-hour to oil up and water "Diana," as well as to refresh ourselves at the charming old café in the market-place. It was 6.30 p.m. before we had lighted up and were ready to start, having still the greater part of our journey before us. We turned to the left out of Yvetot and took the first road on the right to Bolbec; this we traversed for about twelve kilometres, then on our left we took a lane leading to Trouville (two kilometres). Arrived there, we bore to the left on the road leading to Caudebec for close on two kilometres, then, bearing to the right,

most interesting, and something which we had not seen before. It was now ten o'clock, so we paid our indebtedness, said good-bye, and started on the homeward tack, taking a different route to that traversed on Friday. Our first town of importance was Lillebonne; this we made circuitously to avoid a rather stiff gradient on the national road, taking the route we had followed on Saturday, keeping by the Seine's banks, and then through Fosge, Petitville and Mesnil to Lillebonne (fifteen kilometres), thence to Bolbec (six kilometres). From Bolbec our road lay to Goderville (eleven kilometres), which we reached about twelve o'clock, and passing straight through the town, we kept on to Fecamp. This, as we all know, associates itself with "Benedictine." After lunching at the Hotel d'Angleterre, we decided to restart at three p.m., so, after oiling and watering our trusty "Diana," we kept to our word and left punctually. From this point our next town was Cany (eighteen kilometres); this is the great junction for Dieppe and Havre, the Western Company of France having large sheds here, which are used as depots for produce, etc. On through Cany our way lay to St. Valery-en-Caux (eleven kilometres), a

most charming little watering place and largely visited by English during the summer months. From this point we steered for Veules-les-roses (six kilomètres), where we stayed about an hour, having found an obliging hostess at the Hotel de Rouen. Like St. Valery, this place is also well attended by English visitors in the summer. The only means of reaching it is by diligence from Dieppe three times a week, but, when you are there, it is simply Arcadia. At 5.20 p.m. we drove out of the hotel yard and headed for Dieppe (twenty-two kilomètres), passing through Bourg Dun. We went magnificently, "Diana" answering to our demands like a "Briton," and it was 6.15 p.m. when we drew up at my brother-in-law's house in Dieppe, having completed one of the most charming outings it has ever been my lot to enjoy. Beyond two little minor accidents with the machinery, occupying but twenty minutes in all to adjust, we had no mishap. In conclusion, I can only suggest to those readers of the *Journal* who can afford the time to take this little trip: it will repay them in many ways. They will see in France what we so much want in England, i.e., that in every village there shall be a decipherable indicator giving the name of the town or village, and also on the same indicator the distances to the next village, both from and to. Now that we have District Councils they could well introduce this much-needed improvement, and it could be done at a small cost. We noticed an entire absence of the officious policeman, with outspread arms, and, beyond seeing nailed up in two villages "Automobiles, marchez au pas," we did not come across any vexatious restrictions such as one meets in England.

"SYGOGNE."

THE "UNIVERSAL" MOTOR-BICYCLE.

THE accompanying illustration shows a new motor-bicycle of French construction which has lately been introduced into this country by the London Autocar Co., Ltd., of Gray's Inn Road, W.C. A feature of the machine, which is known as the "Universal," is the novel method adopted of transmitting the power of the engine to the rear wheel. As will be seen, the motor, which is of 1½ h.p., is carried in front of the main down tube of the frame; it transmits its power by a crossed strap to a small pulley carried on a special support on the rear frame. Combined with the latter pulley is a small pinion which

gears with a larger pinion fastened rigidly on the hub of the rear wheel. Although the large pinion is additionally attached to the spokes of the rear wheel, the fact that the power is transmitted through the hub as well as the spokes relieves, it is claimed, the latter of considerable strain. The engine is fitted with an exhaust valve lifter and a spray-type carburettor of small dimensions. We

understand that, in addition to complete machines, the London Autocar Co. are able to furnish the motor and its accessories separately to enable cycle makers to build their own motor-bicycles.

CONTINENTAL NOTES.

BY "AUTOMAN."

THE automobile made its appearance on the Paris stage many years ago, and scarcely any music-hall performance was then complete without some allusion to the new form of locomotion. I remember very well at the "Cigale," some three or four years ago, the amusing scene in an electric brougham, one side of which was cut away to allow the audience to see what went on in the inside, and the passengers, one of whom was, I remember, the renowned Jeanne Bloch, got an electric shock which effectually put an end to the love-making. It is now the turn of the navigable balloon, which appears in the music-halls which are just opening for the season. One peculiar feature of it is that there is a *chauffeur* in the usual fantastic French attire in charge of the balloon.

It seems from the recent balloon ascents and from many other signs of the times, that automobilists are more than anxious to take up this newer form of locomotion, and this is perhaps most suitable, because the petrol motor is likely for a long time to hold the field in aerial navigation, and half the battle with the air will consist in the skill of the navigator in keeping his motor in good condition.

CHARRON and Girardot have returned to Paris after their trip to America, and they fully confirm what has been already the opinion in automobile circles, that is, that the Americans are years behind the times in automobile manufacture and are still experimenting with designs of cars quite unsuitable for the requirements. Charron, however, thinks that the Americans will soon get on the right track and then be able to compete successfully with European makers.

In Belgium the authorities have the most casual way of repairing the roads, and it occurs frequently, when one is driving at night, that one comes on holes, tools or other hidden dangers left in the middle of the road without any warning light. The latest accident occurred to M. Deschamps, whose 12 h.p. motor-car was in the race from Paris to Berlin and was described by me in these columns. M. Deschamps, travelling from Paris to Brussels at night, ran into a heap of stones, his car being smashed up and himself badly injured.

FOR the information of English automobilists who may have the intention of taking their cars over to France, it may be well to give the readers of the *Journal* a few hints as to what they ought to do in order to conform with the new regulations. The latest date for conformation with the arrangement is the 12th November this year, after which time they will be subject to prosecution if they are not in line. In the first place they must send in a declaration certifying whether or not their carriage is capable of doing more than thirty kilomètres an hour on the level. This declaration must be sent to the prefect of police in Paris or in the town where they propose to land. If they have already a permit for France they must send this with their declaration. One month from the 12th November is allowed them, during which time they must have the numbers placed on their cars if they are declared capable of doing more than thirty kilomètres per hour. The address of the prefecture of police where these papers will be received and attended to is, The Second Division, Third Bureau, First Section, Caserne de la Cité, Paris.

ALPHONSE ALLAIS, one of the most amusing of French humorists, who has for years written amusing articles for *Le*

Journal and other papers, is devoting special attention at the present time to the automobile, and he makes some suggestions which "Automan" wishes to recommend to the special attention of some British magistrates badly attacked with "motophobia." Allais' idea is to construct a speed-counter with a dial marked up to sixteen kilometres (say, ten miles for England), which no doubt some people will consider the right speed limit. As long as the needle does not get up to the limit all is well with the motorist, but should he be so rash and commit so heinous a crime as to exceed the limit of speed, bang goes a dynamite cartridge which the duly-recognised authorities have placed under a seal alongside his engine, and there is an end to law-breaker and his unlawfully used motor-car.

MR. SYDNEY H. HOLLANDS is an enthusiastic devotee of aviation, but his enthusiasm has carried him altogether too far, and he seems to be oblivious of the fact that opinions on this subject differ. I am sure he does not mean, in reality, to mislead anybody, but enthusiastic people of this sort are apt to forget that the uninitiated public may take them seriously. I think this must be the case; certainly, as far as I am personally concerned, his judgment is quite at fault. I do not pose as an authority on this controversial question, and I began my comments on his first letter by saying so, but in common with all those who, like myself, have taken a keen interest in this subject, I have followed in the Press the accounts of the experiments made in this direction.

I WAS, I will confess it, startled by his latest letter, because I thought that some wonderful flying-machine must have been constructed which I had never heard of, and my astonishment increased when I carefully re-read his letter, and found that it alluded to the well-known experiments in soaring and steam flight which all the world knows of; but why, or how, Mr. Hollands should call these "practical results" I cannot understand. Why does he not go back fifty years and quote Stringfellow's experiments, which attained nearly the same success as those quoted by Mr. Hollands. I can only repeat that no practical result has yet been achieved in this direction. Professor Langley's Aerodrome was an experimental model carrying no human being, and launched by springs from a high platform. Lilienthal soared down mountain sides until he met his sad end. Chanute glided along from the summit of the sand banks of Lake Michigan, and Hargraves is still in a state of crude experiment. To call these "practical results" is quite misleading to the public, and Mr. Hollands might as well cite the toys that one sees flying up to the roof of the Westminster Aquarium.

M. SANTOS DUMONT, on the other hand, has repeatedly risen from the ground, made long and complicated flights backwards and forwards, describing curves, rising and sinking, and coming back with perfect ease to the spot where he started from. These are practical results indeed, and though I am far from saying that aeroplanes will never be successful, I hold the opinion, in common with M. Santos Dumont and many others, that a combination of the aeroplane and the balloon is far more likely to be the successful flying machine of the future. Mr. Hollands, however, falls into error again when he ridicules my comparison between a bird's wing power and the power given off by a motor, and asks me where I can find a bird having 1 h.p. per 7 lb. of weight. I cannot find such a bird, nor can Mr. Hollands find such a flying machine, for, instead of comparing the weight of the bird's motive power with the weight of the motor, he compares the whole bird with the motor, which is obviously absurd, and my assertion that man can never expect to make a flying machine without the use of hydrogen, as light in proportion to its power as a bird is in proportion to its wing power, stands good.

MR. HOLLANDS finishes up by protesting against my calling M. Santos Dumont's flying machine a "gravity navigable balloon," and it is quite evident to me that he has never really

realised M. Santos Dumont's principle. As I have already stated in the *Journal*, on the authority of M. Santos Dumont, the young Brazilian is an advocate of the gravity principle, his navigable balloon is heavier than the air and is raised from the earth solely by means of the propeller. Why, therefore, should it not be called a "gravity navigable balloon"? In conclusion, I may say that I respect every man's opinion, including that of Mr. Sydney Hollands, and should be glad if Mr. Hollands would add to his expressed courtesy the same respect for my opinions.

THE CARSAK PRIMARY BATTERY FOR ACCUMULATOR CHARGING.

A GREAT drawback with the use of small accumulators is often the inconvenience of recharging. This difficulty can be overcome by the use of primary batteries, enabling a motorist in the country to be independent of a dynamo current. Among the many types of primary batteries that have been recently put on the market is the "Carsak," made by the General Electric Company, Limited, of Queen Victoria Street, E.C., and of which an illustration is given herewith. One of the chief claims made for the battery is its low internal resistance, and consequent high output, which, moreover,

is steadily maintained. The inactive element consists of a porous cell, containing the necessary particles of carefully selected carbon and manganese packed together, and held in position by a cylinder of sacking. The positive element is a specially constructed cylinder of zinc, of guaranteed 98 per cent. purity, and thoroughly amalgamated.

The electrolyte consists of a patent non-crystallising battery salt, called "salectron," mixed in the proportions of two ounces to one pint of water. When, through evaporation, the level becomes reduced, a little water should be poured in. The battery which is sold for recharging automobile ignition accumulators comprises either four No. 0 cells, or four No. 1 cells, complete in a box, as shown. The No. 0 cell has an E.M.F. of 1.6 volts, and initial current of 14 amperes and internal resistance of .12 ohms. The No. 1 cell has an initial current of 10 amperes and an internal resistance of .16 ohms. To set up the battery place about ½ lb. of salectron or sal ammoniac in each jar, and half fill with water, stir with a stick until the salts have dissolved, then place one zinc and one Carsak element in each jar, and connect the zinc of one cell to the carbon of the next, repeat the process until a zinc at one end and a carbon element at the other end remain unconnected. Connect these two to the accumulator to be recharged—the positive terminal + of accumulator connect to + or carbon element—the zinc to the negative—and so complete the electrical circuit. The battery should be allowed a rest of twelve or fourteen hours after use.

CORRESPONDENCE.

THE SHOW QUESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Baily in a recent letter stated that the following resolution, passed by the representatives of the trade at the Automobile Club of the 11th June, 1901, was not carried unanimously:—

"That there shall be only one exhibition per annum; that it shall be under the same management as the recent exhibition; that it shall be at the Agricultural Hall at the same time approximately as the recent exhibition, and under the control of the Automobile Club."

Although it may not be so stated in the official minutes, I believe that no one voted against this resolution. Be that as it may, it is officially recorded, and the correctness of the record has never been questioned, that the arrangement referred to in the above resolution was adopted by those present by a unanimous vote on the following resolution:—

"That the Automobile Club of Great Britain and Ireland shall have the right to refuse space at their exhibitions to all who have exhibited automobiles, or their parts, at any exhibition within twenty miles of Charing Cross, which is not recognised by the Automobile Club."

* Mr. Baily endeavours to minimise the importance of the second resolution by saying that it is of a general and philanthropic character, whereas, in reality, it is a resolution by which the trade showed their determination not to permit disloyalty in their ranks to the decision of the majority. This resolution was passed in consequence of the suggestion made by Mr. S. F. Edge at a previous meeting that some such precaution might be necessary. Mr. Baily states that the meeting at which these important resolutions were passed was poorly attended. Permit me to state that all members of, and agents for, motor-vehicles were invited to be present, or, failing that, to fill in proxy forms, giving their votes on the questions to be decided at the meeting.

The following companies and makes were personally represented at the meeting:—

The Daimler Motor Co., Ltd.	The Simms Motor Manufacturing Co.
The Motor Manufacturing Co., Ltd.	The New Orleans Motor Co.
Messrs. Panhard and Levassor.	The Automobile Manufacturing Co. (Delahaye, etc., cars).
The British Motor Traction Co.	The General Automobile Agency (Darracq, etc., cars).
The Motor Power Co. (Napier cars).	Messrs. F. F. Wellington, Ltd.
The United Motor Industries, Ltd.	Messrs. Humber, Ltd.
Messrs. De Dion Bouton, Ltd.	The Petromobile Co.
The Roadway Autocar Co. (Mors and Renault car-).	The British Power, Traction, and Lighting Co. (Serpellet cars).
The Motor-car Co. (Decauville cars)	The Sports Motor Co.
Messrs. Friswell, Ltd. (Peugeot, etc., cars).	The British Electric Traction Co. Ltd.
Messrs. G. F. Milnes and Co. (Berlin Daimler cars).	The British and Foreign Electrical Vehicle Co.
Messrs. Marshall and Co.	The New York Tire Co., and others.
The Locomobile Co. of America.	
Messrs. Brown Bros.	
The International Motor Co.	

It is a question whether there has ever been a meeting of manufacturers of and agents for motor-vehicles in this country at which the trade has been so thoroughly represented. Since the meeting the majority of the firms and companies above mentioned, and many others, have signed an honourable undertaking to abide by the decisions set out in the above resolutions, and many of those who had proposed to exhibit at the National Show and at Mr. Baily's Crystal Palace Exhibition have signified their intention of not exhibiting there, while Mr. S. F. Edge, on behalf of the Motor Power Company, and others, who were originally in favour of the proposed Crystal Palace Exhibition, have from the outset been in favour of the principle of one exhibition per year, and have signified their desire to fall into line with the majority of manufacturers. I understand that all the firms above-mentioned, with, perhaps, two exceptions, have already applied for space at the Agricultural Hall Exhibition of April next, and that over 100 firms have applied for a total of over 40,000 square feet of space at that exhibition.

I am directed to ask you to permit me to take this opportunity of referring to an article which appeared in the *Cycle Trader* of the 13th September, copies of which have been circu-

lated. This article contains many misstatements. There are two misstatements, however, which I am directed to contradict:—
(a) The *Cycle Trader* says, "The Club . . . presumes to dictate to the trade." The truth is that the Club was asked by some members of the trade to call a meeting of the trade, and, at a meeting to which all makers of, or recognised agents for, motor-cars had been invited to attend or to vote by proxy, the resolutions above quoted were passed by the trade. The Club Committee did not vote.

(b) The *Cycle Trader* says:—"The Club for £200 a year has tried to render the trade of the Kingdom powerless in its clutches." The truth is that before the above resolutions were passed it was clearly explained that, in order to avoid the necessity of calling on manufacturers and others who had become guarantors for the Club's Richmond show to pay the deficit on that exhibition, an agreement had been entered into by which Messrs. Cordingley and Company pay to the Club £200 a year in consideration of the Club not organising an exhibition in London and of the Agricultural Exhibition being held under the name and supervision of the Club. The £200 is devoted, not to the coffers of the Club, but to the defrayment of the liability of guarantors. It was emphatically stated at the meeting of the trade that the Club was in a position then and there to terminate this agreement. The trade was given an entirely open choice in the matter, but decided on the policy set out in the resolution above quoted.—Yours truly,

C. JOHNSON.

Secretary, The Automobile Club.

MOTOR-CAR ON FIRE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to a letter from your correspondent, Mr. Maudesley Brook, in which he acts as champion for pressure feed on motor-carriages, the arguments he advances in reference to the safety of pressure feed are worth attention, but I fancy would hardly be borne out by manufacturers, who formerly used pressure feed consistently, and I think a letter from the Daimler Company in Canstatt or the Daimler Company in England would be interesting on this subject.

If pressure feed is so much better than gravity feed, why is it that there is not a single motor-car of an approved type using it to-day? And if its safety is so much greater than gravity feed, why do not Panhards, Mors, Mercedes, Napier, and other firms, who with their racing carriages must take much greater risks than the ordinary user, use the pressure feed? The answer, I think, is perfectly simple—because they know that gravity feed is much the safest. How would pressure feed have saved the burning of the car in the Uxbridge Road? One of the petrol connections was left loose, and whether the petrol was allowed to escape, either because gravity assisted it to run out, or because pressure caused it to run out, seems to me very difficult to determine. I think it makes hardly any difference how the petrol is fed to the carburettor; if you allow it to saturate the road, and at the same time stand around with a lighted lamp, it will nearly always end in the same way—namely, the burning up of the car.—Yours truly,

A. NOBLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We notice in your last issue that one of your correspondents suggests that if the Napier car which caught fire in Uxbridge Road, the other day, had been fitted with pressure feed the fire would not have happened. A moment's consideration would show how unreasonable this surmise is. If the petrol caught fire after it had fallen on the ground and while the car was stopped, as is reported, then the result would have been just as bad if the car had been fitted with pressure feed, and perhaps worse, as the petrol would have issued from the loose connection more rapidly on account of the pressure in the tank. The fact of the tank being nearer the ground would also have made it so much more likely to receive the heat first and cause the pressure inside to rise and force the petrol out all the quicker.

Although we use gravity feed on our cars, the tank is not

right in the body, but is fitted under the bonnet, where, if it should catch fire, it can do little damage compared with a tank fitted in or under the body, while if a leakage should occur it cannot saturate the woodwork. A reason for fires seldom suspected is the smouldering of particles of refuse thrown by the wheels on to the hot exhaust pipes, which particles are likely to fall off while the car is standing and set fire to any petrol that may be on the ground.—Yours faithfully,

THE WOLSELEY TOOL AND MOTOR-CAR COMPANY, LTD.

CALCIUM CARBIDE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the comment on calcium carbide in your last issue, it has evidently been overlooked that acetylene gas engines are already in use in Germany, where reckoning carbide at about £17 per ton, the cost of running is found to be about equal to using ordinary coal gas. The proportion of the explosive mixtures varies, I believe, from 1 to 20 to 1 to 30 acetylene and air.—Yours truly,

W. TERTIUS PRETTY.

REDUCING FRICTION ON MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I would like to enable motorists by a few hints to arrive at the proper lubrication for their motors. Thick oil is not always a forerunner of great lubricating properties, and moreover such thick oils are reduced to the viscosity of water when they are subjected to any great heat. Thick oils are also a nuisance in the drop-feed lubricators, particularly in winter time. The best oil to use on water-cooled motors is one of medium viscosity yet possessing a fire test of 470° Fahr., and, what is more important, will stand on the cylinder walls, piston, and rings against the searching, thinning effect of petrol vapour. Ordinary gas-engine oils used on this work are, in the long run, unsuitable, though at the moment they may appear satisfactory; they mean 25 per cent. shorter life of piston rings and cylinder than should be the case. Light-coloured spindle oils, although they may look nicer in the drop-feed lubricators, do not give the results that an oil containing full-bodied hydrocarbons will do. It is ridiculous to pay much more than three shillings per gallon for an oil. If motorists like to pay five, six, and seven shillings per gallon, it is of course their own look out. Moreover, I have reason to believe there are several firms of repute in Great Britain able to produce an oil equal if not superior to any French oil now on the market.

The lubrication of gear boxes is another important matter. I cannot impress the fact too strongly that grease is a bad reducer of friction, and would advise all motorists to have their cars, wherever possible, fitted with tight gear cases suitable for retaining a proper gear-case oil. Any dirty, black oil will not do for this work; to get the best results use only a black, heavy hydrocarbon oil which in price will cost as much as the motor-cylinder oil. Attention to this little detail will save from $\frac{1}{8}$ h.p. on a 6 h.p. car to $\frac{3}{4}$ h.p. on the larger sizes, to say nothing of prolonging the life of the transmission gear.

For air-cooled motors better results can be obtained by the use of a first-class black oil, with a fire test in the locality of 600° Fahr. It is not as nice looking as the semi-transparent oil, but it will be found to be practically indestructible on this class of work, and will lubricate the motor at nearly burning heat. A friend of mine recently did 250 miles; using an oil of this class, on his 2 $\frac{3}{4}$ h.p. De Dion tricycle, with an additional 12 stone on a trailer, on $\frac{1}{4}$ of a pint. On these little motors lubrication is life.—Yours faithfully,

REDUCING FRICTION.

THE ABOLITION OF THE SPEED LIMIT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—How much longer are we to endure the absurd speed limit of twelve miles an hour? It is fast killing all interest for motoring in England. I know of several cases where gentlemen are getting rid of their motor-cars on account of not being allowed to travel faster than the above speed limit. Twelve miles an hour may be reasonable for crowded thoroughfares and

cities, but on a clear country road it is perfectly ridiculous. This country and especially the rural districts suffer from torpor, which is demoralising in its effect, and a few motor-cars going at, say, fifteen miles an hour, or even twenty, is the best tonic to Messrs. Hodge and Company that could possibly be conceived. But, alas! the chronic conservative grandmotherly element is proving a veritable maggot to progress in this country. I, for one, am waiting to see how long motorists will be content to endure the present regulations.—Yours truly,

“EN AVANT.”

“MOTORIASIS.”

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The motor season is almost over; retrospectively we mark out various features, technical and social, and none perhaps so prominent as the vigorous action taken broadcast over the country against excessive speed. Much has been said and written on the subject either way, not unaccompanied with wild suggestion; something also has been done by those who use motor-cars, and something by those who do not, nor is there much doubt which pan of the balance hangs lowest.

It would lay heavy stress on the statistician to prove that the number of automobiles and the convictions for driving at excessive speed had increased in direct proportion to one another. To one reviewing the motor “crime list” of the past eight weeks—the police methods, the magisterial remarks, the inordinate fines, by no means free from shadow of imprisonment with hard labour—what but a feeling of breathless astonishment and desire for prompt remedy?

To this end it were well to locate the diseased tissue and treat the same on diagnosis, pharmaceutically or surgically, to the betterment of all members concerned. The police force, with the exception of some few promotion-lusting constables, rusty from disuse and soured by repeated failures to raise a case against the solitary village public-house, is by no means the sower of the irritability—the motoriasis, as we may term it; its actions are controlled by orders, the orders are forced by suggestions of peculiarly offensive nature, which emanate in unlimited quantity from Councillors—Urban, Rural District, County, or what other species exists soever—embracing in their ranks almost every provincial non-stipendiary magistrate that sits on the bench, and it is to this very considerable body of individuals that we owe such a state of affairs as is rapidly becoming intolerable. Nor have therapeutic measures been neglected, for we know that pharmaceutical treatment of councillor in shape of soothing ointment has been adopted with qualified success.

Councillor, if means, or, for the matter of that, condescending inclination permitted, has journeyed by invitation to London for demonstration purposes, and has returned, with some recollection—of eating. Nor has stay-at-home, mountain brother-councillor been neglected—to him has arrived Mahomet, snorting, demonstrating, and retired again—unfed. While subsequently councillor, travelled or untravelled, ruminating at leisure, does evolve from profound abyss of legislative mind the not-altogether-to-be-wondered-at conclusion that he is a personage of even more importance than he himself imagined and launches out forthwith into hitherto unexplored seas of truculent authority, the unpalatable truth being that councillor is not amenable to soothing ointment, of which the effect, if anything, is irritant. And so, failing pharmaceutical means, we turn to surgery; if perchance under that more drastic regimen there may be found some method of relieving this highly-inflamed member of a disease which, albeit to infinite regret, not fatal, is nevertheless of exasperating duration. Nor need we seek long; examination will show a small area in far worse state than the surrounding tissue, where deep down embedded in rapidly expanding halo of morbid growth, lies the source of the trouble—small, but none the matter for that, viciously septic—the speed limit. Do but remove this with the knife and the inflammation subsides;

motoriasis is a thing of the past, and councillor, returning to normal condition of narrow-minded ignorance, will devote his useless energy to matters that need not concern the automobile world. To treat the councillor in manner other than by stern excision of the clause in the Local Government Board regulation, under which he shelters, is fatal; nothing but a determined front will check him from doing irreparable injury to an industry that promises to be one of the first in the land.

The true policy is one of prompt combination, ever growing stronger, for the instant purpose of reframing the speed regulation before the ensuing season; in what form and by what means cannot well be discussed here. The motor world—sport and trade, long since strong enough to stand firm without assistance—embraces far too much talent and genius for that we should await solution of the problem other than with complete confidence; but no time must be lost or so surely the season of 1902 will witness a state of affairs fraught with consequences more serious than now imagined.

Howsoever long it be possible to restrict the speed of motors to twelve miles an hour, so long also will everyone continue to overstep the restriction, for be it remembered that driving at 12½ miles an hour, or for the matter of that twelve and one-thousandth miles an hour, is punishable; and if not, of whom shall we ask at what particular stage of increase it does become so? Let it rest—unworthy of argument—courting deletion. The thing were a miserable farce but that it provides source for one of the most flagrant abuses of petty justice conceivable. It is suicidal to pander to the legislative whims of a class of men who have neither the sense nor inclination to perceive that they are playing with that most dangerous of all edged tools—superior knowledge, and that sooner or later they will be cut. Hard experience alone can teach them, and let us hope, for the sake of many others, than the present motor world that the day is at hand when the lesson will go forth.—Yours truly, KAPTA.

MOTOR-CARS IN JAPAN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of July 27th last there is an article on automobiles in Japan which contains a number of misstatements. Were there not a possibility of the writer having mistaken cycle shops for automobile depôts and bicycles on the streets for automobiles, I should think there was considerable ability shown in these misstatements, for anyone who has been through Japan and had half an eye to the subject will have noticed that the majority of the roads are built for jinrikshas having a gauge of about 3 ft. 6 in. In the old cities, such as Osaka, the roads are only wide enough for two to pass with care, and in these an ordinary motor-car could not be operated at all. The writer took the first steam machine in Japan from Yokohama to Tokyo, and in asking for a permit from the police for operating an automobile met with some delay, as the police wished to see, before granting permission, what such a thing was like. Among the persons very much interested in the car was the chief of police, who investigated my machine to draw up rules and regulations for such traffic. To-day there are two, or perhaps three, cars in Japan, and all of these, with the exception of mine, were brought for the personal use of their owners and not for business. My firm is the first to systematically go into the motor-car trade in Japan. As to its future I think that it will develop, but the Japanese have more use for a machine that can draw loads and can be used for passenger service than for cars built merely for pleasure; but while this will no doubt be the trend of things for some time, later pleasure vehicles will also find buyers, after the industry has been more standardised. As my firm has gone very seriously into the subject and will shortly open a combined store, sale and club room, and as we have been working hard to get up an automobile club, the difficulties in the inauguration of all this have shown us clearly that the movement is very new here yet and will take careful coaching for some time to come.

Kobe, Japan.

F. B. ABENHEIM,
Manager of Messrs. Bruhl Frères.

SPARE PARTS PROMPTLY WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—At the close of another season of motoring, may I, through your columns, ask for the following advice? (1) Where to get De Dion Ivorine plates for a 3½ h.p. car, without having to wait a matter of eight weeks. An order has been in the hands of a large city firm for this time. (2) Where to get at a few days' notice De Dion spur wheels. I had to send to the makers for one—time occupied, four weeks. During the past season I had new solids put on the rear wheels—time, four weeks.

I have many inquiries from friends, mostly professional, asking as to the advisability of using cars instead of horses. What can one honestly reply? Although I have found De Dion engines reliable, yet, for want of duplicates, my car has been at a standstill for weeks. If these spare parts could be obtained promptly they could be put on by anyone having mechanical knowledge. I have enjoyed riding in my car, when available, as my time was no object, but what of a professional man delayed so long after giving up his horses? If the people and makers interested in a particular make would only see how detrimental these delays are to their trade, surely if they cannot stock all parts, they might arrange an exchange with the different agents, and so help the matter.—Yours faithfully,

AUGUSTUS KENT.

MR. JOHN GOODY writes *re* the comment entitled "Running the Blockade," in our last issue: "I must contradict your statement as to Earl Russell being 'the only other man who ever drove through the historic archway,' as I took two gentlemen, Mr. C. H. Edmunds and Mr. H. M. Edmunds, through, without even being challenged. I have forgotten the date at the moment, but it was in the early part of last year."

THE Automobile Club of France has withdrawn its suspension order against M. Jenatz.

It is reported that the Cannstatt Daimler Company are building a 16 h.p. Mercedes car to the order of the Kaiser.

M. SANTOS-DUMONT was baulked by the weather on Sunday last, and had to abandon his intention of sailing around the Eiffel Tower in his new air-ship.

A DIVIDEND of 8 per cent. has just been declared by Messrs. Benz and Company, of Mannheim, Germany, the makers of the well-known Benz cars, as compared with 10 per cent. in the preceding year.

ARRANGEMENTS have been made for conveying the Russian mails over the Georgian military road across the Caucasus range between Vladicaucas and Tiflis by motor-cars, in place of the former method of post-horses changed every ten miles.

MAJOR SHELDON CRADOCK, of Hartforth Hall, near Richmond, Yorkshire, who, it will be remembered, met with a serious motor-car accident near Doncaster, is, we are pleased to say, now making most satisfactory progress.

It will be remembered that in the Glasgow trials one of the New York tires fitted to the No. 2 M.M.C. car came off the wheel. The New York Tyre Company, never having had one of their tires come off a wheel of its own accord, instituted inquiries into the matter, and send us a copy of a letter from Mr. Iden, the works manager of the Motor Manufacturing Company, Limited, in which that gentleman states that the primary cause of the failure was that one of the nuts had not been properly secured, and this allowed the tyre to begin to creep. As this crept backwards and forwards the nut became gradually looser, until ultimately the tire severed itself from the nut. The creeping where this nut was, and between the nut preceding and following this, became so great as it got more play that it acted as a splendid lever for the second nut, and so on, until four or five of them had been pulled out or broken. No fault whatever could be found with the studs or the threads, and had this one nut been secured as the others were, the tires would have come off with a splendid record in the trials. [Mr. Iden adds that the other tires on the car are in splendid condition up to the present.

FLOTSAM AND JETSAM.

BY "FLANEUR."

FOR those who have eyes to see there is an instructive parallel to be drawn between the recent experiences of the various members of the Royal Family. On the one side we have the Princess Christian, her daughter Princess Victoria, and the Princess Henry of Battenberg driving to Whippingham Church in a pair-horsed carriage; on the other side we have the King and Queen, King George of Greece, the Crown Prince of Denmark and the Dowager Empress of Russia all driving out repeatedly in King Edward's Daimler at Fredensborg. Now which, in the estimation of the "man in the street," is the safer form of vehicle? He would plump for the landau at once. Yet there is not the smallest doubt but that the Royal ladies in the Isle of Wight had an extremely narrow escape last Sunday, and the consequences might well have been fatal. The horse which took fright is said to have broken loose, and the coachman was then able to turn its companion into the hedge. Clearly the first animal must have been wildly restive, and one is forced to speculate how much violence it used before it broke the traces, and what would have happened if that unusual but fortunate contingency had not occurred. Yet this imminent escape from death received no more attention in the daily Press than the petty "mishap" to the then Prince of Wales, when one of the burners of his car blew out while he was being driven to the station from Sandringham some months ago. The papers all but universally appear to regard the horse either as a necessary evil or as no evil at all, despite its waywardness and the enormous lists of accidents that attend its use.

To many professed *chauffeurs*, no doubt, it may seem a work of supererogation to insist upon the inferiority of the horse, upon the fickleness of its temper, and upon the safety of the motor-car. But facts have to be looked in the face, and the conservatism of the British public in this matter is a potent obstacle to the spread of automobilism. Only a day or two ago, for example, a letter appeared in one of the morning papers from a correspondent who bewailed the establishment of the new public service between Putney and Piccadilly, and drew a lurid, if fanciful, picture of the risks the public would incur as the service was increased. This is ludicrous enough *per se*, but the extent to which this view is shared is not a matter on which to dogmatise; as yet one can neither estimate the strength of the undercurrent of hostility against the automobile nor the amount of tacit approval that is felt by those who are nevertheless unable to buy a car.

MEANWHILE the former class may be invited to consider that the King of England would scarcely be likely to jeopardise his safety and that of so many other distinguished personages by the use of an inexpedient means of locomotion. It is satisfactory to note, by the way, that the King's example has borne good fruit in Denmark in the shape of the establishment of a Danish Auto-

mobile Club, and it was at the formal inauguration of this that the Copenhagen *chauffeur* who had driven the King's Daimler during his stay at Frederiksborg related some interesting details of the ten separate excursions which the Royal car had made. The most gratifying is the fact that His Majesty declared himself to be an ardent automobilist (*un chauffeur passionné*), and though he sat behind the driver and tapped his shoulder at such times as the pace appeared too fast for the ladies in the car, the speed was always "from thirty kilometres upwards" except in traffic. What a hollow farce the British speed limit of twelve miles an hour must appear to our continental *confreres* when even our King does not fear to double it while abroad.

I MET a brother automobilist the other day who had just emerged from a long spell of compulsory inactivity in a hospital. "Another example of the dangers of motor-car driving?" the anti-automobilist might query. No, my dear sir; the gentleman in question was walking towards Waterloo when, being doubtful if he had allowed himself time to catch his train, he hailed a hansom, but specially enjoined the Jehu to drive carefully. The next thing my friend remembers is his waking to consciousness in a hospital ward, suffering from a frightful cut over the eye that left the surgeons a long time in doubt as to whether

his life was safe; and even after that doubt was set at rest there was a contingent remainder in the shape of possible loss of sight. Naturally he is asking himself whether it would not have been better to have missed his train than trust himself, even with a premonitory, but unadopted, caution to the driver of the most carelessly handled and unsafe vehicle on the London streets. I, too, can speak feelingly on this subject, having once been pitched out of a hansom myself, and I can say unhesitatingly that I would rather at any time mount a racing motor-car with a skilled pilot than sit behind the shafts of the so-called "London gondola." What a misnomer, if ever there was one!

THERE is an extraordinary coincidence, by the way, attaching to the accident above described. The victim, as it happened, was an intimate acquaintance of the late Mr. W. B. Beach, the "Father of the House of Commons," who met his death not very long ago by being thrown out of a London hansom. Now, Mr. Beach was in the habit of using a hansom daily, and my friend the *chauffeur*, though at exceptional times resorting to that species of conveyance himself, had spoken to the aged Parliamentarian only a day or two before the accident, and warned him of the risks he ran by this regular employment of his favourite medium. Within less than a fortnight not only had Mr. Beach been killed while driving in his wonted hansom, but the man who warned him had himself become a victim of the very vehicle against which he had raised his voice.

It is refreshing to find that the advantages of the motor-car are gradually commending themselves to municipal and county authorities, despite the amount of opposition that so frequently

MR. C. JARROTT ON HIS 40 H.P. PANHARD RACER.

[Argent Archer.

proceeds from such quarters. Liverpool equipped its borough engineer and staff with first-class automobiles, Manchester followed suit, and Leeds has sanctioned the acquirement of a car at an expenditure of £276. Most surprising, however, is the decision of the Essex County Council to buy a £300 car for the benefit of its surveyor; may the county roads be improved in consequence! The discussion that took place upon this recommendation, however, was somewhat peculiar, as a member enquired whether the surveyor was competent to drive a car, and moved as an amendment that the car should only be hired experimentally for six months. The chairman replied, however, that the men who drove the steam-rollers could drive the surveyor's car when not otherwise engaged. "H'm! Yes!" However, the resolution was adopted, and no doubt the surveyor will soon learn to drive the car himself and be independent of the services of the steam-roller pilots.

If you want to know exactly how you look when driving your car you have only to engage a British Mutoscope Company's operator to turn his camera upon you, and the thing is done. "But how is the effect produced?" you may ask; "the man may take a hundred rapid impressions of my progress, but am I to set up a magic lantern in order to reproduce the movements of my car?" By no means; the thing is ridiculously simple. The prints are pasted in sequence in a tiny book, and all you have to do is to draw your thumb quickly across the edges. The optical illusion is perfect. Mr. Frank Butler, the genial ex-treasurer of the Automobile Club, showed me one day this week a couple of "biographic" reproductions of Miss Vera Butler and her well-known Renault car. In one booklet the car was seen approaching in a straight line, with remarkably realistic effect; in the other the various operations of turning the starting handle, skipping lightly into the car and getting it quickly under way were shown with the perfection of illusion, the number of visible movements of Miss Butler's arms and hands, each intelligible to *chauffeurs* themselves, being really wonderful.

It is reported that the Czar of Russia has placed an order for a motor-car with Messrs De Dietrich and Co., of Luneville, France.

ON Thursday last week Mr. F. Guy Lewin started on an M.M.C. car fitted with New York tires on a run from Land's End to John o' Groat's. On Friday, the 4th inst., we received a telegram from Exeter, stating that the attempt had been abandoned, the explanation of the cause therefor following by letter. It appears that soon after a start was made it began to rain, and kept on unceasingly for ten hours, with the result that Mr. Lewin who was wet through, had to seek medical advice and lay up.

ONE of the desiderata of the driver of a belt-driven car is a belting that will withstand the trying tests to which it is subjected. It must not stretch or slip, it must be flexible and yet proof against "buckling" when thrown off and on, must stand heat and live steam, water and grease, and be of very high tensile strength. All of these qualities are claimed for "Teon," a belt produced about four years ago by the well-known house of Fleming, Birkby and Goodall, Limited, of Halifax. The belt is made up from a specially woven fabric, and "Teon" is the cement used in its construction, which appears to be indifferent to heat up to 220 degrees Fahr., is insoluble in water, and unaffected by oils and acids. The belt is made up without joint or seam, consequently there is perfect evenness in the drive, and in the pamphlet issued by the company it is clearly shown by certificate that the Sheffield Testing Works (who tested to destruction a 7-in. belt of this make) only succeeded in breaking it after the application of no less a strain than 15,600 lb., or, in other words, the belt withstood a ton for every inch of its width. The trade are invited to inspect these belts at the London house of the company, 39, Lime Street, E.C., while for the retail trade a stock is kept on hand at the warehouse of Messrs. C. Lindley and Co., Limited, 34, Englefield Road, N.

EXTRACTS FROM THE "DAILY MOTORIST," THURSDAY, JULY 16, 2000.

(BY OUR SPECIAL CORRESPONDENT.)

PROFESSOR SO-AND-SO'S racing motor the *Flyaway* was forwarded by aerial luggage ship yesterday to America to take part in the Motor-car Challenge Cup race. The Professor follows to-morrow by the White Star Passenger Air-ship.

ALL African motorists are on the *qui vive* in anticipation of the Sahara Automobile Club meeting next week.

THE Paris Motor Gymkhana on Saturday will, instead of the Eiffel-Tower-exterior climb which was so successful last year, include a "greasy-pole" contest, which, it is said, will prove much greater fun. The pole is being prepared, and, although affording not quite so long a run as the tower did, will probably be a little more difficult of ascent, as the pole is round, quite upright, and only 3 ft. 6 ins. in circumference.

DURING excavations on Ampsteadus Eathus last week some workmen discovered what appear to be the remains of one of the old late-Victorian one-horse chariots known as "ansom kebs." It is said to be in an excellent state of preservation.

IT is reported, on good authority, that Count Yankee-Doodle has bought the motor-track round the North Pole, and intends to devote it in future entirely to private sport. In this case the international event will in all likelihood be run at the South Pole track this winter.

PRINCE LONCHI DONCHI has given a splendid specimen of an ancient motorless bicycle said to be 200 years old and in working order, and the skeleton (about the same age) of a horse, to the Chicago Antiquities Society. This gift is a valuable addition to the relics of the museum.

THE Paris-to-Constantinople race, which was to have been held last Monday afternoon, has been postponed for a week on account of the sudden death of Mr. A. T. Doll's *chauffeur*—Ted Slow. A week will be sufficient to reduce Mr. Doll's second driver somewhat to Ted Slow's weight. The latter, whose loss is to be regretted, and who has driven no less than eleven cars to victory in the moting-field, was weighing five stone two ounces at the time of his death. Mr. Doll is confident of doing the distance under the one and a half hours, as against the one and three-quarter hours of the record last year.

THE Colosseum Autodrome is closed for a fortnight for repairs. After that period business will proceed as usual.

ENCOURAGING results have attended Monsieur S—D—'s latest experiment with his "self-acting" motor. It is but a question of time, and the "Crutch Prize" is practically in his possession. On Wednesday, at Damascus, the car was again brought out before large crowds assembled to watch the trial. At 2 p.m. Mr. S—D— released the mechanism, and then retired to the grand stand to await results. The car went slowly round the square once, hesitated a moment apparently to take its bearings, and at once took the route to Jerusalem as indicated by the signpost, keeping well to the left side of the road. Reports say it called at Sidon at 2.30, and at Tyre at 2.56, depositing the mail bags for each place correctly. It followed faithfully the prescribed route on its chart, and was seen passing Safedo at 3.13; but between there and Tiberias a funeral procession got in its way. We presume the brakes did not act effectively, for it took the low road instead of the high road into the latter place, which technically disqualifies it from winning the prize on this occasion. The car arrived at Jerusalem without further mishap at 4.27, went straight to the Bear's Paw motorage, and was there found in perfect condition for locking up for the night. Another attempt will be made by Mr. S—D— next week with his car No. 4 over the same ground.

"ANITA."

FOR the 1902 season the Georges Richard Company, of Paris, are bringing out a light car fitted with a 10 h.p. two-cylinder motor.

THE CRAMPIN-SCOTT MOTOR-CAR.

THE other day we had an opportunity of inspecting a motor-car which has lately been completed by Messrs. Crampin, Scott and Company, of Giltspur Street, Holborn Viaduct, London, E.C. The general arrangement of the car is clearly shown in Fig. 1. The frame is built of channel steel, and as it carries the motor and the whole of the transmission gear any form of carriage body can be fitted. To deal first with the engine, which, as will be seen, is centrally located at the rear of the frame, this is of the horizontal type, and develops 6 h.p. at a normal speed of 750 revolutions per minute. The cylinder, which is water-cooled, is 5 in. in diameter by 6 in. stroke. Both the inlet and exhaust valves, *O* and *P*, are 2 in. diameter on the seat, and are fitted with phosphor bronze caps to enable them to be easily withdrawn. There are no water joints at the cylinder head, and the annular water space is $\frac{5}{8}$ in. wide. The exhaust pipe and ports have a full way clearance of $1\frac{1}{2}$ in. diameter, while the air inlet pipe and port are of $1\frac{1}{4}$ in. diameter. The ignition is electrical, while the water-circulation is on the thermo-syphon system. Two water-tanks are carried, these having a capacity of eight gallons. The engine, of which a general view is given in Fig. 2, is mounted on a rigid phosphor bronze horn plate with bearing stops to take the thrust of the explosion. The exhaust cam is made of large size, and is so

FIG. 1.—PLAN OF CRAMPIN-SCOTT CAR.

formed that, while there is no knock in its action, the exhaust valve is held wide open during the whole of the exhaust stroke.

Coming now to the transmission gear, the car we examined was fitted with two forward speeds only, but we understand that, if desired, a reverse motion can be fitted. The crank shaft projects on the right-hand side of the engine, and carries two cone friction clutches, *E* and *F*. The female portions of these clutches are carried on a sleeve which runs loose on the shaft, and between

the two portions on the sleeve is the chain wheel *X*. The male portion of the clutch *F*, while it can be moved laterally, is so fixed that it must rotate with the engine-shaft, so that when the two parts of the clutch *F* are brought together the power of the motor is conveyed through it direct to the sprocket *X*, and by the single driving-chain to the rear differential axle. This is the high speed. To obtain the lower speed the train of pinions—*A*, *B*, *C*, *D*—is brought into play. The wheel *A* is keyed on the engine-shaft. *B* is keyed on the half-time shaft, and has connected with it the pinion *D*; the latter meshes with the wheel *C*, which is carried on a sleeve on the engine-shaft. On

FIG. 2.—THE CRAMPIN-SCOTT MOTOR.

the other end of this sleeve is mounted the male portion of the clutch *E*, in such a way that while it must rotate with the sleeve it can be moved along the latter laterally. Thus, when the two parts of the clutch are brought into contact, the power of the engine is conveyed through the train of pinions and the clutch *E*, the sleeve on which the sprocket is mounted only then running at half the speed of the motor. The engagement of either clutch with its respective parts is brought about at will by a rocking lever, actuated by a handle with ratchet-catch on the steering-column.

In Fig. 1 bar-steering is shown, but in the car we examined the steering was controlled by a horizontal hand-wheel. The road-wheels are of the cycle type, 36 in. diameter at the rear and 26 in. at the front, all being shod with solid rubber tires. A pedal controls a powerful band-brake on the differential gear-box, while a hand-lever at the side actuates shoe-brakes on the rear wheel tires. A starting-handle is brought well up to the driver's hand, so that the engine can be set in motion from the seat. The car weighs, complete, about 12 cwt., and can attain a speed of eighteen miles per hour. In addition to complete cars, Messrs. Crampin, Scott and Company are supplying the motor separately to engineers, and also complete underframes, to which carriage-builders can fit bodies themselves.

A new motor-bicycle is about to be put on the market by the Riley Cycle Company, Limited, Coventry.

MR. V. F. SHMURLO, of Tomsk, Siberia, is at work on a treatise on the automobile, the first of the kind in the Russian language.

MESSRS. SMITH AND MABLEY, of West 38th Street, New York, have secured the United States agency for Messrs. Charron, Girardot, and Voigt, the sales agents in France for Panhard cars. It is stated that Messrs. Charron and Girardot have secured an option on a manufacturing plant in the vicinity of New York, and intend to establish a branch factory for producing motor-cars with American material and labour.

HERE AND THERE.

THE *Field* considers the fixing of a speed limit in connection with motor-cars to have been a mistake.

A HILL-CLIMBING competition organised by the Swiss Automobile Club is to be held on Sunday over a 10-kilometre course.

THE 1902 De Dion voiturette will have, as already announced, the motor at the front end of the car. In addition it will be fitted with wood wheels and inclined wheel steering.

MOTOR cars were strongly in evidence in Stranraer one day recently. Three splendid-looking machines were driven through the principal streets and attracted general attention owing to the masterly way in which they were handled.

A MEETING convened by the directors of the Daimler Motor Company, Limited, for the purpose of conferring with their larger shareholders "on some questions relating to the present condition and future prospects of the company," was held on Tuesday. The proceedings were private.

MR. J. C. DENNIS, of Guildford, has twice successfully defended charges of furious driving brought against him. On the last occasion, referred to elsewhere, Mr. Dennis was accompanied by a lady on a bicycle who kept pace with the motor-tricycle for four miles, during part of which the defendant was alleged to have travelled at twenty miles an hour.

THE HUMBER VOITURETTE.—FRONT VIEW, SHOWING ACCESSIBILITY OF MOTOR.

At a meeting of the Kensington Borough Council a letter was read from Professor Hull, F.R.S., calling attention to the serious public danger arising from the reckless driving of motor-cars in the streets of the borough, particularly in Ladbroke Grove, by St. John's Church. The Council was of opinion that it was a matter for the police, and no action was taken.

A KINDLY-DISPOSED individual at Tunbridge Wells, who writes anonymously to a local paper, suggests that "all goggles, veils, oilskins, jackets, etc., worn by motorists should be strictly prohibited. Then identification might be obtained." A man so anxious for the identification of others ought to have signed his name to his own letter.

MR. A. L. BENNETT, of Barnstaple, is an enthusiastic motor-bicyclist. Since he purchased his present Werner, he has driven it over 2,000 miles, and during the whole of the time he has

never had a single breakdown, nor has he either changed a valve, or ground one in. Altogether Mr. Bennett has driven a Werner over ten thousand miles, and reports that his opinion of it grows more favourable every day.

To prevent a crack in a piece of metal from enlarging it is suggested to drill a hole at the end of it and put in a copper rivet. It is not always easy to find the end of the crack, and to find it accurately the surface of the metal should be moistened with petrol and immediately a chalk mark made over it. The petrol which penetrates the crack is at once absorbed by the chalk and gives a clear trace of the crack.

A METHOD of cleaning greasy hands, given in *La Locomotion Automobile*, may be of use to automobilists. The hands are first rubbed with petrol and wiped off twice. Then they are moistened with olive oil or greased with butter and rubbed energetically. They are again wiped off, and the operation is concluded by washing them with soap. The nails can be cleaned with a mixture of petrol and alcohol.

WHILST Mr. Winston Churchill, M.P., and a friend were driving through Rochdale in the Hon. Member for Oldham's motor-car, a boy, about seven years of age, ran from behind a wagon in front of the car, which knocked him down and passed over his chest. When lifted from the ground he was unconscious, and Mr. Winston Churchill carried him in his car to the infirmary. The boy's injuries are not of a serious nature.

WHILE the risk of fire with motor-cars when ordinary care is taken is but small, the recent burning of a car in the Uxbridge Road appears to have somewhat disturbed the peace of mind of some of our readers. It is therefore somewhat of a coincidence that there should be brought to our notice by Messrs. H. W. Warren and Company, of 5, Great Winchester Street, E.C., a handy little fire extinguisher, specially intended to put out inflammable oils, or fires caused thereby. The extinguisher consists of a round canister about two feet long by two inches in diameter, in which is enclosed a special preparation in the form of a red coloured powder, in which is said to be contained a certain proportion of carbonic gas. The powder is forcibly thrown on the fire, which is instantly choked and put out. The extinguisher is said to act equally well with paraffin, petrol, methylated spirits, naphtha, and, in fact, all inflammable oils. We have tried it on paraffin and it certainly seems to fulfil the claims made for it. "Sootene" is the name given to the compound, which is put up, as already mentioned, in neat canisters, containing about 3 lbs. The canister occupies but little space, and can be stowed away in a corner of the car, or hung up in the motor stable. It is an accessory that can well be recommended to motorists.

WE hear so much about the 1902 patterns of motor-carriages from the other side of the water that it may interest our readers to know that British makers are not overlooking the new season's requirements. Thus we learn from the Motor Manufacturing Company, Limited, that their new models and designs are ready, for which they are now booking orders, and that deliveries will be in full swing in about a month or six weeks. For some time past the company have been working with extra hands in order to clear off orders for expensive cars, and on the carriages for the Glasgow trials. Having successfully got through this accumulation, they have decided to organise their works upon a basis to produce for the present their voiturette, which is fitted with $5\frac{1}{2}$ h.p. single-cylinder water-cooled engine, their standard pattern light car, and their trade delivery van to carry up to one ton; to the latter two types of vehicles they are fitting their two-cylinder vertical engine (the same as was fitted to the M.M.C.'s carriages which did so well in the Glasgow trials). Orders for special types of cars will be dealt with in a department entirely separate from the main part of the works. Naturally this arrangement has necessitated some change in the staff, as the company have determined to produce the carriages upon the most economical basis possible, without sparing anything in the way of good workmanship and materials.

MESSRS. COLLIER AND SONS, of Herbert Road, Plumstead, have just put a new motor-bicycle on the market.

WE hear that the Clyde Cycle and Motor-Car Company, Limited, of Leicester, are bringing out a motor-bicycle fitted with a 2 h.p. engine.

THE Preston-Davies Tyre and Valve Company, Limited, Broad Street, Bridgeton Cross, Glasgow, are keeping a large stock of Pratt's motor spirit for motorists.

TWO more public service motor-cars are expected in Scarborough shortly, when a twenty minutes' service each way over the selected route will commence.

WE learn from the Begbie Manufacturing Company that Aster water-cooled engines are now being made in 3, 5, 6½, 9, and 12 h.p. sizes, the last-named comprising two cylinders.

A NEW motor-bicycle has just been put on the market by the Cinque Ports Engineering Company of Hastings. The motor is of 1½ h.p.

THE Committee of the Wolverhampton Art and Industrial Exhibition of 1902 have already received more than three hundred applications for space, nearly all the iron-masters and engineering and other firms of the district being represented.

AT a meeting of Kincardine County Council in Stonehaven last week, Provost Bisset suggested that the Chief Constable should be instructed to keep a strict watch on motor-car drivers who ran too fast or failed to stop when requested. The suggestion was adopted.

MANY nervous persons, especially ladies, who can hardly drive in a carriage with horses, because of their imaginative fears that "something will happen," sit calmly and unconcernedly in the motor-car going at thrice the pace that their horses would take them, and know no fear.—*Country Life*.

NEW steam motor dust-vans and water-carts on the Thornycroft system were recently tried for the first time by the Hampstead Borough Council, and are reported to be giving every satisfaction. Although the hills of the neighbourhood make traction difficult generally the motor-vehicles have coped with them very well.

AMONG the many novelties introduced by the B. F. Goodrich Company, of 7, Snow Hill, E.C., which will be found useful by motorists, especially those who go a-totring, is a pocket drinking cup. As will be seen from the accompanying illustrations, the cups are made in two shapes—tumbler and canoe; they are made of a pure white odourless rubber which, it is claimed, does not impart any taste to the liquid. The cups are soft, so that they will lie flat or fold, and so occupy but little space in the pocket.

At a recent meeting the Essex County Council agreed to a recommendation of the Highways Committee that the surveyor should be provided with a motor-car for use in highway work at a cost of £300. The order for the car, a 4½ h.p. De Dion voiturette with Mylord body, has, we understand, been placed with Messrs. De Dion, Bouton, Limited. As the car will have to be used in all kinds of weather it will be fitted with a glass shield, hood, and an extension of the hood connecting same with the shield, so that the passengers will be entirely protected, except at the sides of the vehicle.

FURIOUS DRIVING CASES.

IN the Aberdeen Sheriff Court, John Barnet Gow, shooting tenant of Phesdo estate, Kincardineshire, was charged with having driven a motor-car on September 2nd, and on another occasion the same day from Braemar to Ballater Railway Station, a distance of over seventeen miles, at a greater speed than twelve miles an hour. Accused did not appear, but Mr. Stott, solicitor, watched the case on his behalf. After hearing the evidence, the Sheriff said it was now generally known throughout the country that the regulations were in force, and he was inclined to impose a penalty which would put an end to this kind of thing. He found the first charge proved, and imposed a fine of £5, with the alternative of fourteen days' imprisonment; and the second charge he found not proved.

AT the Wigmore Police Court, Ernest Cleveland, Gatley House, motor-car driver, was charged with driving a motor-car beyond the regulation speed. P.S. Rooke stated that on Sunday, September 1st, he posted himself at a milestone outside the village of Aymestrey and sent P.C. Thomas to the next milestone, having first compared watches. Defendant came by with a motor-car in the direction of Kingsland. He covered the distance between the milestones in 2min. 10sec., which worked out at a rate of twenty-seven miles an hour. P.C. Thomas corroborated. In defence, defendant stated that the car could not travel at the speed given by the police, and that morning he was teaching a fellow servant how to drive. The Magistrates decided to convict, and fined the defendant £10, to include costs.

AT Lymington, Robert Howard, of Brockenhurst, was charged with driving a motor-car at a greater speed than was reasonable, on September 13th. P.C. Hebidge deposed that at 12.45 on the afternoon in question he was on duty on the Brockenhurst Road, and saw a motor-car coming towards Brockenhurst at a furious rate. Witness timed the car from where it passed some pipes to where he was standing; it was 882 yards, and the car did it in one minute. Defendant called his employer, who said he could swear they were not going thirty miles an hour, but he would not swear they were not going twenty-five miles. There was no traffic on the road. The Chairman said the Bench considered the case proved, and imposed a fine of £3 and 11s. costs.

AT Southport, Bertram Bell, was summoned for furiously driving a motor-car on September 24th. Mr. Wilmot Hodge appeared for defendant, who pleaded not guilty. P.C. Forbes said that on the date in question he was on duty at the corner of Eastbank Street and Chapel Street, and saw the defendant driving a motor-car at a furious pace. The speed defendant was driving was about fifteen miles an hour. James Ward Maxwell, a visitor to the town, said that he narrowly escaped being knocked down at the corner. Defendant was driving at from twelve to fifteen miles an hour. Mr. Hodge, for the defence, commented on the difficulty of judging speed, and went on to explain that the car defendant was in had been repaired, and was being taken out for trial. It was impossible for him to have driven it at fifteen miles an hour. Defendant was sworn, and said the utmost speed he travelled at would be eight miles an hour. The Chairman said the Bench considered the case proved, and defendant would be fined 20s. and costs.

AT Romford, G. F. Taylor was summoned for driving a motor-cycle to the public danger. Constable Wells said the defendant drove at the rate of sixteen miles an hour through Romford market-place. The occasion was market-day and people had to rush in every direction to get out of his way. A fine of 34s. including costs was inflicted.

AT West London Police Court, Dillon Clarence Willoughby, a gentleman residing in Piccadilly, appeared to answer an adjourned summons for driving a motor-car on the evening of the 28th August last in the High Road, Chiswick at a greater speed than twelve miles an hour. Mr. Pierson defended. It appeared from the evidence of Sergeant Hardy that the defendant, who was accompanied by other gentlemen, was driving at the rate of fifteen to sixteen miles an hour, colliding with a bicycle, causing the rider to fall off. The speed was disputed, and also that the cyclist had fallen off his machine. On behalf of the defendant, Mark Freeland, of Holborn Viaduct, was called, and stated that the speed was a good ten miles an hour. He also stated that the defendant sounded the horn several times, and tried to avoid the cyclist, who was standing in the road. The cyclist, who was re-called, corroborated the defence by stating that he had dismounted from the machine just before it was struck by the car. Ultimately Mr. Lane, K.C., convicted the defendant, and fined him £5, with 30s. costs. Mr. Pierson gave notice of appeal.

AT Chelmsford, Victor Lee, of London, was fined £5 and £1 4s. 8d. costs for driving a motor-car between Ingatestone and Chelmsford at a greater speed than twelve miles an hour. The defendant, it was said, covered five miles in fourteen minutes, but he alleged that he was mistaken for another driver.—Lieutenant Spender Clay, of the 2nd Life Guards, who was alleged to have covered nearly five miles in ten minutes, was fined £5 and £1 3s. costs for a similar offence at the same court.

AT Eastbourne, a motor-car incident occupied the attention of the County Bench. The police evidence showed that the accused, a Folkestone gentleman named Arthur Leslie Bucknall, covered a quarter of a mile in thirty seconds on a road only sixteen feet wide. Defendant was fined £5 and costs.

AT Norman Cross, Harry Livesay, of Trulls Hatch, Rotherfield, Sussex, was fined £5 and costs for driving a motor-car at a speed alleged to have exceeded thirty miles an hour.

At Guildford, J. C. Dennis was summoned for furiously driving a motor-tricycle. According to police evidence defendant had travelled at a speed of twenty miles an hour. Questioned by defendant as to how he ascertained the speed, the constable admitted that he had guessed at the time taken by the motor-cycle in passing a portion of the road afterwards measured. Defendant produced a stop watch and offered to plead guilty if witness could tell within three seconds when fifteen seconds had passed. The challenge was not taken up. Defendant proved to the satisfaction of the Bench that at the time of the alleged offence he was riding in company with a lady on a bicycle, who had for the previous five miles kept up with his motor-tricycle. The case was dismissed.

At Huntingdon Divisional Bench, Allan Wilson, of Newcastle, was summoned for driving a motor-car at a greater rate than twelve miles an hour, at Alconbury, on September 12th. Defendant pleaded not guilty. P.C. Bozeat said about 12.30 p.m. he was at Alconbury Hill when he saw a motor-car coming from the direction of Alconbury at a very fast speed. He timed it from a cottage, and it was thirty-five seconds coming from the cottage to where he stopped it, a distance of 376 yards, which was at the rate of twenty-one miles 1,714 yards an hour. Defendant offered witness a drink and put money in his hand. Defendant said it was impossible for him to get up that rate of speed, because he had just started from a breakdown which happened at the cottage mentioned by the policeman. Fined £3 and 8s. costs.

At Godstone J. M. Gorham, of Westminster, was summoned for driving a motor-car at a greater speed than twelve miles an hour at Pebble Hill, Limsfield, on 22nd September. P.C. Taverner said defendant's car covered 176 yards in fifteen seconds, or at the rate of twenty-four miles an hour. Mr. Hans Hamilton, barrister, appeared for defendant, and made a point of the fact that the constable timed the car with a watch having only the ordinary small seconds hand, which, he contended, even an expert could not do satisfactorily. Defendant said he had travelled from Tonbridge on the day in question, and his average speed from Tonbridge to Limsfield was about eight miles an hour. Within 200 yards of the bottom of the hill his speed was only two miles an hour. Mr. Soper: If you take it that the constable's time should be eighteen seconds, it still made the speed twenty miles an hour, and even if 50 per cent. were allowed, defendant would exceed the speed allowed by the Act. Fined £5 and costs, 10s. 6d. Notice of appeal was given.

At Godstone, J. Dotteridge, of Bickley, Kent, was summoned for driving a motor-car, on the 15th September, at Limsfield, at a greater speed than twelve miles an hour. P.C. Taverner stated that the defendant covered a distance of eighty-eight yards in seven seconds, working out to about 25½ miles an hour, on the road between Westerham and Limsfield. Defendant pleaded that it was impossible for the car to travel the pace. The Bench inflicted a fine of £5, and costs 10s. 6d.

At Bearstead Police Court William Crawley, of London, was summoned for driving a motor-car at a greater speed than twelve miles an hour. Superintendent Jessop said the defendant covered more than 300 yards in less than thirty seconds. The Bench imposed a fine of £5 and 15s. costs.

At Peterborough, Edward Dyer, of Fathingstone, Suffolk, was summoned for travelling on a motor-car at a greater speed than twelve miles an hour at Wansford and Upton on September 13. Defendant denied the offence. P.C. Perkins stated that he timed the defendant from the turn to Upton to the milestone at Ailsworth, a distance of half a mile, and he covered it in just under a minute. P.C. Cole, who met defendant on the day in question, stated that he was going over twenty miles an hour. Fined £2 and 6s. costs.

At Norman Cross (Huntingtonshire) Police Court, John Parrott, a motor-car driver, of Croxton Park, St. Neot's, was fined £2 and costs for driving his car at twenty-two miles an hour.—Edwin Midgeley, of London, similarly summoned, was fined £3 and costs. Defendant was stated to be travelling at the rate of twenty-three miles an hour.

Reported above are 17 prosecutions for furious driving. In 1 case the summons was dismissed, while in 16 cases fines amounting to a total of £68 without costs were inflicted.

A COMMISSION CASE.

In the Aberdare County Court, Mr. W. Parker Thomas sued Mr. D. J. Ryan, artist, Treorky, to recover £27 15s., being alleged agreed commission of £7 10s. per cent. upon £370 purchase money of a motor-car sold by plaintiff for defendant. Mr. W. D. Phillips appeared for Thomas, Ryan being represented by Mr. W. Howell. It appeared from the evidence that by plaintiff's intervention defendant was on July 5th last introduced to two men named Melville and Rusbatch, who entered into an agreement to purchase the motor-car for £370, and paid thereon a deposit of £5. The balance of the purchase money had not, as a matter of fact, ever been paid, but Melville had since purchased a car elsewhere, and was now a licensed driver. Mr. Phillips contended that plaintiff had fully completed his obligations to Ryan by finding purchasers, with whom defendant entered into an agreement, and cited several authorities in support. Mr.

William Howell, in a lengthy argument, submitted the claim for commission could not succeed until the agreement was carried into effect and purchase-money paid; Melville and Rusbatch were unknown to his clients and seemingly were never in a position to complete the contract. He quoted several cases, and insisted the law required actual transfer before commission became payable. In giving judgment, his Honour said the present case was, to his mind, on all fours with that of *Passingham v. King*, in which the Court of Appeal held that the commission was payable if the agent found a purchaser whom the vendor was willing to accept and who would accept the latter's terms. Here the plaintiff had produced men who, in his (the judge's) opinion, were able to carry out their contract, and consequently there would be judgment for the amount claimed with costs. Stay of execution was granted, with a view to an appeal.

A PROMOTER'S FAILURE.

A SITTING of the London Bankruptcy Court was held last week before Mr. Registrar Linklater for the public examination of Alfred William Mason, one of the promoters of the Reyrol Motor-Car Company, Limited. The debtor, who applied to pass upon accounts showing liabilities £4,395 against assets £25, stated that the greater part of his liabilities related to the promotion of the above-mentioned company. The scheme was initiated in May, 1900, when he consented to join in the promotion and to provide a portion of the expenses of the flotation. The Reyrol Motor-Car Company, Limited, was registered in December, 1900, but never went to allotment, and the subscriptions were returned to the applicants for shares. That was his only experience of company promotion, and he attributed his insolvency entirely to the failure of the flotation of the Reyrol Motor-Car Company, Limited. The examination was concluded.

ON THE WRONG SIDE.

At Southport F. J. Gillibrand was summoned for driving his motor-car on the wrong side of the road on the 18th September. Defendant said he was not aware that there were any special regulations. He was crossing from London Street into Nevill Street, and had to go on to the right side, as there was traffic in the way. He did not notice either of the police-officers. At the time he would be going about five or six miles an hour, and was not aware of any special regulations. The Chairman said they did not think defendant had done it wilfully, and he would be fined 5s. and costs.

PANHARD AND LEVASSOR v. MONTAGUE HAWNT AND COMPANY.

BEFORE the Lord Chief Justice, Vacation Judge in Chambers, the case of *La Societe Panhard and Levassor v. Messrs. Montague Hawnt and Company*, was heard. After hearing the solicitors for the plaintiffs and the defendants, and upon reading the affidavit of Emil Adam Merkel, the Lord Chief Justice ordered the defendants, their managers, servants, and agents be perpetually restrained from using or advertising the name "Panhard" by the title or description of "Miniature Panhard," "M.M.C. Panhard," "Panhard Fittings," "M.M.C. Panhard Motors," or either of them or any other title or description containing the name "Panhard" in connection with the manufacture, sale, or use of motor-vehicles, or parts, and from carrying on their business in a manner calculated to deceive the public and lead them to believe that the goods manufactured or sold by the defendants are those manufactured or sold by or on behalf of the plaintiffs, and that the defendants do pay to the plaintiffs their costs of this action to be agreed or taxed.

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, OCTOBER 19 1901.

[No. 137.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

PARTICIPANTS in last year's run of the Automobile Club to Southsea will learn with interest that another visit to that hospitable resort is being organised, and will take place on the 16th prox. This is the fifth anniversary of the coming into operation of the Locomotives on Highways Act of 1896, and from all we can learn the run is likely to attract even more attention than the popular event of last November. This year the route will be

via Whitehall, Richmond Park, and Staines to Egham Hill, on the top of which the vehicles will be drawn up and restarted. From Egham to Winchester—where lunch will be taken—the route will be via Bagshot, Hartford Bridge Flats, and Basingstoke. Passing through Twyford, Bishop's Waltham, and Fareham, the vehicles will draw up at the seventeenth milestone from Southampton before entering Cosham, where a procession will be formed. Proceeding in regular order the cars will go to Southsea Common, where they will disperse.

Non-Stop Diplomas.

IN the evening a dinner will be held at the Portland Hall, Kent Road, Southsea, at which it is hoped the Hon. J. Scott Montagu, M.P., will preside, and at which there will be a very representative gathering of motorists. It is the intention of the Automobile Club to give non-stop diplomas in respect of vehicles completing the journey from London to Winchester and from thence to Cosham without a stop—except, of course, for restive horses—and at a moderate speed. This latter condition should convince even the most prejudiced person that motorists have no desire to be unreasonable. In fact, the regulations which the Automobile Club proposes to enforce are conceived in the most conciliatory spirit, and drivers are specially besought to avoid driving at unlawful speeds. Not only that, but vehicles arriving too early at their destination are liable to disqualification. We hope the Press will give full publicity to the Club regulations as showing in the clearest possible way the desire of motorists to show every consideration to other users of the road. Claims for the non-stop diplomas will have to be made on the Monday following the trip, and we hope to be able to publish a list of these in our issue of the following week.

More Post Office Experiments.

AFTER a lapse of two or three years the Post Office is again making experiments with motor-cars. This time it is the Milnes' one-ton petrol van, built on the lines of those which did so well in the Liverpool trials, which has been selected for service, and which is now carrying the Parcels Post between Mount Pleasant Post Office, E.C., and Redhill. The distance is

24½ miles, and the car is timed to leave London at 10.27 p.m. and reach Redhill at 1.30 a.m. The first run was made on Wednesday evening of last week, when the lorry left Mount Pleasant at 10.30 p.m. partially loaded, and running through the City to the parcel post office at London Bridge, there made up its load to twenty-one baskets of parcels averaging 60 lb. apiece, or a total load of 11 cwt. 1 qr. Notwithstanding a stop of 5 mins. in Streatham to shed the officials of the department, and another stop of 10 mins. in Croydon, the lorry ran into Redhill 1 min. before the scheduled time. After discharging the down cargo a load, not quite so heavy as that previously carried, was taken on board for Mount Pleasant, and an uninterrupted run home was made in the small hours of the morning. Five o'clock was set down for the arrival, but the petrol van ran in at 4.45 a.m., 15 mins. in hand, with an average speed to its credit of over ten miles per hour. The lorry will essay to repeat the above service every night, except Saturdays and Sundays, for three weeks, and the contractors are sanguine of success, also of inducing the Post Office to put many such vehicles upon the road in lieu of the slower and more expensive horse-drawn vans employed at present. Up to the time of writing we learn that the car has met with unqualified success, most of its runs having been of the non-stop order.

Motor Mail Vans in America.

IN connection with the foregoing it is interesting to note that the United States Post Office Department at Washington has just invited tenders for furnishing and operating five motor-vehicles of a mail-carrying capacity of not less than 1,000 pounds each, for transporting the mails at Minneapolis, Minn., for the period from January 1st, 1902, to June 30th, 1903. The vehicles are to be operated by the contractor with a running time not exceeding sixteen hours each day for each vehicle, divided into such runs as may best meet the requirements of the service. The contractor will be required to have a sixth motor-vehicle on hand as a reserve, so that the service may at all times be performed in the kind of automobile accepted by the Department. The operators are to be provided by the contractor and will be required to operate the vehicles in such a manner as to secure the utmost expedition practicable in reaching the points at which mails are to be received or delivered.

Motor Omnibuses for Birmingham.

ON Friday last the members of the Birmingham Watch Committee, Chief Constable and other officials took part in the trial trip of a motor-omnibus, of the kind employed by the Corporations of Southampton and other provincial towns for the conveyance of passengers. The bus, which holds sixteen or eighteen passengers, is roofed and open at the side. It started from the police station in Newton Street, and in the course of the trip traversed the route which it was suggested some time ago should be worked by motor buses, by way of Broad Street and Five Ways. The vehicle ran smoothly and steadily, and the trial was regarded as satisfactory.

A New Use for Tube Ignition!

A WRITER in *The County Gentleman*, in discussing the question of tube v. electric ignition for petrol motor-cars, remarks:—"There is also another very important (though secondary) advantage in having tube ignition as an auxiliary—even if one could be perfectly positive that nothing would ever go wrong with the electric system—and it is this, that by merely letting the bonnet of the engine down on its hinges, and temporarily substituting a stout wire tripod for the detachable cowl of the little chimney, one has not only a very ready and economical, but also very speedy way of boiling kettles or cooking chops respectively, as the exigencies of travel may require. This can, of course, only be done when the car is at rest, but is of much value; indeed, it is a matter of considerable regret that the oven-like boxes in which the burners are usually placed have not hitherto been made of sufficient size to also permit of comestibles being at the same time baked therein." After reading the foregoing extract, we had to glance over the other portions of the article from which it is taken to ascertain whether it was written jokingly or not, but apparently the suggested new uses for tube ignition are put forward in all seriousness.

The Eccles Motor Fire Tender.

WE are this week able to publish an illustration of the motor fire tender that has lately been built for the Corporation of Eccles, near Manchester, by the Protector Lamp and Lighting Company, Ltd., of Eccles. The tender is arranged to carry five men, three hundred yards of hose, two double-headed

stand pipes, four branches, set of scaling ladders, jumping sheet, bucket and pump combined, ceiling hook, etc. It is driven by a 7 h.p. double-cylinder water-cooled engine fitted with variable electric ignition. The motor is carried at the front horizontally with the frame, and its power is transmitted by means of chains to the countershaft, on which the clutches are actuated, and thence to rear axle. Two forward speeds only and reverse are fitted. The machine handles full load anywhere in the borough on the high-speed gear, varying with ignition, and can attain a speed of fourteen to sixteen miles an hour on the level. Solid tires and tangent wire wheels are fitted. The whole of the body is arranged to slide or lift off, so exposing every part of the engine to view and doing away with the necessity of a pit. The machine was delivered at the beginning of September, and has been running about every day since to give it a thorough testing before the Committee decided to dispose of its horses, which were sold three weeks ago. The idea of a motor fire tender for Eccles originated with the present Mayor, Mr. F. Smith, to whose credit should be placed the introduction of this class of vehicle for First Aid Fire Brigade service.

The Liverpool Self-Propelled Traffic Association.

A MEETING of the council of this Association was held on Monday under the chairmanship of Mr. Alfred L. Jones, J.P. There were also present Mr. John A. Brodie (vice-president), Professor H. S. Hele-Shaw, F.R.S. (vice president), Messrs. S. B. Cottrell, W. Beckett Hill, Arthur Musker, William Oulton, J.P., Henry H. West, and E. Shrapnell Smith (hon. secretary). A letter was read from the Judges of the recent heavy-vehicle trials, intimating that their report would be ready about the 24th inst., and it was resolved to present the report to members of the Association that day. The Chairman announced that Mr. Walter Long, President of the Local Government Board, had consented to receive a deputation from the Association and the commercial associations of Liverpool, with reference to the present limit of tare upon motor-wagons—viz., three tons, which it is sought by the Association to have increased. It was arranged that the presentation of the report should take place at the same time as the deputation to Mr. Long, which will be at 11.30 a.m. on Thursday, the 24th inst., at the rooms of the Liverpool Incorporated Chamber of Commerce.

The 1902 De Dion Light Car.

WE are able to publish on page 599 an illustration of the light car which Messrs. De Dion Bouton and Co., of Puteaux, are bringing out for the 1902 season, and about which there has been a good deal of speculation. The most notable change is, of course, the placing of the engine—a single-cylinder one of 8 h.p.—under a bonnet in the fore part of the frame. For the moment we can but briefly mention that the car is provided with two speeds forward and a reverse motion, the differential and change-speed gear being contained in a single oil-containing case. Inclined irreversible hand-wheel steering and a powerful hand brake on the differential gear drum, in conjunction with which is a device acting on the governor, and so slowing down the engine, are other points of the new vehicle about which we hope to have more to say in an early issue.

Official Education of Horses.

AN idea which we commend to the notice of all rural and district councillors was mooted at the Sculcoates (York) Rural Council the other day when Dr. Wilson-Barkworth moved that the Local Government Board should be asked to sanction the hire of a motor-car by the Council for the purpose of getting horses in the locality accustomed to such vehicles. Such a notion deserved a better fate than to be rejected; but the fact that it was made is notable, and we would suggest that some other local body might make such an application to the Local Government Board. Private owners of automobiles have already done much in this direction; it is about time some representative bodies did similar service.

The Scottish Automobile Club.

ON account of the uncertainty of the weather prospects and the comparatively limited number of members of the Western Section of the Scottish Automobile Club who were free to engage in it, the proposed run to Lanark for Saturday last was postponed. A number of members and friends, however, who had left themselves disengaged for the proposed function, at the invitation of Mr. John Stirling, ran out from Glasgow to Fairholm (three miles south of Hamilton), the residence of Mr. Stirling. During the early part of the afternoon rain fell heavily, but by four o'clock the weather had improved, and by the time Fairholm was reached had entirely cleared. After tea had been served the friends strolled through the picturesque grounds and gardens, and the return journey commenced at six o'clock. Our illustration on page 597 shows the party drawn up in front of Mr. Stirling's residence.

Tram-lines near London.

TRAM-LINES are regarded with aversion by cyclists and motorists alike, and evidently owners of automobiles in the London district are likely to be surfeited with them. A few months ago complaint was made that the main avenues of traffic in the City were "up" and that the streets resembled barricades; now the way of the motorist is threatened in the suburbs, and his progress out of London is harassed by tramway extensions and the like. The Uxbridge Road as far as Hanwell and Southall is now a thoroughfare with tram-lines that threaten the unwary driver; the same company that is responsible for this development is also promoting a similar service on the Surrey side of the river to extend as far as Epsom. A little further afield a proposal is being discussed to connect Farnham with Haslemere, by way of Headley, Grayshott, and Shottermill. In other districts near the Metropolis plans for electric trams are "in the air," and their realisation in actual fact on the roadways is a bad look-out for the Metropolitan motorist anxious to have short runs into the country. The effect of all these projects will be to remove the country further from the City.

A Broken Shaft.

SAD is the plight of the Rev. W. D. H. Armstrong, who is a member of the Yeovil Rural District Council, which has just passed a resolution in favour of the numbering of motor-cars. He told his colleagues at their last meeting that "my horse was frightened the other day, and I had a shaft

when it was ready, delivery of the tires of the size required could not be obtained from the Clement-Gladiator Company, and, as Mr. Phillips wished to spend his vacation abroad, he asked for ordinary Michelin tires to be fitted at once so that he could use the car on the Continent. Having spent some time away, he returned for the Glasgow trials and got into telephonic communication with the Clipper Company, asking them to license the tires on the car (which was still in France) by marking them on payment of the difference between Michelin's price and theirs—or any sum they desired. Mr. Phillips was referred to the Dunlop Company, to whom a similar request was then made.

The Dunlop Company's Action.

IN reply the Dunlop Company wrote that the importation of the Michelin tires would be an infringement of their patents, and Mr. Phillips was warned against such action. He replied, pointing out his position as a private owner who had failed to obtain tires from the Clement-Gladiator Company because of their inability to supply the required size, but the only response was a request for the delivery of the alleged infringing tires and an undertaking not to again import such tires. Still anxious to avoid annoyance and trouble, Mr. Phillips sent to the Clipper Tire Company for a new set of tires to be sent to Newhaven ready to be put on the car when it was brought from France. They, however, had not the size required in stock. The further correspondence disclosed nothing new, but Mr. Phillips, in his letter to us, significantly adds, "It is, to my mind,

THE MAIDENHEAD BRIDGE TOLL-GATE—THE LAST REMAINING TOLL-GATE ON THE BATH ROAD.

Photo by

Luff, Slough.

broken." We fail to see how numbering a motor-car would have minimised the breaking of the reverend gentleman's shaft. "Apart from this," he went on to say, "people's nerves are being upset from the sudden and unexpected appearance of motor-cars on the roads." In addition to blowing horns to announce their coming, motorists will have to telegraph or telephone to all the nervous people fifty miles ahead—or the Rev. W. Armstrong will be on their track. Really someone should take this distinguished member of the Yeovil District Council for a ride on a motor-car, especially as he is suffering from a broken shaft.

Michelin Tires.

ANYTHING that tends to restrict the sale of motor-cars is not likely to find favour with enthusiasts. Hence the attitude taken up by Mr. Robert E. Phillips in sending to us copies of a correspondence in which he has recently been engaged with the Dunlop Pneumatic Tyre Company, Ltd. Some months ago he ordered a car in Paris, giving instructions that, when finished, it was to be fitted with licensed Michelin tires to be obtained from the Clement-Gladiator Company. But,

open to question whether it is not a restriction of trade to refuse to license tires fitted to the wheels of foreign cars before their importation into this country on payment of a sum equivalent to the loss of profit that would accrue from the sale of such tires in this country."

Maidenhead Bridge Tolls.

IN our issue of the 5th inst. we referred to the movement which has been started to free Maidenhead Bridge from toll. This is the only toll-gate now remaining to obstruct the great Bath Road, and, according to the prime movers of the agitation, the Maidenhead Corporation since 1836 have had no right whatever to levy any toll, and they have therefore since that date been acting illegally. Our illustration shows the toll-gate at Maidenhead which it is now being endeavoured to remove. In the picture are seen the three gentlemen who have taken the matter up seriously—Mr. J. Fulbrook being at the wheel, Mr. Howlett in the car, and Mr. Taylor at the side.

The Automobile Club and Electromobilism.

MR. THEODORE CHAMBERS sends us a copy of a long letter he has addressed to the editing committee of the Automobile Club *Notes and Notices*, which limitation of space prevents us from dealing with at length. We may mention, however, that Mr. Chambers is at pains to show that the electric car cannot be said to have received that consideration from the Automobile Club of Great Britain and Ireland which has been bestowed on other forms of carriages. In conclusion, he remarks that "once again the necessity has been demonstrated of the formation of a special committee in connection with the Club to deal with electric cars and their requirements, and to superintend trials in which they are engaged."

Motor 'Buses for Portsmouth.

PORTSMOUTH is moving with the times, and a company has been formed with the object of providing Portsmouth, Gosport, and the surrounding districts with an efficient and regular service of motor-cars. At first, the company intend chiefly to ply upon roads not served by the Portsmouth Corporation Electric Tramways. The new company—Portsmouth and Gosport Motors, Limited—has purchased a car (with a seating capacity for nine persons only, including the driver), which has been plying daily between Clarence Pier and South Parade Pier for some time past. It is intended, as soon as the needful capital has been subscribed, to acquire additional vehicles.

A Motor-Cycling Club.

As a result of a suggestion made in these columns by Mr. T. Underwood, a meeting convened by that gentleman was held in London on Thursday last week, to discuss the advisability of forming a Motor Cycling Club. Mr. Hunt took the chair and Mr. A. J. Wilson opened the discussion with a speech in which, after giving a humorous account of the clubs he had been connected with, he strongly urged those present to join the already existing English Motor Club, rather than to embark upon the troubles of forming an entirely new club. It appeared evident, however, from the speeches of other speakers that what was desired was a motor-cycling club, and that cars should be vetoed. A vote was taken, which showed that eighteen were in favour of forming a distinct club and four against. It was then decided that the club be called "The Motor-Cycling Club," with a subscription of one guinea, and that the first fifty members enrolled would not be called upon to pay the half-guinea entrance fee. Afterwards a provisional committee was appointed to draw up the necessary rules, etc., and Mr. T. Underwood and Mr. G. Tripcony were elected hon. secretary and hon. treasurer *pro tem.* respectively. About twenty-five attended the meeting, but it was announced that letters had been received from thirty-two prospective members. Any motor-cyclist desiring particulars of the objects of the new club should communicate with Mr. T. Underwood, the hon. secretary, at 13, Colville Mansions, Talbot Road, Bayswater.

Danger Boards.

THE Committee of the Automobile Club propose to erect boards cautioning motor-car drivers at points where special caution is necessary. Owing to the great brake power with which motor-vehicles are provided, their drivers are in the habit of paying little or no attention to the cyclists' warning boards. It is not proposed to erect danger boards at every steep hill, but only at such hills and at such points as demand that motor-car drivers should proceed with the utmost caution. The County Surveyor of the Gloucestershire County Council advises that a danger board should be erected by the Club at Tutshill, as there have been several accidents at Chepstow Bridge. If any motorist knows this district it would be a convenience if he would send to the Secretary his opinion with reference to this suggestion. The Gloucestershire County Council have given permission for the erection of a danger board at the top of Birdlip Hill, and arrange-

ments are now being made for the board to be placed in position. The permission of the Surrey County Council has been asked to erect a special danger board on a very dangerous part of the Hogsback at the Farnham end.

Persecution in Surrey.

"NEVER contradict a policeman and never question a witness against you" is the advice which might be tendered to motorists after watching the proceedings at the magistrates' court at Reigate. On Saturday forty-seven cyclists and thirteen motorists appeared before the Bench charged with riding at a pace that was more rapid than the comprehension of the authorities. Not a single man—or woman—escaped; all were fined, and those who attempted to justify themselves fared the worst. In the case of one motorist, whose mechanic was a Russian speaking no English, the constable, of course, had an uncontradicted course, but not so when Mr. Moffat Ford stepped up to answer a charge of driving at the rate of twenty-three miles an hour. The policeman read the pace from a paper, but Mr. Ford suggested he should read from the note-book in which he took observations at the time—a very proper thing for him to have done. But for his curiosity Mr. Ford was ordered to behave himself, and his case was put back till all had been dealt with. The Surrey police are rendering some service in showing the absurdity of the present situation, and helping to make it clearer than ever that the only satisfactory solution of the present difficulties will be to alter the law so that it is criminal to drive to the common danger, and not to make it an offence for driving rapidly on a lonely country road with few people about.

Allotments of Space at the Automobile Club Exhibition.

"At the last meeting of the Club Committee of the A.C.G.B.I. a letter was submitted from Messrs. Cordingley asking the approval of the Allotments Committee of the Club to the allotment of space at the Agricultural Hall Exhibition to a number of firms who had applied for space. It was recommended by the Standing Committee that Messrs. Cordingley be informed that, in pursuance of the resolutions of the trade, the Committee cannot approve of allotments of space being made unless the notice of allotment be accompanied by a statement in writing that it is made on the understanding that the exhibitors do not exhibit anything connected with motors, other than parts of motor-cycles and accessories to motor-cycles, at any other exhibition within twenty miles of Charing Cross prior to the Automobile Club's Exhibition of 1903, and that if an exhibitor infringes this arrangement he shall forfeit the moneys paid by him on account of space taken at the Agricultural Hall Exhibition. It was further recommended that Messrs. Cordingley be requested to submit, for the approval of the Sub-Committee, a copy of a contract embodying this arrangement for transmission to applicants for space. The recommendation of the Standing Committee was adopted by the Club Committee."

Helping the Horse.

WRITING to a Liverpool journal, Mr. Archibald Ford ventures on prophecy, predicting that "before very many years have gone it will be declared by law to be criminal for horses to be used for any purpose whatever on any public highway." Mr. Ford is unnecessarily sanguine. Of course we recognise how much the public is at present at the mercy of animals of uncertain temper, but it must be remembered that, since the world began, the horse has been a recognised help of man in pleasure and in business. Automobilists do not seek the obliteration of the horse, but they do desire the lessening of his burdens.

THE Piccadilly to Putney motor-bus is well patronised, as no doubt would be a more frequent service. At present the solitary motor-cars are not sufficiently in evidence, and thousands of passengers who would gladly avail themselves of its advantages are compelled to adhere to the time-honoured if slower means of transport.

A WINTER RUN IN 1900.

EVEN at the present time it is not everyone who has had the opportunity of a spin upon a powerful car, still less of a run of sufficient length to enable him to gain a true idea of what such a carriage really is and can do. So I am putting down a little account of a delightful week during which almost the entire hours of daylight were passed upon a 12 h.p. car, or in mending its tires. The more powerful vehicles are, of course, not uncommon now, but I am sure that in a touring carriage for not more than four persons no larger engine is needed; while the inconvenience in some respects even of this size—its noise, its enormous consumption of petrol, and so on—would certainly disincline one from desiring anything bigger. I decidedly formed the opinion myself that we had in the car

nature's arrangement in this matter into the art of tailoring; but there seems to be no doubt that as far as warmth goes, and the quality of resisting rain and dust and the various disturbing influences of serious motor work, it is a mistake to put the cloth outside and the fur in. I had already procured in London the only additional garments which I intended to wear—i.e., a tarpaulin cape and knee rug, exactly such as are used by omnibus men, and also what I believe they call a "tool strap" to act as a belt and keep the different layers of clothes and rugs in position. These worn over an ordinary fur coat answered very well, and we intended to be prepared for extreme cold and to put on every kind and sort of apparel, congruous or otherwise. Perhaps I may be allowed to recommend to others what I have found most comfortable myself—a pair of long-cloth gaiters covering the feet like spats,

A PARTY OF THE WESTERN SECTION OF THE SCOTTISH AUTOMOBILE CLUB AT MR. J. STIRLING'S RESIDENCE AT FAIRHOLM. (See page 594).

which was used in this trip a carriage exactly suited to such a purpose, in power and in comfort hitting the happy mean. Of course I was delighted to accept the invitation of my old friend to go with him. The car had been sent on a few days before to Paris in charge of the skilled and, fortunately, bilingual *mécanicien*; it was to have had a second radiator fitted under the frame at the back, for the coils in front of the motor bonnet were in this case at any rate insufficient except when running at a high speed; but there was not time to get this done. We found, however, on our arrival in Paris that the engine had been considerably improved by the orifices of the sprays having been slightly enlarged. My friend and I reached the Ritz Hotel on Monday evening, February 12th, having travelled most of the journey through a snowy landscape. We provided ourselves with the most approved kind of goggles, and my friend with a skin-outside fur coat. An Englishman has a prejudice against carrying

reaching well above the knee, and laced up the sides with hooks. These I had used some years before during a winter in Switzerland for tobogganing, and now routed out again. I consider the knees the most vulnerable parts, and that if they are kept warm the rest of the body remains comfortable. We took with us also several Instras, and both for the driving and as a protection against damp sheets in disused rooms, I think them worth the trouble of carrying.

It took a few moments, as may be supposed after this catalogue, to pack ourselves and our belongings into the car next morning. The luggage went in first—two fair-sized bags and a square leather case; the latter had not been contemplated, and was of some trouble at first, only mitigated by the fact that it contained an ample supply of cigars. While experiments were being made as to the disposal of our goods, I had time to look at the car, which I had not seen before. With what different eyes we

and the general public regard an automobile! They look upon the machinery as a disfigurement, and we as a glory. The lines of a Panhard may not be beautiful in the abstract, but they certainly possess that beauty which consists in suitability; and I am disposed myself to think that those makers who resist the public demand for hidden mechanism, and construct cars which are frankly light locomotives, have the processes of evolution in their favour. Nothing, certainly, could strike one as more perfectly adapted for a thousand kilometres journey than the Twelve Horse in all its simplicity and solidity—with its oilers and grease-pots all brought into a row on the dash, its glass-water filler-cap, its three great Bleriot lanterns that make daylight in the darkness a hundred and fifty yards ahead, and with its enormous reserve of strength betokened by the four almost simultaneous explosions, and the intervals of several seconds, alternating under the restraint of the *ralentisseur*.

At last we were all packed in and the real thing began. We took the road to Fontainebleau, not at all an easy one to follow through the city. However, at length we were past the turning to the Avenue d'Ivry and soon in the open country. Matters did not go very pleasantly at the start. The surface was for a long distance *pavé*, and when it was not it was cut across at frequent intervals by those deep gullies which make many of the best stretches in France so treacherous. Then it began to rain, at first threateningly, and then as if it really meant it. Next the luggage began to get adrift and had to be fixed up in a new way. Have not old cyclists the recollection that the first half day of every tour was occupied in getting "multums" to stick on the topside of the backbone, handle-bar rolls to keep out of the way of the knees, knapsacks on the shoulders, and brown paper parcels on the machine in any way at all? Then as the morning wore on and the rain kept at it, everything and everybody, specially the party on the backseat, became almost unrecognisable with mud. Then the near-side tyre went down, and gave us a foretaste of what was to come. The forest looked thoroughly dispirited and as if its attractiveness were completely washed away. Places with a reputation can afford I suppose, like people, to resign themselves at times to their miseries, and everyone knows that Fontainebleau really does offer the finest woodland scenery in France. We made no stop, but quickly passed through Nemours and Montargis to Briare, where we thought that we had been soaked long enough and decided to stay the night. The canal of Briare was, I think I am right in saying, the first with double slope cut in Europe since Roman times; and the three or four water-ways hereabouts are examples of the admirable system which exists throughout France. They intersect this neighbourhood so as to put the largest river in the country, and the busiest, into mutual communication (the Loire and the Seine), and thus, though the Loire is in places difficult of navigation owing to shifting sand-banks, constitute a thoroughfare running in a great sweep through some of the most active towns and most productive regions in the north-west corner of France, between the busy seaports of Havre and St. Nazaire. The inn at Briare was of the simplest, but Madame made us welcome—even to her kitchen to dry our clothes; what English empress of the range would allow such a liberty?—lit fires in our rooms, and soon served us with a nice meal. Even an old traveller does not cease to be surprised at what is done in this way in the roughest of *auberges*. None of us rested very well for the creakings and crashings which went on continuously. A gale had been raging all night, and when we came down in the morning it was to a scene of devastation. The whole of the windows in the front of the *café* were blown in, and so were most of the windows along the street; slates were still dropping from the roofs, some of the Louvre shutters had been carried away, and the entire chimneypiece had been thrown on the floor of the *mécanicien's* room. ARUNDELL WHATTON.

(To be continued.)

A FRENCH engineer, of Vitry-sur-Seine, is said to have made successful experiments with a motor-plough, and hopes shortly prove its practical utility.

FLOTSAM AND JETSAM.

BY "FLANEUR."

"RUTHLESS and reckless" is the only possible description to apply with accuracy to the organised campaign of persecution which the authorities of several counties have set on foot against the automobilist. Within quick succession we have been treated to the following choice displays of police maladministration:—Timing the speed of a motor-car with a common watch without a seconds hand; guessing pace without any watch at all, and then swearing to a given number of miles per hour on oath; professing to measure a stretch of road, basing speed calculations accordingly, and then confessing in court that the alleged distance was hopelessly inaccurate; amending entries in a note-book to make them tally with those of another constable, and then swearing that no erasure had been made.

FOR this state of things the magistrates themselves are primarily to blame. Their treatment of automobilist defendants being uniformly hostile, as countless arbitrary convictions have shown, the police derive the notion that "any stick is good enough to beat a dog with," and are the reverse of scrupulous in their efforts to summon almost every driver of a car whom they can waylay. Not the least discrimination is shown as to the type of vehicle; they would as lief summon a 3 h.p. Benz if travelling at thirteen miles an hour as they would a 40 h.p. Panhard. And, singular to say, the magistrates support them in this tyrannous crusade, despite the universally acknowledged fact that the twelve-miles-an-hour limit is absurd, and that the motor-car is acknowledged to be the most easily pulled-up vehicle in the world. As usual, moreover, the word of a policeman is accepted in preference to that of gentlemen, and the administration of justice at places like Reigate, where another big batch of automobilists and cyclists were fined last Saturday, is brought into supreme contempt.

POLICE and magistrates alike, however, are hugging a vain delusion if they imagine that senseless persecution is going to put an end to driving in excess of the ridiculous legal limit. No power on earth will persuade the owner of a slow car that he is doing harm by travelling at sixteen or twenty miles an hour on the open road, while those who have really fast cars are simply being forced to defy the law on every possible occasion. They gain nothing by going slowly, nor even by stopping and being civil to a policeman who holds up his hand. If they attend a court their word is not believed, and they are fined, in most cases, the maximum amount which the law allows. What earthly inducement is there to the owner of a fast car to drive with moderation when he meets with precisely the same treatment as though he went "all out"? The immediate result, indeed, of recent prosecutions has been to make the victims generally resolve to "have their money's worth" out of their cars, and, instead of fast driving being suppressed, it will henceforth show a marked increase.

THE irony of the situation is curiously displayed, where the hypothesis of "twelve an hour" being the limit of safety is concerned, by the action of the police themselves when seeking to stop a car. They think nothing of planting themselves directly in its path, knowing full well that the automobile driver has a reserve brake-power which reduces the "legal twelve" to an absolute farce. The mere fact that the policeman dares to stand in front of the car at close quarters *ipso facto* proves that the driver has his vehicle under control. Either, therefore, he is not exceeding the legal limit, or, if he is, the legal limit is palpably absurd, for the car is manifestly under control. Yet in these circumstances a fine of £10 and costs appears to many magistrates a positively benevolent way of treating the "offender."

THE word has now been passed round among the Surrey constabulary that they must enforce the proviso as to the showing of a red light from the rear of a motor-car, and they are making themselves extraordinarily officious in consequence. So

solicitous have they suddenly become upon the subject that they have in more than one instance demanded names and addresses before lamp-lighting time has arrived. It may not be out of place to point out, in this connection, that some interesting arguments may arise as to what constitutes conformity with the Act. Many drivers do not carry a special red lamp in the rear of the car but have a small red lens in the back of each of their front lamps. The brackets, however, on which these are hung are placed at varying distances from the sides of the car, and it will probably be contended by the police, wherever possible, that the projection is insufficient to allow the red lights to be visible from the rear. This is the more likely to occur in the case of a car with a *tonneau* which has a pronounced "swell," with the result that the back of the vehicle is much wider than the front, and the lamps are obscured accordingly.

A GOOD point is made by *Country Life* in calling attention to the fact that the great majority of people have no opportunity of knowing how well a motor-car can behave. They see it at slow speed in traffic, and may even be witnesses of sundry stops, but have no means of knowing how far the car has run without giving any trouble. Comparatively few people, on the other

and, on questioning the mechanic in charge, discovered that nothing more was wrong than a broken exhaust valve. But he had stupidly come out without a spare one, and there was a fine car, which otherwise could have been set going in a very short time, exposed to the gaze, if not derision, of a London crowd while messengers were scouring in search of a spare valve—a longer process than usual because the incident had happened just after office hours, and when I left it was even problematical whether the valve would be obtained at all.

UNIVERSAL surprise has been expressed at General Buller's sweeping condemnation of the cycle for military purposes, but no one seems to have made a correct interpretation of the apparent enigma. Without for a moment agreeing with the general that a bicycle is "cumbrous"—a transparently ridiculous description of the lightest vehicle made—I venture to imagine that I have an inkling of what was in his mind when he proceeded to refer to what could be accomplished 'with a better means of transport.' Is it already forgotten that General Buller was driven about in Mr. J. R. Hargreaves's powerful car at the Aldershot manœuvres, and that the behaviour of this and other automobiles during the field operations greatly impressed the

Cliche de]

THE 1902 DE DION LIGHT CAR (see page 594).

[La Presse Automobile.

hand, see automobiles in the country, for the all-sufficient reason that the country is much less populous than the town. And even when a car is noticed on the high road, no one can know either how far it has come or how far it is going. As a striking case in point an instance is given by the *Country Life* man of a car having run over a hundred miles without a stop, and then momentarily failing near the Marble Arch, in the presence, of course, of great numbers of people, none of whom could have the faintest idea of what the horseless vehicle had actually done. The fact that no spectator can follow a motor-car throughout its progress is really one of great importance, and is materially detrimental to the spread of automobilism. Facts and figures as to actual everyday performances are what are required, and the more automobilists take the trouble to tabulate the performances of their cars and publish the results for the benefit of others, the quicker will be the conversion of the public at large.

SOMETIMES a bit of pure carelessness may give the public a wrong impression at a very unfortunate time and place. I saw one evening, for example, a big car stranded in Trafalgar Square,

military authorities? Why, then, may we not assume that, in General Buller's eyes, at all events, the motor-car has put the cycle's nose out of joint?

THE London Auto-Car Company, of 182, Gray's Inn Road, W.C., in issuing their large and well illustrated 1901-1902 catalogue have done the work thoroughly. Parts and accessories for motor-cars and cycles are the main feature. Motor-cycles complete, of which a large variety appear, will appeal to many, whilst castings for such machines will no doubt attract many makers, who should find during the winter months ample opportunity for putting the same together, and so constructing that complete machine for which there is every probability of a big demand next spring. Luggage carriers, toolbags, batteries, lamps, and a swarm of accessories, for both motor-cars and cycles, also receive their due share of attention, whilst the whole car, ready to take the road, occupies a conspicuous place. Motor traders should write for a copy of the new list, for which a charge of 6d., post-free, is made.

CORRESPONDENCE.

MOTOR-CAR ON FIRE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with interest the two replies to my letter. I am aware that some of the pioneer makers fit gravity feed, and am of the opinion that they were manufacturing on this principle previous to the introduction of pressure feed by Daimler, and, obtaining good results, they would naturally be reluctant to go to the cost of new patterns and experiments. Panhard, too, being generally looked upon as the leading manufacturer, having adopted it, others blindly followed.

I have it on good authority that one of the leading manufacturers in this country fit gravity feed because they get better results; but this need not be so, as the method of maintaining the pressure in pressure-fed cars has been at fault and not the pressure feed itself. I am still of opinion that the Napier car would not have been burnt up had it been pressure fed. Petrol vapour is heavier than air, and falls; this being the case, I cannot see how the driver discovered the leak by the smell. There seems to be doubt, however, that the body became saturated and the vapour was blown in contact with the side-lights. I have a number of cases in mind which would go to prove my arguments, but refrain from giving them in fear of encroaching on your valuable space.—Yours truly,

MAWDSLEY BROOKE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see your correspondents who are in favour of the gravity feed miss one point—the vapour of petrol is much heavier than air, and had the whole of the petrol that escaped got to the ground there would have been no fear of vapour rising to the lamps; the driver would not have detected the leakage by smell—as it was stated he did. The only thing likely to happen would be—as I have had happen to myself when all the petrol was lost on the road—the stoppage of the motor. One of your correspondents also mentions that all pipes and connections of some of the gravity-feed cars are below the floor; but the tank *must* be above. I once had a serious leak in a petrol tank owing to one of the rivets being loose. Another correspondent asks why it is, if pressure feed is safer, that such firms as Panhard and other well-known makers use gravity feed. Pressure feed was not invented when Daimler designed the Phenix motor. It was some stupid arrangement of the English Daimler Company, which discharged the overflow from the feed on to the foot-board and made the overflow pipe so small that, in the event of the float not acting, the overflow ran down close to the lamps, which caused some flares and won an evil reputation for the pressure feed. As Messrs. Panhard acquired such a deservedly good reputation, most makers followed them in using the gravity feed. For six years I have used the first pressure-feed Daimler motor imported into this country, and during that period have never had the least sign of a flare up; because, even as far back as six years ago, Daimler made his float and fixed his overflow in such a manner as to carry away any overflow to a place of safety. I feel quite convinced that pressure feed is much the safer. The difference in pressure is very little; and a joint that will not stand, say, from 2lbs. to 4lbs., is not safe at 1lb. In case of any indication of a leak it is always easy to let off the pressure, and one then knows that all pipes and connections are empty.—Yours truly,

E. ESTCOURT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have followed the correspondence re "Gravity and Pressure Feed" with interest. I have carefully thought this matter over and come to the conclusion that it is not so much a question of "pressure v. gravity" as "Where shall the petrol tank be placed?" in order to ensure the greatest amount of safety from fire in the event of anything occurring to the tank itself or

its immediate connections. I take the matter up on the point of safety only, as I think it is generally conceded that after the petrol has once reached the float the conditions are the same in the working of the motor, under either system.

I contend that in the case of the Panhard, Darracq, and other cars where the petrol tank is placed just behind the dash an absolutely wrong idea is carried out. In this system the only result of a leakage occurring near the bottom of the tank is the flooding of the flooring with petrol, which, if ignited, can only result in the destruction of the car. In other cars I could mention where the petrol tank is carried inside the body I think this is simply madness. As an illustration of the above I may say that the only car I had in my place last week with gravity feed (and made by one of the eminent firms named above) had the petrol tank placed in the usual position, just behind the dash, and whilst one of my men was giving it a final test on the road, after a thorough overhauling, the flange or union at the bottom of the tank gave way, the flooring was saturated with petrol, and almost before he could dismount it was in flames, and the car was totally destroyed.

Had the tank been fitted in a lower position, such as is usual in pressure-fed Daimlers, and a pipe or connection broken, what would have been the result? Simply a momentary flare up, as immediately the pressure is let off the supply must stop, owing to the tank being in a low position. For the past four or five years I have had as many as seven or eight pressure-fed Daimlers constantly running, and have never had anything more serious than a temporary blaze and a little paint blistering. Of course, the placing of the tank in a gravity-fed car in a lower position than usual entails the placing of the carburettor also lower, and other complications; but, I ask, what is to be done? This is a point which, in my opinion, is well worthy of the serious consideration of all, as it very frequently means all the difference between a slight blaze and total destruction of the car. I have left out the relative safety of tube or electric ignition and confined myself entirely to the question of the best position of the tank, so that in case of it, or its connections, giving way, the escaping petrol shall not fall in such a place as to mean total destruction in the event of its becoming ignited.—Yours faithfully,

FRANK MORRIS.

AERIAL NAVIGATION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As "Automan" has been good enough to express his respect for my opinions, I readily reciprocate by saying I feel all due respect for his. Moreover, I give him due credit for having detected the weak point in my comparison of the weights and power of birds with those of artificial flying machines, about which, however, there is this to be said. The bird may almost be regarded as a winged motor, or at any rate, if we deduct the weight of the external wings (but not their muscles, of course), the head and the legs, with their muscles, which together will not exceed forty per cent. of the bird's total weight, the mutilated remains—all conducive to flight—may fairly bear comparison with the motor (and all accessories) of an "aviator," or bird-like flying-machine. Now, most birds can carry an excess load equal to half their own weight, which must be taken into account and which more than compensates for the foregoing reduction. This obviously reduces their ratio of power, for a given weight, from that which is apparent when this factor is neglected—i.e., it effects a reduction of 33½ per cent. in the actual maximum power-ratio. This is what we really have to compete with in a flying-machine.

Careful experiments with the pigeon have shown that its power-ratio (with the surplus load) is only 1 h.p. per 60 lb., and even this is a much higher power-ratio than the large birds have, which depend more on "aspiration," or soaring phenomena, indicating clearly which of these systems we should adopt. I will now amend my figures from 7 lb. weight of motor and accessories per actual h.p. to 28 lb. total weight of "aviator" and freight per actual h.p., which is now practicable, and I still say we are far ahead of the birds in ratio of power for a given weight.

It has been well said that "the absence of intelligent

control in a working model aerial machine places it at a disadvantage compared with a larger machine carrying one or more passengers, and therefore the efficient action of models should be very encouraging." They certainly are practical results, although admittedly not on a large scale. The valuable experiments of Mr. Hargrave, with whom I am in regular correspondence, are beyond the model stage, and further advanced than "Automan" thinks. Dr. Lilienthal prosecuted his admirable and useful soaring flight experiments for about two years successfully before, unhappily, meeting his end; and then in consequence of a perilous new departure.

As to "Automan's" implied question, I can assure him that I intend to be taken seriously. "Automan" talks about my "misleading" the public (although unintentionally) in my enthusiasm. If that is so, how about the opinions—I may say the convictions—of some of the most eminent engineers of the age, with whose views and advocacy mine are identical? That remark of his is certainly not warranted. I hope that "Automan" will see that it is inconsistent with a respect for my opinions, and withdraw it.—Yours faithfully,

SIDNEY H. HOLLANDS.

REDUCING FRICTION ON MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with much interest the remarks of your correspondent "Reducing Friction" in your last issue, and can endorse them with much pleasure. It may be of interest to your readers to know that experiments and tests of lubricating oils for motor work have been in progress at Ipswich for the last three years, with a view to determine the best oils for the work at a moderate price, viz., 3s. to 3s. 6d. per gallon; with the result that shortly, oils will be put on the market embodying all the good points as stated by your correspondent.

The oil for water-cooled engines has a flash point of 480 deg. F., and is a pure hydrocarbon of medium viscosity, the fire test of which is about 540 deg. F. For air-cooled engines, oils are being prepared having a flash point of 610 deg. F. and which maintain their lubricating properties when the combustion chamber attains a dull red heat. For gear cases, etc., a thick, heavy black oil is prepared at a cost of about 2s. per gallon which will fulfil all reasonable requirements.

I have tested these oils for flashing points, viscosity, etc., and found them free from all impurities and acids. I have also tried them on various types of cars, and have proved them to be splendid lubricants and free from all deposit. Arrangements are being rapidly made for placing the oils on the market; the proprietors hoping to be able to supply the public at large in a few weeks.—Yours faithfully,

J. STRUTT.

THE ABOLITION OF THE SPEED LIMIT.

TO THE EDITOR OF *The Motor-Car Journal*.

DEAR SIR,—It is, I think, an unarguable fact that we rather pride ourselves on living in an advanced stage of civilisation and progress, moreover priding ourselves on being always in the front rank as regards engineering and our machinery. Should this be, as I hope it is, admitted, why, then, when all the greatest engineering brains of our country are striving to further the advancement of their country and benefit its people by perfecting means of locomotion and traction by motor vehicles, should the dictators and representatives of the law be so narrow-minded as to endeavour to strenuously defeat the aims of its manufacturers, by imposing absurdly heavy fines on those who are broad-minded enough to demonstrate the capabilities and advantages of the automobile over horse traction?

If one, by law, may gain no time or advantage by automobiles, how is England to keep up in the race of other civilised countries whose legislation is the first to do all in its power to render help in the introduction of any progressive method of locomotion calculated to improve and accelerate transport? Where nowadays competition is so keen and time is money, surely our legislators cannot be so dense to the welfare of the country as to insist on the speed limit. I cannot personally see what the speed limit is for, otherwise than to protect the public from danger.

If this is the only argument, then let the law be framed that any automobilist causing injury to any person shall be fined, and there let it rest. I think the result would be very few fines, as, take the majority of men who drive motor-cars, they are men of steady, cool heads, well fitted for any sudden emergency, and are the last class in the world to cause injury wilfully. If there are those amongst them who habitually drive recklessly, it will be only a matter of time before they are either fined or killed. If the former, they will only have received their deserts; if the latter, they will not be greatly missed. No man would be more cordially hated amongst automobilists than a confirmed reckless driver.

Let the fine be a heavy one, sufficiently heavy to act as a deterrent to even a rich man. This, I fancy, would be a thoroughly satisfactory law, both as regards the safety of the public and the pleasure of the owner of a motor-car.—Yours truly,

RATE.

A FRENCH cycle manufacturer is said to have constructed a two-seated motor-tricycle which weighs less than sixty kilos., and which will cost from 800 to 900 francs.

ACCORDING to a Reuter's telegram, Fournier, accompanied by W. K. Vanderbilt, junior, broke all automobile track records from one to six miles on the 11th inst., covering the whole distance in 6min. 47sec. The time for the fastest mile was 66 4-5sec.

THE Milwaukee Automobile Company, of Milwaukee, U.S.A., inform us that all orders for Milwaukee steam cars for this country must come through their sole agents, Messrs. Shippey Bros., Ltd., King Street, London, E.C., to whom all English enquiries sent direct are referred.

WE learn that a firm of electrical engineers at Cork is about to start a public service of motor-cars between Middleton, near Cork, and Ballycotton, a seaside resort on the south coast of Ireland. There is no direct railway connection with Ballycotton, so that the new service should be a popular one. The distance between the two places is eleven miles.

THE United Motor Industries, Ltd., of 40, Holborn Viaduct, E.C., have sent us a sample of a new sparking plug which they are on the point of introducing to the English market, and which will be known as the U.M.I. cementless plug. The feature of the new plug is that there is not a particle of cement used in it, the packing being done entirely by asbestos, so that the common cause of a sparking plug giving out—namely, the cement in the porcelain blowing out—cannot possibly occur in this plug, there being no cement to blow out. It is a very strong plug, having good terminal points and giving a good spark; it is especially claimed to be suitable for the larger high-speed motors. It is sent out complete with washer and protecting wooden cap, and will retail at 5s. 6d. The United Motor Industries Company informs us that they have not adopted the plug without very careful testing.

HERR MAX CUDELL, whose name automobilists will remember in connection with the De Dion voiturette, for which he was the principal German buyer, has in hand a project to cross Europe and Asia in a motor-car. Dr. Lehweiss is associated with him in the scheme and proposes to be his companion. The idea is to leave Paris in a 20 h.p. Panhard car similar to the one in which the Baron von Zuylen accomplished the Paris-Berlin journey in the tourist section. Messrs. Lehweiss and Cudell propose to have sleeping accommodation and also food and a cooking stove in the car, and with the long wheel base of this car there will be plenty of room. They propose to travel *via* Berlin, Warsaw and Moscow, and to cross the Ural river, thence they will take the military roads *via* Irkutsk, to the Lake of Baikal, and from there run either through Mongolian or Russian territory to the Pacific Ocean. They affirm that from reports from the consuls they find that the roads are practicable. It is a daring scheme and will be watched by automobilists with much interest. There are two serious difficulties in the way—petrol and tires. Then again the car is a very heavy one, weighing quite two tons, and it will be very difficult to run it over sandy or muddy roads.

THE LILLIPUT MOTOR-BICYCLE.

It is not only in England that the motor-bicycle is receiving increasing attention. Even in Italy, where automobilism has made great strides during the past two years, motor-bicycles are springing up at a rapid rate. This week we are able to publish an illustration of an Italian-made machine—the Lilliput, built by Sig. Emanuel di A. Rosselli, of Via Nizza, Turin. As will be seen, the engine is of the single-cylinder air-cooled variety, the radiating ribs being larger than usual, and extending round the inlet and exhaust valve chambers. The battery is carried under the saddle, while the coil is supported from the top bar of the frame. The engine is clipped below the lower tube of the frame, somewhat closer to the bottom bracket than usual; the power of the engine is conveyed by a twisted strap to a light pulley on the rear-wheel. The motor is made in two sizes—1 h.p. and 2 h.p. respectively; the 1 h.p. engine will, it is claimed, drive the machine at a speed of twenty-two miles per

FIG. 1.—VIEW OF "LILLIPUT" MOTOR.

hour on good roads; while the 2 h.p. motor will give a speed of thirty-three miles. As to the capabilities of the Lilliput motor-bicycle, Signor Rosselli informs us that one of them successfully went through the recent 1,000 kilometre tour of Italy. The motor and its accessories are adapted to fit any roadster bicycle, and can be obtained separately.

MESSRS. FELL BROS., of Waltham Cross, Herts, inform us that they stock all motor accessories and undertake repairs of every description.

THE Humber Cycle Supply Company have acquired further premises in Cambridge, at 5½, Pembroke Street, which is on the main road to London. A competent repairer is in constant attendance, there is also an inspection pit and storage accommodation for a large number of cars; grease, petrol, oils, and spare parts can also be obtained. We may add that the Humber Cycle Supply Company are official repairers to Messrs. De Dion Bouton and the Motor Manufacturing Company.

CONTINENTAL NOTES.

BY "AUTOMAN."

ON the 17th November next the A.C.F. proposes to hold the usual hill-climbing trial on the Côte de Gaillon. There will be seven categories, including motor-bicycles up to 50 kilos, motor-cycles up to 250 kilos, quadricycles with two on board, voiturettes up to 400 kilos, light carriages up to 650 kilos, carriages weighing more than 650 kilos with two passengers, and carriages with four passengers. Petrol, steam, electricity, and combined motive power will be represented. Amongst the entries already to hand I notice the names of Reith, Osmont, Bardin and Cormier.

THE Nice races, organised by the A.C.N. and A.C.F., are advertised to take place on the 8th of April, 1902, over a course of 462 kilometres. It remains, however, to be seen whether the authorities will give the necessary sanction. The following competitions in speed contests are projected:—Series A—Vehicles of any description weighing less than 250 kilos. Series B—Vehicles carrying at least two passengers and weighing more than 250 kilos and less than 400. Series C—Vehicles weighing more than 400 kilos and less than 650 kilos, and carrying two passengers. Series D—Vehicles weighing more than 650 kilos, and carrying two passengers. There is also a tourist section, with the following sub-divisions:—The first three sub-divisions similar to those of the speed contest; the fourth sub-division, for cars weighing more than 650 kilos and less than 1,000 kilos, and carrying at least four passengers; the fifth series is for cars weighing more than 1,000 kilos, and carrying six passengers. There will be a kilometre race on the 11th of April along the Promenade des Anglais, and a mile race for the Rothschild Cup; on the 12th of April a race up the Nice-La Turbie Hill. Altogether the programme for the contest is most complete, and it is to be hoped that the authorities will give the necessary sanction.

THE Union Automobile, which was organised in France in opposition to the Automobile Club, and which brought out a manifesto against racing, has come to the end of its tether, and has issued another manifesto, which will be its last. The Committee, wishing to put an end to a misunderstanding which was the cause of injury to the trade, has decided to call the members together for the purpose of liquidating the Union, leaving the A.C.F. the sole recognised authority in France in automobile matters. All true lovers of the sport will be glad of this result, which is clearly in the best interests of the trade. The success which has attended the efforts of the A.C.F. in France should be a lesson to those on the other side of the Channel to uphold the authority of the A.C.G.B.I., and not to allow the show question or any trade rivalry to raise an opposition, which would only have the result of injuring the prospects of all concerned.

DECIDEDLY the motor of an automobile must be placed in front. One by one the makers are all coming to it. Peugeot has been the most stubborn to convince. This great firm, with enormous powers of production, has stuck to its own models with the motor behind, and has certainly sold large quantities of them. I am told, however, by one of their agents that at last they have been obliged to abandon this principle, and that in the near future all their cars will have motors in front.

THE nomenclature of automobilism seems to be a perplexing problem, and crops up in every country. In France there was a fight about the gender of "automobile," and most people made it masculine until the Academy decided that it must be feminine. In England "garage" seems to offend the susceptibilities of our northern friends, and now in Germany there is a prize competition for an automobile word. The prize has been accorded to a Berlin architect named Will, who proposed the word "aut" for the noun and "auten" for the verb. It may go down in German, but I tremble to think of the consequences if it should come into vogue in English—a moment's

reflection will convince the readers of the *Journal* what an endless series of puns would be the result.

THERE is already some talk of an automobile race from Paris to Vienna next year, and it seems that the Austrian Club has mooted the question to the A.C.F., which is inclined to receive it favourably; should the French authorities not sanction it, then the idea is to go to the legal limit as far as the frontier, and then full speed ahead to Vienna. The Baron von Zuylen, interviewed by *Le Velo*, is very strong on the subject, and says that a great annual event is essential and necessary for the trade. Whether such an event should take the form of a road race or not, there is no doubt that an annual competition is necessary from the point of view of the manufacturer as well as from that of the buyer. It is the only way the buyer can safely judge, and it is the only way the maker can get his goods officially tested.

M. SANTOS-DUMONT is gaining plenty of experience, and Parisians are becoming familiar with his flying machine. On Thursday last week he set out at 1.45 for Longchamps, and sailed round the course for an hour or more, and then adjourned in his

ON Monday M. Santos-Dumont was in the air again above the Longchamps race course. It was three o'clock when he set out, flying the red, white and blue flag at the stern of his air-ship. For an hour and a-half he continued his evolutions, which were gone through without any hitch and to his entire satisfaction, so much so that he again summoned the Committee for the Deutsch prize to assemble for an attempt at 2 p.m. on Tuesday to gain the £4,000. Punctually at the hour all the members had assembled. Everything was in readiness for a start when some drops of rain began to fall, so it was put off in the hope that the weather would soon clear. This it did after a time, and then the balloon was brought out of the shed. Presently the air-ship arose amid cries of encouragement, but the workmen never relaxed their hold of the ropes, and after throwing out some ballast M. Santos-Dumont descended. These tactics were repeated several times, and finally, as the atmosphere was too heavy for a serious attempt to double the Eiffel Tower, he decided on taking a turn in the direction of Longchamps. Another light shower, however, came on to spoil even this modest effort, so at last the balloon was placed back in its shed, and the company departed rather disappointed at the collapse of the programme. The aeronaut was himself distressed at the fiasco,

FIG. 2.—THE LILLIPUT MOTOR BICYCLE. (See opposite page.)

flying machine to the Restaurant de la Cascade, in front of which he alighted without the least difficulty. After having partaken of refreshments he sailed back to the grounds of the Aero Club, which he reached before his men had time to arrive there, and instead of waiting for them he sailed his flying machine unaided into its shed. On the following day he made two attempts to win the Deutsch prize, and was twice baulked by the breakdown of his steering gear. The day was fine and the air quite still, a fog hanging over the ground. The start was made at two o'clock, and almost immediately the light rod which supports the steering rope snapped. As a result the ship got out of control and fluttered down into a field, from whence it was taken back to its home. The steering gear was repaired, and a fresh start was made, but it went wrong again and the air-ship landed on the racecourse, where it was again repaired, and, rising easily, made a pretty flight back to the Aero Club.

ON Saturday there was a strong wind, so that it was not deemed advisable to attempt a free flight, but with the guide ropes held from the ground he flew backwards and forwards for the benefit of the photographers employed by the American Biograph Company. On Sunday a short captive ascent was made in the afternoon, but as the wind was still blowing strong it was wisely decided not to tempt providence.

as he was longing to repeat his attempt to win the prize, and is well aware that there is no time to waste.

A CROP of false automobile accidents are going the rounds of the French papers; first from one quarter and then from another arrive stories of women and children run over and killed, with circumstantial details of the minutest kind. The *Auto-Velo* is investigating them all, and is making some startling discoveries. The latest is a telegram from Lille stating that at Loos, at the corner of the Rue Merou, a woman and a child, named Bumez, had been run over and killed by a red car containing two men and a woman. On making enquiries the *Auto-Velo* has found that there had been no accident, that there was no Rue Merou and no woman named Bumez in the village of Loos.

THE Swiss Automobile Club held on Sunday last at Trelex-St. Cergues a 10 kilometres hill-climbing contest. The following were the winners in each section:—Motor-bicycles, C. Dufaux, 21 min. 20 sec.; Voiturettes (400 to 650 kilos), Brollet, 18 min. 19 2-5 sec.; Cars over 650 kilos, Barbey, 17 min. 10 sec.

THE GLASGOW RELIABILITY TRIALS.

JUDGES' REPORT AND AWARDS.

THE Judges' Committee of the Automobile Club of Great Britain and Ireland beg to recommend to the Council of the Glasgow International Exhibition that they should award medals as shown hereunder. The Judges' Committee, in arriving at their decisions, have relied not only on the numerical results of the Trial, as shown by the marks for reliability and hill-climbing, but have taken into consideration the following matters:—

- | | |
|---|---|
| (a) Price. | (m) Quality and sufficiency of speed gear. |
| (b) Weight. | (n) Easiness of adjustment. |
| (c) H.P., shown by performance. | (o) Steering gear. |
| (d) Persons carried, or load. | (p) Brakes and brake gear. |
| (e) Price in proportion to seating capacity occupied. | (q) Ignition arrangements and apparatus. |
| (f) Price in proportion to power of motor. | (r) General design, mechanically. |
| (g) Power in proportion to seats occupied. | (s) General design, appearance. |
| (h) Power in proportion to weight. | (t) Workmanship, especially of machinery. |
| (i) Mechanical efficiency as shown by Hill-climbing Trials. | (u) Condition of car at end of Trial. |
| (k) Simplicity of transmission. | (v) Breakages and defects not previously mentioned. |
| (l) Accessibility of mechanism. | |

The Judges' Committee attach to the Report an appendix in which are shown the marks gained by each vehicle for reliability and hill-climbing, and an analysis of the causes of stoppages on the road. As regards Class A, Section 1, the Judges' Committee found that a complete comparison could not be made between two types of vehicles so different as steam cars and cars driven by internal combustion engines. The disadvantages of the one system do not appear in the other, and one system has advantages which cannot be claimed by the other. For instance, the steam car is comparatively noiseless, vibrationless, and runs extremely smoothly. The internal combustion engine, however, is highly economical in fuel as compared with that of the steam engine using the same fuel. Vehicles driven by internal combustion engines can run long distances without the stops for water which at present are necessary in cars of the Locomobile type. The Judges' Committee, therefore, recommend that in Class A there should be awarded two gold medals, one for cars with internal combustion motors, and one for steam cars. Of these they recommend that one should go to car No. 9, the 5 h.p. Wolseley, and the other to car No. 20, the Locomobile steam car.

Of the other classes, the Judges recommend the award of medals as shown hereafter. A gold and silver medal were offered for pneumatic tires. A set of tires was entered by the Dunlop Pneumatic Tyre Company, and was run throughout the trial on a vehicle weighing, without its four passengers, 22 cwt. As is shown in the appendix, the tires behaved well. The treads of the tires were found to be in good condition at the end of the trial. On examination of the tires, however, and in consideration of the fact that the experience with tires made in this country for heavy motor-vehicles had been far from satisfactory, the Judges' Committee are not prepared at present to recommend the award of a medal in respect of these tires. The Judges' Committee suggest, however, that a certificate should be given to the Dunlop Pneumatic Tyre Company, stating the behaviour of the tires during the trial, and the condition of the treads at the finish. In view of the importance of encouraging makers who honestly strive to produce satisfactory tires, the Judges' Committee further recommend that the Dunlop Pneumatic Tyre Company should be given an opportunity of submitting a set of tires for a vehicle weighing over 21 cwt. for a prolonged trial of (say) 3,000 miles, the trial to be free of cost, except for the tires, to the Dunlop Company, and that should they, in the opinion of the Judges' Committee, be in a satisfactory condition at the end of this trial, the Council of the Glasgow International Exhibition should award a medal to the Dunlop Company.

The Judges' Committee desire to put on record their satisfaction with a system of trial which provides that the cars should be under continuous observation, inasmuch as the results are

eminently more satisfactory than can be the case in trials in which no record is kept of the duration and cause of stoppage on the road, and repairs.

AWARDS.

SECTION I.—(Cars entered by Manufacturers or Agents.)

Class A.—Cars declared at a selling price of £250 or less:—Gold Medal—Car No. 9, 5 h.p. Wolseley, entered by the Wolseley Tool and Motor-Car Co. Gold Medal—Car No. 20, Locomobile Steam Car, entered by the Locomobile Co. of America. Silver Medal—Car No. 16, 7 h.p. New Orleans, entered by the New Orleans Motor Co., Ltd. Silver Medal—Car No. 30, 4½ h.p. De Dion Voiturette, entered by the De Dion Bouton, Ltd.

Class B.—Cars declared at a selling price of more than £250 and not more than £350:—Silver Medal—Car No. 2, M. M. Co.'s 6 h.p. 2-cylinder light Carriage, entered by the Motor Manufacturing Co., Ltd.

Class C.—Cars declared at a selling price of more than £350, but not more than £500:—Gold Medal—Car No. 10, 10 h.p. Wolseley, entered by the Wolseley Tool and Motor-Car Co. Silver Medal—Car No. 3, M. M. Co.'s 6-seated car, entered by the Motor Manufacturing Co., Ltd.

Class D.—Cars declared at a selling price of more than £500:—Gold Medal—Car No. 14, 16 h.p. Milnes C.P.C., entered by George F. Milnes and Co., Ltd. Silver Medal—Car No. 13, 10 h.p. Mors, entered by the Roadway Autocar Co., Limited. Silver Medal—Car No. 23, 9 h.p. Napier, entered by the Motor Power Co., Ltd.

Class F.—Delivery Vans:—Gold Medal—Car No. 4, M. M. Co.'s 1-ton van, 6 h.p., entered by the Motor Manufacturing Co.

SECTION III.—Parts of motor vehicles entered by their manufacturers or by their authorised agents.

Class B.—Tires:—Diploma of performance and condition of the tires at the finish of the trial, and the opportunity for a more extended trial, with a view to the award of a medal. P 1, Set of tires affixed to 12 h.p. car, weighing 22 cwt. and carrying four passengers. Entered by the Dunlop Pneumatic Tyre Company.

Class G.—Ignition Apparatus:—Gold Medal.—No. P 4, Simms-Bosch Magneto-Electric Ignition and Interruptor-Timing Gear. Entered by the Simms Manufacturing Company, Limited, 55A, Southwark Park Road.

J. H. A. MACDONALD,	DUGALD CLERK,	} Judges' Committee.
W. WORBY BEAUMONT,	BRYAN DONKIN,	
D. S. CAPPER,	H. S. HELESHAW,	
	H. C. L. HOLDEN,	

Automobile Club, 4, Whitehall Court,
October 8th, 1901.

A LIGHT car fitted with a four-cylinder motor of 14 h.p. has just been put on the market by Messrs. Cottereau, of Dijon.

MESSRS. JAMES GRACE AND COMPANY, of Christchurch, New Zealand, write us that they are open to take up the agency for one or two reliable types of motor-cars.

THE *Morning Leader* remarks that motorists, it appears, are unable to agree among themselves as to the most suitable word with which to describe the "stable" of a motor-car. "Motor shed," "motable," "motor den," "motor barn," "motorium," have been suggested, but none seem to meet with satisfaction. "Why not call it 'The motory'?" asks our contemporary.

WE learn that Mr. J. H. Adams has been appointed sales manager of the business of the Motor Traction Company, Ltd., of Walnut Tree Walk, S.E. We understand that this company has secured the agency for this country for the "F. N." vehicles of the Fabrique Nationale d'Armes of Herstal, Belgium, and of the Daimler Motoren Gesellschaft of Cannstatt. A new light car with 9 h.p. engine, the first turned out at the Cannstatt works, is expected over at an early date.

HERE AND THERE.

THE membership list of the Automobile Club now comprises a total of 1,038 names.

A NUMBER of improvements are being introduced in the 1902 patterns of the Minerva bicycle motor set.

A NEW light car, fitted with 8 h.p. De Dion, is, we hear, about to be put on the market by Messrs. Renault Frères, of Billancourt, Paris.

GEN. THE RIGHT HON. SIR REDVERS BULLER, V.C., G.C.B., K.C.M.G., and Mr. Winston Churchill, M.P., have notified their willingness to serve on the General Council of the Automobile Club.

THE manager of the Acetylene Stores, 92, Charing Cross Road, London, W.C., asks us to mention that they keep a large stock of the prepared (French) carbide of calcium which is used in the Bleriot motor lamps.

THE County Councils of Cheshire and Denbighshire are being urged in the local press to take action against the speedy motorists who are said to be delighted with the excellent condition of the road between Chester and Wrexham.

AT a meeting of the Automobile Mutual Protection Association, Limited, held at 88, Chancery Lane, London, on the 9th inst., Mr. J. S. Crichtley, of Donnington House, Norfolk Street, Strand, was elected a member of the Executive Committee.

ONE of the first acts of Mr. Roger W. Wallace, K.C., Chairman of the Automobile Club, on the publication of the awards in the Glasgow Reliability Trials, was to send congratulatory telegrams to the recipients of the medals.

AT a meeting of the Dublin County Council last week, the secretary was directed to write to the Commissioner of Police, calling his attention to the fact that the regulations with regard to speed of the Local Government Board were being violated.

THE annual dinner of the Automobile Club will be held at the Whitehall Rooms, Hotel Métropole, on Thursday, November 14th. It is hoped that members will, if practicable, attend the dinner and introduce to it as their guests friends who are likely to become automobilists.

THE Earl of Ilchester and his son, Lord Stavordale, were riding in a motor-car, near Abbotsbury, on Wednesday, when the vehicle overturned and its occupants were thrown out. Lord Stavordale had an arm and some fingers badly injured, but Lord Ilchester escaped with nothing more serious than a shaking.

WE are informed that the Electric Ignition Company, of Highgate Square, Birmingham, have made arrangements in the wholesale selling agency of their E.I.C. sparking plugs for the United States of America, with Mr. J. W. Jackman, of Victoria Street, London. We understand that they are open to negotiate for the selling agency of their plugs in France, Belgium, and Germany, in which countries the company hold patents.

ON this page we give an illustration of the electric parcel delivery cart which has lately been put on the market by Messrs. Shippey Bros., Limited. The vehicles are made in two sizes, to suit all trades—one to carry loads up to two cwt., and a larger one for loads up to three cwt. On one charge of the batteries they are able to cover a distance, on ordinary roads, of from 25 to 30 miles.

SPEAKING at the shareholders' meeting of the Rover Cycle Co., Limited, at Coventry last week, Mr. J. K. Starley, the managing director, said that, with regard to the question of the company undertaking motor-car making, he had already made a car for himself, and found the work was so intricate that he had come to the conclusion that it would not be wise to combine it with cycle manufacture. He did not think there was at present in existence a motor-car out of which anyone could make a profit, and the changes in construction—mostly relating to the wish for greater and greater speed—were so rapid that much work was rendered useless.

A MEMBER of the Automobile Club having inquired as to the Customs' proceedings in Holland and on the German frontier

in connection with a motor-car, communications on the subject were addressed to the British Consuls at the Hague and at Cologne, and the following information obtained:—
“When an automobile is imported into Germany duty has to be paid on it, which will be refunded when the car leaves that country again; and for the purpose of identifying the car, leads are put on it. In Holland permission must be obtained from the Minister of Waterstaat, Handelen, Ny verheid, at the Hague, which will probably necessitate a visit to the place before commencing the journey.”

AT the last meeting of the East Riding Standing Joint Committee the Chairman referred to an allusion made by the

Chief Constable to the necessity of legislation to facilitate the identification of motor drivers. They all knew that there had been many complaints made as to the excessive speed at which motor-cars had been driven in the Riding. He did not think that the Committee would do anything to cripple what he thought was a very thriving industry in this country. He meant the motor-car, with all its possible developments. He believed they would see the day when a service of motor-cars would be found to be more economical and just as efficient as the light railways, of which they had heard so much.

WE have received from Messrs. John Marston, Limited, of Wolverhampton, a pamphlet descriptive of the “Mabley” car, a detailed account of which we published recently. The main feature of the car is its shape, which is of that curious, but comfortable and convenient piece of furniture found in many drawing-rooms and known as a “cosy corner.” The advantage of such an arrangement is, of course, that the width of the car is much reduced, whilst driver and passenger partially face each other. A 2½ h.p. water-cooled engine is used, speeded from four to twenty miles an hour and the approximate weight of the complete car is 4½ cwt.

THE SHIPPEY ELECTRIC PARCEL DELIVERY CART.

MESSRS. ROBINSON AND PRICE, Limited, of Liverpool, are about to put a new motor-bicycle on the market.

SUTTON BRIDGE, on the road from King's Lynn to Spalding, is at last to be freed, the county authorities having now decided to provide the money necessary to abolish the tolls.

ONE day last week Mr. Thomas Shaw, of Dundee, who is local agent for the Wolseley motor-car, had the pleasure of giving the Lord-Advocate, Mr. Graham Murray, a drive on a vehicle of that make.

WE understand that the Central Motor Company, of 46a, Tottenham Street, Tottenham Court Road, W., are now in a position to let out motor-bicycles and tricycles on hire, either by the day, week, or month.

AMONG the larger vehicles recently turned out from the works of the Daimler Motor Company, Ltd., are a fifteen passenger char-a-bancs, with 18 h.p. motor, and a 12 h.p. van for Messrs. Hugh Stevens and Sons, of Manchester.

THE Bucks Standing Joint Committee has decided to place the police stations in the county in telephonic communication. It was urged by some members that this would enable the police to deal with drivers of motor-cars who rushed about the county at a terrific speed.

AN alteration in the route followed by Eastbourne buses has robbed the inhabitants of Upperton of their direct communication with the sea front and one of the principal thoroughfares of the town. As a result an agitation is now on foot to replace the withdrawn service with motor-cars, which it is believed would be extensively supported.

MESSRS. JOY AND COMPANY, Stoney Stanton Road, Coventry, have now taken up the manufacture of all kinds of sheet metal work, such as carburettors, petrol and water tanks, battery and lamp boxes, etc. For a considerable time they have confined themselves to the manufacture of carburettors only, but have now made arrangements to extend their business.

ONE of King Edward's 12 h.p. Daimler cars has been in the workshops of Mr. Frank Morriss, of King's Lynn, for the past few weeks undergoing a thorough overhauling of engines and gear. After passing its final test, it has now returned to Sandringham in readiness for His Majesty's use early next month. It reflects great credit upon Mr. Morriss, and his staff, that they are able to satisfactorily serve His Majesty, practically on the spot, in such important work.

AT the last meeting of the St. Albans Rural District Council the Mayor drew attention to the furious driving of motor-cars in the streets. The violent driving was shocking and dangerous in the extreme. He hoped the Rural District Council would do all they could to see that motor-cars shall not go through their villages at such high rates of speed. The Chairman endorsed the sentiments expressed by the Mayor, but it was pointed out that the Council had no jurisdiction.

AT the last meeting of the Club Committee of the A.C.G.B.I. a letter was submitted from Colonel FitzGeorge recommending the establishment of a school for motor drivers. The Standing Committee recommended that Col. FitzGeorge should be informed that the Committee have already had the suggestion under consideration, but that, owing to many important matters which they have had on hand, they have not been able to deal with, but hoped to do so as soon as an opportunity is afforded.

A NEW motor-bicycle is about to be put on the market by Messrs. Fell Brothers, of Waltham Cross, Herts. The motor, which is of $1\frac{1}{2}$ actual horse power, is placed inside the frame, near the head, of the machine. The power is conveyed to the rear wheel by a belt, a jockey pulley being fitted on the main down tube. The petrol tank has a capacity sufficient for a run of 100 miles, and any speed from five to thirty-five miles per hour can be attained. For the frame they are using heavy gauge tubing, the fork stem, fork sides, and crown being specially constructed and heavily reinforced.

THE AUTOMOBILE CLUB'S QUARTERLY 100-MILE TRIAL.

THE quarterly 100-mile trial of the Automobile Club was held on Tuesday, the 1st instant. The usual route was followed, viz., from the second milestone from the Marble Arch, via Ealing, Uxbridge, Beaconsfield, High Wycombe, and Stokenchurch to the fifty-second milestone (outskirts of Oxford), and back. Total, 100 miles. The roads were greasy for the first eight miles, very loose at the foot of Astor Hill, but otherwise very good. The weather was fine with a light wind. The hills on which hill-climbing trials took place were:—(a) The steep portion of Dashwood Hill, commencing at 33rd milestone and ending at danger board at the top—1,180 yards, having an average ascent of 1 in 16.0 and including 352 yards of 1 in 10.9; (b) One mile including Dashwood Hill, commencing at the 33rd milestone and terminating at the 34th milestone, having a total rise of 241 feet in 1 mile, including 275 yards of a gradient of 1 in 27.7 and 600 yards of a gradient of 1 in 11; (c) Aston Hill on the return journey; distance 1 mile 1,100 yards, having a total rise of 316 feet and including 1,910 yards of a gradient of 1 in 21.

Only three vehicles took part in the trials as follows:—

A Simms four-seated voiturette (the Simms Manufacturing Company, Limited, Bermondsey) fitted with 6 h.p. Simms single-cylinder petrol motor, water-cooled, having Simms-Bosch magneto ignition and timing gear. The complete weight, with four passengers, was 15 cwt. 3 qrs. The following are the results as given by the observers:—Quantity of petroleum spirit used on the journey, 4 gallons 1 pint; quantity of water used on journey, practically nil; speed, up to the legal limit of twelve miles per hour; number and cause of stoppages, no stops. Hill-climbing speeds:—(a) The steep portion of Dashwood Hill:—Took four passengers up all the way. Time to Danger board, 4 mins. 33 secs. = 8.8 miles per hour. (b) One Mile including Dashwood Hill:—Took four passengers up all the way. Time for the mile, 5 mins. 31 secs. = 10.8 miles per hour. (c) Aston Hill:—Took four passengers up all the way. Time, 9 mins. 9 secs. = 10.6 miles per hour.

A four-seated Teras (Gobron-Brillié) car (W. T. & S. E. Botwood, Ipswich), fitted with 14 h.p. "Gobron-Brillié" water-cooled, two-cylinder motor with electric ignition. Weight, with four passengers, 23 cwt. 1 qr.; quantity of petroleum spirit used on the journey, 8 gallons 2 quarts 1 pint—(Petrol pipe leading from tank to carburettor was broken before the start and was leaking badly throughout; the water pump was also leaking slightly throughout.)—quantity of water used on journey, 2 quarts; speed, up to the legal limit of twelve miles per hour; number and cause of stoppages, one, for 15 secs., owing to the driver missing the change of speed on running on to a patch of loose stones in the dark. Hill-climbing speeds:—(a) The steep portion of Dashwood Hill:—Took four persons up all the way. Time to Danger board, 3 mins. 29 secs. = 11.5 miles per hour. (b) One Mile including Dashwood Hill:—Took four persons up all the way. Speed up to the legal limit of twelve miles per hour. (c) Aston Hill:—Took four passengers up all the way. Time, 8 mins. 55 secs. = 10.9 miles per hour. General remarks:—The start was delayed owing to defective porcelain sparking plug, and owing to the end of the exhaust box being blown out on starting the engine.

A four-seated C.P.C. car (George F. Milnes & Co., Limited), fitted with 16 h.p. Daimler, water-cooled, four-cylinder motor with Simms-Bosch magneto ignition and timing gear; weight, with four passengers, 29 cwt.; quantity of petroleum spirit used on the journey, 6 gallons; quantity of water used on the journey, 3.15 quarts; speed, up to the legal limit of twelve miles per hour; number and cause of stoppages, no stops. Hill-climbing speeds:—(a) The steep portion of Dashwood Hill:—Took four passengers up all the way. Time to Danger board, 3 mins. 45 secs. = 10.7 miles per hour. (b) One Mile including Dashwood Hill:—Took four passengers up all the way. Speed up to the legal limit of twelve miles per hour. (c) Aston Hill:—Took four passengers up all the way. Speed up to the legal limit of twelve miles per hour.

ACTION FOR DAMAGES.

AT the Bungay County Court, Robert Murton, farmer, of Carlton Colville, near Lowestoft, sued the Hon. John Mulholland, of Worlingham Hall, Beccles, for the sum of £19 in respect of damage done to his horse and cart by reason of the alleged negligent and furious driving of a motor-car, defendant's property. The horse and cart were passing over a narrow bridge across the Waveney at Oulton Broad, when the defendant, who was in a motor-car with two ladies and a little girl, being unable to pass the other vehicle, sounded a horn twice. Plaintiff's horse was frightened broke away from the driver, and collided with the gateway of the Wherry Hotel, upsetting the cart and injuring the horse. For the plaintiff it was contended that the speed of the motor-car was excessive, that the blowing of the horn was an unreasonable act, and that the defendant did not use proper care and caution in the circumstances. Mr. Staplee Firth, who appeared for the defendant, subjected witnesses to a searching cross-examination and denied defendant's liability. Without calling upon the defence, Judge Eardley Wilmot gave judgment in favour of the defendant, remarking that motor-cars were now recognised by the Legislature and had as much right to the use of the highway as any other vehicle. Horses had to get used to them. It was quite clear that the horse was frightened by the warning of the horn, but sounding the horn was exactly what the law said drivers of motor-cars must do and he failed to see any evidence of negligence. The judgment carried costs for the defendant.

OVERLOADING.

At Bournemouth, George M. Dorey, a motor-car driver, pleaded not guilty to overloading his motor-car on the 17th August. Mr. James Druitt, jun., appeared to prosecute on behalf of the Bournemouth Corporation. Patrick Byrne, Hackney Carriage Inspector to the Corporation, said the car, which was the property of the Bournemouth Motors, Limited, was licensed to carry eight persons in addition to the driver. On the night in question, shortly before half-past ten, he saw the car in the square, and it then contained twelve passengers, three being on the box seat, where only two should have been, two standing on the step of the car behind, and seven in the car itself, which only had seating accommodation for six. The defendant said he remembered nothing about it, but he dared say that the people behind were the two inspectors and the engineer. The Bench fined the defendant 13s. and 7s. costs.

FUTURE AUTOMOBILE TRIALS.

A MEETING of manufacturers and sellers of electrical motor vehicles will be held at the Automobile Club on Wednesday, November 20th, at 5 p.m., to discuss details of a proposed trial of motor vehicles. Probably shortly afterwards manufacturers and sellers of the lighter class of motor vehicle, propelled by other power than electricity, will be called upon to consider what, if any, trial similar to the 1,000 Miles Trial of 1900 and the Glasgow Trial of 1901 should be held in 1902. No schemes have yet been discussed. It appears that the expense of the trial might be reduced if the daily runs were made longer, and if the trial were to consist of, say, six runs of about 120 to 160 miles per day, having London as a centre, thus:—

	Miles.
Monday.—London, Oxford (54 m.), Gloucester (102 m.), Worcester (128 m.), Birmingham ..	153½

By this means, three starts would be made from London, and three finishes would be made in London, thus stimulating the interest of the London Press and people. The other three nights would be spent in the centres of the Midland, Lincoln, and Nottingham Automobile Clubs, where there is an ever-increasing number of people adopting automobilism.

A suggestion has been made that as soon as the trade find time to give to the important subject of motor delivery vans for loads of a ton or under, the Automobile Club should organise a really serious trial of such vans by enlisting the sympathy of the big firms in London, such as the Railway Companies, Whiteley, Barker, Maple, Swan and Edgar, etc., and inducing them to offer handsome prizes for the best delivery van, and to test the vans submitted for trial by running them in actual work under Club observation for, say, three months or more, and thus to ascertain the cost per mile, and particularly how far the vehicles suffer from wear and tear. If traders can once be convinced that a reliable, economical delivery van is obtainable, there can be no doubt but that orders for such vans will be forthcoming by the hundred. Probably the wishes of the automobile trade in this matter will be ascertained by a conference at the Automobile Club.—*Automobile Club Notes.*

FURIOUS DRIVING CASES.

At Settle Petty Sessions, Fred. W. Thomas, of Halifax, was summoned for driving a motor-car above the legal limit of twelve miles an hour. Police-sergeant Topham said that on the 1st ult. he was on duty with Police-constable Matson in plain clothes in the township of Long Preston for the purpose of timing the speed of motor-cars. Defendant came along in the direction of Settle, and witness in conjunction timed him over a measured mile. He did the mile in three minutes—that is, at the rate of twenty miles an hour. Defendant said he did not know he was exceeding the legal limit. If he was, he did it unintentionally. A fine of £2 and costs was imposed.

At the same court, Henry Gardner, of London, was fined £2 and costs for a similar offence on Sunday, the 8th ult. Police-constable Matson and Police-sergeant Topham said defendant did the mile in 2 mins. 55 secs.

At Bristol, Edward Rickham was summoned for riding a motor-bicycle at a furious rate in Park Row on 29th September. The police evidence was to the effect that the bicycle was travelling at the rate of about sixteen miles an hour. The defendant said he did not know he was going so fast. He was fined 10s. and costs.

At Retford County Police Court, Amédée Lestrade, employed by Captain J. F. Laycock, of Wiseton Hall, appeared to answer a summons charging him with driving a motor-car at a greater speed than twelve miles an hour, between Everton and Wiseton, on Sunday, the 29th ult. Mr. A. P. Williamson prosecuted, and Mr. R. A. H. Tovey, Doncaster, appeared for defendant. Dr. W. J. Johnson, of Bawtry, deposed to driving with his groom from Drakeholes to Everton on the Sunday in question

about mid-day. On mounting the hill he met a motor-car being driven from ten to twelve miles an hour. This he considered a reasonable speed. The next thing he saw was a cloud of dust, and another car coming at a much faster rate, and making a noise. His groom drove to the side of the hedge. Witness had just time to press his hat on his head and catch hold of the side of the carriage as the car passed. The speed of the second car, he should judge, was between thirty five and forty miles an hour. When it had passed him he turned round, but it was almost out of sight. The distance of three-quarters of a mile was covered under the minute. Cross-examined by Mr. Tovey, witness said he was a fairly good judge of speed. He had driven a horse and trap for thirty years, and generally travelled from eight to ten miles an hour. Mr. Tovey, in his speech for the defence, said that Captain Laycock wished it to be understood that if defendant was guilty, he did not wish to get him out of a scrape, but he (the captain) was not responsible for his drivers, so that if the Bench should fine defendant they would bear in mind that they were not fining Captain Laycock. The defendant stated that he was driving a motor-car from Bawtry Station on the day in question. He started from Bawtry at eight miles an hour. The first car was in front of him. He saw a gentleman's trap and a load of straw. The first motor-car stopped on the left side of the road soon after he had passed the trap. He slackened up as he passed the doctor's trap, and was travelling at from seven to eight miles per hour. He could not go at thirty-five miles the hour if he wished. Cross-examined by Mr. Williamson, defendant said he had been in England about three months. Captain Laycock had told him not to travel too fast, and therefore he did not do so. The captain had never complained of his driving. At Doncaster, when he was said to have stated that he rode fifteen and a half miles an hour, kilometres were mistaken for miles. The Chairman, after a few minutes' deliberation, said the Bench had considered the case carefully, and imposed a penalty of £10, including costs.

At the Hythe County Sessions, Percy Morgan, of Folkestone, was fined £1 and 12s. costs for exceeding twelve miles an hour with a motor-car, on September 8th, at Newington. Defendant declared that his car only had two speeds—one seventeen miles an hour and one ten miles, and that he was travelling at the latter. The magistrates, however, accepted the evidence of Police-sergeant Stevens and Police-constable Honey, who asserted that 440 yards were traversed in fifty seconds, giving a rate of eighteen miles an hour.

At Norwich Shirehall, John Reginald Hargreaves, Cawston, was summoned for driving a motor-car at a greater speed than twelve miles an hour at Horstead, on 25th September. Mr. E. Reeve represented defendant, who was unable to attend. The first witness called was Sir Edward Birkbeck, who stated that on the day in question, about half-past four in the afternoon, while he was in a field about 200 yards from the road leading from Horstead to Buxton, he heard a motor-car coming from the direction of Buxton and going towards Horstead. It was travelling at a great pace. There was a lady by the side of the driver, and no one else in it, as far as he could observe. The witness continued: "About three-quarters of an hour after I was standing at a gate with Sir W. Dyke, M.P., and Mr. G. Daniels, farmer, of Buxton, when I heard the horn of a motor-car coming from the direction of Horstead village. It would be, I should say, 200 yards to 250 yards off when the horn was sounded. It dashed past close to where we were standing, but I could not see the motor-car more than four yards from the direction it was coming on account of a very high fence and the road being curved at the place in question. It appeared to me to be the same car I had seen before, and was going at a very great pace, certainly over twenty miles an hour. Other witnesses having sworn to seeing the car in question travelling at twenty miles an hour on the same date, Mr. Reeve, for the defence, said he apprehended the Bench must convict, for it was perfectly clear that Mr. Hargreaves was driving more than twelve miles an hour. But he hoped the Bench would judge the case by its surroundings—there was no reckless driving on the part of Mr. Hargreaves, he had the motor-car under perfect control, the road was a broad one, and there was very little traffic about. The Bench would not, he was sure, deal with what might have happened, as Sir Edward's conjectural evidence suggested, but with the facts of the case. No one was hurt, no one was annoyed by what had happened. The Chairman, after a brief consultation with his fellow-magistrates said the Bench were agreed that Mr. Hargreaves was driving beyond the limits of pace laid down by law. In fact, they quite believed he was travelling at twenty miles an hour, but it was not over a part of the road which was much frequented, and they therefore thought a fine of £5 would be sufficient to check him. They hoped that would be the last time he would have to answer a summons of this sort. He would also have to pay the costs, 16s. 6d., or in default, seven days.

At Leeds, Percy Cradock, of Wakefield, was charged with furiously driving a motor-car. Defendant did not appear, and was not represented. Police-sergeant Vaughan's evidence was to the effect that on a recent Sunday afternoon defendant and a lady passed through Garforth on a motor-car at a rate which he estimated at from twenty to twenty-five miles an hour. The defendant did not sound any alarm nor slacken speed when passing a conveyance on the road. The Chairman remarked that "magistrates up and down the country are doing their best to stop this, and we shall do the same." The full penalty of £10 and costs was imposed.

At Ramsgate County Police Court, Laurence Hubert Greig, of Kingston-on-Thames, was fined £5 and costs for driving a motor-car at an excessive rate. Police-constable Ashby saw defendant approaching from the Prospect Inn, Minster, towards Sarre, and he covered a distance of two miles in four and a half minutes. Inspector Stanford stated that numerous complaints had been received in regard to the high speed motor-

cars travelled along the roads, and in giving the decision of the magistrates the Chairman expressed a hope that this fine would be a warning to drivers to moderate their speed.

At the Petty Sessional Division of Penge, Arthur Wood, of Streatham Hill, was summoned for driving a motor-car at a greater speed than twelve miles an hour. It appeared that while he was travelling along the Thickett Road, and just as he passed the end of Lullington Road, a mounted policeman called to him to stop. He pulled up, and the constable informed him that he had been driving at sixteen miles an hour. Witness stated that when he accused the defendant of going sixteen miles an hour, he said, "I was not going sixteen, I was going fourteen. I am very sorry," and that he apologised. This Mr. Wood absolutely denied, and said that the charge was a fabrication from beginning to end. The officer was put through a searching cross-examination by Mr. Staplee Firth, who defended, and he admitted that the rate of speed was simply an opinion, but that he was satisfied he was right, because he knew the speed at which he had to gallop his horse to overtake the car. He was then tackled as to the speed of his galloping horse, and again admitted that it was an opinion, whereupon Mr. Firth set up for the defence that the opinion of a policeman as to speed was inadmissible, and that the magistrates could not take cognisance of it. The Chairman of the Bench, however, said that they should treat the policeman as an expert witness, and should certainly take cognisance of his opinion, upon which Mr. Firth protested that they had no power to do so, as it was establishing an absolutely wrong principle. The magistrates conferred with the Clerk, who evidently advised them that they were making a mistake, and they dismissed the case on the ground that the evidence of the policeman was unsatisfactory.

At Reigate Police Court, Mr. Wotton, of Thornton Heath, was summoned for driving his motor-car through Merstham on September 29th at a speed over twelve miles an hour. The police stated that defendant was going twenty-three miles an hour—a declaration at which he seemed astonished. The Bench wanted prompt evidence to justify this implied contradiction of the police; but there was a difficulty. The only person whom Mr. Wotton could call was his mechanic, who was a Russian unable to speak a word of English. Fined £2 and costs.

For travelling on the same day and at the same place at the rate of thirty miles an hour, Mr. Turner, of Cavendish Square, London, was also brought before the Reigate Court. Mr. Henry Strakosch, solicitor, who appeared for the defendant, said the motor-car was not of sufficient power to attain that speed. Fined £5 and costs.

In the next case, called at the same Court, the motorist had given the policeman who stopped him a card purporting to bear his name and address. A summons was accordingly issued against Mr. Cheesright, of Queen Victoria Street, for driving his car furiously through Horley on September 20th; but, although Mr. Cheesright is guilty of keeping two motor-cars, both of which were out of order, upon the date mentioned he was at the time on his way to Canada. It appeared that the car did not pull up when ordered to do so, and a constable thereupon ran after it and boarded it while still in motion. He was then given a card bearing Mr. Cheesright's name. Mrs. Cheesright, who attended with her son, produced a telegram and letters showing that her husband could not possibly have been one of the six occupants, of whom, to use the policeman's expression, "four were in the car and two in front of it." The case was dismissed.

ANOTHER gentleman appeared to answer a charge of driving his motor-car at Merstham about eighteen miles an hour, on September 29th. Defendant said he certainly did not know he was travelling at a dangerous pace, or he would not have gone so fast, for there was a person with him in the car who was dearer to him than anyone else in the world. The Bench was not in a mood to appreciate the sentiment, and imposed the usual fine of £2 and costs.

A SUMMONS was also issued against Mr. H. Halford, of Kensington, for driving his car too rapidly near Horley. Mr. Halford admitted the charge, but was very indignant at being classed with the scorchers. "Did we," he asked the inspector who gave evidence, "look like the scorchers? Had we goggles on?" The Constable: No, I can't say you had. His Worship: That is not to the point. £2 and costs.

At Portsmouth, Charles Parker, of Chelsea, London, was fined in all £3 7s., including costs, at Portsmouth for furiously driving a motor-car along Clarence Parade, Southsea. Mr. Thomas Cousins, one of the borough magistrates, said the car passed his house at quite twenty miles an hour. Some tram horses were frightened, one being seriously injured in falling.

MR. MOFFAT FORD, Managing Director of the Motor Car Company, Limited, 168, Shaftesbury Avenue, appeared before the Reigate Bench on Saturday last to answer a summons for driving a motor-car at a greater speed than twelve miles an hour at Merstham, on the Brighton road, on September 28th. The summons was for eleven o'clock in the morning, and the case not having been called on by 1.30 when the Court declared its intention to adjourn for lunch, Mr. Ford rose to protest against being summoned for the morning instead of the afternoon. The Chairman, however, cut short Mr. Ford's remarks by saying that he was only wasting the lunch time, and that he had better go and get some lunch. The case, however, was not called until four o'clock, when, on appearing at the table, Mr. Moffat Ford protested against being summoned for eleven o'clock when there was such a large number of cases to be dealt with which could easily have been divided into morning and afternoon batches. The Chairman of the Bench: "If you think you have come here to teach us, you are making a great mistake." Defendant: "I have not come here for the purpose; that is purely incidental. I shall be quite satisfied if the Press will make a note of my protest." The information was then read, and an

inspector went into the witness-box, and commenced reading from some notes on a paper he was holding. Defendant questioned this procedure. Witness then laid the paper down on the desk, but he was afterwards distinctly observed to glance again at the paper on the desk below him. Defendant (heatedly to the Bench): "Witness is still referring to notes made since the occurrence."—The Chairman of the Bench: "Behave yourself. The case will be put back and not heard till last." Mr. Moffat Ford (sharply, and sitting down): "Oh!" (Loud laughter.) After all the summonses had been heard Mr. Ford's case was again called, and, upon stepping forward, he once more protested against being kept from eleven o'clock in the morning until five o'clock in the evening doing nothing. The information was then read, and the inspector gave evidence to the effect that on the day in question he and another police officer were on the Brighton road dressed in plain clothes, and saw the defendant driving his car at twenty-four miles an hour. He had five uniformed policemen stationed out of sight about 100 yards away. As the defendant passed him on his car, he blew his whistle, and the uniformed policemen then showed themselves and stopped defendant's car. Mr. Moffat Ford: "How do you know I was travelling at twenty-four miles an hour?" Witness: "Because you travelled over a measured distance of 176 yards in sixteen seconds, and that works 'hout' at between twenty-three and twenty-four miles an hour." Defendant: "Who measured the ground?" Witness: "I didn't. My brother officer did." Defendant: "What did he measure it with?" Witness: "A tape." Defendant (addressing the Bench): "Then I claim on a point of law that you are not in a position to give judgment against me upon the evidence before you, because neither the measure nor the watch have been produced." The witness then handed the watch to Mr. Ford, but before doing so, looked at it, put it up to his ear and then shook it. Here the Chairman remarked to defendant, "You are not doing yourself a bit of good, you know." Defendant: "I don't suppose I am, but I am fighting this case to the best of my ability, and I intend to continue doing so." After further discussion the Chairman of the Bench said: "You will pay a fine of £5, or go to prison for a month." Mr. Moffat Ford: "I will do neither. I appeal on a point of law." Chairman: "Of course you can appeal if you like." Defendant: "I know that. That's why I have done it."

Reported above are 16 prosecutions for furious driving. In 2 cases the summonses were dismissed, while in 14 cases fines amounting to a total of £54 10s. without costs were inflicted.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, OCTOBER 26, 1901.

[No. 138.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE Automobile Club Committee have decided that on the occasion of the run to Southsea the vehicles taking part in the run shall be identified by names instead of by numbers. Those who enter for the run will be supplied by the Club with cards bearing the names selected for the vehicles, and these cards must be attached, one to the front and one to the back of the car during the run. The names may be selected by the owners of the cars. They must not, however, consist of more than ten letters. Owners who have entered vehicles are requested to communicate to the Secretary as soon as possible the name selected for their car. In order to assist owners in selecting names, the Committee call attention to the list of Greek and Latin names which appears in Nuttall's and other dictionaries, but reserve to themselves the right to refuse a name selected by an owner. The Committee of the Automobile Club have also decided that the entrance fees for the anniversary run shall be as follows, the choice of whether their vehicles be entered for a non-stop certificate or not resting with the owners:—(a) Entrance fee for non-stop certificate, including storage for one vehicle for two nights at Southsea (November 16th and 17th), and identification cards, 10s. per vehicle. (b) Entrance fee, including storage at Southsea and cards of identification (but not non-stop certificate), 5s. per vehicle. (c) Entrance fee, including cards of identification (but not non-stop certificate nor storage at Southsea), 2s. 6d. per vehicle. We may add that all motorists, whether members of the Club or not, are invited to take part in the run, and that entries are already being received at a satisfactory rate.

Lessons from the Glasgow Trials.

THE enormously-increased value given to automobile competitions when they are carried out under a rigid system of observation is well brought out by the judges' report of the Glasgow trials. There may have been room for criticism of minor details of arrangement, and it is almost impossible that such events should be carried out so as to satisfy all competitors; but it is not too much to say that the mass of facts presented in the report before us is of a scientific value never before attained in the annals of automobilism. The difficulties in the way of ensuring a careful and accurate record of the behaviour of competing vehicles are obvious, while the fact that a mere point-to-point race is far more to the taste of most drivers does not increase the cordiality of their co-operation; but the utility of the results amply justifies the labour of obtaining them, and suggests the desirability of further and more purely scientific

tests of motor mechanism being undertaken in a similar manner. In this country, unfortunately, manufacturers are seldom alive to the value of research, as not immediately and certainly productive, and such work has usually to be looked for from the laboratories of public educational centres, whose facilities for it are at best limited, and by no means able to make up for the lack of industrial interest as shown in more progressive communities.

Some Comparative Figures.

TURNING to the details of the report, they will, of course, appeal to the majority of readers as factors to assist them in the choice of next year's car, though—with the new recruits at least—the question of "smartest turn-out" will probably be accorded an entirely undue prominence. Entirely apart, however, from the point of view of individual merit, the figures obtained by the cars may be considered as data from which some instructive averages can be drawn, so far as is possible having regard to their somewhat limited number. It will be seen, then, that in the course of 500 miles run by thirty-seven vehicles, giving a possible mileage of 18,500, a total loss of time of 26 hrs. 23 min. was due to more or less easily reparable accidents. Assuming an eighteen-mile average, this corresponds to about one-forty-fourth of the running time, or a minute and a half for repairs in every hour. In addition to this, though, there were nine mishaps serious enough to necessitate withdrawal from the runs, three being due to piston failure, three to gear fracture, and one each to broken crank, carburettor, and ignition. The behaviour of the "steamers" is not here included, their conditions being somewhat different. Of the total loss of time, *pannes* excluded, pump troubles account for 528 minutes, or 33·35 per cent.; ignition comes next, with 23·75 per cent.; brakes, 6·63 per cent.; carburettor ailments, 4·99 per cent.; lubrication, 2·59 per cent.; and miscellaneous repairs make up the remaining 28·69 per cent. No account is here taken of stops merely to fill up or start engine.

Points for Attention.

IT is noticeable that while the amateur drivers had more than their share of carburettor troubles, and quite their allowance of those due to water circulation, they were singularly happy with their ignition, eight cars only losing eleven minutes from this cause, while twenty-nine of their professional brethren lost 365 minutes by it, which may fairly be attributed, at least partially, to electrical knowledge being scarcer with the latter, as well as to the fact that many otherwise good cars are flimsy in their electrical arrangements, a point worth the makers' attention, being so easily obviated. Regarding pumps, the figures are suggestive enough without comment, and should be appreciated by designers. The stoppages from broken gears deserve more than casual consideration, it being probable that the enormous strain on the bevel gear of a live axle has hardly received sufficient attention or allowance for the increase therein due to its position when chains are abolished. Taken on

the whole, however, the results are a most satisfactory proof of the reliability of the modern car, run under the severest conditions as regards attention permitted, though favourable as to weather.

Poor Reigate.

POLICE zeal against motorists is but sorry sport for the hotel-proprietors and tradesmen of Reigate and other Surrey towns in which the persecution of motorists has been carried to excess. Since the recent great motor day in the local court, hundreds of motorists who were wont to frequent that road have gone to "pastures new," and the loss must amount to a few hundred pounds every week to such a town as Reigate. Motorists are profitable to innkeepers, and anything that sends them in other directions cannot be welcomed by tradespeople—as the Surrey police will find out if they continue their persecuting tactics much longer.

THE RT. HON. SIR J. H. A. MACDONALD ON THE "GOOD GIRL"

The Speed Limit.

WE are pleased to find the dailies coming round to our way of thinking as regards the speed limit. The *Daily Telegraph* the other day remarked: "Are not the Reigate magistrates wasting a lot of time over the furious driving cases of cyclists and motorists? Surely the best plan would be when sending the summons to mark on it the amount of the fine—there would be no difficulty about this, the scale seems to be fixed—and add: 'Your prompt remittance will oblige.' This would save time and trouble to the cyclists and motorists, and would also prevent the magistrates from being exposed to the horror of hearing the expert accuracy of the police put in question. It must not be thought for a moment, however, that we advocate the removing of all restrictions. Quite the contrary. Admittedly there is a great deal of reckless and inconsiderate cycling and motoring, which we would gladly see stopped. But make the question of "endangering" someone the touchstone, and apply the rule equally to riders and drivers of horses, cyclists, and motorists. Those who ride or drive fast round corners or past cross-roads, who cut it fine in passing one another or persons crossing the road; who stop or turn off to the right or left without signalling their intention to those behind; who will not allow the pedestrian room for peaceful walking, but prefer to scrape by his elbow—these we would gladly see fined. Let us have those who endanger the public punished according to their demerits, but let us have no more of the farce of measured miles on country roads, where no one is about but the trap-setting police."

Somerset and the Speed Limit.

OUR advocacy of the abolition of the speed limit with regard to motor-vehicles has found support in many unexpected places, and we are glad to see that, on the motion of the Marquis of Bath, the Somerset County Council has approved of the idea. Everyone must recognise that a speed which would be dangerous in a crowded thoroughfare would be safe and reasonable in a deserted country lane. In connection with the debate at the Somerset County Council Mr. H. Carver organised a little motor-car demonstration which impressed the people of Wells and influenced many Councillors. Unfortunately the County Councillors showed themselves in favour of numbering motor-vehicles, but the important point of the discussion was that all agreed it was practically useless to impose a speed limit. Mr. Thring said there were about 10,000 motor-cars in England, and in speaking against the numbering proposal Mr. Neville Grenville, who said he had been thousands of miles on motor-cars, pointed out that a number could soon become obliterated with mud and dust. If County Councillors would content themselves with the abolition of the speed limit and the infliction of penalties if life is endangered they would be acting more wisely than in attempting to number cars.

The Speed of Motor-Cars.

AT a meeting of the Executive Council of the County Councils Association, at the Westminster Guildhall, on Wednesday, Mr. W. W. B. Hutton brought up a resolution declaring that the existing law, if scrupulously observed and rigorously enforced, is sufficient to secure public safety, "provided that every driver should be required to obtain and carry a license of competency to drive a motor-car, and that each motor-car have fixed to it some identifying number." Mr. Hutton also proposed a resolution in favour of caution boards being fixed at dangerous places on roads requiring drivers of all vehicles to drive slowly. On the motion of Lord Northbrook, it was agreed that both resolutions should be printed and circulated at next meeting.

Automobiles and the Late U.S. President.

LITTLE more than passing notice was accorded to the part played by the automobile at the time of the assassination of President McKinley. Now that the popular feeling with regard to that sad event has somewhat abated, it may be of interest to recall that the President was carried to the hospital at the Buffalo Exhibition on a motor-ambulance; several motor-vehicles were sent in hot haste for the best surgeons in the city; on an automobile Dr. Rixey went to tell Mrs. McKinley of the occurrence; the nurses arrived on motor-cars, and finally the President was borne to the house of Mr. Milburn on the motor-ambulance. Without any delay or hesitation everyone seemed to turn to motor-vehicles as the most reliable and speedy conveyances available, and they certainly proved their capacity without a single mishap.

At Worthing.

A NUMBER of prominent motorists have lately been staying at Worthing, and we hear that it is the intention of Mr. A. F. Warne, a local hotel proprietor, who is also a member of the Automobile Club, to entertain the members of that institution to dinner in a short time. "The larger number of the cars" lately seen in the town, says the local paper, "were by Panhard-Leverson, and they have a running capacity of from twenty to eighty miles an hour." How earnestly do the representatives of provincial journals strive to become learned with regard to motor matters. Panhard Leverson, Esq., motor-car maker, is almost as novel as the "Damecar" car about which Yorkshire people were informed during the 1,000-mile Trial, or the "Lowcoalmobile" on which a cockney journalist once waxed eloquent while passing rapidly over the London streets.

"Freedom" in the Press.

REALLY we are surprised at the apparent neglect of some editors to adequately revise their correspondence columns. Evidently some letters are only admitted to newspaper publicity because of their extreme tone, or why is such a sentence as the following allowed to appear:—"Motor-cars are an unmitigated nuisance, and likely to cause many deaths and fearful accidents. Twice I have had to seek shelter in a lane off the main road, and several ladies dare not drive out for fear of meeting them." Such absurdities are admitted in the columns of respectable journals, and we really wonder where some editors draw the line.

The Friend of the Horse.

A WRITER in the *New Liberal Review* says "It is quite certain that the motor-car will not oust the horse any more than the bicycle has." Of course it won't. Ousting horses is not the function of the automobile. But it will reduce their burdens, and by taking up heavy loads lessen the cases of cruelty that are too frequent in some districts—especially hilly localities, where one or two horses are often required to struggle up elevations that should be encountered by teams of three or four animals. The motor-car is becoming the horse's best friend.

Highways and Locomotives Amendment Act of 1878. The question rests on article one. The definition of "light locomotive" states that the expression "light locomotive" means a vehicle propelled by mechanical power, etc., and is so constructed that no smoke or visible vapour is emitted therefrom, except for any temporary or accidental cause. The case was heard at Kingston, on Thursday, when Mr. Staplee Firth, on behalf of the Motor Union, appeared for defendant, and we learn by telegraph that all three charges were dismissed. The J.P. proved to be Mr. Thomas Weeding Weeding, the Clerk to the Surrey County Council, who publicly announced in court that he had been instructed by the County Council to lay the information and prosecute.

A Solution of the Dust Problem.

AMONG the many motorists who have suffered from the dust nuisance, and who are devoting their energies to the question of obviating the same, is Mr. E. C. F. James, of Knockdrin Castle, Mullingar, Ireland, who has sent us the accompanying illustrations of the cowl-hood he has patented, and fitted to his 8 h.p. Panhard tonneau car. Mr. James writes:—"It is the first I made, and is only a rough pattern. It acts like a cowl, creating a draught of air, which entirely prevents the dust coming into the car. When it rains it can be

THE DUST NUISANCE.—THE JAMES COWL HOOD IN AND OUT OF USE.

An Important Case.

MR. ARTHUR SHARP, of Byfleet, was driving a Locomobile at Walton, when a person, who happened to be a J.P., followed on a bicycle, and shouted out to him, "What's wrong with your condenser." Mr. Sharp rather resented this interference by a person whom he did not know and told him to mind his own business. This angered the J.P., who followed the motorist for some distance and told him that if he knew his name and address he would summons him. On this Mr. Sharp handed his card to the J.P., with the result that the latter caused to be issued three summonses, one charging Mr. Sharp with being a person in charge of a locomotive passing on a highway who failed to employ two persons in driving or attending to such locomotive; another summons charged Mr. Sharp that he, being the driver of the locomotive, did drive the same along a certain highway there situate (meaning Walton) at a greater speed than four miles an hour. The charge in the third summons was that he, being the person in charge of a locomotive, did use the same in a highway within the administrative county of Surrey, such locomotive not being licensed according to the statute. The first and second summonses were taken out under the Locomotives Act of 1865, which deals with traction engines and so forth. The third summons was taken out under the

reversed, or if not wanted can be folded or removed. It can be made to suit any kind of car, and what I claim for it is that it is a simple, cheap, and effective way of preventing dust coming into a motor-car. It may be contended that the device catches the wind; this, of course, is true to the extent that it catches the wind less the amount two people catch; which is, however, very small." We understand that Mr. James is open to arrange with some firm for the placing of the device on the market.

Favoured Motorists.

NOT often does the law favour motorists, but they appear to have exceptional treatment so far as Sunday traffic is concerned. A deputation of Bournemouth ministers recently waited upon the Town Council of that delightful town to oppose the running of omnibuses and motor-cars on the Sabbath. The mayor having heard their views said the corporation had done what they could to stop omnibus traffic, but counsel's opinion was against them. At the same sitting of the Council a recommendation of the Horse Committee compelling the drivers of omnibuses to walk the horses when passing churches on Sunday was adopted. In the course of the discussion the question was asked what was the walking pace of a motor-bus, and it was explained that the Town Council Clauses Act—

under which the recommendation was made—only applied to vehicles drawn by horses, so that motor-vehicles could not be restrained from going their own steady pace outside ecclesiastical buildings on the Sabbath day.

Motor Delivery Vans.

DESPITE the contradiction of the rumour as to the amalgamation of the two largest carrying firms of the Metropolis, "for the present," we believe the combination will shortly take place, and that the introduction of motor-cars into the carrying trade of London will be a strong point in the appeal to the public which will be made by the amalgamated concerns on their transformation into a limited liability company.

Up Ben Nevis on a Motor-Bicycle.

AN attempt was made last week to ride from Fort William to the summit of Ben Nevis on a motor-bicycle by Mr. Grierson, of Coventry. On reaching the halfway house, Dudley—an elevation of about 2,000 feet—the attempt was abandoned owing to punctured tires. We understand that Mr. Grierson will make another attempt to reach the highest point in the British Isles.

M. TESTE ON HIS PANHARD RACER TRAVELLING AT 47 MILES AN HOUR.

L'Avenir de

[L'Automobile.

France since the Racing.

VERY remarkable has been the condition of things in France since racing has been a prohibited sport. Motorists seem to have been at a loss for a subject of conversation, and the current excitement has been maintained by alcohol trials and aërial navigation. There has been a breathing time in France, and not having been bothered with racing excitements makers have been able to look to their business and perfect their machines in many minor details.

Reaction in Manchester.

It is rather surprising that so enlightened a body as the Watch Committee of the Manchester City Council should pay heed to the intolerant suggestions of prejudiced horse owners. Such, however, seems to be the case. The Watch Committee are seeking Parliamentary powers to regulate the traffic at the street crossings in the city and to prescribe the maximum speed at which vehicles may be driven. The final clause of the Committee's proposals reads as follows:—"To prescribe and regulate the several routes to be followed, and the particular streets or portions of streets to be used by all or any

carts, waggons, lorries, vans, or other heavy and slow-going vehicles of any description, and for preventing unreasonable obstruction in such streets in any case where the same may be thronged or liable to be obstructed by reason of the amount or nature of the traffic." On the suggestion of the representatives of the Horse Owners' Association it has been decided to insert the following after the words "slow-going vehicles of any description":—"Worked by any power other than by horses, or drawn by more than one chain horse in front of a shaft horse between the hours of nine in the morning and seven in the evening." We hope the local automobilists will watch the action of the City Council in the matter.

A Notable Conversion.

THE conversion of Alderman Haywood, the vice-chairman of the Herefordshire County Council, to automobilism is a significant victory for our movement. He has been a decided opponent; but latterly he has had actual demonstration of the reliability of motor-cars and has confessed the errors of his earlier attitude. Mr. Haywood is a noted agriculturist, the largest estate agent in the county, and an all-round sportsman. The other day he appeared at a great pedigree cattle sale at the Court House, Pembridge, having driven thither on a motor-car which belonged to his nephew—Mr. Hodges, of London. Mr. Haywood has been much struck with the civil behaviour of horses in the presence of the motor-car, and his testimony should prove of much service in directing public opinion in his county in a right direction.

A Public Service for Birmingham.

WE learn that there is every probability of Birmingham being provided with a motor-car service at an early date. Mr. A. H. Rooksby and Mr. Louis Cox, of Birmingham, acting on behalf of an influential syndicate, have applied to the Watch Committee for authority to place on certain specified experimental routes a service of cars. The powers at present requested are confined to the portion of Hagley Road between the Fountain and Five Ways, and a route connecting Edgbaston directly with Moseley, *via* Calthorpe Road. This idea of connecting the suburbs is a valuable part of the scheme, because it will, if achieved, bring within a twenty minutes' ride outlying portions of the city which are, by ordinary means of access, more than an hour apart. As a start, it is proposed to put six cars on the indicated routes, and to give a ten minutes' service, with penny stages. A special early-morning service for workmen is in contemplation. The cars are to be Daimlers of the latest pattern, to carry fourteen to sixteen passengers. The trial trips which have been run with one of these cars during the last few days have vindicated the most sanguine expectations.

FOR the 1902 season the Peugeot Company announce two new light cars—one fitted with 6 h.p. motor, and the other with 5 h.p. engine. The latter is to be put on the market at a popular price.

SPEAKING at the shareholders' meeting of Rudge-Whitworth on Monday last, Mr. C. V. Pugh stated that the directors had carefully considered the advisability of manufacturing motors, and had come to the conclusion that no cycle firm could combine satisfactorily in the same works the manufacture of motors.

MESSRS. J. BLAKE and Co., carriage builders, Beaumont Street, Liverpool, who are at present supplying bodies for several motor-cars, inform us that they keep a stock of Pratt's motor spirit, and have excellent accommodation for storing motor-vehicles, cars belonging to members of the Automobile Club being stored free of charge.

THE Motor Power Company, Limited, inform us that they are now undertaking repairs to all types of cars at the Napier Works, Vine Street, Waterloo, S.E. A special garage has been acquired close to the works, so that the cars shall be kept free from harm and away from the workshop until they are absolutely required there. Owing to it being possible to draw men from the works into the repair shop when a special job is required, they are able to deal with repairing, when necessity arises, expeditiously.

A WINTER RUN IN 1900.

(Continued from page 598.)

WE had been troubled more than once the day before with our tires, and the first thing to be done was to put in a new tube. This and the necessary oiling and watering were quickly done, and we set off. For the first few miles the road was blocked at frequent intervals by trees fallen across it, which obliged us to go upon the grass at the side. The storm, though it was felt more or less all over Europe, seemed to have been particularly violent in this district. We had had some little difficulty in starting the engine, and now she did not go at all well. The idea was that it was the wind, which blew upon the off-side, driving the flames of the burners away from the tubes; so we hung a coat over the bonnet. It was not much better. Then we thought that it could only be the carburation, and tried every possible variety of mixture. Still the explosions were feeble. Before long, however, we came, at a point where we could not see it ahead, upon one of those channels I spoke of, and bumping over it at a fair speed, the explosions immediately became perfect in force and regularity.

in, pump up, or, if possible, get someone else to; run ten kilos, and repeat the process.

We did not get far in this style, as may be imagined. We had struck the Loire at Briare, and we followed it up stream as far as Nevers, passing Cosne and La Charité, the latter a place of much importance in the mediæval religious world—"the elder Daughter of Cluny," and mother of a multitude of other abbeys. Nevers is a spot of great natural beauty in point of situation, for it lies not far from the confluence of the Allier with the Loire, in the midst of an extensive and fertile plain, upon a terrace which enjoys the full Southern sun. It was a town of consideration in Cæsar's day, and is so still. There are several big metal works, and one of these (belonging to the State) supplied the whole of the iron for the fleet in the American War of Independence. Le Creusot, the home of the formidable weapon of that name, lies only a little distance to the east. Nevers is well known, too, among collectors of pottery, a tiny piece of the genuine ancient faience the size of a small mustard-pot costing as much as seven or eight napoleons. We continued to head up the Allier, on a road gradually rising, of course, to Moulins, where is the tomb of the last of the French branch of the ancient family of Montmorency.

MR. D. M. WEIGEL AND MR. CLIFTON ROBINSON, JUN., ON A 24 H.P. PANHARD.

Hence the difficulty had probably been connected with the feed of petrol. I may mention that we were using heated air, and did so till, I think, the middle of the next day, when we found, as we got south, that the cold did better. The wind continued extremely strong, and would have made driving unpleasant had not one been prepared for it, with a close-fitting cap. But even at the worst of times, in the rain and blast, there was always the fascination of listening to the unvarying pulsation of the motor, and in feeling with what tremendous disregard the car was urged on in the teeth of nature's opposition. With a really big motor this is impressive. On an ocean steamer one may enjoy somewhat the same sensation, but then the whole affair is so huge that the vital organs of it are hardly within one's perception, nor of course the control of it in one's own hands. However, there is a weak spot in most of our arrangements wherein nature will have the best of us. And here it was our tires—our tires again. Down they went, now on this side, now on that. We patched and mended valves and put in new air chambers the whole day long. It became at length a regular mode of progress—"bump, bump, bump"; halt—a tire flat; cigarettes; get the cover off and a sound tube

and where Lawrence Sterne met with an adventure familiar to readers of "The Sentimental Journey." During the day matters had come to a fearful pass in regard to tires. We had used all our tubes and could not make our patches hold. We were in desperation, when it struck one of us that we were no very great distance from Clermont, and that by taking the night train we could at once replenish our stock both of air chambers and envelopes, and also tell M. Michelin how very excellent his goods had proved themselves to be! So we ran into Moulins as cautiously as possible on our last remaining fit-out, and the *mécanicien* went off to see what could be done. In the morning our toilet was interrupted by the coughing of a motor which sounded strange, and yet strangely familiar. We rushed to the windows of our respective rooms, and what was it but an English Daimler?—Frenchified, it is true, with pneumatics, worm-steering, radiator, etc., but still an English Daimler. I do not know why a Daimler makes one sound and a Panhard another, though the construction is so much alike; but probably everyone has noticed it. After coffee we got the car thoroughly cleaned down, and filled up ready to start, so as to save as much time as

possible. It was not far short of midday when our messenger arrived from Clermont with several new inner tubes and a pair of covers, and had them on the wheels. Then we had a substantial meal, saying to ourselves in the vanity of hope, "We shall not have any more bother now; we will go on solidly for six hours."

We continued along the river as far as La Palisse, and then, instead of keeping to it to Vichy, bore away to the eastward. The road soon began to ascend. The scenery was far grander than any we had passed through before. The formation is volcanic. The secretary of the A.C.F. had most obligingly given advice as to our best route, and somewhere hereabouts we were to leave the main road in order to avoid a long bit of *pavé*, and take a new by-road which would join the other farther on. We succeeded in finding it after many enquiries, and, though better than cobbles, it was not much to boast of. The gradients were not always easy and the surface was soft and stony. But it was wonderful how the car made light of it. It seemed hardly to notice whether the ground were rising or flat, and often we had to put her, for the sake of our own comfort, on a lower speed than she would take. Then we fell again to the river level at Roanne, a prospering town of much modern development; and at this point we left the route of the Gordon-Bennett Cup (Paris-Lyons) which we had been following till now. St. Etienne was our next objective, about fifty miles on, but we did not reach it till after dark, as the new tires were little better than the old ones. One tube which was properly put in burst with a loud report before four kilogrammes of pressure had been pumped in. The rubber of it appeared to be rotten. Our progress became a series of wild dashes and delays. There were splendid straight lengths of perfect road, and we were doing kilomètre after kilomètre well under the minute. It was simply grand, sitting down tight and holding on every now and then where there was a turn or piece of rough, to hear the music of the fourth speed rising in pitch higher and higher, to feel the air rushing past one's face, and see the earth and trees, and the milestones too, skimming away behind. Never a slack, never a swerve. This is the next thing to flying. It may not be luxurious; it may not be even exactly comfortable; superior persons may make fun of it as the scorchers' method of seeing the country; but, by Jove, it is thrilling, it is intoxicating. . . . But it is too good to last: "Easy; get out the jack—look alive; in with a new tube."

ARUNDELL WHATTON.

(To be continued.)

MR. J. H. KNIGHT is to read a paper on "Two Years' Motor-car Progress," at the Camera club, Charing Cross Road, W.C., on Thursday, the 31st inst.

THE municipal authorities of Madrid have sanctioned a public service of automobiles between the capital and its suburbs. The company which is to run them also proposes to start similar services in other Spanish cities. It is stated that the choice of the vehicle to be employed rests between one supplied by an English and one supplied by a German firm.

THE New Hudson Cycle Company, Limited, Birmingham, are one of the latest firms to take up the manufacture of the motor-bicycle. They have adopted the "Minerva" system of motor, and from what we saw at their works the other day, are apparently intending to make a strong feature of this type of machine next season. A speciality of this firm is the supply of bicycles for Post Office and Government service, and they have decided on a modification of the G.P.O. bicycle, so as to include the adaptation of a "Minerva" motor.

A PLEASANT and interesting event took place on Friday last week at the Duke's Head Hotel, Lynn, when Mr. Frank Morris gave the first annual dinner to his staff. Mr. Morris referred to the rapid progress the motor trade was making. As to its rapid strides in Norfolk and Cambridgeshire alone, he had only to look round the room to see that his staff had more than trebled since last year. He hoped there would be a still larger number next year. There was no possible doubt as to the future of the industry, which he believed in the course of time would equal, if not exceed, that of any other.

CONTINENTAL NOTES.

By "AUTOMAN."

THE Spanish Minister of Agriculture has decided that motor-cars must be subjected to an examination at the hands of experts appointed for that purpose, and that certificates of efficiency must be obtained by all who wish to drive them. The fee for having a car examined is 30 pesetas, and 15 pesetas are charged for the driver's certificate. The decree says nothing about foreign automobiles or their drivers.

ELECTROMOBILISTS will be interested in learning that a new record has been established in long distance travelling by electric car without recharging the accumulators. To Mr. Krieger, the well-known manufacturer, belongs the credit of covering over 192 miles with one charge of electricity, a feat he accomplished one day last week, when he drove a machine of his own construction from Paris nearly to Châtellerault. The previous best record was 163 miles, made some time ago by M. Garcin.

THE great Continental event for 1902 is occupying motorists' attention on both sides of the Channel, and all kinds of rumours are about. It was thought at one time that the German authorities had put their veto on road racing, but this is not the case. The A.C.F. therefore wishes it to be understood that races organised by the German Club are likely to be sanctioned by the Government of the Kaiser. We may, therefore, still have another Paris-Berlin race, for, after all, it is really a question of proper arrangements and good organisation.

IN the meantime Paris-Vienna is the order of the day, and the A.C.F. at their meeting of the 16th inst. had before them a long letter from the Austrian Automobile Club, inviting the A.C.F. to join in a race from Paris to Vienna next year. It is proposed that the route should be through Switzerland and Bavaria via Salzburg to Vienna. Once arrived at Vienna, it is proposed to hold kilomètre competitions on the Corso, and a series of other events. It is proposed to give big prizes, and altogether the scheme is on a colossal scale. Should racing not be sanctioned in France, it is proposed to proceed as tourists to the frontier. The A.C.F. unanimously decided to accept the invitation, and at once commence the organisation of the event.

THE ink of the minute was barely dry when Mors applied for the first four numbers, and Panhard for the next six, and now entries are coming in fast. The Hon. C. S. Rolls was not long in telegraphing for a place, and Jarrott and all our old friends are coming up to the scratch, though I search in vain in the fifty-three entries for Mr. Edge's name. All this enthusiasm is very delightful, and shows what vitality there is in the trade. There remain, however, enormous difficulties and prejudice to overcome before there is any likelihood of the race being held. The Austrian authorities have to be consulted, and also the Swiss, and it is a sad fact that in both these countries motor-cars are prohibited entirely in some parts. I was talking to a friend of mine in Berlin, the other day, who has some extensive shooting in the Austrian Tyrol. He sought my advice, some time last year, with regard to the purchase of a motor-car. I asked him if he had purchased yet, and he said, "No; the Austrian Government has forbidden them to circulate on the mountain roads, because they frighten horses." However, let us hope for the best; there is no doubt that a large number of entries, and some more Royal and Presidential prizes, would assist greatly in causing the hesitating authorities to come to a decision.

ONE hardly knows which to consider the greatest, M. Santos Dumont's courage and triumph, or his bad luck. Never was there a human being with more cool, persistent courage and perseverance, and never was there an instance of such stupid bad luck. At every turn some little insignificant hitch has occurred at the wrong moment, and now, to crown it all, a stupid regulation, added as an afterthought—not with any bad intention—has produced a vulgar wrangle around an event which all the world

holds to be a great victory. To make it plain to the readers of the *Journal*, let me explain exactly what has happened. The original rules for the competition for the Deutsch prize provided that the winning airship should be the one that first accomplished in less than thirty minutes a journey, starting from the grounds of the Aero Club, and forming a closed loop with the Eiffel Tower inside it, finish again at the Aero Club. The Committee, as an afterthought, added that the time should be counted from the moment the guide rope was let go to the moment it was again seized hold of after the return journey. But here comes in the difficulty. The Aero Club grounds are small, and contain two lofty balloon sheds. There are also houses and telegraph wires nearly all round them, so that whilst sailing over them is quite easy, stopping and coming down is difficult and dangerous, and needs evolutions which take time and have nothing to do with the time which M. Deutsch had in view when he fixed the half-hour limit.

ON Saturday last, at 2.28, in the presence of some members of the Deutsch Committee and a great number of notabilities, M. Santos Dumont set out for the twenty-third time in his navigable balloon, and headed off for the Eiffel tower and the Deutsch prize. His guide rope, however, caught in the trees, and he had to start over again. At 2.42 he was off again, and, aided by the wind, which was blowing at the rate of nearly five yards per second, he reached the Tower in eight minutes and forty-five seconds, doubled back and beat up against the wind. His motor now began to miss fire, but eventually Dumont sailed triumphantly over the winning post, just 29 minutes and 30 seconds after leaving. He was, however, a little too high up in the air for the guide rope to be seized, and it took him one minute and ten seconds to turn and come down. The scene along the route below him was indescribable. There was a wild rush to points of vantage, and roars of cheering everywhere. At Auteuil the racing was forgotten and every face was turned upwards to watch the contest with the air. At the Aero Club grounds an ovation awaited Dumont, and there were loud and angry protests when it was announced that his time was not to be taken until he had descended. The balance of opinion in France seems to favour a decision by the Committee, that the prize has been won, but the Marquis de Dion holds a contrary view. M. Deutsch (who ought to know) has telegraphed to M. Santos Dumont that he, in his opinion, has won.

TALKING of the victory of M. Santos Dumont brings me back to the discussion I have been having with Mr. Hollands, which is really summed up in a few words—i.e., the interpretation to be given to the words "practical result"—and I doubt not but that we shall both agree after his courteous letter in last week's issue. From the point of view of the public, I hold that a practical result in flying machines means the achieving of a result demonstrating the possibility of a flying machine being used for practical transportation purposes. M. Santos Dumont has repeatedly raised himself into the air, taken the direction he desired, and sunk again to the earth at the spot where he started from. No one else has approached such result—Dr. Lilienthal's experiments were, I admit, admirable but not practical—soaring down a mountain side can never be of much use for transportation purposes. I lean towards M. Santos Dumont's idea (i.e., a combination of the balloon and aero-plane) as the successful flying machine of the future for the reasons I have already given, and I cannot quite agree with Mr. Hollands' figures, for the bird is not only a winged motor, but a winged motor carrying a passenger; and not only should his legs, head and wings be lopped off to compare him with a motor, but also the greater part of his other organs—in fact, all those not specially concerned with the creation of power. Referring to the concluding paragraph of Mr. Hollands' letter, it is, I know, the opinion and conviction of many eminent engineers that the aero-plane is the flying machine of the future, and that opinion he has a right to and it has my respect—but up to the present there have been no practical results in that direction.

THE readers of the *Journal* will remember that I briefly referred, some weeks ago, to the question of alcohol *versus* petrol in France, saying that the price of alcohol prevented it becoming generally used in preference to petrol, notwithstanding the high price of petrol caused by the heavy import duty. Great efforts are now being made by the distillers to produce a cheap and satisfactory alcohol, and to cause depôts to be opened all over France for the convenience of automobilists. The Parliamentary Committee, which has the Budget in hand, has now decided to recommend the Government to make a monopoly of the refining of petrol. The effect of this will probably be to increase the price and deteriorate the quality—if one is to judge by other Government monopolies, such as matches, for instance. If this be the case, alcohol will be very soon the motive power of automobiles in France. Such a transformation will make the agriculturists welcome the motor-car, and with such a powerful ally, automobilism in France will be able to easily overcome the opposition and obstacles placed in the way of its further development.

It has been stated that the Prussian authorities have placed a definite embargo upon any road races. Baron de Hammerstein, Minister of the Interior at Berlin, has, however, now specifically stated by letter to the Duc de Ratibor, the president of the German Automobile Club, that no official interdiction has ever been promulgated in Prussia. So far as the German States are concerned, no question of suppression has been raised. The position is that special permission must be asked and obtained from the Government ere a race can be held.

THE QUADRANT AUTOCYCLETTE.

THE Quadrant Cycle Company, Sheepcote Street, Birmingham, have devoted much time and study during the past season to the bringing out of a first-class motor-bicycle, and although adopting practically the Minerva motor, pride themselves on having made various improvements to the same which should be of benefit to riders of the Autocyclette. Regarding

the design and construction of the machine itself special attention has been given to this with a view to reducing vibration when travelling at a high speed and increasing general comfort. The company make a special feature of their powerful brake and also the design of their fork-crown. Although the season is so far advanced orders are coming in daily for these little machines, and arrangements are being made for a large output next season. We hope shortly to put one of these machines to the test.

MR. B. LAURIEZ, of 6, Fenchurch Buildings, London, E.C., has been appointed sole export agent for the United Kingdom and British Colonies for the Koch heavy-oil motor-vehicles.

At a meeting of the Police Committee of the Belfast Corporation last week, Mr. Leslie Porter made application for a licence to ply motor-buses for hire in that city. The Committee expressed themselves favourable to granting the licence, and requested Mr. Porter to bring the car for their inspection at the next meeting.

THE "CRESTOMOBILE" PETROL CAR.

THE accompanying illustrations depicts a type of light motor-carriage that has met with success in America, as its design is taken from one of the most popular types of carriages in use in that country—the Runabout. As will be seen the little car, which has been named the Crestomobile, is fitted with a single cylinder air-cooled motor, which develops $3\frac{1}{2}$ h.p.; it is located, together with the carburettor and silencer, in the front part of a tubular frame. The power is taken from the motor to the countershaft by means of a chain, a second chain connecting this shaft with the differential gear on the rear axle. A friction clutch is fitted on the countershaft to admit of the motor being thrown out of gear, but apparently no mechanical change speed gear is fitted, the different speeds being obtained by regulating the ignition. The numerous levers usually found on motor-cars have been dispensed with, reducing all the mechanism to one simple lever, operated by the right hand. In operating the carriage the driver sits on the right-hand side, with the side-steering bar handle in his left hand. The right hand rests on the speed-control handle, which is connected to a shaft leading through the centre of the side-steering upright, this shaft being connected with the

advance ignition device. With the right hand the operator controls all the changes of speed from the lowest to the highest, cutting out the electric current if desired, and opening the exhaust valve when coasting hills, thus cooling the motor, relieving it of compression, and preventing the mixture from being drawn into the cylinder. The friction clutch lever is placed where it can be easily reached by the right hand in starting the carriage; the right foot rests on the brake pedal. Under the seat are the battery and coil, the tank taking up the remainder of the spare room. As will be seen every part of the machinery is under the eye, and can be easily reached for repairs or examination. The weight of motor and passengers is brought very near to the ground, so that sharp turns can be made at good speed without any danger of upsetting. The petrol tank has a capacity sufficient for a run of fifty miles. The car weighs complete under 400 lb. The road wheels are 28 in. in diameter, and are fitted with heavy pneumatic tires. The car, which is made by the Crest Manufacturing Company, of Cambridge, Mass., U.S.A., can attain a maximum speed of twenty miles per hour, and mount grades of 1 in 7. In view of its low price, 550 dollars (£110), it has, we learn, met with a favourable reception in America, particularly at the hands of the middle class.

FLOTSAM AND JETSAM.

BY "FLANEUR."

A DRAMATIC example of the mischief that equine irresponsibility can wreak within a few moments has just occurred within a mile of my own door, and brought sorrow to a most estimable household. While a horse was being hitched to an omnibus the passing of a tram caused the animal to swerve, and the conductor dropped the pole on to its hocks. It dashed off at once in terror, and either of its own accord, or through the efforts of the boy on its back, it turned into a side street, where it knocked down an elderly clergyman, who died the next day as the result of this grievous catastrophe. Though an octogenarian, the victim had eyesight and hearing alike unimpaired, and a younger man would probably have experienced the same fate. A tragic incident of this kind, when it happens to a family of your own friends, brings home with much greater force than the mere reading a newspaper report the awful risks that people everywhere are content to run, simply because they regard the horse as indispensable. Once more I marvel, as I have marvelled many a time before, that the nation does not recognise the manifold advantages that are derivable from the substitution of mechanical for animal traction, and so far from opposing the growth of automobilism, or even according it a tacit approval, does not actually clamour for the change to be brought about, and that right quickly.

It cannot be urged that the runaway horse is a rare thing. Though most of them become accustomed to what they meet, including motor-cars, a sudden happening may quite upset the nerves of almost any animal. A fluttering newspaper caused a pair of horses attached to a landau to take fright the other day near Stratford-on-Avon, and but for the pluck of a cyclist who held on to their heads a serious disaster would have been certain, as the driver was quite unable to hold them in. At Clapham Junction the other evening an equestrian was run away with, and the horse simply bolted along the sidewalk, scattering people right and left and knocking down and severely injuring a woman. The eye-witness who described the incident to me states that for aught he knows it may have still done more damage, for when last he saw it the animal was still in full flight, and in a populous quarter. Again, on Monday evening of this week a mail van came into collision with a Highbury 'bus, and the driver was then thrown to the ground. Naturally the horses bolted, and small blame to them in such a case, and the passengers had a nerve-destroying time until the runaways were stopped. Now the paramount advantage of a horseless vehicle is that in the event of such a mishap as a collision the consequences end with the impact, which does not set up a probable train of further disaster in the wake of a runaway team.

SOMETHING exceptionally new and strange requires to be invented concerning which it is not in some way possible to find some reference in Shakespeare or in the Bible. The motor-car might reasonably be expected to come within the category of "impossibles," but here is an extract from the Book of Nahum, which contains a by no means recondite allusion to automobile vehicles:—"The chariots shall rage in the streets, they shall jostle one against another in the broadways; they shall seem like torches, they shall run like the lightnings." The passage will be found in the fourth verse of the second chapter. In the Revised Version the reading is as follows:—"The chariots rage in the streets, they jostle one against another in the broad ways: the appearance of them is like torches, they run like the lightnings."

THE first two clauses would serve admirably as a metaphor for an indignant anti-automobilist describing the opening stages of the anniversary run to Southsea, when the cars are squeezing through the congested traffic at the junction of Great George Street and Parliament Square. The "torches" might be construed as referring not so much to the firing irons of the Locomobile cars as the appearance of the steam car when suffering

from a "back draught," or the Peugeot when flames are issuing from its "oven" in the rear; or the reference might even be applied to the flare of a Blériot lamp. As for the running like the lightnings, that is clearly an allusion to the flight of a racing Mors or Panhard in a Paris-Bordeaux race, or, to bring the matter nearer home, the mad career of a low-powered, solid-tired car in the opinion of a Reigate "bobby."

AUTOMOBILISTS are threatened, now that the movement is firmly established in our midst, with the same long series of artistic nightmares that beset the pathway of the cyclist when "safety" riding became fashionable. Every wheelman knows how nine-tenths of the illustrations appearing in magazines and sixpenny weeklies, when dealing with the cycle, were the veriest travesties of that machine, to which, oftener than not, they did not bear the least resemblance. Cranks and pedals were always wrongly placed, the chain would travel from the off-side of the rear hub to the near-side of the crank bracket, the main tubes of the frame were set at impossible angles, the nice parallelism of the mudguards with the tires was invariably violated, the wheel-base was so short that the machine was quite unridable from that cause alone, and, in fact, almost every mistake that could be made was perpetrated with complete success. And why? Simply because of all sections of the conservative British public the artist is the most conservative. He has studied the anatomy of the human figure and of the horse, but anything mechanical is quite beyond him.

HARDLY a single illustration of a motor-car has yet appeared in a non-technical journal in recognisable form, and the latest example, I think, is the most flagrant of the lot. A new monthly has been published this week under the title of "Living London," with Mr. G. R. Sims as editor. Presented therewith is a full-plate drawing by Gordon Browne, R.I., R.B.A., over the title of "A Halt in Piccadilly." The incident depicted is the familiar one of a policeman controlling the traffic. Prominent in the picture is what out of pure charity we may assume the artist to have intended as a motor-car. There is the bell-mouth of a motor-horn, and the driver is wearing a peaked cap, but here all verisimilitude comes to an end, and it is only the fact that the vehicle has no shafts nor horses that enables one to interpret the artist's meaning. The forepart is of the weirdest and most mysterious kind, and utterly unlike any automobile vehicle that was ever built or ever will be.

To describe it is quite impossible, and the artist himself could not explain, for the thing is meaningless—as a motor-car. One meaning, however, it bears very plainly indeed, and that is that the artist apostrophised himself as follows:—"I don't know what the front of a motor-car is like; I am too lazy to find out; I will therefore evolve something from my inner consciousness." But why this insult to the intelligence of the general reader? And what is art worth if it is not faithful? The artist would feel insulted if told that he could not draw a horse; why should he rest content with his obvious inability to draw a motor-car? And if his lack of talent in that direction be irremediable, the least that he can do with propriety is to leave the car out of the picture. Nobody asked him to put it in; but if it is there it should be properly drawn.

THERE is an article in this month's *Harmsworth Magazine* on "Celebrities who 'Mote,'" which is interesting in its way, but is by no means conspicuous for accuracy. It is open to doubt whether the German Emperor has himself steered a motor-car, more especially when we consider the physical infirmity which compels him to hold a gun with one hand and to have special bridles fitted to his specially trained horses. At the same time the Kaiser is undoubtedly a keen supporter of automobilism, which is more than can be said of President Loubet, who is quite erroneously described as "one of the most ardent devotees of the art of motoring." M. Loubet, as a matter of fact, officially recognises automobilism because of the importance of the national industry, but he is an out and out horse-lover *in propria persona*.

The only time he is reported to have mounted a motor-car was during a visit to the Vincennes annexe of the Paris Exhibition of last year, on which occasion he was taken a short ride by M. Jeantaud on an electric car. The President insisted on a gentle pace, and expatiated on his love of horses. Eventually M. Jeantaud ventured to accelerate the car to a mild eighteen miles an hour. "Ah!" exclaimed the President, "now I appreciate the fascinations of *speed*!" No, we must look elsewhere for our "ardent devotees of the art of motoring."

THE "CLYDE" VOITURETTE.

THE accompanying illustration shows a neat voiturette which has just been put on the market by the Clyde Cycle and Motor-car Company, Ltd., of Shenton Street, Leicester, with the view of meeting the demand for a small vehicle at a moderate price. The motive power is supplied by a Simms 3½ h.p. water-cooled engine, fitted under a bonnet in the fore part of the frame. The Simms-Bosch magneto-electric system of ignition is adopted, which enables the speed of the motor to be regulated from 400 to 2,000 revolutions per minute. Two speeds are provided, the power being conveyed to a countershaft at the rear by a belt, and from thence by pinions to the rear axle. The car is fitted with a device by means of which any slack of the belt can be taken up without it being necessary for the driver to leave his seat. A

pedal controls a powerful band brake on the countershaft, while emergency shoe brakes operated by a hand lever are fitted to the rear wheels. The illustration shows a vertical steering pillar; but we understand that in future the cars will be fitted with inclined wheel steering. The petrol tank has a capacity of 1½ gallons, and on this quantity the makers inform us they have covered a distance of fifty-five miles. By means of the two-speed gear and the regulation of the motor, speeds ranging from four to twenty miles per hour can be obtained.

A STOCK of petrol is now being kept by Mr. David S. Clarke, Lenzie Cycle Dépôt, Alexandra Terrace, Lenzie.

WITH regard to the Universal motor-bicycle described in our issue of the 12th inst., Messrs. Whitehall and Crew, Thoroton Street Works, Nottingham, write to say that they introduced this machine some months ago.

THE English Motor Club propose to continue their runs throughout the winter. On November 2 there will be a run to Brighton, on November 16 they support the Automobile Club's run to Southsea, and other fixtures will be shortly announced. At the recent annual general meeting of the Club nearly all the officers were reappointed and a strong committee elected.

MR. JOHN LOVE, of Kirkcaldy, N.B., informs us that, after having represented the Motor Manufacturing Company in Scotland for two years, he is now free to take other appointments. He intends starting an automobile agency on his own account. While Mr. Love will be free to purchase any make of cars, his experience of the past few years should lead him to select only the best and most reliable types.

THE "PRECISION" BICYCLE MOTOR.

OUR illustration shows two views of a small petrol motor, intended for motor-bicycles, which has just been put on the market by the Precision Motor Company, of 79, Derngate, Northampton, and which possesses several novel features. It may first be mentioned that the cylinder, combustion chamber, and valve boxes are all cast in one piece, thus reducing any loss of compression due to leaky joints. The crank-shaft pin and flywheels, which are made of a special steel alloy, have been ingeniously designed, there being only one joint to connect the flywheels and pin instead of four, so that there are three less joints than usual to work loose and get out of line. A novel compact form of pulverising carburettor is used, and it will be

noticed that this is fixed to the motor in such a way that the base of the device, when the engine is fitted to a bicycle, is parallel to the ground. The inlet and exhaust valves, as well as the carburettor, are readily accessible. The motor, which develops up to 2 h.p., clips on to the main down tube of the bicycle, and drives the back wheel by means of a belt, enabling any speed up to thirty-five miles per hour to be attained.

THE Dutch Automobile Club, owing to bad weather, has postponed the heavy vehicle trials which it was proposed to hold this month.

A FRENCH contemporary writes enthusiastically of the spread of automobilism in Madagascar. Motor-wagons for purposes of transport are numerous, as are also lighter cars and motor-cycles for pleasure. High speed is not, however, much sought after, the roads, which are uniformly bad and mountainous, rendering a higher average than twenty kilometres an hour out of the question.

THE U.S. Board of United States appraisers have of late had so much experience and so much trouble with the proper valuation of imported motor-vehicles that they may now fairly call themselves experts. As a proof of this, the Board lately handed down a decision in regard to a Mors car which was entered as being worth £1,200. No advance was made in the value of the vehicle proper, but an advance had been made of some £160 altogether for various accessories. The importer, Tod Sloan, claimed that these were all a part of the vehicle itself, and should not be charged extra. The appraiser made the advance as stated, however, and this advance the Board sustained.

CORRESPONDENCE.

THE GLASGOW TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—After careful study of the judges' report on the Glasgow trials, I feel bound to encroach on your valuable space, as I regret to say that the judges have so far not assisted, in the slightest degree, interested amateurs and intending purchasers, who, like myself, hoped to have acquired some useful information and guidance from them. This is the more disappointing as they informed us that in making the awards they were taking into consideration certain matters, which—after a careful study of the awards in Section 1, Class A—I am sorry to say they seem to have completely ignored.

If any of your readers will study the report and appendix they will see that the gold medal in the above class is actually awarded to the internal-combustion engined car which secured the least number of marks in the hill-climbing trials. Why have trials at all if the prize is to go to the least successful car, unless it is a trick of the trade to try and confuse intending non-expert purchasers like myself? We keep on hearing that every maker is cutting down weight per horse-power, and rightly so in my humble opinion. Yet the heavy-weighted Wolseley car for two people only gains the gold medal!

Again, the judges are unable to tell us which is the best car for the second prize; this seems absurd, as two such totally different types as the $4\frac{1}{2}$ h.p. De Dion and the 7 h.p. New Orleans must be, either the one or the other, the better value to ascertain, which I thought was the *raison d'être* of the trials. Surely there is something strange in such awards, and I venture to submit that judges who are unable to judge between two cars so totally opposed as these two are had better call in some practical assistance in the future. The makers of the De Dion seem quite able to judge, as they are now, I believe, ceasing to make $4\frac{1}{2}$ h.p. cars, and are putting on the market one which is exactly similar in its mechanical parts to the New Orleans, except that the latter has two cylinders instead of one. This announcement is, by a peculiar coincidence, published in the English and French papers the same week as that in which the awards are published.

Surely the want of practical skill shown in this judgment is thus fully proved, and shakes the faith of all non-experts like myself in the trials. As far as I can see, there is only one solution to all this—let the judges be men and open our eyes by telling us, through your widely-read columns, their reasons for giving the gold medal to the Wolseley car, and also for bracketing the two silver medal awards, and not leave in the dark any longer such people as myself.—Yours faithfully,

A CONFUSED CONTRIBUTOR.

THE REIGATE PROSECUTIONS.

TO THE EDITOR OF *The Motor-Car Journal*.

As you published a report in your issue of Saturday last of a case before the Reigate Bench the previous week, in which I was defendant, I beg that you will give me an opportunity of laying before your readers a general view of the police situation with regard to motor-cars as it appears to me, and of requesting assistance from a few of your readers in combating what I feel to be a real danger to the motor industry.

Not but that I believe that the police have their proper position in relation to motor-cars generally, and if their zeal were born of knowledge, I am sure that that position would be admirably filled. Unfortunately, however, this is not the case. Their ardour accords more with their ignorance than their knowledge, and as they appear unwilling to improve opportunities of acquiring the latter, automobilists must combine for the purpose of curbing their zealous propensities inspired by the former.

Now, before directing your further attention to the behaviour of the police at Reigate upon occasions where no harm could possibly have resulted, I should like to point out an instance in which their services would have been of real value to the industry and to the public. Could anything be more absurd than making a racecourse of the carriage drive in Hyde Park

during Church Parade on Sunday morning? I accuse the driver of a certain red-painted voiturette of misbehaving himself in this way last Sunday. He drove up and down the carriage drive at between twenty-five and thirty miles an hour, and exhibited to the wealthy crowd on the footpath the picture of his car bumping violently, and the ladies therein holding their hats on their heads with one hand and grasping the backs of their seats tightly with the other hand to prevent themselves being unseated by the swaying from side to side of the car. A police inspector and several constables viewed this criminal foolishness with equanimity, but if the driver in question had overheard, as I did, the remarks of several of the wealthy crowd, I believe his opinion of himself would have been considerably lowered. I assure you, Sir, that if the police had taken proper action on this occasion, I would willingly have given them my card as a witness upon their side; in fact, I had almost a mind to prosecute myself.

But returning to Reigate, we find a very different state of affairs. As, however, my own case must still be considered *sub judice*, I will confine myself in this letter solely to facts, and these are as follows:—(1) Sixty summonses against cyclists and motorists were heard upon this occasion by the Reigate Bench, and in every case, without exception, a fine was inflicted; distinctions in the amount of the fine being made only according to whether the defendants pleaded guilty or not guilty. In the case of motorists, those who pleaded guilty were fined £2 and costs, and those who pleaded not guilty were fined £5 and costs.

(2) Although there were at least eighty cases in the Reigate list for that day, every defendant was summoned for eleven o'clock in the morning; thus, the last case (my own) was not heard until past five o'clock in the evening. Motorists, therefore, with their lady and girl witnesses, were obliged to sit and listen to squalid drunk and disorderly cases for hours before their cases were called. My protest against this arrangement was treated with contempt.

(3) One of the magistrates on the Reigate Bench, who took the chair in the course of the day, upon being informed that a motor-car driver who had been stopped had given somebody else's card instead of his own to the police, made the extremely injudicious and unjudicial remark, that "it shows the trouble these people give us."

(4) During my cross-examination of a police witness, I elicited the fact that Captain Sant, the Chief Constable for Surrey, was responsible for the ambush or trap by means of which the names and addresses of motorists were obtained.

(5) I appealed against the fine, and the case will now, therefore, be re-heard before one of His Majesty's judges.

This is the situation so far as Reigate is concerned; and I maintain that automobilists have a right to take any action they possibly can, within the limits of the law of this country, to prevent a recurrence of such a state of affairs, whether at Reigate or at any other police centre. I have, therefore, thought out a scheme by which the situation may be, to a very large extent, altered, and to this scheme I am prepared to devote a considerable amount of time and attention. I shall need, however, for its proper execution, the assistance of a few automobilists with their cars and, if possible, of their friends with cameras, on Saturday afternoons and Sundays for the next few weeks; and if any of your readers could spare time for this purpose, I should be glad if they would communicate with me in confidence.

At the same time I should like to ask all those cyclists and motorists who have recently been stopped by the police, to whom they have given their names and addresses, whether a summons followed this procedure or not, to communicate with me confidentially at the earliest possible moment, because I may be able to materially assist them.—Yours truly,

R. MOFFAT FORD.

A GOOD RUN ON A MOTOR-TRICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The following details of a ride I accomplished may, perhaps, interest your readers. Mounted on a 2½ h.p. M.M.C. tricycle, I left Birmingham for Blackpool on the 14th September. I wanted to call at Warrington and Northwich, so I made my way thither from Birmingham. I went through Newport (Salop)

and on to Whitechurch, called on Mr. Dawson and obtained some spirit, and went straight to Northwich, through Hartford. My cyclometer registered some eighty miles; I accomplished this distance, including one hour for stoppage and meal, in five hours, so that I averaged twenty miles an hour all the way. I stayed at Northwich the night, and then went to Warrington, fourteen miles, which I did in thirty-five minutes. I went back to Northwich at night, and back again to Warrington in similar time.

Leaving Warrington a few days after, I went to Wigan, then to Preston, then over Freckleton Marsh to Blackpool. Outside Preston I had trouble with my sparking plug—the first trouble all the way; the packing worked loose, and the middle wire moved. This I rectified by fitting a fresh plug. After ten days at Blackpool I started back at three o'clock in the afternoon and reached Birmingham, by almost the same route as I came, at 10.15 p.m.; the most marvellous ride I ever did in my life. I stopped only once at Warrington for petrol, having a very large spare tank on my machine, so that I averaged twenty miles an hour for seven hours; my cyclometer registered 140 odd miles. The machine during that time never gave the slightest hitch, and I had a 1s. 9d. plug in.

One funny little incident I might recall. I stopped at a small place called Newton-le-Willows, between Warrington and Wigan, and a tremendous crowd gathered round in a few minutes, one man remarking, "Aye, lad, you watch him, he don't pedal." Hoping I have not occupied too much of your valuable space.—Yours truly,

CLAUDE H. MAY.

MOTOR-CAR ON FIRE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It seems to me that the relative safety of a petrol car against total annihilation depends far more on the position of the containing tank than on the means employed to convey the petrol along the supply-pipe. May I ask the correspondents who champion gravity feed as being so safe, to explain to the public why a tank placed high in the body of the car, to obtain the necessary pressure they object to get by a little air, is less likely to totally destroy a car than it would if placed well under the frame and right in the rear, where, in the event of any leak taking place in a joint between it and the carburettor, the chances are in favour of the petrol falling harmlessly on the ground, providing it is placed well clear of the exhaust?

I believe it is possible to design a tank placed right in the rear of the car and slid into a cupboard, so that it could, in the event of a flare, be shot out into the roadway behind by a lever arranged to eject it, and at the same time automatically close the slender apertures of the feed and pressure pipes. No doubt some correspondent may have his "gravity" perturbed by this little idea of mine, but as I happen to have had some experience of the Lee-Metford rifle and the Westinghouse brake, I think I can describe my idea in detail.—Yours truly,

A. E. S. CRAIG.

THE GRANTHAM POLICE AGAIN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I feel it my duty to inform you and motor-car owners generally respecting the charge of furious driving brought against me at Grantham on Saturday, the 19th instant. I started on Thursday, the 3rd October, with a driver (Collins), to whom I told my errand, to see the method of "clocking" motor-cars on the Great North Road. After leaving Newark I clocked each mile from the boundary of Notts to Long Bennington. The mile, which finishes about thirty yards in the village, I ran in 5 min. 30 sec. This mile the police swore on oath I did in 2 min. 50 sec.—(to Bennington is all uphill). At the next mile we were stopped by the first policeman we had seen, P.C. Kirk. He entered my name and time, twenty-three minutes past one—this Collins and I both saw—by Kirk's watch.

Now I will give you the times sworn to for the two miles. P.C. Bean, who was at one end of the mile timed, said I passed him at 12.55. He further stated that he followed me on his bicycle, and when he got to the milestone where P.S. Holland was

they compared watches, which were alike, each showing one o'clock exactly. P.S. Holland said I passed him at 12.57 50 sec., then he rode on his bicycle to meet P.C. Bean, and compared watches 200 yards away from the milestone, and both showed the time to be one minute to one. Now, one of these officers was lying.

P.C. Kirk, who was at the second mile, gave the time as 1.1, not 1.23, therefore the whole of the times were arranged afterwards. When stopped I told P.S. Holland I had come for the purpose of clocking them by request of the Secretary of my Club—the Automobile Club of Nottingham—and that we should defend the case. Collins, my driver, fully endorsed my evidence, stating the reason of the trip, also that he received instructions how to drive at each mile. The first I clocked before we came to the police mile was covered in 5 min. 8 sec.; the second in 5 min. 30 sec., and the last I forgot to note at the time. P.C. Kirk's watch being at 1.23 and mine at 1.30, I must, however, have done the mile in no time!

In conclusion, I can only advise all motor-car owners to keep away from Long Bennington or the Great North Road where it runs through Lincolnshire, for, whatever speed they travel at, they will be stopped and have to make their appearance at Grantham and pay the piper. The time I left Newark by my watch, which was correctly set before starting, was 12.44. When I stopped it was, by my watch, 1.30 and by the policeman's 1.23—distance travelled eight miles.—Yours truly,

S. HARVEY.

SPARE PARTS PROMPTLY WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of the 12th inst., I notice a letter from a correspondent complaining about the delay experienced in obtaining spare parts. As he points out, to professional men, to which class I belong, this delay is of great inconvenience, and I have warned intending members, who thought of purchasing cars instead of horses, to ponder. In my own case one of the pulleys on my car had to be replaced. Eight weeks have elapsed since the work was put in hand, and I have still no tidings of the car!—Yours faithfully,

M.D.

ENGLISHMAN writes:—"If we must have another name for 'garage' let it be one which suggests even to the uneducated its meaning. What could be more self-explanatory or easier of pronunciation than a combination of the two simple words *motor* and *home* vernacularised into *motorome*? There is at least a genuine British ring about it. The superfluous "h" is, of course, optional.

THE Crypto Works Company, Limited, of 29, Clerkenwell Road, London, E.C., are about to bring out a new motor-bicycle of special design. The ordinary chain wheel is attached to the bottom bracket axle with a free clutch. Attached to the chain wheel is a large gear wheel, which meshes direct into a small pinion on the motor shaft, so that, whether the machine is propelled by the pedals or by the engine, the power is transmitted to the rear wheel through one chain. There is a free wheel on the back hub, so that in going down hills the engine can, if desired, run quite free. The motor is placed in the bottom V of the diagonal, close down to the bottom bracket, thus providing a rigid fixing.

THREE of the cars which participated in the recent 500 miles endurance contest in America were fitted with New York tires, viz.:—Two sets 36 in. by 3 in. tires on two heavy petrol vehicles weighing 2,000 lbs. each; one set 28 in. by 3 in. tires on one heavy steam Stanhope weighing 1,600 lbs.; and two sets 28 in. by 2½ in. tires on two light petrol cars weighing 1,200 lbs. each. The two heavy petrol vehicles and the heavy steam machine made the run and earned first-class certificates. One of the light petrol cars met with a severe accident and was wrecked *en route*. The other one made the run, but too late to qualify for a certificate, owing to trouble with the engine. We understand that none of these vehicles lost any time through difficulty with the tires, and that no repairs or replacements were made *en route*.

HERE AND THERE.

THE King of Portugal followed the operations in the recent Portuguese military manoeuvres in a motor-car.

LAST week the environs of Paris witnessed the trials of automobiles constructed for postal service in Tunis. The course taken was about sixty kilometres and was covered in a satisfactory manner.

THE Caledonian Railway Company have decided to experiment with a motor-van for the delivery of parcels arriving by passenger trains, and the first car was put to work in Glasgow on Monday. It has a carrying capacity of two tons.

THE Marquis of Ailsa recently drove round his estate in Scotland in a Wolseley car. There were four passengers up, representing a weight of 53 stones, and with this burden the car climbed a hill which has a gradient of one in seven for the whole distance.

AT the last meeting of the Beckenham District Council Mr. Blake said he thought it was quite time that body took some action with a view to bringing to the notice of the police the dangerous speed at which many motor-cars went through the neighbourhood.

THE DON, of Holborn Viaduct, London, E.C., advise us that they have now opened a special department for motor clothing, and have sent us a leaflet showing a few illustrations of the different articles stocked. All goods are warmly lined and made especially for comfort when motoring.

As an impression prevails that they are only sub-agents, Messrs. Bennett and Carlisle, Limited, of Exchange Arcade, Manchester, ask us to mention that they have been appointed sole direct agents for the Locomobile Company of America for Manchester and district.

At a meeting of the Gloucester County Council on Monday it was decided to petition the Board of Trade with a view to some restrictions being put into force in reference to the speed of motor-cars, the main suggestion being that each driver should be granted a certificate for proficiency before he be allowed to drive a motor-car.

MR. FRANK MORRIS, of King's Lynn, has just introduced into that district a Gardner-Serpollet steam-car. Notwithstanding that Mr. Morris had had no previous experience with this type of car, he went to York to fetch it and had no difficulty in driving it to Lynn, a distance of 174 miles.

COMTE BOSC DE PERIGORD, who was married in London a week or so ago, is the son of the Duke of Talleyrand and Sagan, and one of the best-known among Parisian automobilists. He has been identified with the movement in France from its earliest days, and "endowed" two big races, the Paris-Trouville and the Paris-Rouen respectively, both of which were won by M. Girardot.

ON Sunday last Mr. F. Guy Lewin drove Prince and Princess Mohamed Abraham from London to Windsor on his M.M.C. voiturette, fitted with New York tires. The journey from the Hotel Cecil to the White Hart Hotel, Windsor, was accomplished in one hour and ten minutes. The prince was highly delighted with his drive, and we believe intends to take a car of this description to Cairo with him.

THE members of the Yorkshire Automobile Club will hold the last run of the season to Harrogate to-day (Saturday). Leeds members will meet at the City Square, Leeds, at 2 p.m., Bradford members will meet at Manningham Park at the same hour, while the Harrogate members will meet at The Stray (Prince of Wales) at 3 p.m., and then proceed to meet Leeds and Bradford members. The return arrangements will be made *en route*. The last club run to Ilkley was a great success, nine cars and twelve cycles taking part.

AT times we have mentioned a week's sales of some of the London firms in the trade. We now refer to a provincial house, the Motor-Car Depot, of Reading, under the proprietorship of Mr. A. E. Major, which last week supplied a Royal Enfield motor-bicycle, a four-seated Locomobile, a 12 h.p. Benz tonneau, and a 12 h.p. Benz Charette. The first mentioned was sold to a lion-tamer, and the last to a lord, the whole representing a good week's batch at the end of a season.

MR. C. T. CROWDEN has promised to read a paper on "Motor Steam Fire Engines" during the present session of the Coventry Engineering Society.

be very detrimental to motor-cars that they should be numbered, although he did not object to their being registered. The motion was carried by eleven votes to two.

THE "LOCOMOBILE" CARS AT THE GLASGOW TRIALS—READY TO START.

MESSRS. SHAW & SON, of High Street, Crawley, have introduced a number of improvements in the Shaw motor-bicycle. Pedals are now fitted in place of the former foot rests, while the engine, which is of $2\frac{3}{4}$ h.p., drives the rear wheel by a $1\frac{1}{4}$ inch belt.

ON another page we reproduce a photograph of Mr. D. M. Weigel and Mr. Clifton Robinson, Junr., on the 24 h.p. Panhard, which has since been acquired by Mr. Eric Chaplin, nephew of the Duke of Sutherland.

As regards the case reported in our issue of the 12th inst., Messrs. Montague Hawnt & Co. ask us to say that they are quite innocent in this matter, as they inserted the wording in their catalogue exactly as furnished to them by the Motor Manufacturing Company, Ltd.

THE United Motor Industries Ltd. have just issued a price list of spare and replacement parts for Aster, Darracq, Decauville, Mors, Panhard, and Peugeot motors. Included in the list are prices of parts for Minerva, Werner, and Moto-sacoche bicycle motors. This should interest those cycle makers who are joining in the motor-bicycle movement.

THE Imperial Tyre and Rubber Company, Ltd., of 27, Brooke Street, Holborn, E.C., are making a special feature of re-rubbing and repairing motor tires, which is done on the premises by experts. They inform us that this department of their business is rapidly increasing, and that they are in a position to promptly execute any work with which they may be entrusted.

AT the last meeting of the Tavistock Urban District, Mr. J. Friend moved that the Tavistock Rural District Council be asked to support the Urban Council in petitioning the Local Government Board to have motor-cars registered, and numbered in front and behind. Mr. E. Yelland thought it would

THE ceremony of cutting the first sod in connection with next year's Art and Industrial Exhibition was performed on Thursday last week, at Wolverhampton, by the Earl of Dartmouth, the Lord Lieutenant of the county, in the presence of a large assembly. In many respects the Wolverhampton Exhibition will follow the lines of the Glasgow Exhibition.

A REMARKABLE feature of the advance of the motor industry is the large number of the better class cycle agents who are adapting themselves to the automobile business. We were the other day in Luton, and were not a little astonished to see the fine new premises of Messrs. Lloyd, Partridge and Company, in Chapel Street. The dépôt has been erected for the sale, storage, and repair of motor-cars. The firm deal chiefly in voituresses and motor accessories, and have every convenience for motor repairs, keeping several skilled mechanics on the premises.

THE Hozier Engineering Company, Ltd., of Bridgeton, have sent us a copy of their preliminary 1902 catalogue, from which we learn that the Argyll voituress will next year be fitted with a 6 h.p. De Dion pattern single-cylinder engine. For the new season the company are also bringing out an Argyll light car, fitted with double-cylinder motor of from 8 to 10 h.p. at 750 revolutions per minute. The transmission will be on the lines adopted in the voituress, the weight complete of the car

BACK FROM THE RUN.

coming out at about 13 cwt. The Hozier Company are now devoting attention to delivery vans, and notify us that they are about to introduce two types—one of 6 h.p. to carry 6 cwt. and one of 8 to 10 h.p. to carry 15 cwt.

countries. Lowe had introduced himself to his victims at exhibitions, and had inspired confidence by inviting them to call on him at well-known hotels. Detective-sergeant John Bissell, of the E division, who apprehended Lowe at Preston, whither he had absconded when he had fled the prosecutors to his own satisfaction, said he had posed as a wealthy American gentleman staying in this country. Lowe had paid some of his bills at the largest hotels, but had at others left behind only a few newspapers, a little correspondence, and his unsettled account. He had obtained between £300 and £400 by his frauds, and had ruined a working man, who invested his all, nearly £50, in an invention. His lordship described Lowe's offences as cruel and persistent, and ordered him twelve months' hard labour. Just before the last Motor-car Exhibition at the Agricultural Hall the prisoner brought out a new motor paper, which, however, only survived one issue.

OFF SIDE.

At Eastbourne Mr. James Davis appeared in answer to a summons charging him, as driver of a motor-car, with not keeping the vehicle on the left, or near, side of the road, on September 28th. Mr. F. Lawson Lewis defended, and intimated that his client pleaded not guilty. The magistrates, after hearing the evidence, considered that there was practically no defence, and inflicted a fine of 40s. including costs.

FAILING TO STOP.

At the Winchester County Bench, Ernest Hannell, of Drayton, near Andover, was charged that he, being the driver of a light motor-car on the road between Sutton Scotney and Micheldever, in the parish of Wotton, on the 28th September, did not stop when Thomas Redwood held up his hand as a signal for him to do so. After hearing the evidence the Chairman said that on the part of the Bench he could say that they were not unanimous as to their decision in the case, but they all believed that on both sides the evidence had been given with truthfulness. They did not doubt any of the witnesses and it was difficult to say what mistake might have arisen, and under those circumstances they would dismiss the case.

FURIOUS DRIVING CASES.

At Epsom, George Pauling was summoned for driving a motor-car at a greater speed than twelve miles an hour, at Chessington, on September 26th. Mr. A. Clarke Williams defended. Constable 614 V said the defendant passed him at ten miles an hour, but then increased his speed to fifteen or sixteen miles. He (witness) met Mr. Bird on horseback, and got defendant's name and address from him. By Mr. Clarke Williams: Mr. Bird suggested that proceedings should be taken. His idea of the speed was simply a guess. George Bird, of Chessington, said he held his hand up for the motor to stop, but defendant kept on. Witness's horse was frightened, turned round, and galloped in front of the motor-car. He turned and told the driver that if he did not stop he would follow him to Kingston. After much squabbling he gave his name and address. When defendant met him the motor was going at from fifteen to eighteen miles per hour. For the defence William Wickins, the driver of the motor-car, denied that he increased his pace after passing the constable, and said he slowed down and stopped when Mr. Bird held up his hand. There was no truth in the story that the car chased the galloping horse. Mr. Pauling left the car and offered to lead the horse by, but Mr. Bird would not allow him to do so. The defendant was also sworn, and gave similar evidence. The case was dismissed, but the Chairman wished it to be known, that if cases of furious driving of motor-cars were proved before them defendants would get no mercy. "In this case, however," said the chairman, "the evidence is overwhelmingly against a conviction."

At St. Albans, Sir Charles Lawes, Bart., was fined the maximum penalty of £10 for furiously driving a motor-car through St. Albans. Witnesses stated that the defendant was driving at the rate of from fifteen to twenty miles an hour, and that he ran over and killed a dog. Sir Charles denied furious driving. He admitted having been fined £3 recently at Kingston for a similar offence.

At Spittlegate (Lincolnshire), Alfred James Poole, of Seaford, Sussex, was fined £10 and costs for furiously driving a motor-car on the Great North road. A cyclist stated that the car was travelling forty miles an hour. It went past him like a pigeon flying, and nearly knocked him off his machine. He had, he said, never seen one travel so fast before. A policeman said the car was going as fast as any train he had seen on the Great Northern Railway.

At the same Court, Samuel Harvey, of Nottingham, was fined £5 and costs for a similar offence. Mr. C. S. Welles-Lucas, of Nottingham, defended, and pleaded not guilty. Police Constable Bean stated that defendant was travelling at a rate of over 25 miles an hour. Police Sergeant Holland corroborated the evidence of the previous witness, as did also Police Constable Kirk. Mr. Welles-Lucas addressed the magistrates for the defence, and said defendant was a member of the Nottingham Automobile Club, and one of their rules was to keep within the twelve miles pace. It was on behalf of this Club that he appeared. The Club had asked defendant to go down to Long Bennington and see how the police "clocked" motor-cars. Mr. Collins drove the car, and defendant timed the distances. The time the mile was done in was five minutes thirteen seconds. The magistrates retired, and on their return into court after three minutes' absence, the chairman said the Bench were of opinion that the case had been proved.

At Kirkcaldy Police Court, Archibald James Hedges, motor-car driver, Wemyss Castle, was charged with driving a motor-car at a speed

of sixteen miles an hour. Several witnesses spoke to the car travelling at over twenty miles an hour, but as the driver wore goggles they could not identify the accused. The charge was withdrawn.

At Milnthorpe, Joseph Fisher Hodgson, of Etterby View, Carlisle, was charged with driving a motor-car at an unreasonable speed, having regard to the traffic, at Milnthorpe, on October 1. John Clark, of Milnthorpe, said the defendant was travelling at between twenty and thirty miles an hour, and ran into his cart, doing considerable damage. Defendant and his wife, who was with him at the time, gave evidence to the effect that they were travelling at not more than seven or eight miles an hour, and that the horse backed the cart into the car, doing great damage to the car. Witnesses having been heard on both sides, the case was dismissed.

Reported above are 6 prosecutions for furious driving. In 3 cases the summonses were dismissed, while in 3 cases fines amounting to a total of £25 without costs were inflicted.

WHY did the Locomobile run? Because the petrol (patrol) was after it.

A RATEPAYER writes to the Scarborough papers recognising, with evident pleasure, the fact that the motor-cars in the city can go where trams are impracticable, and suggesting that they are more useful in such towns than cumbersome tramway systems. We agree with him.

MESSRS. GREEN AND BOULDING, of 105, Bunhill Row, E.C., are issuing a well-illustrated catalogue and price list of the many fittings, mostly applicable to, if not actually designed for, steam motor-cars. Metallic packings, of which several systems are displayed, are a well-known speciality of Messrs. Green and Boulding. Lubricators figure prominently, while gun-metal wheel valves, stop-cocks, and check valves, in a large variety of designs and sizes, are amongst other fittings depicted.

We learn that Mr. A. E. S. Craig, of Putney, has devised a universal stand for motor-bicycles. Mr. Craig states that the stand will fit any type of machine—Werner, Singer, Minerva, etc., instantly, no matter where the motor, tanks, etc., are. There is only one attachment, and this is made with a thumbscrew. The wheels are free to revolve, and as there is no fastening at the hub nuts or fork-ends, the chain and bearings can be adjusted while the machine is on the stand.

THE provisional committee of the new Motor Cycling Club held a meeting on Thursday last week, and after a three and a half hour's sitting evolved a set of rules and a programme for next season. The suggested programme consists mainly of runs from various well-known starting points on the main roads out of London, tours at Easter, Whitsun, and August, an "open" non-stop run from London to Bath, an open hill-climbing competition, and socials in the "off" season, embodying lectures, discussions, and concerts.

IN July last Mr. Roger Wallace, the Chairman of the Automobile Club, addressed a letter to all the members, in which he urged them to propose suitable candidates for membership, in order that the Committee may be placed in a position immediately to rent new Club premises. From the list which has been sent us we notice that, in response to this appeal, eighty-four candidates have been proposed, through the efforts of fifty-nine members. There are now over 1,000 members of the Club. It is hoped that every member will be able to propose at least two new candidates for membership, so that the Committee may be able to proceed with the selection of a suitable Club house, including a storehouse for members' vehicles.

ON Wednesday evening an accident, resulting in the total wreck of a new motor-car valued at £800, and the injury of one of its passengers, occurred in the Goldhawk Road, Shepherd's Bush. The car, which is a 16 h.p. Milnes, was being driven by Mr. H. G. Burford; at the time he was following a tramcar, and in order to pass a lad with a barrow on the wrong side of the road, the car was temporarily checked, with the result that it slipped right across the road with the bonnet end on to the pavement. The consequence was that an approaching tram could not be pulled up in time, and dashed into the rear of the car. Three of the occupants were thrown out, Mr. Burford and two of his companions escaping with some bruises, whilst one gentleman, less fortunate, received a severe scalp wound, which necessitated surgical attendance. We learn, however, that after a short rest the injured gentleman was able to return to his hotel.

THE Motor-Car Journal.

VOL. III.]

LONDON, SATURDAY, NOVEMBER 2, 1901.

[No. 139.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

IN securing the presence of the Rt. Hon. Walter Long, M.P., at their meeting on Friday, the Liverpool Self-Propelled Traffic Association did well, and his speech must have gratified all who were present. It was very clear that in the preparation of any new regulations which may be made with regard to motor-vehicles, light and heavy traffic must be considered separately. Or else the pre-

judice against the pleasure vehicle will wreak some sort of vengeance upon the heavier class. Mr. Long agrees with those motorists who contend that the law as it stands at present is calculated to create law breakers rather than law observers. Evidently that view is being largely accepted, and and its general endorsement will bring us all to the conviction that the only satisfactory thing to do is to abolish the speed limit and make prosecution consequent on driving to the public danger. We trust that Mr. Long will urge that view on his colleagues in the Government and in the House of Commons. He might also have a little conversation with Sir Henry Campbell-Bannerman on the subject.

The Removal of the Tare Weight Restriction.

THE disadvantages under which heavy motor traffic is at present labouring are so apparent to all who have any knowledge of the subject that they should be easily demonstrable to our legislators. The tare limit imposed by the Light Locomotives on Highways (1896) Act has had a dire effect on the industry, and the work already done by builders of heavy motor-wagons is most meritorious in view of the restrictions now in vogue. If the restrictions were removed, or at least made less severe, the progress would be rapid indeed, and the effect of the general introduction of motor vehicles for heavy traffic would be a great boon to English manufacturers and agriculturists. Mr. Long believes such a request to be reasonable, and, such being the case, his influence ought to prove valuable in securing an alteration of the law.

Royalty and Automobilmism.

SOME information has this week come into our hands which shows that the King's interest in automobilism is probably of longer standing than is generally supposed. It appears that in the days of the now defunct Beeston Motor Co. His Majesty had a fancy for a motor-tricycle, and at his command, Mr. E. A. Gorton, of Coventry, took a Beeston machine to Buckingham Palace for inspection. Subsequently he was

requested to take the machine to Sandringham, where Mr. Gorton remained a fortnight, giving frequent exhibitions before the then Prince of Wales. On this occasion, too, the present Duke of Cornwall rode the machine several times.

The Aero Club of the United Kingdom.

By the formal registration of the title "Aero Club," which transaction took place on Tuesday, the first practical step has been made towards linking the pastime of aerostation with that of automobilism in this country. The subject has been discussed by the Committee of the Automobile Club for some time past, the final decision to register the new club being arrived at on the 21st ult. The new club, indeed, will have its headquarters at 4, Whitehall Court, and that its membership will be recruited in the main from the ranks of the Automobile Club goes without saying. Those two well-known *chauffeurs*, the Hon. C. S. Rolls and Mr. Frank Butler, are the leading spirits in the new venture, as to the future of which they are decidedly enthusiastic. Nor is there any apparent reason why sanguine anticipations should not be realised. The French Aero Club has already over 700 members, most of whom are also prominent members of the Automobile Club de France. They have made 500 ascents in eighteen months, and without a single accident. The members ballot for their turn to make an ascent, the cost of which varies somewhat according to the season, but is not expensive in any case. During the present month the tariff stands at 50 francs; which is very much less than a man must pay who charters a balloon at the Crystal Palace, which is a matter of over £20.

The Future.

WHAT it is proposed to do is to raise a sinking fund out of which the initial cost of the balloons and apparatus may be defrayed, and, as regards the ascents, to follow the same methods as the Aero Club de France, i.e., to ballot for turns. The annual subscription at the outset will be very moderate—probably not more than a guinea. We need hardly add that the progress of this new development will be watched with great interest, especially by automobilists. Some day, perhaps, when the *chauffeur* is no longer persecuted, and the legal limit is a thing of the past, he may enjoy the spectacle of a "twelve miles an hour" embargo on dirigeable balloons. Of one thing we may rest assured, and that is that if the powers that be can harass the movement in any way they will not be so false to their obstructive traditions as to pass the opportunity. We may add that a meeting of those who have intimated a desire to join the new club is to be held at the Automobile Club on Dec. 3rd to appoint an organising committee.

A Motor-Car Repairers' Association.

AN association has been proposed among automobile dealers in New England, U.S.A., to serve the object of regulating prices on motor-car repairs and storage, to meet occasionally and to have at each meeting some practical demonstrations, with possible lectures on the different makes of motor-cars. Apparently nothing but good can come from the proposed organisation, and the suggestion should therefore meet with hearty approval, and form an example to be followed by motor-car repairing firms in this country. The business is new, and anything leading to a free exchange of ideas between repairers, by which individual experiences can be made available for the guidance of all, and tend at the same time to protect the business as a whole, should be encouraged and supported.

Upheaval of London Thoroughfares.

AT last definite action is to be taken to check the apparently irresponsible opening up of the thoroughfares of London. As long ago as November last a joint committee of the London County Council, the City Corporation, and the Metropolitan Boroughs came to the conclusion "that the time had arrived for concerted action on the part of the local authorities of the metropolis to remedy the inconvenience, annoyance, loss of time and money now caused by the operations of the gas, water, telephone, and electric lighting companies in laying down, renewing, maintaining, and repairing their mains, pipes, services, and wires." The Highways Committee of the London County Council now suggest that the Council, as the central authority, should have power to exercise effective control over such burrowing operations as the various "workmen's camps" are perpetually carrying out, and they are encouraged to believe that application for this right would be favourably considered by the Government, "as inquiries have been made by the Secretary of State for the Home Department as to what action the Council propose to take with the view of effect being given to the resolution of the conference." It has consequently been decided that the City Corporation and the Metropolitan Boroughs should be asked to support a request to the Government for such power to control these street operations to be conferred on the County Council.

Prejudicial Appearances.

MAJOR RIACH of Bandrum, by Dunfermline, has drawn attention to the attire of many who took part in the Glasgow trials. They made "guys of themselves" in a way "calculated to frighten children." Such is the opinion of the gallant major, who is an enthusiastic motorist, occasionally organising local meets of motor-cars, etc., but who believes the interests of the pastime will suffer "unless drivers and their friends can discard these disfigurements and be content to appear more as ordinary mortals." There is something to be said in confirmation of this protest against some of the hideous raiment donned by a few drivers. At the same time it must be recognised that the winter is approaching, and warmth and comfort must be regarded as of greater importance than appearance. After all, it is a matter of taste—and in this motorists do not err, more than other people.

Wood Paving.

A QUESTION of considerable interest to surveyors has recently been occupying attention in connection with a certain wood paving contract in the city of Westminster. Few persons are concerned, however, with the personal aspect of the discussion. But what those responsible for the proper paving of thoroughfares are concerned in is, remarks the *Architect's Magazine*, the outcome of the Westminster controversy, viz., the proposal that there should be a conference of all local authorities to consider and, if possible, determine what is the best form of paving for the great traffic of the metropolis. At present there is no attempt at uniformity, and even in one

district it is possible to detect several kinds of wood blocks of varying qualities of endurance doing duty on sections of a particular thoroughfare. If a mass of informed opinion—in other words, of local experience—could be collected on the subject, and some kind of wood, be it Australian, American, or what not, could be agreed upon as the best paving to meet the known conditions of traffic, London would gain immensely in the long run both in respect of cost and comfort in locomotion.

Wheel v. Tiller Steering.

IN a series of comments on the results of the recent 500-mile endurance contest in America the *Horseless Age* brings up once more the question of wheel v. tiller steering. Our contemporary is apparently in favour of the latter, and remarks that public fancy has perhaps played a considerable role in the substitution of the hand wheel for the steering lever. This is a part with which the operator has continually to do, and he therefore feels himself competent to select the most suitable device, more so than in matters relating to the power equipment. The problem of devising a reliable and all round satisfactory steering arrangement is, however, as difficult as any connected with the motive power, and for some time to come, at least, the purchaser's fancy in this matter should stand behind the manufacturer's experience. The direct acting steering lever arrangement has less backlash and can be operated quicker than a wheel steering device, and for this reason it would seem preferable to rely on a rational construction of the steering pivots to protect the operator's arm against vibrations transmitted from the steering wheels and to operate these wheels directly by a powerful (long) tiller, than to use the conventional irreversible wheel steering.

A Superb Car.

THE distinction of owning the costliest and speediest car in Ireland is now held by Dr. Colohan, who has just received delivery of a 24 h.p. Daimler listed at £1,360. It is superbly fitted and finished. The doctor has added his own patented improvements to the engine, which now shows 28 h.p. on the brake. He intends bringing the power up to 30 h.p. A magnificent turn of speed is evinced by the car, so much so that it will have to be geared down considerably for use on Irish roads. A new self-starter and several other valuable improvements make it beyond all doubt the finest and fastest car in Ireland at the present time.

A Dust Blow-off.

WE noticed a rather useful fitment to a new car recently. From the silencer a thick tube was carried round the back of the car parallel to the frame, its underside drilled with numerous small holes, the total area of which was considerably more than the usual openings in the silencer. The idea is that the exhaust gases rushing out through these holes will beat down directly on the dust cast up by the rear wheels and the vacuum of the car. Unfortunately, since the fitment was made there has been a deplorable absence of dust in the district where this car travels, and no opportunity has yet been offered of testing the merits of the idea.

Mud! Mud! Mud!

SOON will the muggy days be constant companions of ours. Then the roads will assume an almost inveterate habit of slatternliness and sludginess. Autumn mud is a composition with peculiarities of its own, which winter, unfortunately, has also discovered the secret of. But whilst in January or February our wheels and our hands have got the grip of the treacherous stuff, it comes suddenly in autumn full of tricks which are almost new to us. The young motorist who has come through the summer months triumphantly is driving for a fall if he fails to be respectfully cautious with the autumn mud. Even on bright sunny days it will be found lurking in secret

places ready to cause disaster to the reckless driver. From day to day during the muggy weeks of November it varies in consistency, one sample being more devilish than another in its sliminess. The man who wants to come through it safely must eschew wild driving, he must beware of rushing down hills at summer-speed, for at the base there is frequently a greasy patch; he must not hazard guessing about the condition of the road round the next corner; he must not use his brakes rashly, and he must avoid all sharp curvings. The old proverb, "Hasten slowly," might well be written on the dash-board and carefully observed.

Motor-Cars for Milk Transport.

THE members of the Macclesfield Chamber of Agriculture have been put to considerable inconvenience of late by the alteration of the trains conveying milk to Manchester. An enterprising company have now intimated their willingness to convey the milk by motor-cars, and at a meeting of the Chamber held on Tuesday, the chairman, Mr. Jabez Wright, asked the members to support the movement.

No Service for Belfast.

IN connection with the application to the Police Committee of the Belfast Corporation by Mr. Leslie Porter for licences to run motor-buses in Belfast, the sub-committee appointed by the Police Committee has inspected and weighed one of the buses, and subsequently decided against granting the licences, on the ground that the conveyance is too cumbersome for the

the unwonted diversions and exercises of hunt balls and the like."

Great Scott!

MR. CLEMENT SCOTT is a keen observer of dramatic matters, but his *Free Lance* cannot penetrate the ways of locomotion with anything approaching accuracy. He declares that the "rapid increase of motor-cars about the streets of our larger cities, with their colossal addition to the already desolating pandemonium of traffic and other noises, will soon necessitate a new Minerva to invent us some fresh musical instruments." For the noise that is now common will, according to this critic, deaden our ears to the musical notes of present-day instruments. And so he pictures a time when the hurdy-gurdy will be fashionable in drawing rooms—owing to the loss of musical taste occasioned by the roar of the motor-car. Mr. Scott must have been in a bad way for a paragraph or two when he wrote such nonsense. Where is the noise with a steam car or an electric vehicle, and does the rattle of the petrol car over cobble stones jar on the nerves any more than does the clatter of horses' hoofs on an asphalte road?

Dinner—Before or after Runs.

OUR friends in the United States are observant as well as ingenious, and the Runs and Tours Committee of the Automobile Club of America have evolved a method for preventing scorching on club runs which is worth considering elsewhere. They noticed that when the members met at the

Photo by]

THE GLASGOW TRIALS—UP AMONGST THE HILLS.

[Mr. M. D. Rucker.

congested streets of Belfast. The sub-committee consists of five, three of whom were against granting the licences.

An "Enthusiast's" Idea.

THE "Enthusiast" who writes the "Jottings of a Motorist" in the *County Gentleman* appears to be making a speciality of searching for unexpected advantages of certain designs and parts of motor-cars. It was only the other week that he suggested that tube ignition offered an economical method of boiling kettles and cooking chops. In his latest contribution he discusses the question of bodies for motor-cars and remarks that "the *vis-a-vis* has but one advantage, and that only when not more than two passengers are travelling; and it is that by placing a box or board between the seats on the near side, one is permitted to lay one's weary body to rest with one's head upon the back seat and one's feet upon the front. The steering pillar unfortunately necessitates the other occupant remaining in a sitting posture, but exchanges might be effected, and thus the woeful weariness of breakdowns might be greatly solaced, or, should both parties consent, there would be nothing to prevent the non-driver from travelling in this position, which could not fail to be very soothing after a long day's journey, or even when returning home after

club house for a run to some suburban resort for dinner the scorched were many and the scorching was hot. So a reversal of the procedure was tried—the members made for the suburban resort in their own way and having partaken of dinner drove back in company to the club house. Not wishing to disturb a well served dinner, speed was sacrificed to comfort and the difference in pace has been ascribed to the fact that the automobilists were more contented after dinner than before.

More Education Wanted.

THE Reading Automobile Club has done much to educate the people of Berkshire with regard to the automobile, but its work is not yet finished. There is a writer on the local *Mercury* whose education in motor-car matters is singularly incomplete. He declares that such vehicles are "still nothing but a toy in the households of semi-civilised princes," and desires a special rule for every county limiting the speed of cars in that particular area. At the same time he recognises that the automobile is bound to advance; but apparently he is willing to join the crowd that is anxious to hinder its progress. Still "the toy in the households of semi-civilised princes" will prevail.

Cars for Every-body.

WITHIN five minutes of writing the foregoing we were reading a sanguine anticipation of the future in the column of an American contemporary, by Mr. E. C. Stearns, who believes that in a very few years every family of moderate means will have its own motor-vehicle. There is certainly no reason why such should not be the case, and we have recently heard of three gentlemen in a London suburb co-operating for the purpose of acquiring an automobile for their joint use. Professional men are rapidly being accustomed to the motor-vehicle, and the middle classes will establish a great demand for motor-vehicles in the near future.

"C.B.'s" Horror.

WE hope it is not the fact that many of the leading automobilists in the House of Commons sit on the opposite benches that causes Sir Henry Campbell-Bannerman, M.P., to look with such dismay on the popularity of the motor-car. Opening a bazaar at Dundee on Saturday, he acknowledged he "looked forward with horror to the time when we should be eaten up and driven out of all the streets and roads by these artificial methods of conveyance." There is no cause for alarm. The horse and Shanks's pony will still remain on the road; though lightened of many a burden by the vehicle which Sir Henry C.B. regards with such horror. But, as we have already suggested, we hope his objection is not a political one due partly to the fact that his leading antagonist in the Commons is an automobilist on the road.

The Motor's Twenty equal to the Horse's Seven.

MR. G. E. WRIGHT, a practical engineer residing at Blackheath, says he has had some experience in the question of the brake power for vehicles, and has ascertained that, striking a rough average, a motor-car running at twenty miles an hour can be brought to rest in as short a distance as a horse-drawn vehicle running at seven miles an hour. It must be acknowledged that the mechanically-propelled vehicle has thus an enormous advantage over the horse-drawn. This is a point that cannot be too frequently recalled, for so many people appear to vainly imagine that it is the high rate of speed which constitutes the danger of vehicles.

Tractors for Military Purposes.

ON another page we publish full particulars of a further series of trials shortly to be taken in hand by the War Office Committee on Mechanical Traction, viz., with tractors capable of hauling a gross load of twenty-five tons. The conditions that will be considered in awarding the three prizes offered will be the prime cost, economy in working and maintenance, ease of steering and manipulation, simplicity of design, which shall enable repairs to be executed in a minimum of time, absence of noise, vibration, smoke, or visible vapour, immunity from damage by mud or dust, and capability of working with fuels varying in description and quality.

Advanced Prices in America.

MANUFACTURERS of automobiles in the United States have lately advanced their prices, and it is thought that this step will do something for the real interests of the industry. There has been a tendency in the States to "cut prices" rather low, with the result that quality has sometimes been sacrificed so that a large sale could be sustained. The lack of wisdom in such a policy appears to have dawned upon the leading firms, with the result that the newer machines will contain many improvements, both in design and workmanship. Quality and price must go hand in hand, and with the better rates that now seem to be obtainable the standard aimed at by the American makers should be higher than heretofore.

WAKE UP, ENGLAND!

LAST year the Paris-Berlin race attracted a great deal of attention all over the sporting world, and five different nations competed in it. First of all, and away ahead of all, came France, with her Mors, Panhards, Renaults, etc., etc. Germany came second a long way behind with the Mercedes; Belgium followed with Gobron-Brillié and Deschamps; Austria sent two or three vehicles, which arrived too late; and England was a bad last with a solitary Napier, though Mr. S. F. Edge and the Napier Company deserve all credit for the efforts they made. Of sportsmen *chauffeurs* in the race England was behindhand, being represented only by Messrs. Rolls, Edge, and Jarrott, and the only thing to put to England's credit was the purchase by an Englishman (Captain Laycock) of the winning car.

When we come to think of the sums of money the British public have subscribed to companies for the purchase of French patents or licences for use of French patents, and of the large sums of actual cash that have crossed the Channel to the Continent in payment for these patents, and of the equally large sums which are being poured into the coffers of Panhard, Mors, Renault, Darracq, etc., it gives food for reflection, and this reflection has decided me to bring the subject forward, and make an effort to set the "ball a-rolling," in order to rouse such a public feeling amongst British automobilists and capitalists, that a term may be set to this state of affairs, and a start made towards bringing to our shores at least a fair share of the new industry.

The contemplated Paris-Vienna race gives me a good text. It is not much more than a week since the idea was started, and there are nearly a hundred entries, amongst which appear Mors, Panhard, Darracq, Decauville, Peugeot, Mercedes, Deschamps, Dietrich Gobron-Brillié (Belgium). Amongst the names of the *chauffeurs* I am pleased to see those of Messrs. Rolls, Jarrott, and Edge. The last name I am particularly glad to note, for I suppose and hope that it means that the Napier Company are going to build a racer. As the rules of the A.C.F. limit the weight to 1,000 kilos. (one ton), Mr. Napier will be put on his mettle, and turn his attention to maximum power with minimum weight, and if he sets his brains and energy to solve this problem, I think he will take some beating. One car is, however, no good in such a race, and there should be six of them. Are there not sportsmen in England rich enough to order twenty British cars to compete, and are there no public-spirited men in England to found a prize important enough to encourage the British manufacturers to compete?

It may be answered that our absurd speed limit and the shortsighted way in which our country magistrates are dispensing the law make it impossible to test racing cars in England, but plenty of localities are to be found where the police are not set to trap motorists, and where judicious drivers, who will conscientiously slow down through agglomerations, may "let her go" in the open; and what would be a better object lesson to our legislators than an English contingent successful in an international motor-car race? The public in England would greet such a success with enthusiasm. My object is to open up the question, and I would ask motorists to let their views be heard, and if there is unanimity, we shall see what can be done while there is yet time, in order to bring to our shores a trade which we need.

"AUTOMAN."

PRINCE NILKOFF, the Russian Minister of Roads and Communications, has lately made a signal personal test of the efficiency of his own department. Having to attend the jubilee commemorations at Tiflis of Georgia's annexation to Russia, the Prince did the entire journey by motor-car. The distance from Vladikaukus, his starting-point, was 444 miles, and the route was along the Georgian military road, which is both mountainous and rough.

FLOTSAM AND JETSAM.

By "FLANEUR."

"THIS is too hot!" was a famous ejaculation in the baccarat *cause célèbre* of Tranby Croft memory. Within the last few days the automobilist, at least, has had numerous incentives to repeat the phrase, with something unwontedly strong in the way of epithetic additions. The policeman who swore to seeing a Croydon automobilist pass at 153 miles an hour was quite enough in the way of sensation for one week, but equally calculated to take one's breath away was the brazen attempt at Kingston to drive the light steam car off the road, for that is virtually what the efforts of Mr. Thomas Weeding Weeding had in view. In the whole course of my fifteen years' experience as a journalist I have never seen anything so impudent as this prosecution under an old Act on the ground that the Locomobile concerned was not complying with the terms of the Act of 1896. Even the Kingston Bench was compelled to recognise the undignified figure which their prosecuting colleague cut, and dismissed the summonses.

A HUMOROUS incident in the course of the hearing deserves to be recorded in passing. Mr. Thomas Weeding Weeding was declaiming with all the vigour of the heavy villain of transpontine melodrama when Mr. Staplee Firth, who was defending for the Motor Union, enquired with a similar flourish of the arm and an exactly imitative amount of vocal exaggeration, "Why all this ter-r-rible ter-r-ragedy?" The effect was instantaneous; the whole court was convulsed with laughter, in which the magistrates themselves could not help but join.

I DON'T know whether Mr. Claude Johnson repeated the ejaculation with which I began this page when he was fined the vindictive sum of £20 by the magistrates at Thirsk, but I do know that I said something of that kind when I read the report of the case on Tuesday. There is not the shade of a shadow of doubt that the popular secretary of the Automobile Club was made a victim to the prejudices of the horse-breeding magistrates, and the fact that a fast car had passed over the same road not long before. Had the Bench not been absolutely blinded by anti-automobilist hostility, they would have gauged at once the probabilities in the case when on the one side they had a driver of easily demonstrable experience and, on the other, a mere lad in charge of a powerful and untrained horse.

WHEN a driver has come 200 miles to defend his case rather than let judgment go by default, and when he has shown that he did everything in his power to avert an accident for which he was in no way responsible, it certainly is "too hot" that the magistrates should coolly tell him that he was "mistaken in thinking that he had stopped" when called upon to do so, and fine him £20 and costs. Mistaken! As if a man did not know whether he had put down his clutch pedal, applied the brake, and put the speed-change lever in the "neutral" notch. When you have gone through these three processes you ought to have a tolerably clear impression as to whether you have stopped the car or not; but the Solons of Thirsk, of course, knew far better than their victim. He had only the facts on his side; they had imagination and prejudice, which are far more potent.

I BELIEVE it was Horace who wrote *Dulce est desipere in loco*, which may be interpreted as "It is pleasant to play the fool on occasion." Judged by their recent utterances in public, certain of our men of (alleged) light and leading have laid this apothegm to heart. But they joke with obvious "deeficulty," and the shock to their constitutions is palpable. Sir H. Campbell-Bannerman, for example, in his attempts at persiflage, expressed a *penchant* for "two old-fashioned animals—the horse, and another strange animal called Shanks's mare." He further spoke, in terms that were disparaging, of the modern motor-car. Where "Shanks, his mare" comes in opposition to the motor-car

is a mystery. The motor vehicle has merely to be compared with that drawn by the horse; perambulation is in a class apart.

YET we find the *Echo*, even more devoid of humour than the Liberal Leader, gravely patting him on the back for his reference above quoted. "It would be a great calamity," remarks the journal named, "if Shanks's mare were driven off the roads by the laziness bred of the motor-car, and we hardly think that the exhilarating vibration of gas explosions under a seat affords a good substitute for walking exercise on a good country road." Then, with a fine perversion of metaphor, it adds, "Shanks's mare has been *trotting* since the days of Adam; may it continue to *trot* till the crack of doom." Will the *Echo* man be good enough to explain where he has found his cars that explode gas under a seat; how motor-cars are likely to destroy walking, unless they can be produced at about a penny apiece; and by what miracle a mare can walk and trot at the same moment? The whole paragraph is a fine illustration of that combined ignorance and anti-motor prejudice which defaces so many professedly "progressive" organs. May I remind you, oh *confrère* of the *Echo*, that conservatism is not always spelt with a capital C?

ANOTHER professedly enlightened journal, the *Westminster Gazette*, invariably inserts without sub-editing the hostile and ill-informed reflections of its financial critic on automobile matters. Were he to confine himself to his proper sphere one would have nothing more to complain of than his obvious bias against the automobile industry; but on every possible occasion he goes out of his way to assail their mechanical efficiency and otherwise speak prejudicially of cars and their drivers alike. The irresistible deduction to be drawn from a perusal of this gentleman's animadversions is that he derived his impressions of automobiles and automobilism in November, 1896, and that from that time to this he has closed his eyes to every improvement in the situation, both commercial and mechanical.

So attractive will the Austrian portion of the Paris-Vienna race of 1902 inevitably be, that a large entry in the tourists' section may confidently be expected. Already several members of the Automobile Club have entered for this event, in the persons of Messrs. Frank Butler, T. B. Browne, J. Clifford, and H. Loeffler. If at this early stage the race attracts a following, the muster ere the closing day will undoubtedly be very large.

THE Bexhill Motor Company has issued a revised list of fares at an all-round reduction; the most popular change being the introduction of a penny fare for short and intermediate distances.

A SET of cycle parts specially designed for the building up of motor-bicycles is about to be put on the market by Messrs. Perry & Co., Ltd., of Birmingham.

THE Brighton and Sussex Motor Car and General Engineering Works, 123, Gloucester Road, Brighton, inform us that they are prepared at short notice to convert existing wire wheels of motor-cars to take New York tires.

THE Motor Power Company, Ltd., have made arrangements whereby customers can be supplied with Gladiator or Napier motor-cars on payment of equal monthly instalments extended over twelve months. By this means, on payment of a quarter of the amount down, the purchaser can obtain a Gladiator from £12 to £18 a month, or a Napier from £48 per month.

WE understand that the lorry entered by Messrs. George F. Milnes & Co., Ltd., for the forthcoming War Office trials will comprise some special features and departures, especially with regard to the motor. The lorry has been built by the Motor-fahrzeug und Motorenfabrik, of Berlin, in accordance with the specification of Messrs. Simms & Co., and will be equipped with a 20 to 25 b.h.p. four-cylinder motor on the Daimler principle. The engine is of the most recent type, and will be able to burn either common petroleum, benzine, or alcohol, fired by the Simms-Bosch magneto-electric ignition.

CORRESPONDENCE.

THE GLASGOW TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As one rather disgusted with the complaints of unsuccessful competitors and their friends after the result of the Glasgow Trials, I should like to congratulate the judges on their labours, and think the best thanks of motorists are due to them for discharging a very difficult duty. I have had much to do with some of the light voiturettes on the market, and venture to assert that many motorists, especially when touring, very soon grow tired of them. Needless to say, many light voiturettes might run not only for a week but for a month without a stop, and thus gain full marks; but what about the condition of the mechanism, bearings, and other vital parts after a year's hard work? No doubt the judges in awarding the medals have taken full cognizance of this, and therefore makers of the "feather-weights" blaspheme instead of taking their beating like men. It is childish to see a maker claiming that his machine is the best under nearly all the headings from A to V.

In conclusion, I would advise would-be motorists to avoid the cars that are puffed *ad nauseam*. The best cars do not need it. Experienced motorists know that design and fine workmanship will score in the long run, and therefore I think that a system of marks deducted for stops, which may be for trifling adjustments, very deceptive. I know of one car that did not stop; but what about the condition of the steering gear at the end of the trials? Only the judges could enlighten upon such points.
—Yours faithfully, ENTHUSIAST.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—When first I heard of the Glasgow Reliability Trials and the rules under which they were supposed to have been carried out, I, amongst many others, thought that at last prospective buyers of motor-cars would have the question decided, viz., "Which is the best car for my money." In my opinion this question would have been settled, had the awards been given in accordance with the original rules, by giving one prize in each class to the car gaining the highest number of marks and also taking into consideration the numerous other points mentioned as conducive to a thoroughly reliable machine.

But as the case stands now one is in just as big a quandary as ever, for in Section 1, Class A, instead of one prize we have four, viz., two gold medals and two silver. One gold medal goes to the Wolseley, which for marks gained, hill climbing capability, and weight per passenger carried was apparently a long way behind several other cars entered. The other gold medal goes to the Locomobile, the principal reason given for the award being that it was quiet and the only "steamer" competing. One silver medal goes to the New Orleans, which for marks gained (as per original rules), hill climbing capability, and weight in proportion to passengers carried was streets ahead of the winner of the gold medal in the—may I term it—"explosive engine class." The other silver medal is given to a De Dion of the type which I understand the makers are now abandoning in favour of one practically identical with the New Orleans. I ask you, Sir, how can anyone from these awards come to a conclusion as to which is the best car to buy?

Having frequently driven a New Orleans, as have also many of my friends, with the greatest satisfaction, I naturally and openly stick up for that car. I consider, too, that the car should have been returned the absolute winner on its marks gained, especially being by far the most up-to-date car compared with the Wolseley and De Dion, not that I would say anything against either, being quite an amateur.—Yours faithfully, E. G. R.

THE SURREY POLICE AND MOTORISTS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—At a time when the recent prosecutions at Reigate are occupying so much attention, it may interest your readers

to hear of the unusual activity of the police in other parts of Surrey. The other Sunday I was a passenger on a 9 h.p. Napier car, and during a sixty-mile run I had opportunities of observing much that surprised me. Between Ripley and Guildford, at intervals of about a mile, policemen were observed near the road-side, a small gathering of rustics usually assisting us to locate each post. We drifted by on our second speed and escaped with nothing worse than the scrutiny of the officers—one of whom had a cyclist in attendance, as if for purposes of pursuit. On our return journey in the afternoon these policemen were still on duty. Shortly before Godalming was entered, two plain clothes men, holding watches and posted about 200 yards apart, were observed to consult their timekeepers as we passed. Immediately after, a constable in uniform walked out into the middle of the road and raised both hands for us to stop. Our car was drifting very slowly by this time, and, owing to the temporary absence of mind of our driver, we failed to pull up and glean the results of the timing test. We pursued our way to the summit of the Hind Head without further incident, but on our return journey, *via* the Hog's Back, we again became conscious of police attention. At three or four points between Farnham and Guildford uniformed policemen were posted, but we observed no attempt at timing and were not spoken to. One constable was observed studying the *flora* of the district behind a hedge.

Very few cars were sighted during the day, and the motor-cyclists passed were all proceeding at reasonable speeds. Our own transit, thanks to the prudence and skill of our driver, was unattended by the smallest injury or embarrassment to any of the other road users encountered, and it certainly seemed to us that the police must have spent a very dull and unprofitable day.—Yours faithfully,

C. W. HARTUNG.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read a great deal recently in reference to what one might almost term persecution of automobilists and cyclists by the police, but on Sunday last on a Surrey main road I actually saw action taken by the police of a most extraordinary nature. When travelling slowly along the road I saw approaching in the opposite direction a small voiturette, coming so slowly on a good level road that I remarked that I thought there was something the matter with it. Just before it reached me two men in ordinary clothes stepped off the footpath and held up their hands for it to stop. The men in the car, I think, did not notice them and were still proceeding slowly when one of these men drew a whistle from his pocket and blew a shrill blast from it, with the result that a constable in uniform came from out of a barn a little further down the road, where he had evidently been hiding, and walked up towards the voiturette, which had immediately stopped on hearing the whistle.

Wondering what the trouble could be I got down off my car and went back some few yards from where I had stopped to find out. The two men dressed as civilians stated that they were constables, and that they wanted the names and addresses of the occupants of the voiturette for going over twenty miles per hour. I immediately came forward and told them that I would be very pleased to act as a witness on their behalf, as they were not doing eight miles per hour. Immediately on my saying this the man in plain clothes, who afterwards turned out to be a sergeant, turned upon me and said he would summons me for leaving my car unattended. Luckily, however, three or four other motor carriages were behind mine, the whole of their occupants amounting altogether to some sixteen people, who had seen the whole occurrence and alighted from their automobiles to offer their names and addresses as witnesses.

The disguised sergeant completely lost his temper and insisted upon having the names and addresses of the drivers of the other motor-cars on a charge of leaving their cars unattended, although in most cases there were ladies sitting in them, and the cars were drawn up closely one behind the other, some in front and others behind where the police were

standing. The names were given in due course and it is to be hoped that the sergeant in question will proceed by bringing the matter into court, when I think an extraordinary state of things will be revealed, of men presumably on duty to assist the public trumping up charges against anyone daring to come forward to see justice done to two complete strangers. There must really be something beneath this action, which savours of persecution; it cannot be possible that these men are acting on their own initiative; they must be receiving their instructions from some higher authority.—Yours truly,

S. F. EDGE.

THE AERO CLUB OF GREAT BRITAIN AND IRELAND.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Seeing what our enthusiastic and enterprising friends across the Channel are doing reminds me that I should wait no longer in carrying out my idea of forming "The Aero Club of Great Britain and Ireland," for the purpose of encouraging and developing aerial navigation in this country. The formation of this new club I had in contemplation a long time ago, and having carefully prepared the preliminary steps for its foundation, I shall be able to shortly make some further announcements in your valuable journal concerning the powerful committee that I am at the present moment constituting, as well as other important matters concerning the new club, such as rules, inaugural meeting, premises, etc. I have not the slightest doubt that the new club will soon bring about a different state of things with regard to my "Pet" problem, one that I have privately devoted much time to during the last eleven years, for I am convinced that it only wants a club or society on modern lines to bring together the many British enthusiasts and those interested generally in aerial navigation to advance in and perhaps to ultimately help solving this great problem.

At the inaugural meeting it will also be decided which title will be adopted, the above, or "The Aero Club of the British Empire," "The Aero Club of the United Kingdom," "The Aeronautical Club of Great Britain and Ireland," "The Aeronautical Club of the United Kingdom," or, short, "The Aero Club."—Yours faithfully,

FREDERICK R. SIMMS.

[As will be seen from our "Comments" columns, an Aero Club of the United Kingdom has this week been formally registered.—ED. M.-C. J.]

SPARE PARTS PROMPTLY WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I see in the last issue of the *Journal* another letter about spare parts. The only way at present to stop these disastrous delays is, when buying a car, only to buy it conditional to the makers undertaking to supply spare parts within a week at the outside. Makers who will not guarantee this should be left alone. I think all must agree that where £200 to £300 is put down, one expects a car to run for more than half a season, and not to be rendered useless for weeks at a stretch for want of a few shilling articles.—Yours truly,

AUGUSTUS KENT.

OVER THE AUSTRIAN ALPS BY MOTOR-CAR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have just noticed in your issue of the 5th October a letter, entitled "Over the Austrian Alps," from Mr. C. N. Williamson, and hasten to give you some information concerning the matter. Lajos is only a Hungarian Christian name (equals Lewis), the family name being Lukacsy. Count Gyulai was not the first motorist to take an automobile over the Stelvio. In his article it is only said that he was the first to reach the summit of the Karersee Pass in the Dolomites. The motor-car which Mr. Williamson saw on September 4th, 1899, was a De Dietrich (Amedée Bollée,) belonging to General-Consul Alexander Singer,

who, attended by Dr. Suchanek, was the first to climb the summit of the Stelvio.—Yours truly,
Vienna.

FELIX STERNE.

WITH regard to the comments on Michelin tires in a recent issue, the Clipper Pneumatic Tyre Company, Ltd., write:—"We have read the correspondence published by Mr. R. E. Phillips in reference to the Dunlop Company. As a matter of fact, the whole responsibility of dealing with Michelin tires rests with this company and not with the Dunlop Company. The statement made by Mr. Phillips that he endeavoured to purchase properly licensed tires from us in England, and that we informed him in writing that we had not the required size in stock, is untrue. The only communication which this company has received from Mr. Phillips was addressed to its French agents, and this was a request to license a set of infringing tires already fitted to his car. The fullest enquiry, both at our English and French branches, has failed to substantiate Mr. Phillips' statement that he endeavoured to obtain licensed tires, and Mr. Phillips has only himself to blame if he has suffered inconvenience in consequence, a point upon which we beg leave to express some doubt.

"P. P." writes:—"Sir,—I have a motor-car which is at present fitted with tube ignition, and I wish to have it changed to electric ignition. Will some of your readers be kind enough to inform me how to do it myself, or tell me what I ought to pay to have it done by a competent person."

MR. R. E. PHILLIPS writes: "I shall esteem it a favour if you will allow me through the publicity of your *Journal* to thank the many automobilists who have sent in alterations, corrections, and additions for the next edition to *The Automobilists' Guide*, as I have not time to thank them all personally."

THE Trafford Motor Company, which is making a speciality of carriage bodies and wheels for motor-cars, has removed to larger premises in Christ Church Square, Hulme, Manchester.

THE way in which the French automobile trade is developing is observable in the returns for the first eight months of the year, these showing that the value of vehicles exported was £391,160, as against £223,360 in the similar period of 1900.

IN addition to Cannstatt Daimlers, and the F. N. cars, the Motor Traction Company, Ltd., of Walnut Tree Walk, Kennington, S.E., have secured the agency for the Boyer cars, which are made in several sizes, fitted with engines of 7, 9, and 12 h.p.

WE learn that Messrs. F. J. and H. C. Rodgers, of Sayer Street, New Kent Road, S.E., makers of the Dreadnought cycles, have taken up the manufacture of motor-bicycles on the Minerva system.

PETROL and spare parts for motor-cars are now being stocked by Messrs. Drewry and Sons, of the Cycle and Motor Works, Herne Hill, S.E. The firm are also able to carry out any necessary repairs.

MESSRS. HIGGS AND FOX have started in business as repairers of motor-cars of all kinds. Their present address is 2, Portland Terrace, Regent's Park, N.W., but they will shortly open new premises where storage accommodation for a number of cars will be available.

MR. P. KEEN, of 63, High Street, Putney, has special facilities for promptly repairing motor-cars of every type—petrol, steam, or electric, and guarantees satisfaction. Sundries and broken parts can usually be replaced without the delay often caused by the necessity of obtaining these in France.

MR. ARTHUR JULIAN, manager of the Portsmouth and Gosport Motors, Limited, writing from 9, Grand Parade, Portsmouth, informs us that he has laid in a stock of spare parts and sundries for all types of cars which are likely to join in the run to Southsea on the 16th inst. He is also making full arrangements for a good staff of competent men to be in attendance for all kinds of repairs, and arranging for a good supply of both Carless Capel's petrol and Pratt's motor spirit. The company will have temporary premises at Broad Street, also a few men at the Drill Hall for repairs.

THE "GLADIATOR" LIGHT CAR.

OUR illustration shows the 1902 model of the Gladiator light car fitted with detachable glass front, canopy, and storm or dust curtains. It is, of course, obvious that the curtains all roll up at the sides if desired.

The car is driven by an Aster single-cylinder motor, developing $6\frac{1}{2}$ h.p. The cylinder is water cooled, the water circulation being ensured by a rotary pump driven off the flywheel. The water tank, which is carried out of sight at the back of the carriage, holds about three gallons; efficient radiators are also provided. The ignition is electrical, being generated by accumulators and an induction coil of great power. The changes of speed are effected by the well-known Panhard type of gearing, giving three changes of speed and a reversing gear, this combining a good speed on the level with very good hill-climbing powers on the lower gears. As a matter of fact, the Motor Power Co. claim that they have not yet found a hill which the car with four persons up will not climb. The petrol reservoir, which is carried under the driver's seat, holds three gallons, which is

sufficient for a run of seventy-five miles. There are two distinct sets of brakes, one being actuated by a hand lever and acting upon the large drums on the hubs of the rear wheels, and the other being actuated by a pedal and acting on a large drum on the countershaft. The rear road wheels are thirty inches in diameter and the front wheels twenty-six inches in diameter. The standard type of car is fitted with *tonneau* body, having accommodation for four persons. Complete, the vehicle weighs $10\frac{1}{2}$ cwt.

The Motor Power Company, Ltd., of 14, Regent Street, S.W., who are sole agents for the Gladiator cars in this country, have sent us a copy of a very complete little hand-book they have just produced dealing with the vehicle, which should be found exceedingly useful by all who drive Gladiators.

WE hear that Mr. Mark Mayhew has entered for the Gaillon hill-climbing competition in France, and that he will drive his 50 h.p. Napier.

TO-DAY (Saturday) the English Motor Club will hold a run to Brighton, which all members are invited to attend. The run will really take the form of a meet at the destination, as no fixed route will be followed.

REFERRING to the Precision bicycle motor illustrated in our last issue, the Precision Motor Company inform us they have on hand some water-cooled engines of similar size, but with special base. These engines are to be coupled up to small dynamos, and are to be used for searchlights by our troops in South Africa.

CONTINENTAL NOTES.

BY "AUTOMAN."

A PUBLIC trial of automobiles using alcohol, organised by the Minister of Agriculture of the French Republic, took place on Monday, Tuesday, and Wednesday this week, during which time tests were made on a course of 100 kilometres, commencing at the Porte-Maillot, passing through Chatou and St. Germain and returning to Paris *via* Versailles. The trials rather resembled the recent Glasgow competition in that they included stoppages up hill and down hill, the maintenance of a moderate speed, and in that each carriage competing had an observer on board. The competition had for object the demonstration of the utilisation of alcohol, and included tests of the quantity of alcohol used per kilometre ton, the quality of running up hill, down hill, and on the level, the facility of starting and stopping, the absence of danger, and the quantity of water and grease necessary. Tests were also made of the construction and solidity of the cars. There were four classes, including—First: motor-cycles and light cars up to 250 kilos. Second: light cars from 250 kilos. to 650 kilos. Third: cars weighing more than 650 kilos; and fourth: delivery wagons. The speed allowed was twenty kilometres an hour in *agglomerations* and thirty kilometres an hour on the open road. It was optional to use either pure alcohol or alcohol of 75 per cent. or 50 per cent. carburation.

THE Criterium of motor-bicycles, organised by the *Auto-Velo* under the patronage of the A.C.F., took place at the Parc de Princes, near Paris, on Friday last week. The weather was most favourable and several thousand people assembled to witness the competition. There was only one race in which all the competitors started together, but there were two classes—first: motor-bicycles on which pedalling was allowed; second: motor-bicycles from which the pedals had been removed. There were thirty-two competitors and the winners were the following:—Without pedals, Cissac on a Chapelle bicycle, who accomplished the 100 kilometres in one hour thirty-four minutes twenty-five and one-fifth seconds, making a world's record. With pedals, Derny on a Lamaudiere and Labre bicycle, in two hours four minutes twenty-nine and two-fifth seconds. There was a third prize given for motor-cycles weighing less than thirty kilos., and it was gained by Deguichard on a Clement bicycle in two hours forty-four minutes seventeen and four-fifth seconds.

M. HENRI DEUTSCH is getting a very poor recompense for the public spirit and generosity which prompted him to encourage aerial navigation by offering a prize to the first man who should double the Eiffel Tower inside half an hour, and return to his starting place at the Aero Club. M. George Prade in the *Auto-Velo* gives a very clever and most amusing article in which he tells the history of the prize from the start and shows how at every step some section of the French Press has reviled M. Deutsch in the most unwarranted manner. First, by saying he was obtaining a cheap advertisement; then, that he only offered the money because he knew nobody could win it; again, that he was making a balloon to win it himself and that he had obtained a special petrol which would enable him to do so (M. Deutsch, as no doubt many of the readers of the *Journal* will know, is the chief refiner of petroleum in France). As soon as M. Santos Dumont had his first accident, M. Deutsch was treated almost as an assassin and so on, but to crown the whole edifice of these absurdities, I notice in the *Auto-Velo* an article from the pen of the Count Henri de la Vaulx, who has just come back from his courageous attempt to cross the Mediterranean in a balloon. The Count starts in to defend M. Deutsch and heads his article "An Act of Justice." His act of justice, however, brings to mind the old saying, "Preserve me from my friends," for the Count's argument resumes itself as follows: "M. Deutsch is a Jew and I am a Jew-hater, but when one of these Jews, contrary to the custom of his race, tries to do some good, why should we not proclaim it." How flattered M. Deutsch must feel!

M. SANTOS DUMONT is still the hero of the hour in France, and his movements are recorded as if he were an Emperor. According to the latest account, he is going to take his balloon to the Riviera, where he intends to attempt to cross the sea in it and land in Corsica. Even more ambitious designs are said to be in his head, and a more powerful machine is already talked about destined to attempt to cross the Atlantic Ocean.

THE entries continue to roll in for the Paris-Vienna Race, and I see that Mr. S. F. Edge has come up to the scratch. Mr. Jarrott seems to have taken a fresh entry, and Mr. Frank Butler is down as No. 91. All the well-known makers are represented, including Mors, Panhard, Peugeot, Dechamps, Jenatzy, Mercedes, De Dion-Bouton, Darracq, Gillet-Forest, Clement, Bardon, De Dietrich, Deauville, Gobron and Dekert.

THE site chosen for the Italian motordrome is in the Monticharia district, between the Brescia-Mantone tramway and the railway line from Milan to Venice. The Brescia Motodrome will thus be served by both rail and tram. The length of the course will be thirteen kilometres, and the radius of the smallest curve about 600 metres. A straight four kilometres will lead to the winning post. Buildings will consist of sheds, the middle one of which will serve as a *garage*. The two adjacent sheds will have accommodation for over 100 vehicles. Another shed will contain sufficient plant to repair twenty cars at the same time. Here quarters will also be found for the skilled mechanics who will always be in attendance, bath-rooms, etc. The petrol supply will be kept underground and at a safe distance from all buildings. Spectators will find accommodation on a grand stand near the winning post. A luxurious hotel and restaurant with covered terrace will also be conveniently situated.

HERE AND THERE.

AT a meeting of the Lincolnshire Automobile Club on Tuesday it was decided to hold a club run from Lincoln to Woodhall Spa to-day (Saturday).

UNDER the title of the Kingston Motor Express Company, a company has been formed at 9, St. James Road, Kingston-on-Thames, for the purpose of facilitating the delivery of trade parcels in that town and the surrounding districts.

THE Piccadilly-Putney motor-bus service, which opened with a single vehicle barely a month ago, is steadily increasing its rolling stock. There are now four motor-buses on the road, and further important developments are expected within the near future.

THE Committee of the French Automobile Club have decided to award a silver medal to Madame Gobron, wife of the well-known automobile constructor, and who was the only lady having made, as a *chouffeuse*, the whole journey from Paris to Berlin in the tourist section.

THE Clipper Pneumatic Tire Company, Ltd., ask us to mention that any member of the trade or public purchasing French cars can obtain licensed Clipper-Michelin tires from the French agents, the Societe Francaise des Cycles Clement et Gladiator, 33, Quai Michelet, Levallois, Paris.

SOME interest was aroused in the courtyard of the Hotel Cecil, Strand, W., on Wednesday, by the arrival of an elegant electric landaulette. A few minutes later it left the courtyard with a party of ladies and a gentleman. We noticed Mr. Still at the helm, so presume that the vehicle was one of those built on his system.

THE Wolverhampton and District Automobile Club completed its season's runs on the 26th ult. The club has steadily progressed, and now has a membership of about forty. A great item in its favour is that it has successfully demonstrated to the district police the reliability and easy control of cars in traffic, with the result that they are very favourably inclined towards the movement.

A NEW departure in steam vehicles is, we hear, likely to be introduced in a short time. A 10 h.p. double-acting compound engine of the launch type will be used, steam being generated by ordinary petroleum in a flash boiler. Simplicity of design and easy management are being aimed at, the work being carried out under the patents of a well-known engineer in the Midlands.

AT a meeting of the Association of Municipal Corporations last week, the town clerk of Harrogate moved:—"That this association is of opinion that one uniform series of bye-laws should be adopted in boroughs for regulating the driving of motor-cars, and that it be referred to the Law Committee to consider the question, and take all necessary steps to give effect thereto." The resolution was carried by a large majority.

LIZURD BERG, the Danish Socialist representative, protested, at a recent meeting of the Folkething, concerning the order sent to the local authorities at Fredensborg to take no cognisance of the speed at which King Edward drove his automobile during his recent visit. The Minister of Justice answered that the dispensation given to King Edward was merely what every foreign Prince would receive while on a visit to that country under the usual ex-territorial rights.

THE Motor Power Company, Limited, have just received from the works one of their 1902 model Napier cars. As there are many points of interest in the vehicle, they ask us to mention that they will be pleased to show this car at 14, Regent Street, S.W., to any of our readers whom it may interest. Attention is particularly drawn to the new governor, which has greatly simplified the governing gear, and at the same time added to its efficiency, and also reduced the amount of petrol used per mile.

IN the *English Illustrated Magazine* Mr. George A. Wade tells the story of the motor-car, and with the help of several familiar illustrations shows the prominence enjoyed by automobiles in the early days of the last century. Hancock, James and Dance, receive most notice in the article, very little being said about Gurney's carriage, which, for some time, plied regularly between Gloucester and Cheltenham, and no mention is made of the work of Murdoch, Ogle and Heaton. The reproductions of some old prints are interesting.

CALLING in at the depot of the United Motor Industries, Limited, of Holborn Viaduct, E.C., the other day we were shown an induction coil fitted with a new form of trembler. The feature of the new device is the provision of a small auxiliary coil spring to the trembler blade, resulting in the production of a more regular spark. The coil which we inspected, and to which the new trembler is fitted, is of the three terminal variety. Combined with the terminals are small springs, so that the connecting wires are firmly held and cannot be shaken out by any jolting due to uneven roads. That the new trembler possesses advantages over the ordinary form is indicated by its adoption by Messrs. Bassé and Michel, the well-known makers of induction coils, for use in connection with electrical ignition. We understand that the United Motor Industries are in a position to fit the new trembler to any Bassé and Michel coil.

DUNKLEY'S gas motor-car, of which an illustration is given herewith, is fitted with a twin-cylinder gas engine, working on an adaptation of the Otto principle, and with a small compressing pump. The engine is

claimed to drive the car at an average speed of sixteen miles with a consumption of 30 feet of gas per hour; and 30 cubic feet of gas will compress in the storage cylinders under the car a supply of 150 cubic feet of gas, sufficient for at least five hours' travelling. The car is fitted with two forward speeds and a reverse motion. The width of the vehicle is 36 inches over all, so that the car can pass through an ordinary doorway. We are promised a run on this car shortly.

A SPECIALLY powerful vehicle (24 h.p.) has been built by the Daimler Motor Company, Limited, for the Duke of Santo Mauro.

MOTOR-CARS were employed as the means of conveying voters to the polling stations at the municipal elections at Wolverhampton on Friday.

FOR some time past an electric delivery-van has been used by the Saxon postal authorities in Dresden, to obtain quicker delivery for the parcels post.

THE Kingsland Manufacturing Company, of 'Doweras' Buildings, Dalston, N., are about to put a new motor on the market suitable for motor-bicycles.

WE learn that an Aeronautical Institute and Club is in course of formation in London. Those interested are invited to communicate with Mr. L. Senecal, Hon. Sec., 14, Stayton Street, Chelsea.

THE French Chamber has voted urgency for a motion making it an offence punishable with from six days' to two months' imprisonment for the driver of an automobile causing an accident to attempt to make off.

WHILST a motor-car was being driven along Kennington Road, S.E., one day last week, one of the wheels came off, and the occupants, Mr. and Mrs. Plush, were thrown out. Mrs. Plush sustained a serious scalp wound, but her husband escaped with a severe shaking.

It has transpired that certain members of the burglar fraternity in Paris are making use of motor-cars in more than one part of the city. On Sunday last three of these gentlemen drew up in front of a well-known shop, and, having effected an entrance, carried off in their car about £100 worth of goods.

ACCORDING to *Commercial Intelligence* there is an immense future for the development of motor-van traffic in Italy. Ten days is the average time for goods by a slow train from Milan to Genoa, a distance of one hundred miles. Motor cars that could do the distance there and back in twenty-four hours would never lack a full load.

THE bridge over the River Nene at Sutton Bridge, connecting Lincolnshire and Norfolk, which is the joint property of the Great Northern and Midland Railways, has hitherto been subject to tolls in respect to ordinary road traffic. After long agitation the local authorities have agreed to pay £7,000 to the railway companies as compensation for freeing the bridge.

MR. E. A. GORTON, of Earlsdon Works, Coventry, is now making a speciality of motor repairs. This should be welcome news to the many users of Beeston tricycles and quads up and down the country. In 1896, when motoring was in its infancy, Mr. Gorton drove a 1½ h.p. Beeston tricycle from London to Brighton and arrived fifth, the only one of English make to arrive.

"ARE you de gemman dat said 'de hoss mus' go?' asked the coloured man. "I am," answered the man with the leather coat and a face mask, who was an enthusiast on the subject of mechanics. "Well, sub, I jes' desiahed to take de liberty o' say-in' dat I has de balkies' animal dat ever blocked a street, jes' aroun' de corner. I sho'ly would be much oblige ef you could come aroun' an' prove yoh words."—*Motor World*.

A CURIOUS accident occurred recently at Banchory, resulting in injury to John Eaton, a young engineer who was driving with others in a motor-car. The car had failed to work properly and Eaton had gone behind it with the intention of pushing it forward. While in the act of doing so the car suddenly moved backwards, knocking him with great force against an adjoining wall, between which and the step of the vehicle one of his legs was severely bruised at the knee.

AT a recent meeting of the Northfleet District Council the Surveyor called the attention of the Works Committee to the high speed at which motor-cars, plying between Gravesend and Northfleet, were driven along the streets opened up by the tram-

way company during the construction of their new line, and more especially round corners. The clerk was directed to caution the owners of the cars, and to request the Inspector of Police to keep them under observation.

THE largest automobile parade ever held in America started from Madison Square Garden, New York, at eleven o'clock on October 11. There were over one hundred electric motor-cars, carrying about three hundred and fifty persons. The parade was organised by Mr. H. Sanderson, president of the New York Electric Vehicle Company, as a compliment to the wives and friends of the American Street Railway delegates, then holding their annual meeting.

At the quarterly meeting of the Radnorshire County Council last week Mr. Hamer proposed that a resolution should be sent to the Local Government Board expressing the opinion that it was desirable that regulations should be made to more effectually control reckless motor traffic on the highways. At the suggestion of the vice-chairman a rider was added, "and to secure the competency and identity of the driver in charge thereof." The motion as amended was unanimously agreed to.

It is understood that the German military authorities are well satisfied with the work done by the automobiles during the recent manoeuvres. Seventeen cars were in use, and all worked well. In case of war a large number would be bought, or "commandeered," for the generals in command and their aides-de-camps. Less satisfaction is expressed concerning the steam-wagons used for the conveyance of commissariat and ammunition. The roads were very bad and the tests unusually severe.

At the monthly meeting of the Sherburn Rural District Council held at Scarborough last week, Sir C. Legard, Bart., moved a resolution to the effect that the Council were of opinion that all light locomotives should be registered for the purpose of identification, and should be numbered or otherwise marked, and that such expression of opinion should be sent to the Home Secretary and the Local Government Board with the opinion that regulations were desirable in this direction.

LA SOCIETE D'ETUDES DES MESSAGERIES AUTOMOBILES, of Tunis, recently finished a successful tour with one of its cars—a Panhard—from Sfax *via* El-Djem, Ksoursef, Melidia, and Moestaur to Soussa. In spite of the almost insurmountable difficulties of the route, which is nothing more than a camel track between El-Wjem and Ksoursef, the automobile made the journey in excellent time. From Melidia to Soussa (79 kilometres) the time occupied on a dark night with a defective light was two hours and forty minutes.

At a meeting of the Kingsclere Rural District Council, Sir Alexander Arbuthnot, after a discussion on the furious driving of motor-cars, moved, "That the Council recommend the desirability of enabling the magistrates to enforce the law by empowering them in aggravated cases to imprison the offender without the option of a fine." The motion was defeated by five votes to four. One of the members gave notice that he would at the next meeting move the appointment of a Committee to decide in what way the Council could best word a recommendation to the Local Government Board on the matter.

WE learn that Messrs. Dennis Bros., Limited, of Guildford, have commenced the erection of a three-storeyed factory which, when completed, will give them an additional working area of 14,000 superficial feet, and admit the employment of over 150 workmen. The new factory is already partly erected, and will be completed in time for next year's trading, it being the intention to use it solely for the manufacture of Speed-King motors. Special arrangements are being made for a coach-building department, in which every description of motor-car body will be turned out painted and upholstered. Messrs. Dennis have been experimenting for some time with a 12 h.p. double-cylinder four and six seated car of their own make, and, after numerous trials, they have decided to give this a prominent place among their productions for next year. They are also building a four-seated *tonneau* car fitted with an 8 h.p. genuine De Dion engine.

THE CRUSADE AGAINST UNREASONABLE PERSECUTION.

IN continuation of his communication to us last week upon this matter, Mr. Moffat Ford, of 168, Shaftesbury Avenue, writes us this week as follows:—

"I have now the pleasure of informing your readers, and the motoring and cycling public generally, that matters have so been arranged that the Brighton road, *via* Redhill and Horley, will be safe for motoring and cycling on Saturday and Sunday next. Last Saturday I succeeded in locating and photographing an ambush of police near Merstham, and I hope to be able to send you prints shortly, which I think your readers will find amusing and instructive. Moreover, our patrol car was the means of warning several motor-cars, and many more cyclists, of the bad nature of the road, whose drivers and riders, respectively, seemed to be duly grateful for the expense to them thus obviated. In conjunction with several automobile friends, therefore, I have inaugurated the 'Brighton Road Motor Patrol,' whose duty it will be for several weeks to keep watch and guard over the road between London and Brighton; whose cars will be distinguishable by a flag bearing the letters B.R.M.P., and whose officials may be distinguished by their red rosettes. They will also be furnished with a supply of smaller red flags or cards with which cyclists or motorists will be supplied upon a small payment. These red flags or cards will have on them a large white P, which naturally signifies 'Patrol,' and if, in the course of their journey, they would display this initial to passing cyclists and motorists, I have no doubt that the latter will understand its significance.

"I have said that the Brighton road will be safe, by which I mean that before arriving from either direction at parts of the road with bad surfaces, where driving at an excessive speed might be attended with unpleasant consequences, such as delay and subsequent expense, cyclists and motorists will observe the red flag of the Brighton Road Patrol Motor, whose officials will then signal to them to stop and will inform them of the nearest mile-stone to which the danger lies. For these services, a payment will be requested of 1s. for every cycle and 2s. 6d. for every motor car, for which a receipt will be given which will frank the recipient through the patrol at any other point of the road. Proper accounts will be kept of the items thus received, which will be laid before a committee at present in course of formation.

"It has been brought to my notice that the habit is increasing in country districts, of leaving horses attached to tradespeople's vehicles unattended in the roadway. Curiously enough, this is particularly noticeable in the town and vicinity of Reigate. The patrol last Saturday discovered several instances of this nature and forthwith secured the names and addresses of the offending parties, against whom summonses will be issued in

due course. The patrol next Saturday will be alive to the situation in this respect, and automobilists may be sure that such flagrant negligence as this will not be allowed to pass unobserved.

"The Brighton Road Motor Patrol will start from Shaftesbury Avenue sharp at eleven o'clock to-day (Saturday). There is still plenty of work to do for one or two more cars and cameras, and I should be delighted if any automobilists, who can spare the time on Saturday or Sunday, will turn up at that time and be prepared to accompany us."

THE M. M. C. 7 H.P. LIGHT CAR.

WE are able this week to reproduce drawings of the Motor Manufacturing Company's new light carriage which gained the highest number of marks in its class at the recent Glasgow Reliability Trials, and which is now being constructed in large numbers in anticipation of next season. Built

upon a tubular frame of special design, this carriage is provided with a two-cylinder governed vertical motor, constructed upon the Panhard system. The engine, developing 7 h.p. at a normal speed of 720 revolutions per minute, is carried under a bonnet in the fore-part of the frame. In front of it a radiator finds place, thus ensuring the perfect cooling of the circulating water. A rotary pump, provided with a spring balance to compensate vibration, and driven off the engine fly wheel, ensures efficient water circulation.

The motive power is transmitted to the rear or driving wheels by cog-gearing—the wheels of which are always in mesh—and roller chains. Three variations of speed and reverse are provided. Wooden road wheels with artillery hubs are fitted to the car, the rear wheels measuring 36 inches and the front 30 inches. All are fitted with Michelin-Clipper pneumatic tires. The worm and segment type of steering is employed. Band brakes are fitted to the sprocket

rings, and a similar brake acts upon the differential shaft. Practically any type of carriage body can be attached to the motor and frame, but the manufacturers themselves usually fit the *tonneau* and "Chariotee" designs. We understand that the Company have already received a very considerable number of orders for the new car.

DURING the month of August there were exported from the United States motor vehicles and parts thereof to the value of £11,260.

THE High Wycombe policeman who placed a scaffold pole across the roadway to impede the progress of passing automobilists has found an imitator in the United States. The village authorities of Winnelka, Ill., have placed a cable across the road to prevent the speed of automobiles exceeding nine miles an hour,

ELEVATION AND PLAN OF M. M. C. 7 H.P. LIGHT CAR.

THE LIVERPOOL SELF-PROPELLED TRAFFIC ASSOCIATION.

A MEETING of the Liverpool Self-propelled Traffic Association was held on Friday last week at the rooms of the Liverpool Chamber of Commerce, for the purpose of receiving the report of the Judges of the recent trials of heavy motor-vehicles. There was a large attendance, including Mr. Walter Long, President of the Local Government Board. The chair was occupied by Mr. G. H. Cox, who stated that the subject of motor traffic was very important, both locally and nationally. Abroad and in the United States transportation was very much cheaper, both by rail and water carriage, than in this country. One of the things we were suffering from in our international trade was the great cost of transportation in this little island. The chief obstacle to the adoption of motor-wagons was the three-ton tare limit. It had fallen to his lot to propose at the meetings of the Associated Chambers of Commerce a resolution in favour of the increase of tare. This was almost carried unanimously; in fact, there was never any discussion, nobody thinking it worth while to say anything against it. He hoped Mr. Long would remember that when he came to consider this subject.

Professor Hele Shaw, as one of the vice-presidents, then presented the Judges' report, which is referred to elsewhere in the present issue.

Mr. E. R. Calthrop also submitted a report, and remarked that the recent trials had made it possible to arrive at a practical and increasingly efficient solution of the question of cheapening the cost of goods carriage. It was now open to any large manufacturer or merchant to adopt mechanical haulage, about which there was no monopoly or close corporation. The railway companies themselves were beginning to use it, and the arbitrary regulations in force had no longer any rational support, although at the beginning of the movement they might have served a useful purpose.

Mr. Max Muspratt moved a vote of thanks to the Judges. In expressing regret at the absence of Mr. A. L. Jones, the Chairman, and Mr. Shrapnell Smith, the Hon. Secretary, he accounted for the non-appearance of the latter by saying that he was one of the chief witnesses in an important legal action in London. If "motorage" succeeded, as it must succeed, the country would owe a deep debt of gratitude to the Judges, who had done so much without recompense. Mr. Salisbury, in seconding, spoke of the vast labour bestowed on the trials by the Judges, and of the immense progress which had been made in motor-building. He had been instructed by the Postmaster-General to watch the trials, and as a result it was in contemplation to use in that district a motor of the pattern of one of these employed in the trials.

Mr. H. H. West, in acknowledging the vote on behalf of the Judges, said that the merits of the competitors in the trials vastly increased the Judges' labours, and had the motors not been separated in classes their difficulties in arriving at which was the best vehicle would have been even greater. Although the motor-wagon for heavy traffic could not be fully developed under the present state of the law, yet there were now produced vehicles which could render useful, efficient, and needed service, and which, by great skill and leaving off the last coat of paint, could be managed to be squeezed within the tare limit. If this movement was to accomplish what was expected, restrictions must be removed, except perhaps the limit of total load per unit of width of tread.

Mr. Long began his address by premising that in any remark he was about to make he expressed only his individual opinions, and did not speak as a member of the Government. The report of the Judges would form very valuable material in helping the Local Government Board to arrive at a just conclusion on the subject. Those present had all made up their minds and looked upon the question from an instructed point of view, and were keen advocates as to the wider limitations in the law which, they thought, were necessary in order that their industry might be successful. On that question, however, as on most others, people were not all of one mind; indeed, since he took up his present office he had received, and continued to receive, quite as many declarations against any change in the law as he had received in its favour. It was, therefore, idle to ignore the fact that there was considerable prejudice yet to be removed and of instruction still required. Changes in the law in the direction advocated by the association could not, therefore, be carried out without some considerable difficulty and without meeting with no inconsiderable opposition. To be perfectly frank with them, he did not think that the users of motor-vehicles, whether for trade purposes, or light ones for pleasure, were altogether free from blame. His own position in dealing with the question would be much easier were it not for the fact that there were constantly coming before him cases of the unwise use of some of the powers possessed by the new inventions. He most earnestly begged of the association to impress by all means in their power upon those using either heavy or light motors to do their utmost to remove such prejudices. He was himself one of those who firmly believed that this new form of traffic was not only a great and startling invention, but that it had come to stay, and the question he himself respectfully asked of those opposed to it, and who were afraid of its development, was, could they hope to stop by any means whatever the development of an industry so important to the national welfare? Were it only a question of increasing the tare, he did not think there would be much difficulty about it; but it was not only a question of tare or width of wheels, but whether they could in any legislation deal only with the heavier motor-cars. Those who used the lighter class of motors for pleasure purposes often found the restriction as to speed irksome in the greatest possible degree. They found the regulations interfering with what they regarded as a legitimate use of the machine, and he (Mr. Long) was bound

to say, from very careful examination of the subject, that the law as it now stood was calculated to make law breakers instead of law observers. The restriction of speed to so many miles an hour exposed the driver to be summoned on evidence that was not of an altogether satisfactory character, although it might be perfectly genuine. At the same time, from the point of view of those whose business it was to enforce the law, they had a difficulty of the most acute kind to exercise as to whether the pace was within or without the limit of the regulation. He was aware that any suggestion to remove regulations of that kind would meet at once with a storm of opposition in many quarters. It might, however, be possible to deal solely with the question of heavy traffic, keeping it by itself. Speaking with some reserve, he did not think there would be the same strong opposition to proposals for amending the law with regard to the heavier traffic as to the other. The Automobile Club had been extremely useful and very courteous in getting information for him on the subject, and as one who had been for some little time connected with Liverpool, he was proud that that city had been foremost in this work of promoting trials which had been of enormous benefit. The report of Mr. Willeocks, who attended the trials on behalf of the Local Government Board, was altogether satisfactory from their point of view. The report would give him additional material, and he assured them he would approach its consideration with an impartial mind, and one fully alive to the advantages of the new form of traffic to trade, commerce, and agriculture, and with a desire to remove restrictions where they could be done without injury and injustice to the general community.

Mr. Long was cordially thanked, on the proposition of Mr. A. F. Warr, M.P., and the proceedings concluded with a vote of thanks to the Chairman.

THE LIVERPOOL HEAVY MOTOR-VEHICLE TRIALS.

AFTER much work the judges of the Heavy Motor-Vehicle Trials, held by the Liverpool Self-Traffic Association, in June last, have at length completed their labours, and a copy of their report now lies before us. It is a most complete work, and extends to about 176 pages. The divisions of the report are:—(1) Origin of the Competition; (2) General Arrangements; (3) The Competing Vehicles; (4) Summary of Particulars; (5) General Account of the Trials; (6) Manœuvring Results; (7) Hill-climbing Records and Curves; (8) Summaries of Log-sheets; (9) Costs of Working; (10) Awards; (11) Conclusions. Practically every point is touched upon. The complete report, which can be obtained from Messrs. Winstanley and Watkins, of 16, Cable Street, Liverpool, at a cost of 10s. 6d., should prove a useful work of reference to all interested in heavy motor traffic, it being elaborately illustrated and full of very valuable information, calculations, and tables. We have already published the awards in respect of the Trials, so that it only remains for us to give the judges' "Conclusions," which are appended.

CONCLUSIONS.

Progress since 1898.—We observe a gradual and marked improvement in the construction and behaviour of Heavy Motor Traffic Vehicles since the first trials held three years earlier than the present competition, and we now consider that reliance may be placed upon the systems, to which gold medals have been awarded, for regular employment in general haulage operations where due care and supervision are exercised. We consider that the system to which a silver medal has been awarded will give satisfactory results, subject to the points named in connection with the awards.

Internal Combustion Engines.—The two light vehicles propelled by internal combustion engines using petroleum spirit (0.680 sp. gr.) are the first examples of this type which have taken part in the Liverpool trials. They behaved satisfactorily in all respects, and their chief drawback is the heavy cost of fuel per ton-mile compared with that of solid fuel in a steam propelled vehicle. But where ability to travel considerable distances at average speeds of from six to eight miles an hour, with loads not exceeding two tons, is a factor in determining the motive power to be adopted, the higher cost of fuel may be more than compensated for. These vehicles were not seen to the best advantage during the trials, as they were held back at intermediate depots to let the heavier vehicles catch up. When internal combustion engines can use ordinary mineral oil, petroleum or paraffin, under the varying conditions imposed by road locomotion, without creating a nuisance, their wide adoption is assured, because the cost of fuel will then come within the range of commercial conditions for road transport.

Fuel.—Solid fuel was used by the six steam vehicles which went through the competition. The gas coke supplied to the Association proved very soft and contained fourteen per cent. of ash. Its low quality and the crumbling which occurred on the runs must be taken into account in conjunction with the recorded consumptions.

Town Haulage.—No risk of fire need attach to a motor-vehicle by reason of discharges from the fire by the funnel, as the effective baffling of sparks, small cinders, and dust, has been accomplished without interference with combustion. No nuisance need arise from the blowing-off of steam, as the firing is under control while waiting for a load or while standing from other causes.

Distance Haulage.—The performance in ton-miles per working day depends very largely on the facility with which loading and unloading can be carried out. In good weather a motor-vehicle can average five miles an hour on the road which, in a shift of twelve hours, leaves four hours for meals and the collection and delivery of goods, with a journey of forty miles between the terminal points. In wet weather, and during

portions of the winter, it will be advisable to reduce the speed or load according to circumstances. During the trials, voluntary delays occurred at, and late departures were made from, the starting-points in order that the competing vehicles might be seen and examined by business men during business hours. We are of opinion that the three components of transport work, viz., collection, conveyance, and delivery, may generally, where the total mileage does not exceed forty-five miles, be completed within twelve hours.

Maintenance.—The standardising of construction has rendered maintenance a less difficult matter since the 1898 trials took place, as users can stock spare parts or obtain immediate delivery of them from the builders. Renewals can be effected without delay and without laying up the vehicle, while work proceeds on the making and fitting of the worn or defective parts of the mechanism. Improvements in the methods of suspension, e.g., the Coulthard spherical bearing, have reduced the strains and twisting movements. Such contrivances will contribute to a reduction in the cost of upkeep. It is probable that carelessness on the part of drivers, particularly in running the water low in the boilers when climbing long hills, with resulting damage to joints and tubes, will be one of the most serious factors in the cost of maintenance and one not easily estimated. There is no apparent reason why automatic arrangements should not be made to prevent damage arising from this cause, a cause which does not exist in the case of boilers of the "flash" type. Taking into consideration the imperfections of common roads, and the fact that users will take advantage of any structural improvements in the vehicles by working them harder than before, we think it will be necessary, apart from accidents of an exceptional nature, to allow not less than £75 per annum per vehicle for repairs and adjustments, when working a single shift of twelve hours per day, even where the mileage is regulated with discrimination according to the roads travelled over. We note with satisfaction the attention which has been paid to our recommendations of 1899 in respect of lock-nuts, cotters, collars, split-pins, and the effective keying of wheels and pinions, and the improvements in this respect account for the absence of annoying minor accidents which were so noticeable in the previous competitions.

Manœuvring.—The fact that a motor-vehicle can travel backwards with great facility will prove of considerable advantage for entering and leaving many loading-ways, as compared with a horse-drawn vehicle, the capacity of which for backing and manœuvring is limited by the strength of the shaft horse and the skill of the driver in securing the leverage obtained by moving the fore-carriage about one wheel as a centre. The vehicles to which medals were awarded, particularly the one which took up its position in the embayment in one movement, excelled in performance those competing in 1899. They are certainly "capable of going anywhere that a horse-drawn vehicle carrying the same load is ordinarily required to go, and of being placed in the same positions and withdrawn therefrom without external assistance."

Hill-climbing.—The tests at Everton confirmed the results of 1899, viz., ability to start and stop, both up and down hill, on a gradient (set pavement) of 1 in 9, with the improvement that every vehicle possessed sufficient adhesion to start promptly from rest, laden or unladen. Short lengths of road as steep as 1 in 8 were included in the distance runs on two days, and were climbed without difficulty fully laden.

Control.—The powers of control possessed by the driver of a motor-vehicle are particularly evident in manœuvring, and on hills, and are superior to those exhibited by the best types of horse-drawn vehicles. In descending steep hills, the normal speed can be maintained without locking a wheel or using a slipper.

Operating Gear.—The tendency of builders to provide that vehicles must be stopped before a change of gear can be effected is to be commended. Compared with 1898 and 1899, the disposition of the various levers and valves is generally satisfactory and convenient for easy manipulation, though each maker has particular methods of arrangement, the aim clearly being to fit the machines for operation by unskilled drivers. The most frequent attention is given by drivers to stoking at short intervals. Much of this watchfulness would be obviated by the adoption of automatic firing, on some system similar to that fitted to one of the vehicles described in the report where the construction of the boiler admits of such an addition.

Gearing and Transmission.—Improved forms of both tooth and chain transmission, e.g., the Thornycroft bell-crank drive and the Spurrier flexible chain pinion, were employed with corresponding advantage to each system, but the general absence of adequate, dust-proof, oil-retaining casings between the last countershaft and the driving axle, or wheels, is a matter calling for further consideration in design on the part of the makers. The several methods of locking the compensating gear were satisfactorily tested on more than one occasion during the trials.

Wheels.—Although the design of the driving wheels, which gave rise to the principal troubles in 1898, is now such as to render them structurally efficient, signs of undue stress, the results of the heavy shocks and vibration experienced on sets and rough roads, were not altogether wanting in the spokes and felloes of some of the wheels, which indicates that some practical means of absorbing these shocks is desirable. With reference to the recommendations made subsequently with regard to the increase of tare weight and the width of tires, we have to point out that the damage to road surfaces, commonly alleged as an objection to the increase of axle-load, cannot occur when the width of tires is in proportion to the load upon them, and further that the increase of load on wheels with a corresponding increase in width is, on the contrary, of direct benefit to the roads, as is demonstrated by the action of the ordinary steam-roller.

Legal Restrictions.—The present tare limit of three tons has again proved to be too low if loads of above five tons are to be dealt with, even under favourable conditions, upon a single platform. Whilst one of the competing vehicles carried as much as five tons during the trials, with a tare weight of slightly less than three tons, this load will be excessive for the same vehicle in winter or wet weather, and an average load of four tons is probably the most that can be carried regularly having due regard to the life of the machine. Such a vehicle could also haul three tons on a trailer, under favourable conditions, in addition to the load of four tons carried on its own platform. This third series of trials has not, therefore, resulted in the bringing to light of any new fact to indicate that the present three-ton limit of tare will meet the requirements of the trade of the country, or that improvements in design will enable builders to comply with it. While ten-ton loads are by no means unusual on the larger horse-drawn lorries, it is clear that as the demand for such loads exists their haulage by motor-wagons should not be prevented by legislation, and the present trials indicate that there is nothing to prevent such loads being transported.

It is to be noted that no difficulty has arisen in the United Kingdom in respect of the running of individual motor-wagons weighing between three and four tons unladen, of which over one hundred are working at the present day. At the same time, seeing that these vehicles are employed on sufferance only, the urgency for an increase of the tare limit by the legislature is even more pressing than before, and for the following principal reasons:—

- (a) Foreign countries and the United States of America have no such restrictions, and are building more serviceable vehicles for their own use and for export to the colonies;
- (b) A promising British industry is held back owing to uncertainty as to the lines of development;
- (c) The trade of the country is deprived of the full benefits to internal communication which it was thought the Act of 1896 would confer;
- (d) The development of motor-wagons for purposes of military transport, both for the regular and auxiliary forces, is seriously hampered, with resulting continual excessive expenditure on horse haulage;
- (e) Motor traffic is placed at a disadvantage compared with horse-drawn traffic, in many parts of the country, through being prevented from dealing with equally heavy loads per vehicle;
- (f) There is a present temptation to builders to reduce strength in parts of their machines, and cut down factors of safety, in order to comply with an arbitrary limit which has no real or useful significance now that it has been tentatively tried and proved wrong;
- (g) The limit being placed only on the tare of the vehicle, equal total moving weights are legal or illegal according to the proportion which the tare bears to the gross weight.

We recommend:—

- (a) That a limit of sixteen tons total moving weight, for any single motor-vehicle, shall be substituted for the present limit upon the tare alone;
- (b) That there shall be a minimum width of one inch of tire per wheel for each twelve cwt. of maximum total load upon it at any time;
- (c) That the width of tires for vehicles having a total moving weight (laden) of less than eight tons shall continue to be regulated by Article II., Section 3, of the Light Locomotives on Highways Order, 1896;
- (d) That since no inconvenience follows from the absence of restrictions as to the width of horse-drawn vehicles no restrictions should be placed on the width of motor-wagons.

Commercial Requirements.—We consider that several makers are now building upon lines which closely meet the requirements of trade in large manufacturing and distributing centres. It is possible to carry loads of up to seven tons, and haul up to three tons on a trailer, by using vehicles similar to the one exhibited in Class C of the competition, and such haulage may be undertaken with confidence subject to the provisions of the 1896 Act affecting the tare weight, but commercial requirements will not be fully met until loads of ten tons can be carried on one platform. We consider the vehicles which competed in Classes C and D well suited for export.

Future Trials.—We lay this report before the members of the Association and the public, with a full sense of the thorough manner in which the three series of Liverpool Trials have been conducted, and of the completeness of the data now available, owing to the assistance of the honorary observers and the organising powers of the honorary secretary, whose abilities and energetic services cannot be sufficiently recognised. We are of opinion that it will be unnecessary to organise trials on such a comprehensive scale for some time to come. As other wagons of interesting construction and extreme ingenuity failed, from the causes indicated, to go through the competition, and others were not completed in time to take part, trials of these and new types of vehicles can easily be conducted separately, and the reports, of which this is the third, will furnish a basis for sound and trustworthy comparisons as to the performance of any later vehicles.

TRACTORS FOR MILITARY PURPOSES.

It being essential that Tractors for military purposes should be capable of a much greater radius of action, without replenishment of fuel or water, than is at present attained by any such engines constructed for either military or commercial purposes, the Secretary of State for War has decided to offer prizes as under for the best Tractors meeting the requirements mentioned hereafter:—

First prize	£1,000.
Second prize	£750.
Third prize	£500.

1. To each prize will be added a bonus of £10 for every complete mile, beyond the minimum of 40 miles required by paragraph 2 of the "Requirements," that the Tractor awarded such prize can travel under the conditions therein described. The total amount of this bonus shall not exceed the value of the particular prize to which it may be added. 2. The trials, which will be conducted by the War Office Committee on Mechanical Transport, will commence in the Spring of 1903, and will extend over a considerable period, so that the Tractors may be thoroughly tested. The exact nature of the trials will be determined upon by the above Committee. A general scheme will be drawn up and issued to all competitors, but the Committee reserve to themselves full powers to carry out any additional tests that they may deem necessary, whether included in the general programme or not. The Committee reserve to themselves the power of rejecting any Tractor which does not comply with the requirements published herewith, or of suspending, at any stage, the trials of any Tractor which in their opinion has proved itself unsuitable. 3. The decision of the Committee on all matters connected with the competition shall be final. 4. Forms of entry will be supplied on application to the Secretary, Mechanical Transport Committee, War Office, Horse Guards, Whitehall. Firms or individuals who intend to enter must send in these forms, duly completed, to the Secretary, not later than 1st January, 1903. 5. No Tractor will be admitted to the trials unless a fully dimensioned set of drawings, and a specification, giving complete details, exactly as submitted for trial, together with a statement of the purchase price, have been lodged with the Secretary, Mechanical Transport Committee, before the commencement of the trials. 6. A firm or individual may enter more than one Tractor, but the conditions of paragraphs 4 and 5 must be complied with for each separate machine entered. 7. His Majesty's Government to have the right of purchasing all or any of the competing Tractors at the price stated by the competitor under paragraph 5. 8. All designs and specifications lodged under paragraph 5 will be considered confidential, and those of the Tractors that may be purchased will be retained for the purposes of the Government, but without prejudice to patent rights. Those of the Tractors not purchased will be returned to the competitors after the trials.

STATEMENT OF REQUIREMENTS OF TRACTOR FOR MILITARY PURPOSES.

1. Not to exceed a gross weight of 13 tons when fully loaded with all its fuel and water, and with all stores necessary for its proper manipulation on the march, and must be independent of any extraneous machinery for the supply of its motive power.

2. To be capable of hauling a gross load of 25 tons for not less than 40 miles over ordinary roads, having, so far as may be possible, grades not exceeding, approximately, 1 in 18, at an average speed of 3 miles an hour without at any time exceeding a speed of 5 miles an hour, using only the fuel and water that can be carried on the Tractor itself, without being replenished during the journey from either a separate vehicle or from any other source, and, in the case of a steam-engine, without reducing the amount of water in the boiler below a safety level to be fixed upon by the Committee.

3. To be capable of hauling a gross load of 12½ tons along a good level road for a distance of not less than 1 mile at a speed of 8 miles an hour.

4. To be capable of hauling a gross load of 12½ tons up a slope of 1 in 6 (for this test the Tractor can be fully loaded with fuel and water).

5. To be so designed and constructed that it shall be capable of travelling on all classes of roads and over rough ground without excessive wear and tear or injury, either from shock or from any of its lower portions striking obstacles projecting from the surface of the ground, or from the wheels sinking into the ground in soft places, or from other causes, and to be capable of being driven through water 2 feet deep without its motive power being seriously affected.

6. To be capable of being driven either ahead or astern.

7. To be fitted with efficient brakes on all driving wheels.

8. To be efficiently spring-mounted on all axles.

9. Provision must be made for rapidly locking together each or every pair of driving wheels.

10. To be capable of being steered by one man, and entirely controlled and manipulated by not more than two men, who must be placed in convenient positions for the work they are required to do.

11. To be provided with adequate covering to protect the men from the weather.

12. The handles, levers, or other arrangements for controlling the mechanism to be so arranged that the Tractor may be driven either ahead or astern, changed from one speed and from one direction of movement to another, steered, have brakes applied, and have any oiling or adjustments, necessary whilst travelling, carried out without the driver or assistant (if employed) leaving his normal position.

13. Proper arrangements to be made that no part of the machinery be liable to damage from mud or dust. When casings are used these should be dust proof, and readily removable for inspection and repair.

14. To be fitted with a winding gear, carrying 75 yards of flexible galvanised steel-wire rope, 2½ inches in circumference, the breaking strain of which must not be less than 15 tons, with suitable leading sheaves arranged so that a fair lead may be obtained for the rope from the drum to either the forward or after end of the Tractor, and from thence in any direction within an angle of 90 degrees on either side of the fore and aft centre line of the Tractor. The winding gear to be arranged so that the wire rope can be paid out from the drum whilst the engine is moving ahead.

15. The driving wheels to be not less than 6 feet 6 inches in diameter, nor less than 18 inches wide across the tires.

16. To prevent the Tractor being stopped by its weight being taken on under surfaces, should the wheels sink into the ground, the clearance between such under surfaces and the ground must not be less than 18 inches.

17. Not to exceed the following outside overall measurements:—Height from the ground level—for the fixed parts of the engine, 9 feet; for removable parts, such as chimney, roof, etc., 12 feet. Width, 7 feet 4 inches. Length, 20 feet.

18. No restrictions are placed on nature of fuel or class of engine, whether steam, internal combustion or otherwise, except that oils having a flash point of less than 75 degrees F. (Abel's close test) must not be employed.

19. As the Tractor is intended primarily for hauling purposes, it is not essential that a fly-wheel should be provided from which machinery can be driven by a belt, but if a fly-wheel is fitted it must be made of steel.

20. No armouring need be arranged for.

21. In the case of steam-engines—(a) The boiler must be of any form or material, but the construction must be such that it will comply with the requirements of the Manchester Steam Users' Association. Boilers normally working at exceptionally high pressures are not desirable. (b) The boiler must be so designed that it can be easily washed out. (c) An efficient arrangement must be fitted for preventing the emission of sparks from the chimney. (d) The boiler feed apparatus must be in duplicate. (e) A reliable water lifter for filling the engine tanks must be fitted. (f) If coal fired, means must be provided to deal with fuel that clinkers freely, and the grate area must be sufficient to enable coal of a very inferior quality to be used. (g) If condensing apparatus is employed, it must be substantially constructed, and not liable to damage from vibration or to be clogged up by dust. (h) If a condenser is used means must be provided for properly filtering the lubricating oil, if any, used in the engine, from the condensed water before returning it to the boiler.

22. If internal combustion engines are used, it is desirable that means should be provided for starting the engine, putting it into gear, and starting the load without noise or shock.

23. If friction clutches are used, the material forming the working surfaces of the clutch must be such that it will not require frequently renewing, and provision must be made that the clutch can be easily adjusted on the road.

24. If liquid fuel is used means must be provided for rapidly filling the tanks on the Tractor.

In considering the merits of competing vehicles, special importance will be paid to the following points:—(a) Distance over which a gross load of 25 tons can be hauled at 3 miles an hour with the fuel and water that can be carried on the Tractor without replenishment. (b) Prime cost, having due regard to efficiency. (c) Economy in working and maintenance. (d) Ease of steering and manipulation. (e) Simplicity of design, accessibility of parts, and the readiness with which repairs can be effected, or worn parts replaced on the road. (f) Absence of noise, vibration, smoke, or visible vapour. (g) The means by which the working parts are prevented from being damaged by mud and dust. (h) Capability of working with fuels varying in description and quality.

LOCOMOBILE OR LOCOMOTIVE.

As briefly mentioned in our last issue, Mr. Arthur Sharpe, of St. Helens, Byfleet, appeared before the Kingston County Bench to answer three summonses charging him with being in charge of a locomotive, and not having a licence for the same, with driving it at a greater speed than four miles an hour, and with failing to employ two men to control the locomotive. Mr. T. W. Weeding prosecuted on behalf of the Surrey County Council, and Mr. Staplee Firth defended on behalf of the Motor Union. Mr. Weeding said the question the magistrates had to decide was whether the locomotive in question was a traction engine or an ordinary motor-car exempt from the regulations affecting traction engines. He was the deputy clerk to the Surrey County Council, and was the chief witness in the case. On October 8th he was cycling through Walton, when he overtook the defendant driving a "Locomobile" car. There was a great cloud of steam coming from it. He contended that the vehicle was not an ordinary light locomotive or motor-car within the meaning of the Act of 1896, which stated "that no smoke or visible vapour shall be exhibited, except from some temporary or accidental cause." Mr. Firth observed that if the summonses were upheld there were about five hundred cars of this particular pattern that would be stopped. He ridiculed the idea that this light locomotive, which was only half a ton in weight, should be subject to all the restrictions of a ponderous traction engine. Something went wrong with the safety valve, which accounted for the temporary emission of steam. The Chairman said the Bench found that steam was escaping, but they were of opinion that it was due to an accident, and the summonses would be dismissed.

THE GLASGOW RELIABILITY TRIALS.

Mr. S. F. Edge writes:—"I was exceedingly sorry to see in your last issue a letter from Mr. Astell finding fault with the judges who gave the awards in connection with the recent Glasgow Trials held under the auspices of the Automobile Club. Surely if he objects to them it should have been prior to the competitions and not afterwards. Possibly he is quite right in many of his contentions, but I do think that he should recognise that the names of the judges place them above all suspicion so far as the genuineness of their opinions are concerned. No doubt everyone would be better pleased to see men with more knowledge of the subject than some of the judges who were appointed, but obviously with merely a very slight outside knowledge and absolutely no practical experience such a constitution of judges is, of course, liable to very curious judgments, but I think everyone must agree that they have given judgment honestly to the best of their ability.

"I have very little doubt that the majority of those judges who have recently purchased cars will be in a position to explain to their co-judges at the next trials why they should not give marks to those particular cars, and Mr. Astell should take account of this, as he may find that although his car failed this year the mere fact of its failing and some of the judges purchasing other cars may possibly put them in a position to find faults in the cars which they this year believed in.

"I must admit Mr. Astell makes a very strong point and one that deserves very serious consideration when he sets out that one of the cars,

NEW GRAPPLER PNEUMATIC COMPANY, LIMITED, v. MOTOR MANUFACTURING COMPANY, LIMITED.

In the King's Bench Division, last week, Mr. Garrett Walker (instructed by Messrs. Maunsell and Darley), on behalf of the defendants, who have their registered offices at Holborn Viaduct, London, applied that the order dated 11th September last, giving liberty to plaintiffs to issue a writ and serve it out of the jurisdiction on the defendants, be set aside. The action was brought to recover £200 damages for breach of contract in respect of 100 sets of motor-tricycle tires and rims. Counsel said he could not contest the fact that the contract had been made in Ireland, but he asked that the order should be set aside on the ground of balance of convenience, as all the witnesses resided in England. Mr. John Gordon, K.C., M.P., and Mr. E. A. Gollins opposed the motion. The application was refused.

BRITISH MOTOR TRACTION COMPANY v. MOORE.

On Saturday, in the Chancery Division, Mr. Justice Farwell gave judgment for the plaintiffs in the action of the British Motor Traction Company, Ltd., v. Moore, brought for infringement of the plaintiffs' letters patent. His Lordship granted an injunction in the terms asked, with the usual accompanying relief and costs. Mr. A. J. Walter was for the plaintiffs. Defendant did not appear.

THE SERPOLLET STEAM CAR EMPLOYED IN THE RECENT MILITARY MANŒUVRES IN FRANCE.

(Le Chauffeur.

to which the judges awarded the gold medal, actually weighs 3cwt. for every horse-power of the engine. It does make one think that the judges at any rate were interested in testing tires, as if everyone built their cars on such lines one would wonder what sort of tire to fit. Unfortunately the evil results of such a judgment do not merely end here, as it gives such a powerful lever to foreign manufacturers to point out that in England the Automobile Club's gold medal was awarded for a car weighing nearly 3cwt. for every horse-power. If there was nothing to beat such a vehicle in the class surely it would have been better to have awarded no medal at all? Curiously enough I find in my large Napier the weight carried per horse-power is about 56lbs., and yet many people have told us that this is too heavy."

BRITISH MOTOR TRACTION COMPANY v. CENTURY ENGINEERING COMPANY

This case was mentioned before Mr. Justice Joyce in the Chancery Division last week. Mr. A. J. Walter, on behalf of the plaintiffs, said the defendants agreed to a perpetual injunction, an agreed sum for damages and to pay costs in the action. Counsel for the defendants intimated that they consented, and the order was made accordingly.

AN IMPORTANT CASE TO MOTORISTS.

In the Cambridge County Court last week an important point with regard to motor-cars was raised as to whether the driver of a motor-car is always responsible if a horse takes fright at it. The defendant was Henry Alfred Bedwell, of Cherryhinton, and the plaintiff was John Young, of Birdbrooke, Essex. The evidence given was to the effect that the plaintiff and a man named William Broughton were proceeding with a hay-press from Sible Hedingham to Ridgewell, on the morning of Whit-Monday. The plaintiff was sitting at the back of the press, and Broughton was leading the horse. Close to Gilden they were about forty yards from a corner, when Broughton saw a motor-car, driven by defendant, coming down a hill. As the car turned the corner the horse grew a little restive, and upon the car stopping about five yards from them the horse backed across the road, and sent the press into a ditch, with Young underneath it. The defendant then got out and helped to extricate Young, and the car went on. The plaintiff's leg had been injured, and he claimed £5 8s. damages. The defendant, who had two friends with him, said that he had had considerable experience with motor-cars. On the day in question he saw the hay-press when he was about seventy yards away. He was going at about ten miles an hour at the time, and went round the corner at four miles an hour. He then saw the horse

was restive, so he pulled up within about twelve or fifteen yards of it and stopped the engine, so that there was no noise. His Honour reserved judgment.

FURIOUS DRIVING CASES.

At Ashford, William P. Warren Smith, of Oxford Street, London, was summoned for furiously driving a motor-car at Shallock. The defendant did not appear, but wrote to the magistrates, apologising for being unable, through business matters, to attend the Court, and stating that the car was not travelling at a great speed, as the mechanism was injured. This he had pointed out to the constables at the time, and further stated that it took from 9.30 in the morning till 7 in the evening to travel from London to Deal. He trusted the Bench would be as lenient as possible under the circumstances. Sergeant Dann gave evidence to the effect that at 4.35 on the Saturday afternoon he timed the defendant over a measured course, and found that he travelled at the rate of over eighteen miles an hour. The magistrates imposed a fine of £6 and 11s. costs, the Chairman remarking that the defendant should have appeared, although his letter of apology to some extent made up for his absence.

At Wetherby, Robert License, Leeds, was summoned for driving a motor-car furiously. A quarter of a mile was said to have been covered in fifty seconds when near Collingham, on September 22nd. Sir Robert Gunter, the chairman, gave particulars of an instance he personally observed on the Boston Sparoad recently, and fully corroborated the superintendent as to the dangerous speed of motor-cars in that district. Defendant, who said his machine would not travel twelve miles an hour, was fined £5.

At Romsey County Bench, Alexander Wyllie, of Woodspeen, Newbury, was fined £2 and 30s. costs for furiously driving a motor-car on the 13th ult. at Braishfield, near Romsey. Three witnesses deposed that at one place the car was, in their judgment, travelling from twenty-five to thirty miles an hour, and it was elicited that a journey of twenty-three or twenty-four miles was done in one hour twenty minutes, including three stoppages to see to the machinery.

At the Rochdale Police Court, Emile Violor, the driver of Mr. Winston Churchill's motor-car, was charged with furiously driving the motor-car on the evening of the 7th ult., in Whitworth Road, Rochdale. Mr. Thomas Burrows, Rochdale, stated that he saw the car coming down Whitworth Road at a furious rate. It was going at the rate of between twenty and thirty miles an hour. Mr. Winston Churchill and Lord Lytton were in the car at the time. A few hundred yards lower down the road a boy named Wilfred Ingham, aged eight, was crossing the road from behind a wagon, when the motor-car knocked him down, and ran over him. Mr. Winston Churchill took the boy in the car to the infirmary, where it was found that no bones were broken. The magistrates imposed a fine of £2 and costs.

At Croydon, Edgar Cundy, of South Norwood, was summoned for furiously driving a motor-car in Brighton Road, South Croydon, on October 13th. The police evidence as to speed was conflicting, various estimates ranging from 16 to 153 miles an hour! The defendant denied the pace, contending that it was only eight miles. The summons was dismissed.

GEORGE HARRISON, 16, of Cambridge Road, Barnes, was summoned for a similar offence at the same place and on the same day, the machine being a motor-tricycle. A police-constable said he saw the defendant with several other cyclists, who were proceeding at such a pace as to be dangerous to some people who were getting on and off a tram-car. The witness, who stated that he was a cyclist and a judge of pace, said that the rate was fifteen miles an hour. The defendant was fined 16s. 6d., including costs, in consideration of being a first offence.

At Sale, James Brindles, of Altrincham, was summoned for furiously driving a motor-car at Ashton-on-Mersey, and also for carrying no light on the vehicle after dark. Constable Nighall stated that defendant was driving at a rate of about twenty-three miles an hour. Superintendent Okell said complaints had been received from different local authorities as to the excessive speed with which motor-cars were driven through the district. Defendant was fined 20s. and costs for not carrying a light, and £3 and costs for furious driving.

At Thirsk, on Monday, Mr. Claude Johnson, secretary of the Automobile Club, appeared in answer to a summons for driving a motor-car to the danger of other persons using the highway, and for refusing to stop his motor-car when requested. Defendant said the boy in charge of the horse and cart was on the wrong side of the road at the time, and when he held up his hand he was close to him. He stopped directly, and the horse, which had previously looked interested in the car, swerved round, and the boy was swung clear of the horse. After hearing the evidence a fine of £10 and costs in respect of each case was imposed.

Reported above are 8 prosecutions for furious driving. In 1 case the summons was dismissed, while in 7 cases fines amounting to a total of £28 10s. without costs were inflicted.

SEQUEL TO A TRAP ACCIDENT.

At Lanark Sheriff Court, before Sheriff Scott Moncrieff, William Harper, manager of the Scottish Motor-car Company, Limited, Edinburgh, was charged with having, on September 9th, failed to stop a motor-car which he was driving near Wintermuir Farm, Biggar, while passing a horse and trap belonging to Dr. Robertson, Biggar, whereby the horse became restive and jumped a fence on the side of the road. The evidence for the prosecution was that Dr. Robertson and his coachman, when they saw the motor-car coming, shouted to the occupants of the car to stop to allow him to pass. This they did not do until within twenty yards of the trap, and then only for two minutes. Before getting a chance to lead the trap past the car the driver of the car started again, with the result that the horse jumped the fence, the trap being broken and the horse injured. The two occupants of the car besides the driver said they stopped for five minutes, and the horse would not pass. Mr. Harper then drove past slowly, and when the car had passed the horse jumped the fence. Mr. Harper, in being examined, said he had during the last four years driven over 50,000 miles in a motor-car, had taken part in the recent 1,000 miles motor-trials, and had received the first prize in the section in which he competed. He considered himself a competent driver, and was well acquainted with the rules relating to the driving of motor-cars. The Sheriff found the charge proved, and inflicted a penalty of one guinea.

OBSTRUCTION BY MOTOR-CAR.

At Eastbourne Walter C. Bersey was summoned for obstructing Elms Avenue with a motor-car on September 29th. Defendant did not appear. Police-sergeant Veness and police-constable McGill explained that the motor-car was left unattended in Elms Avenue for over four hours. When defendant returned he refused to give his name and address. The chairman said that, considering the manner in which defendant met the police, they should increase the usual fine, and he would have to pay £1 ls. and costs.

A PUBLIC motor-car service has been established between Mons and Beaumont, in the Hainault division of Belgium. Each car carries twenty persons.

AN American company has been authorised by the municipal authorities of Mexico to establish an automobile service in that city.

BROOKLYN, N.Y. is said to be attracting, as residents, many wealthy automobilists, who appreciate the fine roads in the vicinity—roads superior to any others in the States.

At an automobile race meeting at Fort Erie, Canada, recently, Fournier made a brilliant exhibition in a 25 mile run in his 50 h.p. car, and established a record of 1m. 14sec. in his fastest mile, covering the entire distance in 31 min. 58½ sec.

ACCORDING to a Reuter's telegram from Detroit, Mr. Alexander Winton has broken all automobile records from one mile to ten miles, his time for the whole course being 11 minutes 9 seconds.

EXPERIMENTS took place last week at Brussels with an automobile lorry which is destined for the Congo Free State. It was loaded with 36cwt. of iron and tested over difficult country, including very heavy and muddy roads. The result was entirely satisfactory. One of these motor-lorries will replace sixty-five native carriers, and eventually it is hoped that sufficient lorries may be used to dispense with carriers altogether.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notices will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Wednesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

COMMENTS.

IN the development of South Africa the motor-car will undoubtedly play an important part. Seeing the good work done in the early part of the war by mechanical traction, we wonder that more has not been heard of the matter, and that the automobile has not been generally employed for despatch carrying and the like. Anyhow, Mr. Cecil Rhodes has become a patron of the motor-car, and that means its adoption in many ways when the trouble in South Africa has quietened down. In company with Dr. Jameson and Mr. Alfred Beit, Mr. Rhodes has been taking the "cure" at Salsomaggiore—a new and remarkable resort in Italy. The village, with its baths of gravy-brown water (the richest in the world in lithium and strontium), is an hour's drive from Borga San Donnino railway station on the main line to Bologna. In order that Mr. Rhodes and his party may thoroughly enjoy the scenery round about, they had a smart motor-car sent out from Paris, and in this they are to tour through Italy by way of Rome, Naples, and probably Sicily. Doubtless after such an experience, and remembering the success with which he used a similar car when recently shooting in Scotland, Mr. Rhodes will take an automobile or two back to South Africa with him, in which case our English manufacturers should try and secure an opening in that country.

The Lincolnshire Automobile Club.

MR. E. CRAGG, M.D., one of the vice-presidents of the Lincolnshire Automobile Club, has consented to give his popular lecture on "Automobilism from a practical point of view," in the large room of the Saracen's Head Hotel, Lincoln, on Saturday, the 23rd inst., at eight o'clock. A discussion is to follow, and this, with the lecture, should be of great interest and usefulness. The date has been fixed as one when there will be late trains out of Lincoln, and there will be a full moon, so that those driving in will have a good light, and, with fair weather, be able to drive home in comfort. An invitation has been sent to all members, and any other gentlemen interested in the movement are invited, as it is desired to have a thoroughly representative company. Should this lecture and discussion prove the success anticipated it is probable that the Council of the Club will arrange a series.

Slow Canterbury.

CANTERBURY loves its ancient traditions, its ancient ways, and its ancient means of conveyance. When a light railway was proposed to connect the old city with the modern town of Herne Bay, the idea was rejected, and the lumbering buses continue their heavy running to and fro. The only other available means of communication is the still more uncertain route by the railway. Can we wonder then that some of the local City Fathers are unfavourable to motor-cars, and have lately been airing their

ignorance and prejudice to such an extent that Councillor J. G. B. Stone had to make the suggestion—in an ironical mood—to keep motors out of the town altogether? A rolling stone gathers no moss, but we hope Councillor Stone will shortly see an efficient motor-car service in the shadow of the Cathedral.

Interest at Southsea.

IN view of the event of Saturday, the 16th inst., one of our staff recently visited Southsea to discover the local feeling with regard to the run. Last year's great reception at the steps of the Portsmouth Town Hall is still vividly remembered. Till then motor-cars had been somewhat unfamiliar sights in the locality, but that procession educated many Hampshire people, and throughout the past twelve months automobiles have been frequently in and about the streets of the district, while the steady running of a service from the "Clarence" to the South Pier has been a daily reminder of the usefulness of the motor-car. Consequently public curiosity is not quite so keen as in 1900, but a good reception will doubtless be the lot of the automobilists who drive to the fine common facing the front at Southsea.

"Killing an Industry."

THE initials "C. S. R." present no difficulty to automobilists, especially when over the address "Knightsbridge," and we are glad to see the famous motorist still alert as ever to defend his favourite—if ballooning has not yet usurped the place of the automobile—pastime in the columns of our contemporaries. His latest letter is one pointing out that at a corresponding period of last century attempts were made to restrict the speed of railway trains to eight miles an hour. Those efforts failed, and it is satisfactory to know that the present ignorance and prejudice is likely to be as unsuccessful as was the opposition to Stephenson and his fellow pioneers in cheap travel. "Killing an industry" is too great a task for prejudiced people to undertake, especially when that industry has such doughty champions as those who favour the motor-car.

Man v. Motor.

OLD-TIME contests of horse *versus* bicycle have gone out of fashion, but Mr. W. Header, a well-known Plymouthian, has treated the people of his town to a new sport. Having watched the progress of motor-cars in Union Street, Plymouth, and having come to the conclusion that "there will be a smash-up before long," he has taken the usual course of anti-automobilists, and written to the local newspaper. He believes that some of the venturesome motorists have sometimes exceeded twelve miles an hour, and "a good runner that I put on could not keep up at times with them." The spectacle of a good runner and a good motor-car racing at twelve miles an hour in one of the busiest streets in the "West Countrie" must have been almost as interesting as John Gilpin's ride. No wonder Mr. Header concludes his letter with the naive remark, "The police seem to look on and smile." Does the promoter of this new public entertainment expect the police to join in the competition?

The Scottish Automobile Club.

THE Scottish Automobile Club had a pleasant run to North Berwick on Saturday last. The cars assembled in Charlotte Square, Edinburgh, at 11 a.m., and the route taken was *via* Craigmillar Park and Dalkeith, in order to avoid the badly laid causeway at Musselburgh. The drive past Gosford on the coast road in the crisp autumn air was delightful. After luncheon at North Berwick the cars returned *via* Haddington. Amongst those taking part in the run were Sir John Murray, Dr. and Mrs. Dawson Turner, Mr. John Wilson and party, Dr. and Mrs. Ronaldson, and Mr. W. L. Sleight and party.

Motor Cars in Australia.

OUR Melbourne correspondent writes: During the past few weeks there has been quite a spurt in the trade here and in Sydney, where two or three American firms have opened up under "Free Trade." A uniform tariff throughout Australia will have an equalising effect, however, and give an impetus to the manufacturing trade. The General Post Office has been making a series of tests with all the available cars—De Dion voiturette, Mail quadricycle, 7 h.p. De Dietrich, and a Thomson steam car. Two or three more have to be tried, but up to the present, the local car, the Thomson, has the best trials to its credit. The Metropolitan Fire Brigade has also adopted one of this Company's cars, and several are under construction. The Tarrant Motor Company have also recently turned out an oil car, which is running very satisfactorily. Recent importations include a Darracq and two Benz cars. Two or three Locomobiles are in use here, but the high price of petrol (2/6 per gallon) makes their running cost very high, consequently they are seen on the road but seldom. A few motor-tricycles are also in use, but automobiles generally are still such a novelty that crowds always surround them when standing in the streets. Great interest is being felt in Melbourne by the promise of Mr. H. Sutton's new car, and a motor-bicycle by a local cycle firm. This latter, however, is somewhat late, as already arrangements have been made by the Thomson Motor-Car, Limited, for the importation of motor-bicycles and sets, at very low prices.

The English Motor Club.

THE run of the English Motor Club to Brighton on Saturday last was not marked by a single incident with the Surrey police, thanks to the thorough way in which the patrols organised by Messrs. Panhard and Levassor and the Motor-Car Company carried out their duties. The police, finding their clocking was being checked by independent witnesses, some of whose watches they discovered to have even second hands, gave up the job for the day and retired crestfallen. The result was that every car reached its destination, the muster being unexpectedly large and the run as enjoyable as ever. The return on the Sunday was by various routes, but from reports since received all met the fog somewhere and had weird experiences; indeed, in some cases, the cars had to be discarded, and one gentleman who failed to escape from Epsom High Street, finally sought the sheltering wings of the Eagle.

A Motor Parcels Delivery Service for Kingston

IN our last issue we briefly referred to the formation of the Kingston Motor Express Company for the purpose of facilitating the delivery of trade parcels in the town of Kingston-on-Thames and surrounding districts, so as to save tradesmen the trouble and expense attached to the keeping of a large staff of porters, horses and carts, etc. We have made some enquiries regarding the new service, and have learned that the cars to be used are those known as "F.N.," and that it is proposed to place a sufficient number on the road to enable four to six deliveries to be made in a day. The company anticipates that

the price at which goods can be delivered on this system will be considerably below that at which they can be delivered by any other method at present. We may add that the company has already received promise of considerable support in Kingston.

Motor 'Buses for Brighton.

AT a meeting of the Tramways Committee of the Brighton Town Council a letter was read from Mr. Councillor Wallis, requesting the Committee to take into consideration, at an early date, the question of the desirability of including in an application to Parliament powers to run motor-omnibuses on certain routes in connection with the tramway system. It was resolved that the town clerk be instructed to include in the appointment of the Committee on the 9th inst., authority for it to consider the expediency of applying to Parliament for the necessary powers.

The Halifax Automobile Club.

WE learn that a number of automobilists in Halifax have formed themselves into a Club, with the object of popularising the use of motor-cars generally, and also for social intercourse. They are to be congratulated in having secured as their first president and chairman, Alderman J. T. Simpson, chairman of the Halifax Corporation Highways Committee. Mr. James Lord, the Halifax borough engineer, is also a member of the Committee. With these two gentlemen in the Club the local roads ought soon to be in first-class condition. Mr. H. Raymond Wood is hon. secretary of the new club.

Conversions in Buckinghamshire.

ONE of the local magistrates for the borough of Wycombe and county of Bucks has been doing much during this year to familiarise his locality with motor-cars, and to remove prejudices which threatened in the spring to break out into petitions to the Government for stronger and more stringent powers which would have checked automobile industries. As a member of the Bucks County Council he did a good deal to stay and restrain proposed petitions to the Local Government Board against motor-cars, and Lord Cottesloe, the president of the County Council, Mr. Tonman Mosley, the chairman, and Captain Farwell, the vice-chairman, and other members of the Bucks Highways Committee have been observed riding apparently with satisfaction and enjoyment in the car in question and at a speed fully up to the present legal limit. We understand that the chairman of the Highways Committee has now purchased two cars himself. At the Wycombe borough election for twenty-four new councillors on November 1 (after the extension of the civic boundaries) Mr. Alderman Vernon, the owner of the car (which is a 10-horse M.M.C. tonneau), drove it throughout the day to bring up voters, and it doubtless much assisted his candidature, as he was returned nearly at the head of the poll.

Great Possibilities.

ONE is sometimes apt to wonder why such an army of witnesses confronts the unfortunate motorist who finds himself before the local Bench on a charge of furious driving. Some light was thrown upon the problem in the hearing of a charge of this order at Bolton recently. A Councillor who had appeared as a witness against the motorist asked for expenses, and was told that 2s. 6d. was the usual fee. On protesting the fee was raised to 5s., though the solicitor for the defence remarked that the witness had only been in court thirty-five minutes. A humbler witness, with no pretensions to municipal honours, then applied for expenses, and was well pleased with the half-crown awarded for "speaking the truth, the whole truth, and nothing but the truth." To appear against a motorist charged with furious driving is certainly an easy way of earning money and might, with a little ingenuity, be developed into a profession

congenial to many in search of light occupation of a non-speculative order. But the would-be exponents of automobile speed must beware lest in their zeal they kill the goose that lays the golden egg.

The Projected Public Service at Belfast.

AT the last meeting of the Belfast Police Committee the application for permission to run a public service of motor-cars again came under notice. Mr. Porter, with his solicitor, attended, and urged that the Committee should reconsider their decision not to grant permission to ply a motor-omnibus for hire in the city. The Committee, by four votes to two, decided, however, to adhere to their former decision, but it is to be noted that they so far appreciated the strength of public opinion on the question as to approve of the principle of a motor-car service for the streets of Belfast, as it was pointed out that if suitable vehicles were provided they would have no hesitation in licensing them.

Sensible Scotchmen.

A MEETING with a view to a discussion of motor-car matters should be arranged between the Rt. Hon. Graham Murray, the Lord Advocate of Scotland, and the Rt. Hon. Sir J. H. A. Macdonald, the Lord Justice Clerk of the country north of the Tweed. It ought to result in a joint declaration which should be a warning to the small fry on the magisterial bench and to the little local authorities. Mr. Murray is in favour of a pace limit for towns and villages with controls similar to those adopted in the recent Glasgow trials. In the open country he would have the general law of the land applied—no regulation as to speed at all—subject to the proviso that driving or riding to the public danger should be a punishable offence. With this suggestion no motorist need find fault, and if this sensible view generally prevailed the long list of prosecutions appearing in our columns every week would be materially lightened, without in any way endangering the public safety.

Progress in America.

A PHILADELPHIA correspondent, in the course of a recent letter, remarks that "a lot of good and reliable vehicles are being made in America, and the forthcoming show at Madison Square Garden, New York, will bring about a revolution here as regards models. Steam-cars have been the most popular type of automobile so far, but the gasoline (petrol) vehicle is making rapid strides with the public. The Locomobile Company are doing the best business; they are very progressive people, and are shortly sending a representative out to Japan to see exactly what the prospects are for motor-cars in the 'Land of the Rising Sun.' Very few manufacturers have made money this year; in fact, I think that those who have made money could be counted on the fingers of one hand; the principal cause is that they have turned out a lot of unreliable machines which have been sent back to them. They have, however, profited by the experience, and next year they should make money."

Cycle Manufacturers and the Motor Industry.

CYCLE manufacturers appear to be rapidly recognising that the construction of motor-cars and cycles is not identical, and that the two classes of industry do not lend themselves for amalgamation under one roof. Such views have already been expressed by the Rover Cycle Company, Limited, and Rudge-Whitworth, Limited, while a further expression of opinion on the subject was given at the annual meeting of the shareholders of the New Hudson Cycle Company, Limited, at Birmingham last week. Mr. H. G. Hills, the chairman, then stated that the question of the motor industry had been taken into consideration by the directors, who had come to the conclusion that it would not answer the purpose of that or any other cycle company to manu-

facture motors. Machinery used in cycle manufacture was not adaptable to motor manufacture. They had, however, taken in hand the manufacture of motor-cycles with fair success, the demand being an increasing one.

Fogged.

ARDENT motorists who are stayed by nothing have this week experienced sensations such as they have probably never experienced before. Fogs we have had before, it is true, but never since the motor-car won its legal right to the road five years ago, has the "ninth plague" so completely wrapped London and our great cities in its mantle. From Kennington Road comes an account of two cabs colliding, and a motor-car proceeding at a snail's pace running into the prostrate horses. No doubt we shall hear of more thrilling adventures and hair-breadth escapes before the week is out. Meanwhile, steady all!

A ROAD-SIDE REPAIR.

(L'Avenir de l'Automobile.)

The Brighton Road Motor Patrol.

THE operations of the Motor Patrol, organised by Mr. R. Moffat Ford, upon the Brighton road on Saturday and Sunday last for the purpose of militating against the recent unfair tactics of the Surrey County police were completely successful. Motor-cars with the patrol flag and observers with binoculars paraded the entire fifty miles of the road throughout the whole of the day. Several ambuscades of uniformed and plain-clothed policemen were located early in the morning, but in view of the increasing activity of the Motor Patrol, these parties evidently concluded that their plans had been rendered useless, as they were observed to retreat into the villages towards noon, where they dispersed. As the result, therefore, of the inauguration of the Brighton Road Motor Patrol the police did not succeed in stopping a single car throughout the whole of Saturday and Sunday, and no names and addresses, therefore, could possibly be taken. Great assistance to the work of the Patrol was rendered on Saturday by a small army of cyclists, recruited from Messrs. Panhard and Levassors' riders, and provided with red hand-flags, which they used for signalling purposes. We understand from Mr. Moffat Ford that it is intended by his committee to establish a permanent paid patrol for the Brighton Road, and to extend the organisation during the next few weeks in other important directions, such as the Portsmouth Road, the Great North Road, etc. By this means he hopes to break up the police opposition to the growth and extension of the motor industry in this country.

The Surrey Persecutions.

REIGATE and its frequenters have had their lesson, by which it appears the local hotel interest has profited at least as much as the victims thereof, and the scene has shifted *pro tem.* to the Ripley road and the vicinity of Guildford, no less than nine summonses against motorists for venturing to drive along the Hog's Back on Sunday week being down for hearing at the Guildford County Court on Saturday the 9th inst. The scene of several of the alleged offences is an unusually deserted and broad road, where little danger to traffic could be caused by even excessive speeds, and it is therefore popular with the police, who, as a rule, dislike having their attention distracted from their duties by butchers' carts, unattended horses, or Sunday toppers. A temporary abstinence from driving in the neighbourhood until it becomes more salubrious will probably be the result, unless a hebdomadal "patrol" (week-ends being the only unhealthy time) is adopted as an alternative; and in connection with this, the familiar uplifted hand, if seen on a car, might well be adopted as a signal among automobilists for "danger ahead." As a considerable audience will probably assemble on Saturday, in the hope of enjoying a practical demonstration of the Ninth Commandment, they will do well to exercise care in avoiding delays on the road.

Kind Surrey.

Is the Surrey County Council in a penitential mood? The suggestion occurs to us because special instructions have just been issued to the various District Councils within the area of the county with regard to the repair of the highways, so as to avoid inconvenience to motorists consequent on the necessary overhauling of the roads at this time of the year. It is suggested that such lengths of road should be undertaken at a time as would enable the rolling to be done and leave the roads at nights as free as possible from inconvenient patches, and that in all cases arrangements should be made that the lengths under repair might be entirely finished before the end of the week, so that no unrolled metal might be left from Saturday to Monday morning. This is certainly a wise proposal, and we hope it will be extended to Hampshire, so that the roads may be quite clear on the occasion of the Automobile Club's run to Southsea.

Police Court Procedure at Reigate.

WE have received a copy of the correspondence between Mr. Moffat Ford and the clerk to the justices of the Reigate Bench, relative to the method of conducting the business of that court adopted at the recent wholesale fining of cyclists and motorists. Pressure on our space prevents us from reproducing this correspondence. We might, however, draw attention to the fact that Saturday, October 12th, was certainly an extraordinarily full day for the Bench, for the reason that, owing to the instructions issued by the Chief Constable of Surrey, a normal business of a sitting of the Reigate Bench was increased by 300 per cent. as the results of a determined crusade against cyclists and automobilists. Furthermore, there remains the equally important fact of the eightieth summons being issued for the same time as the first, and that of really criminal cases being heard continuously with those for the hearing of which we might almost say that a civil penal court might profitably be constituted. Out of the whole eighty cases, only eleven appear to have not been heard, representing a percentage of, say, fifteen which might naturally be reckoned upon as not requiring to be heard. This leaves a balance of sixty-nine cases which required hearing, and Mr. Moffat Ford's question as to whether it was reasonable to suppose that all these could be heard before lunch time is just as applicable to the sixty or sixty-nine as to the seventy or eighty, because it is impossible to presume that this number of cases could be heard before the luncheon adjournment, and absurd to summons them all for the same time. Yet the clerk does "not think that

it would be practicable to issue a certain number of summonses for the morning and the rest for the afternoon." These things are much better arranged in London, where the magistrates' courts are, unfortunately, more busy, and where criminal cases are heard in the morning and what might be called civil summonses issued for the afternoon. We notice that Mr. Ford's query whether defendants were compelled to be in attendance at the court has been turned by the clerk, in his reply, to a question of being in the court. Unless a defendant at Reigate, however, is in the court with his witnesses, he runs the risk of being declared absent and of judgment being declared against him by default through not answering to his name.

FOR some time past rumours have been current as to a possible amalgamation of the Daimler Motor Company and the Motor Manufacturing Company, but we hear that this is now not likely to take place.

A CENTRAL NEWS cable from New York on October 30 announced that M. Fournier, the well-known French *chauffeur*, had met with a terrible accident. Along with five guests, M. Fournier was riding in a motor-car at Long Island, when the vehicle came into violent collision with a locomotive. The car was practically wrecked, and one of the occupants fatally injured.

AT a meeting of the Warwickshire County Council on Tuesday a resolution was agreed to reaffirming the position which the Council has already taken up in previous resolutions, namely that if motor-cars were numbered, it would not be necessary to place any restriction on their speed other than imposed on the drivers of vehicles, i.e., that they should not be driven at a speed greater than is reasonable and proper, having regard to the traffic on the highway, or so as to endanger the life or limb of any passenger, or to the common danger of passengers. The object of the resolution, said Lord Algernon Percy, was to do away with the speed limit. It seemed to him that the speed limit had been a failure, and was in itself unreasonable. But it was clear that there must be some special means of identification, owing to the speed of the vehicles.

THE Locomobile Company of America during the past three days have been keeping "open house" at the extensive new dépôt at Sussex Place, South Kensington, to which we referred in our issue of September 28 last. Motorists throughout the land have been invited to call to inspect not only the new dépôt but also the latest type of Locomobile, in which a number of improvements have been made during the past twelve months. The engine is now built stronger and heavier, the boiler is absolutely safe, it being impossible under any condition to explode it. The burner is now constructed in one piece, doing away with back firing, that was experienced so much in the earlier makes of cars. The differential gear has now been covered in, the running gear, wheels, piping, and framing of the carriage have all been constructed heavier and stronger, and the additions that were wanted have now been placed on the car, such as the feed water heater, which effects great saving in petrol. Now, instead of cloth upholstery and flimsy looking woodwork, all the cars are upholstered in the finest leather, and the woodwork is of the best coach-building material. The new show-rooms, which are known as 39-40, 42-43, Sussex Place, consist of two ground floors, about 104 feet long by 30 feet wide, with a height of 15 feet, the basements corresponding. The floors of the show-rooms are capable of holding a hundred cars, and although at the present moment there are not more than thirty or forty vehicles on show, by next February the company intend to have 150 carriages in the building. An elaborate suite of offices has been built in connection with the show-rooms, the whole of the woodwork being finished in old English oak. A railed-off space will be found in one corner of the show-room which will be used as a waiting room, provided with writing materials, periodicals, etc. The walls present the sight of a miniature picture gallery, being studded with beautifully framed photographs representing the "Locomobile" in different parts of the world.

A WINTER RUN IN 1900.

(Continued from page 614.)

WE were passing between the masses of Mont du Forez and the Monts du Beaujolais; the former showing all the characteristics of a granite formation in its immense piles heaped one upon another, and in its bold and rugged outline; the latter a serrated silhouette typical of limestone. This district of Auvergne is in many ways interesting. The two mountain masses were, in geological periods, united at their southern termination, and constituted the *barrage* of the great lake of the Loire. The depression which parts them from one another, and, to the north of Beaujolais, separates it from the mass of Morvan, formed long ago the path of communication, the line of action and reaction, between South and North in France; for it is here that the tributaries of the Seine and of the Saône (itself falling into the Rhone) intermingle most conveniently for the intercourse of the nations. The valleys themselves are rich in coal, and this since its discovery has had its usual effect. The soil is barren, the climate severe, and until recent times all this plateau was most thinly inhabited; now it is increasing more rapidly perhaps than any other part of France; since the beginning of the century the population of the whole country has increased by only one-third, while in the coal fields of the Loire it has increased by nearly one-half. The people of Auvergne were formerly of a type distinct in face, in dress, and in customs, and preserved their distinguishing features in the annual descents which they made from their mountain homes in search of work; but now of course all this is lost. As we drove on we were rising higher, though in the growing darkness it was hardly perceptible; the engine seemed not to feel it in the least. We were obliged to keep upon the third speed after a time, for the way was winding and we could make out that there was a deep declivity at the side. At length we saw lights twinkling below; the lights of St. Etienne. We wound gently down, a good many hundred feet, and put up at a decent inn in the long and rather fine street (part of the main Paris-Marseilles road) which runs through the middle of the town. About St. Etienne there is nothing to say which is not summed up in the statement that the population has more than trebled in the last fifty years. In the fifteenth century the place consisted of two hundred poor houses, and the inhabitants were allowed by Charles VII. to surround themselves with a wall as a protection against the marauding English; traces of the wall still remain.

We had been so much hindered that we began to see that we should not reach our destination by the end of the week, which we both had reasons for wishing to do, unless we could make our last two days really long ones; so before separating we summoned the particular *garçon* whose duty it would be to rouse us next morning, and my companion promised to be a very good friend indeed to him if he appeared in our rooms with our rolls and coffee at five a.m. precisely. He proved sufficiently alert—to his own interests as well as ours—and we were on the road before six o'clock. It was not, of course, yet light, but we were some little time getting clear of the steam trams, and it was dawning as we left the town behind. We had missed some fine views the night before, and were glad to be able to look back upon the ground we had passed over. We had a very long and often steep hill to climb, well engineered in straights and turns across a spur of Mont Pilat (more than 4,000 feet high). The whole situation recalled the Devil's Punch Bowl in Surrey, but upon a far larger scale. Here and there we were compelled to use the first speed, though for the most part the car took the second. An engine of smaller power—an 8 h.p.—is probably as fast as most people wish for on the level; but the moment one encounters anything like a severe gradient the going is so considerably reduced as to be tiresome by contrast, and seriously to lower the average rate of travelling. It is just here that the game is felt to be worth the candle with a 12 h.p. There is no sense of crawling uphill, and the time saved enables one to run down at a steady pace. I have said that the larger motor is

not without its drawbacks, but they are more than made up for in this way.

Passing through Bourg Argental, we reached the summit, and the descent commenced. The corners were sharp and we would run no risks. At Tournon the road comes down obliquely upon the Rhône, and thence we pursued it for most of the day. It was only a few miles to Valence, the capital of the Department, and we stayed there for breakfast. The walls of the room were adorned with diplomas earned by the proprietor at various exhibitions for skill in cooking; such a professor is of little account among our neighbours, with us he would be a man of mark. The river is here spanned by a noble suspension bridge, and a road follows the stream on either side. We kept to the right bank. Our luck was fairly good, though we had a worry with our tires occasionally, and with the contour of the country in our favour we got on well. We took in petrol at Montelimar (what a convenience it is being able to buy it in almost any village), and my lady friends now tell me that I ought to have brought home nougat from there. The face of the land gradually assumed a softer aspect; indeed before getting to Orange one passes the boundary of the olive-growing region, and the people begin to wear an unmistakably southern appearance. Orange is of course full of historical and antiquarian interest; the Arch of Triumph is perhaps the finest in all France. I have somewhere read that the accumulated débris has actually raised the ground-level nearly three feet, and the whole place still abounds in Roman remains. We were not long

A GROUP OF MOTOR-CARS AT THE ARCH OF TRIUMPH, ORANGE.
(*La France Automobile.*)

in sighting the Papal Palace of Avignon perched upon its hill. We were on familiar ground, and stayed but half-an-hour or so. On starting again, we struck out eastward, and as we crossed the narrow bridge over the Rhône, it began to rain heavily. This afterwards occurred to me as rather curious, inasmuch as the spot is markedly dry in comparison with its surroundings, while the vicinity of Paris to the south and east, where we were drenched on the first day, has the smallest rainfall in the entire country. The wet, however, was not enough to spoil the road, and the going was splendid. Often one could see many kilometres of clear road ahead. Then we let her go, with the accelerator down. Soon it became dusk, but there was not much beauty to forfeit—just the sand dunes which everyone notices out of the carriage windows when he begins to pull himself together after a poor night, and wonder how long it will be before he is in Marseilles. We lit our lamps and sped on again. We had done a very fair day's work, but we proposed to stick to it for some hours longer, as the rain had abated and the sky was bright.

ARUNDELL WHATTON.

(To be continued.)

STIRLING'S MOTOR CARRIAGES, LIMITED, of Glasgow, are now coming to London, a large show room having been taken at Albert Gate Mansions, opposite the barracks at Knightsbridge, S.W. A full range of cars will be on show at the new depot to-day (Saturday).

THE ROTHWELL LIGHT CAR.

THE accompanying illustration shows a new light car which is about to be put on the market by the Eclipse Machine Company, Ltd., of Oldham. Power is supplied by a 6 h.p. vertical petrol engine, which is placed under the bonnet in front, and is supported on a strong underframe, as are also the gear box and countershaft. The cylinder is water-cooled, the circulation being maintained by a pump. The gears provide three forward speeds of seven, fourteen, and twenty-one miles per hour, and one reverse motion; from the countershaft to the rear live axle the power is transmitted by a strong chain. Two powerful and independent band brakes are fitted, either of which

is sufficient to hold the car on any hill, and we understand that they act equally well in both directions. The body is hung on springs independent of the motor and other mechanism, so that there is practically no vibration when the car is stationary and the engine running. The illustration shows a two-seated body, but we understand that future vehicles will have accommodation for four persons. Inclined wheel steering is fitted, and all the changes of speed are controlled by one handle working in a notched quadrant. The road wheels are all 26in. diameter and fitted with pneumatic tires. The weight of the car complete is $7\frac{3}{4}$ cwts.

THE City and Suburban Electric Carriage Company inform us that they have been granted the Royal Warrant as Electric Carriage Makers to Her Majesty the Queen.

MR. EARDLEY BILLING has resigned his position as manager of the Motor Mart, and has started on his own account as the Central Motor Company, 46A, Tottenham Street, Tottenham Court Road, W. A feature of the Central Motor Company's business is the letting out on hire of motor-bicycles.

THE Kensington Motor Company, Ltd., has been registered with a capital of £2,000, to carry on the business of manufacturers and repairers of and dealers in motors, motor-carriages, electro-platers, etc. The first directors are E. H. Clift and W. E. C. King. The registered office is at 83, Hammersmith Road, Kensington.

WITH the liability of frosts which the winter months bring, owners of motor-cars will do well to assure themselves that the water which should circulate freely by means of pumps does not freeze by the way. To prevent such an accident, too frequently attended with disastrous results, it is as well to mix a small quantity of glycerine with the water in circulation. No matter how sharp the frost, water so treated will always remain in a liquid state.

FLOTSAM AND JETSAM.

BY "FLANEUR."

THE decision of the Automobile Club to use names instead of numbers on the cars participating in the Southsea run affords an opportunity for a little comic relief and a little police mystification alike. Numbers are uninteresting; they are also easily deciphered. Names, on the other hand, may amuse the spectators at the appointed halting places, and checkmate the aggressiveness of ambushed policemen or malevolent anti-automobilists when the cars are under weigh. Not that I would for a moment suggest that any scorching should be indulged in; the official time-table removes all inducement to anything of the kind, and for the most part makes it quite impossible. But recent experiences have shown that pace is entirely unnecessary to bring the *chauffeur* into court; he may be driving at eight miles an hour and the sneaks of Reigate and elsewhere will none the less secure his conviction with the greatest ease.

ANYTHING, therefore, that assists in baffling indiscriminate persecution is worthy of adoption, and the selection of the most indecipherable names is a plan to be commended. One has only to turn up one's Lempriere, or even the list of classic names in Nuttall, to find jaw-breakers in plenty which would serve admirably for the purpose in view. Unfortunately the club has limited the length of the chosen names to ten letters; still, good use may be made even of this allowance. A knowledge of Greek and Latin nomenclature is hardly to be expected from intelligent policemen, much less the bumpkins who do duty in rural districts. Why not, therefore, ring the changes with some of the following, which can scarcely be spotted and spelt at sight—Mnemosyne, Callirhoe, Plinthine, Amynone, Astrynome, Osrhoene, Acholoe, Orithyia, Zeuscippe, Aglaopheme or Iphigenia? There are plenty more that are equally mellifluous. Or if classicism be unwelcome, something scriptural might serve, e.g., Kushaiah, Jeshebes, Shemariah, Phibseth, Xerolybe or Ashabish. It is obvious that a policeman would think twice before attempting to write "Xerolybe" in his note-book, with a lively anticipation of his own efforts to pronounce the name in court. While there is this rich choice of appellations it is a positive crime to label the cars with monosyllables like "cob" and "owl," and so convert the procession into a sort of kindergarten for observant youngsters and half-educated "bobbies."

REVERTING to the matter of the Locomobile prosecution at Kingston, which I mentioned last week, I have been wondering what the melodramatic Mr. Weeding Weeding meant when he said that there had been no less than three convictions of light steam-car drivers for displaying a visible exhaust. The only case of which I can find mention was one at Dorking a few weeks ago, when a fine of one guinea and costs was imposed upon a baronet who drove through the main street of the poultry town with a trail of steam behind him. Now there are two things concerning that conviction that distinctly require explanation. In the first place, the emission of steam was temporary, owing to a broken valve, and was, therefore, not illegal, for the wording of the Act with regard to smoke and vapour contains the clear exemption of "from any temporary or accidental cause." On what grounds, therefore, did the bench convict?

BUT there is another still more important point. The specification of a light locomotive is made in the initial clause of the Act, but I have looked in vain throughout the whole Act, and the attendant regulations of the Local Government Board, for any mention of a penalty. If, therefore, the steam car in question did permanently show a visible exhaust, the utmost that the magistrates could legally do would be to declare that the vehicle had no right to the road. To impose a fine was out of their power, and one wonders where they derived their notion of a guinea as a meet penalty. I may add that I have referred this view of the situation to Mr. Staplee Firth, and he bears it

out to the letter. The reference in the Act to what constitutes a light locomotive is a legal definition only, with no penalty attached, and the Dorking conviction, he avers, was altogether *ultra vires*.

THE Aero Club has made a very successful debut, a considerable proportion of affirmative replies having already been received to the preliminary circulars issued from 4, Whitehall Court. From what Mr. Frank Butler tells me the cost of aeronauting is by no means so great as might be supposed. Mr. Butler has already purchased a balloon on his own account, in which with some friends he will make a preliminary ascent at the Crystal Palace this (Friday) morning. With a capacity of 45,000 cubic feet of gas, and accommodation for four passengers, the price is only £160. At three shillings per thousand the cost of inflation amounts to £6 15s. With incidentals in the way of labour, etc., an ascent may be brought off at an outlay of £10, which, considering the novelty of the experience, can hardly be regarded as excessive. It may be mentioned as a fact of interest, by the way, that coal gas has an approximate lifting power of 40 lb. per 1,000 cubic feet, while that of hydrogen is 70lb. per 1,000.

IN announcing, somewhat late in the day, that a motor-car race is forthcoming between the Duke of the Abruzzi and Cavaliere Garibaldi Coltelletti, the *Daily News* adds that the first-named "rides a Paulhard-Levassor made in Italy." Presumably Panhard-Levassor was implied, but even then the information would be wrong. It is the Cavaliere who drives a Panhard; the Duke's car is of local design, and was built at Turin.

PRECIOUS little discrimination appears to be exercised by the editors of "popular" magazines when dealing with technical subjects; so long as the article is "chatty" the qualifications of its writer and the inaccuracies with which it bristles may go for nought. In the November *Pearson's Magazine*, for example, there is a contribution headed "The Sport of Racing Motors," by Herbert C. Fyfe, which is a bald *rechauffe* of newspaper stories with certain imaginative deductions which are as apochryphal as they are absurd. Of King Edward we are told that "His Majesty possesses more than one splendid car, capable of running at speeds almost equal to the best on record." The bare suggestion of the King's serviceable Daimlers, which are fitted with solid tires, and have 12 h.p. motors, being "almost equal" to the flights of a Paris-Berlin 60 h.p. racer is too ludicrous for words. Then the writer proceeds to inform us that the King, "if he entered his cars in races, might well secure some first prizes," and retails the ancient myth about the Serpollet car which his Majesty does not possess, and never has possessed, despite the high falutin' descriptions of the *Daily Mail* and of Mr. Herbert Fyfe anent the "finest car ever built as regards luxury and appearance." In all likelihood, however, this Serpollet legend will linger for a decade, or perhaps longer, with reversionary probabilities of being resuscitated from time to time, and made to do duty for some hotch-potch compilation of the coming century.

ELSEWHERE in the *Pearson's* article we are informed that the legal pace of mechanically-propelled vehicles ere the passing of the Act of 1896 was three miles an hour. It is added that "the County Council have been endeavouring" to reduce the present twelve an hour limit to one of ten. What is the mysterious body known as the County Council? If "councils" were the word intended the reference would still be wrong; some County Councils have made themselves ridiculous, but not all. On the same page is a picture of "The Hon. C. S. Rolls racing a mile in 1 min. 35½ sec., or 38 miles an hour," the explanation in the adjoining text being that this feat was performed "at Welbeck Abbey." I have a lively recollection of seeing Mr. Rolls go past me in Welbeck Park in May, 1900, when the mean of his two journeys, up and down, worked out at the time above named.

But naturally he was *solus* in a denuded car, whereas the illustration shows Mr. Rolls with three companions all in heavy winter garb and goggles. As a matter of fact, the photograph from which the picture was made is that of Mr. Rolls bringing his 12 h.p. car home from Paris in fiercely cold weather, and far enough from Welbeck Park. But so long as Mr. Rolls was on board that was enough for the magazine, and if the car had been a 3½ h.p. Benz the editor would have been none the wiser. After this little inaccuracy no one will be surprised to learn that a final photograph is labelled "Arrival at Whitehall of the competitors in the 1,000 mile motor race held last year."

A NEW MOTOR TIRE.

"AN Occasional Motorist in France" writes us as follows:—
"Knowing the deep interest taken by motorists in any improvement in tires, perhaps a short account of my visit to the 'Teuf-Teuf' Tire Company's works at Levallois Perret, near Paris, may be of interest to your readers. Happening to be in Paris I took the opportunity offered of calling on a friend, whom I found just starting on his motor-car for the 'Teuf-Teuf' factory to have it fitted with this tire. Asking me to join him, I did so, and was greatly struck with what I saw.

"After being introduced to the patentee, I was taken over the works, and had the tire explained to me in its various stages. The points of the tire are as follow:—(1) It is a combined pneumatic and solid rubber tire. (2) It possesses a complete immunity from puncture, being protected by a solid rubber outer tire. (3)

The impossibility of the tire being wrenched from the rim. (4) Perfect adjustment to the nature of the road travelled, the tire accommodating itself to any obstacle without strain on the air-chamber or wheel rim, independent of the load carried. (5) The two parts of the tire being each distinct in itself. the air-chamber can be removed or replaced without disturbing the solid tire, and in the event (very unlikely) of the air-chamber becoming deflated, the car can proceed on its journey without any inconvenience, to the steering, running on the solid tire till such time that a convenient place can be found to repair the damage.

"I understand that the combined tire has been tested up to 4,000 lbs., and came perfectly through the ordeal. There is an entire absence of sideslip with the tire. I tested it on a road positively ankle deep in greasy mud, with the result that I consider it is peculiarly adapted for heavy van work, as well as for the lighter cars. I understand that sections of the tire may be seen in London, but for the moment I forget the address.

"In conclusion, Mr. Editor, I may say that I am in no way interested in this tire beyond desiring to put before the notice of motorists advantages which, I think, this tire possesses over the ordinary pneumatic now used."

MESSRS. BRADBURY AND COMPANY, LTD., of Oldham, are about to bring out a new motor-bicycle on the Minerva system.

IN addition to their light type of carriage, the Locomobile Company of America will, next spring, place on the English market a heavy steam touring car and a delivery wagon.

CONTINENTAL NOTES.

BY "AUTOMAN."

THE official alcohol contest organised by the Minister of Agriculture, which took place at the beginning of last week, attracted a considerable number of entries, amongst which the principal manufacturers, such as Panhard, Darracq, Peugeot, Delahaye, Gobron-Brillié, Georges Richard, de Dietrich, Gillet-Forest, Bardon, Mors, etc., were represented. The first trial took place on Monday morning, and commenced at half-past six, nineteen vehicles starting out of the Porte Maillot. At the park at Acheres a speed trial took place over a 15 kilomètre course, which was covered by Marcellin on a 6½-h.p. Darracq, using pure alcohol, in 22 min. 50 secs. After the speed trial the cars returned to Paris, the last car arriving at a quarter to six. Only one car failed, a *voiture légère* driven by M. Chauveau. This day included the trials of the first and second sections, that is

NUMBERED CARS IN FRANCE.

(La France Automobile.)

to say motor-cycles and cars up to 650 kilos in weight. The trials for the third section, viz., cars weighing more than 650 kilos, took place on Tuesday of last week. M. Mors, driving one of his 10-h.p. cars, arrived first at the park, and did the 15 kilomètres in 18 min. 49½ secs., making the best time. He was also first back to Paris. On Wednesday the trials of motor delivery vans and waggons took place. There were seven entries, and a Gaillot 6-h.p. waggon did the best time. Most of the cars in the trials used alcohol at 50 per cent. of carburation; a smaller number used alcohol at 75 per cent., while but a very few used pure alcohol.

THERE is a rumour abroad that the Yacht Club of France is about to amalgamate with the A.C.F., and evidently negotiations in this direction have been carried on for some time. The club-house of the A.C.F. in the Place de la Concorde, Paris, is magnificent and very well arranged, as all those readers of the *Journal* who have visited it will testify. It is not, however,

the liveliest place in Paris, and except on rare occasions it is rather deserted, and if the fusion with the Yacht Club will give it a little more animation it will be a good thing. Nowadays most owners of yachts are also owners of automobiles, so that the two sports will be able to go hand in hand from more than one point of view.

EVERYONE who takes an interest in motor-car racing is aware of Girardot's reputation as the "eternal second," and the bad luck that has followed him in big races. The latest thing is that after piloting fast cars continually with impunity, he has been summoned and convicted for excessive speed *on a bicycle*, and as he was away from home when the proceedings took place and absolutely oblivious of their existence, he has been stupefied to learn of the arrival of bailiffs to execute the judgment.

THE hill-climbing trials which will take place on the Cote de Gaillon on the 17th inst. have attracted over sixty entries. The contest has been authorised by the police. Amongst the competitors are Mr. S. F. Edge with a 50-h.p. Napier, and Mr. Mark Mayhew on a similar car. There are two 35-h.p. Mercédés, and a 100-h.p. Jenatzy entered, while Panhard-Levassor, Gladiator, Darracq, Dechamps, Clement, De Dion-Bouton, and Bardon are amongst the competitors, and there are also two Serpollet steam cars and two electric cars. The results of the test will be extremely interesting, and I hope that the English competitors will not disappoint us.

ALL those interested in automobile racing will be glad to learn that Levegh has recovered his health, and is coming to the front again. It will be remembered that Levegh was first for the Gordon-Bennett Cup as far as Poitiers, and that he should have run in the Paris-Berlin, in which, if my memory does not deceive me, he was replaced by Anthony on account of his severe illness. In a few weeks' time he will be able to take to the roads again.

THE Automobile Club at Nice is making strenuous efforts to have the races for the coming season sanctioned, and already has the consent of the mayors of all the localities through which they will pass. It only remains now to get the consent of the Central Government.

ALL'S well that ends well! and I feel sure that all the readers of the *Journal* will be pleased to hear that the Committee for the Deutsch prize in their meeting on Monday decided to give the prize to M. Santos Dumont, by thirteen votes against nine, thus putting an end to an unfortunate and uncalled for incident. The Marquis De Dion at the meeting led an acrimonious attack on M. Santos Dumont and his friends, but fortunately for the sake of impartiality there were a number of independent people present at the meeting who would not allow any question of nationality to weigh in their minds and by whose vote the plucky young Brazilian was awarded his just due. It is pleasant to have to record that all the scientists on the Committee voted in favour of M. Santos Dumont.

REFERENCE has already been made in these notes to the new French law requiring numbers on cars capable of travelling at a speed of over 30 kilomètres (18½ miles) per hour. The accompanying illustration shows a special lantern which has been introduced by M. Bleriot to meet the requirements of the new regulation, which specifies not only the sizes of the letters and numbers, but the distance between each. The face of the lantern—with three figures and a letter only—measures about 19 in. by 7 in.

THE New Zealand Customs authorities have lately given a decision to the effect that "pneumatic or rubber tires for motor tricycles and quadricycles propelled by oil-engine, electricity, or other such agency," imported into the colony, are to be classed as parts of carriages, the duty being 20 per cent. *ad valorem*.

THE "INCASSABLE" SPARKING PLUG.

OUR illustrations show a general view and section of the "Incassable" or "Unbreakable" sparking plug, for which several advantages are claimed—notably the absence of all cement. The porcelain is made in two pieces which rest on asbestos joints, so that there is no contact with metal. The central metal rod is also in two parts; each part has a flattened end, and these are held together by the external

GENERAL AND SECTIONAL VIEWS OF PLUG.

nuts. The central rods are an easy fit in the porcelains, so that they may expand freely without any danger of cracking the porcelains. The plug is only about two-thirds the length of the usual pattern, and is claimed to give an extra powerful spark. The plug, which is guaranteed to be unbreakable, is made by M. H. Labitte, of Paris, and is being marketed in this country by Messrs. John Child Meredith, Limited, of Summer Lane, Birmingham, who have sent us a sample for trial.

THE Vienna Association of Motor-car Drivers has purchased a car for the instruction of its apprentices.

A GOOD story of the King of Belgium is going the rounds of the French Press. It is said that the King was passing through a small village *incognito*, and stopped at a little farm and asked for a glass of milk. Whilst he was drinking the milk he talked English with his attendants, and the farmers evidently took him for an Anglo-Saxon globe-trotter, and discussed in Flemish what "this idiot of an Englishman" would give them for the milk. The King, it is said, handed a franc to the peasant with the head uppermost, and remarked in Flemish that he would give them his portrait, at which there was a recognition and collapse on the part of the peasants and great merriment on the part of the King.

THE Chief Constable of Birmingham has caused to be issued a placard setting forth the regulations issued by the Local Government Board with respect to the use of light locomotives on highways, and particularly directing attention to the regulations respecting the speed of motor-carriages. The Chief Constable, in specially directing attention to Article IV. of the regulations, adds: "It is to be clearly understood that any person using such carriage is not necessarily entitled to drive at the maximum rate of speed laid down in the regulations, but only at such a rate as is reasonable and proper having regard to the traffic on the highway. The police will strictly enforce this regulation in Birmingham, and it is also to be noted that the Towns Police Clauses Highways Act, 1835, apply to the use of light locomotives. Any person driving any such carriage to the common danger of passengers in any thoroughfare may be apprehended without warrant and charged before a magistrate."

CORRESPONDENCE.

A DUST BLOW-OFF.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reference to your remarks under the heading of "A Dust Blow-off," in your last issue, we would like to point out that the arrangement mentioned by you is a portion of Mr. Estcourt's excellent and most successful idea for keeping cars free from dust, as described by him in a letter appearing in your issue of October 5. There is not the slightest question as to the efficiency of the arrangement, as we fitted it to the car in the early spring, and there has been ample opportunity to test it, including the demonstration at Leicester. Since proving its success we have converted a number of cars, including Mr. Owers' 18 h.p., and Lord Hastings' 7 h.p. Daimlers, and are fitting it to all new cars turned out from our factory.—Yours faithfully,

J. W. BROOKE AND CO., LIMITED.

MAWDSLEY BROOKE, Director.

THE GLASGOW TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having followed with the keenest interest the discussion on the result of the Glasgow Trials, I fully endorse the opinions of your numerous correspondents, who all agree that the medal went to the wrong car. The only dissenting letter is that from "Enthusiast," in your last issue, which I do not think should go unanswered. He entirely misses the point that Class A was a special class, framed for voiturettes and light cars, declared at a selling price of not more than £250, and the result was to be a guide to purchasers not wishing to exceed this figure. His contention *re* the merit of heavier cars refers to an entirely different class, at a much higher price. I believe I am correct in stating that the particular New Orleans car ran some 1,000 or more miles before its entry at Glasgow, and this is quite good enough for any ordinary common-sense purchaser, as, we may take it, had the car been built too lightly for the class of work it is intended for, the extraordinary performance it made would not have been possible. I find, from taking an average of eleven of the best cars entered in Class A, we get a weight per vehicle of 9 cwt. 7 qrs., and the weight of the New Orleans is 10 cwt. 3 qrs., ample, in my opinion, for good service.

It seems we must conclude that all makers of this particular class of car have been wrong up to the present, and the only car worth considering for 1902 is one propelled by a 5 h.p. motor, weighing at the very least 14 cwt. odd. This edict will go forth to other countries, where it will be regarded as proof of the advancement of motor construction in England.—Yours faithfully,

J. WILLIAMS.

THE NOMENCLATURE QUESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am pleased to see that "Englishman," in your columns, calls attention to the use of that dreadful word "Garage."

I have already done so myself, but it appears to me that "Englishman's" substitute is almost as bad as the original. I am quite aware that the English language does not provide a word which would replace "Garage," but that is no reason why another French word should be hauled in, and which sounds so much like the English word "Garbage."

"Running Shed" is time honoured in its application to railway locomotion. Why should not "Running Store" play a similar role in regard to road locomotion? "Motor Running Store" would, I think, be self explanatory. "Motor Store" would be read in the same sense as the Americans refer to their shops as stores—namely, a show room for motors, but a "Motor-Running Store" would mean exactly the same thing as a loco-running shed.

If I were driving into a country village I should not hesitate to ask a yokel if he could direct me to "The Motor-Running

Store," but I should hesitate except for the pleasure of observing a look of blank dismay suffuse his features—to ask him to show me the "Garage."—Yours truly,

ALF. R. SENNETT.

THE ROOTS AND VENABLES CAR.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—With regard to my letter of last month about the Roots and Venables car which I have had now in use for the last twelve months, I forgot to say at the time that I bought this car from a former owner who had had it in use for twelve months and that the car had not been returned to Messrs. Roots and Venables for any repairs during that period. Since I have had it I have carried out what repairs have been required myself. I have since found that the occasional difficulty in starting was solely due to the state of the old ignition tube and to the lower tube leading to same. I have not since had either of the spokes give way and as I am informed that other users of the cars never have this trouble, it was evidently entirely due to some imperfect fitting of spokes and to the bad stone sets in the district in which I reside.

Although not a new car I have made some long journeys upon it; once during last summer from Derby to Reading and back, and I frequently take long runs with my wife and child. We surmount the Derbyshire hills, which, as everyone knows, are very steep, without difficulty, occasionally, of course, on the lowest speed, and I would certainly not be inclined to change this car for any that I have seen on the road. Its general reliability, the ease with which a re-supply of kerosene can be obtained and the absolute safety of the fuel employed are great considerations in the use of the car. I am certainly well-satisfied with the running, and for medical men I should think a car of this type invaluable. It is something to feel that you have not to use that extreme care with lamps or a light of any kind in its neighbourhood that is necessary when using spirit cars.—Yours faithfully,

ROOTABLE.

MOTORS, AXLES, AND TIRES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—It would be highly interesting and instructive if Mr. W. H. Astell would give us his views regarding the advantage of vertical over horizontal engines, and perhaps Mr. Austen would also state his. A statement by these two authorities on the relative merits of a live-axle would also be highly interesting. Another point of great importance that is worthy of discussion is the best tire for the back wheels of a business motor-car. I have heard of some medical men who have used solid or compound tires, and these are said to lessen skidding and of course do away with punctures. But what do experts say, is the effect on the engine and other machinery?—Yours faithfully,

CONSTANT READER.

THE MOTOR-BICYCLE FOR 1902.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Many who, like myself, prefer the motor-cycle to the motor-car (considering its use to constitute almost an ideal method of transport and enjoyment), will be curious to inspect the 1902 models. Report speaks very well of the recent improvements made in the Minerva type of motor, and we are now also promised a new Werner. The Singer type, fulfilling, as it does, practically all the requirements of the class of riders for whom it is designed, is to undergo but few changes of note, if we except the addition of the conveniently placed air-lever which now admits of control during the actual riding. Two excellent American machines are also on the market, and will probably find large support.

It would be interesting to have various riders' experiences of their mounts for 1901. Regarding the Werner, I have somewhat to modify the opinion I had of it at the outset of the season. An excellent machine, it is inferior in some respects to some rivals

of the Minerva type as regards cleanliness, petrol storage, freedom from slip and general finish—the latter, indeed, being unsatisfactory and evincing oversights and rough work which would not be passed at a Coventry factory. In all these respects machines such as the "Excelsior," and "Phoenix," are uncontestedly superior, and, indeed, in so far as concerns absence of side-slip, the Minerva type is even safer than an ordinary bicycle. The Werner, however—a specially built one—I have ridden, is faster and better than either the Minerva or Singer type on hills. As to relative reliability, I cannot speak, but my engine has given some trouble—no set screw being fitted to hold the gudgeon pin. I had one spoilt cylinder among other mishaps also the result of lax workmanship. At the same time, I gladly acknowledge that the condition and behaviour of the machine, as now righted, are remarkable. Racing cyclists cannot even hang on, while I have easily passed a 2½ h.p. water-cooled De Dion trike on one of our very difficult hills. The machine is coveted by at least a score of enthusiasts who have seen its prowess.

Among the improvements desirable are the following:—(1) Abolition of the present weak and ridiculous band brake and the fitting of two reliable brakes to every machine as the law enjoins. The present brake nearly cost me a bad accident, and two Werner riders unite with me in condemning it as useless and dangerous. (2) A means of easily and cleanly greasing the head. (3) A good silencer which shall not slow machine overmuch, in place of the present makeshift iron pot. (4) An exhaust valve lifter to replace compression tap. (5) A "free wheel" that is really free and does not run as if its bearings were clogged with mud. (6) Less visible wiring and better general finish, now very defective. (7) A cleaner method of lubrication and more petrol space. (8) Optional h.p. of 2, 1½, and 1¼ as riders prefer. For most tourists 1½ or 1¼ would be ample and more economical of petrol, but the 2 h.p. has its merits for many districts. (9) A reliable carburettor that is not one day flooded and the next constantly empty; also removal of all projections which hamper the knees while one is pedalling. (10) An exhaust tap which will, on steep hills, allow of a free exit for exhaust without passing it through silencer, thus economising power, and assisting to keep down heating. (11) The present air-ring control on the right handle-grip is admirable, but the sleeve is apt to work loose. This again is a matter of finish. Also the throttle-valve and advance sparking lever frequently get loose, to an extent destructive to skilful driving.

In conclusion, I may express a hope that more care will be taken in future in sending out these machines and attending to small orders for interchangeable parts, for which one has to wait indefinitely. It is annoying also to receive a spare crank of different pattern to its fellow, and a petrol tank which does not even fit the frame! Such carelessness ought never to be traced to "the Viaduct,"—Faithfully yours, E. D. FAWCETT.

POPULAR PRICED CARS WANTED.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think the suggestion of a road race will do no good to the motor movement; indeed, I think that the sale and use of very fast high-powered cars should be discouraged as much as possible. I should like to see makers turn their attention to the production of voiturettes capable of running at a steady twelve miles an hour at prices ranging from £75 and upwards, according to the number of seats and the horse-power of the engines.

In the present state of the law and public opinion, it seems to me that special attention should be given to producing moderate-paced cars at popular prices, so as to counteract opposition by creating a large class of law-abiding users. Motorists should, in my opinion, slow down to about five miles an hour some little distance away when meeting horses or when rounding sharp curves, and should also pay great attention to going slowly through towns and villages. If strict attention were paid to these points, I think that the speed limit would be less rigorously enforced, or would be repealed altogether.—Yours truly,

CECIL JACKSON.

WITH regard to the letter of the Clipper Pneumatic Tire Company, Limited, *re* Michelin tires, in our last issue, Mr. R. E. Phillips writes:—"As my complaint was not made against the Clipper Pneumatic Tire Company, I should not trespass on your space to reply to the letter of the managing director of that company had he not questioned the veracity of the statements I have made. This gentleman asserts that my statement, that I endeavoured to purchase licensed tires from the Clipper Tire Company, is untrue. In face of my direct statement that I had done so by letter and received a written reply, this is an allegation that any ordinary business man would have hesitated to make without first making the fullest of inquiries. I stated that the letter could be seen at my office, but no attempt has been made to inspect it, and I am given the lie direct. The letter shall speak for itself. It reads as follows:—'11th September, 1901. Messrs. The Clipper Pneumatic Tire Company, Limited. Dear Sirs,—Kindly send me price list of Clipper-Michelin pneumatic tires, and say if you have 800 by 80 in stock for immediate delivery for a car weighing 15 cwt.' This letter was sent down by hand to Clerkenwell Road, and my messenger waited for a reply. He was handed the price list asked for and my own letter, with the following written at the foot:—'Less 10 per cent. off list prices. 800 by 80 out of stock at present; expected next week.' That an inquiry such as this can be completely overlooked—I am putting the mildest construction on it—does not redound to the credit of the gentleman responsible for the management

THE ROCHET LIGHT CAR.

A FEW months ago we illustrated the voiturette recently put on the market by La Compagnie Générale des Cycles et Automobiles Rochet-Petit, of Paris. This company have also followed the general tendency of the times and have introduced a light car, of which an illustration is given herewith. The motor, which is located under a bonnet in the fore part of the frame, comprises two water-cooled cylinders, and develops, at a speed of 750 revolutions per minute, 6 h.p. Electrical ignition is adopted, the water-circulation being maintained by a pump and radiator. The engine transmits its power through a friction clutch to the variable speed-gear, which is adapted to give four speeds forward and a reverse motion. The change speed-gear is similar to that in the heavy touring cars built by the Rochet Company, and as this was described in our issue of August 11, 1899, it is not necessary to describe it on the present occasion. From the gear box, a longitudinal shaft with universal joints transmits the power direct to the rear live axle through the intermediary of bevel gearing. Inclined wheel-steering is fitted, as also are wooden wheels, these being shod with pneumatic tires. A pedal controls the friction clutch and a band brake on the variable speed-gear shaft, while a hand lever at the side operates band brakes on the hubs of each of the rear wheels. The car complete weighs between 9 and 10 cwt., and can attain a speed,

THE ROCHET 6 H.P. LIGHT CAR.

of the company. I now leave it to the good taste of Mr. Siddeley to withdraw the statement he has made. With regard to my other communications with the company, they were per telephone, and although it is possible, it is not conceivable that these communications should have been forgotten, even if they were unrecorded. It only remains for me to add that whatever my professional opinion may be or has been, I have in my private capacity as an automobilist always respected the patent rights of the Dunlop Company."

KING GEORGE OF GREECE and the Duke of Sparta having each lately acquired motor-cars, improvement may be looked for in the roads in Greece.

A SET of castings suitable for small bicycle motors has been put on the market by Messrs. J. H. Norton and Co., of 71, Scrutton Street, Great Eastern Street, E.C., and also by the Carlton Motor Company, of Elm Grove, Cricklewood, N.W.

DR. H. E. DENNY, of Longtown, near Carlisle, recommends any motorist passing through Cumberland in need of supplies or repairs to look up Mr. James Fendley, of the Cycle and Motor Works, Cecil Street, Carlisle.

the makers claim, of 30 miles an hour. The illustration shows a *tonneau*, but any type of carriage body can be fitted.

ON Thursday evening next the annual dinner of the Automobile Club will be held in the Whitehall Rooms of the Hotel Metropole.

THE Locomobile Company of America have this week shipped from London four steam "Surreys" to the order of Mr. Zacharias, for the Malayan Transport Company, of Kuala Lumpur, the vehicles being intended to carry mails.

WITH regard to the new Mercedes 9 h.p. light car which the Motor Traction Company are sole importers of, and dealers in, one of these vehicles was taken for a trial trip on Tuesday on a non-stop run from Kennington to Crawley and back, when the principal advantages claimed for the car were developed in an extraordinary degree. We understand that the water-cooling arrangement is especially efficient, the total amount of water consumed during the journey being measurable in the proverbial egg cup, the water in the tank at the end of the trip being furthermore only lukewarm.

THE "BRITISH IDEAL" CAR.

WE are this week able to publish a detailed description of a new car, which, under the name of "British Ideal," has just been put on the market by Messrs. Montague Hawnt and Company, of 146, Clerkenwell Road, London, E.C. The vehicle comprises a number of new features, it being built to the designs of M. Schandel,

FIGS. 1 AND 2.—ELEVATION AND PLAN OF "BRITISH IDEAL" CAR.

of Bordeaux, whose British and Colonial patents have been acquired by Messrs. Hawnt and Company. To deal first with the motor, this in the car illustrated is of $6\frac{1}{2}$ h.p. The engine (Figs. 4 and 5) is of the two-cylinder horizontal type; the cylinders are cast in one piece with the explosion chambers which permits the water jacket to be carried

FIG. 3.—VIEW SHOWING INTERIOR OF ENGINE CRANK AND VARIABLE-SPEED GEAR CASE.

around the valves as well as the cylinder proper. It also does away with the packed joint between the cylinder and head, which is frequently a source of trouble. The water jacket is sealed by a separate plate E (Figs. 4 and 5), which is fixed in position by two nuts. By removing this plate the water jacket can be

cleaned out when necessary. The crank case N is of aluminium. It is provided with a door, H, of the same material, which will turn on a stud after a bolt has been removed, and uncover two openings which permit a rapid inspection of the encased parts. The casing itself is so designed that it can be easily removed should repairs have to be made on the crank shaft, the cam-shaft gears, or the connecting rods and pistons, it being unnecessary to loosen the cylinders or remove any of the piping. The arrangement of the valves is also such that they can readily be taken out. An arm D (Fig. 4) is held on the inlet valves by a nut, by unscrewing which the two suction valves B can be withdrawn, as also their seating, and the exhaust valves immediately below, after, of course, disconnecting the springs of the latter. The second motion gear wheels by means of which, through a connecting rod or oscillating lever, the exhaust valves are actuated, are located inside the crank chamber. Electrical ignition is employed while the water circulation is maintained by a pump and radiators. The diameter of the cylinders is 94 mm., and

FIGS. 4 AND 5. ELEVATION AND PLAN OF MOTOR

the stroke 120 mm., the normal speed of the engine being 900 revolutions per minute.

Although the motor is of the horizontal type, it will be noticed from the elevation (Fig. 1) that while it is located in the fore part of the frame it is not fixed horizontally, but at a slight angle with the ground, the cylinder ends being foremost and uppermost. The claim made for this arrangement is that not only does it prevent oil entering the combustion chambers, but it enables the sparking gear to be readily inspected. A special form of spray-type carburettor, automatic in action, is employed to furnish the explosive mixture.

As regards the transmission gear, it may here be mentioned that three speeds forward and a reverse motion are available. The engine shaft is extended at one side and terminates in one half of a friction clutch. The female part of the clutch is carried on the end of a sleeve which surrounds the engine shaft. On the sleeve are mounted a series of spur-wheels, constantly in mesh with corresponding pinions on a short countershaft forward of the engine shaft. The various speeds are all actuated

by one lever on the steering column, the desired pair of pinions being made to transmit the power by means of small clutches. The variable-speed gear is entirely enclosed; in fact, the crank case and the change-gear case are practically all in one, which is dust proof and oil containing. From the countershaft the power is transmitted by a single Brampton roller chain to a sprocket surrounding the differential gear on the rear axle.

The outer surfaces of the clutch on the engine form a band brake actuated by a pedal. The first result of depressing this pedal is to disengage the clutch and so put the motor out of gear from the transmission; by further depressing the pedal the brake is applied. There is also an emergency band brake on the differential gear. This is operated by a hand lever, and like the pedal brake its first action is to disengage the friction clutch on the engine shaft. It should be added that the brakes act equally well, whether the car be running in a forward or backward direction. The frame is of tubular construction, and as it carries the motor and transmission gear, practically any form of carriage body can be fitted, fig. 5 showing a very comfortable four-seated tonneau. The road wheels are of the artillery type, and are all thirty inches in diameter, shod with Clipper-Michelin pneumatic tires. The car complete weighs about nine cwt., and with four persons up can attain a speed of thirty miles per hour. The petrol tank, which is located under the front seat, has a capacity of six gallons, while the water tank, which is located in the fore part of the frame, holds five gallons. Special attention has been devoted to the lubrication of the various parts.

We understand that a 12 h.p. car on similar lines will be ready for the market early in the new year.

WE hear that the Ormonde Motor and Cycle Company, of Wells Street, Oxford street, W., are about to put a new motor-bicycle on the market. A machine on the Minerva system is also about to be introduced by Messrs. W. A. Starley and Co., of St. John's Works, Coventry.

THE fastest mile ever accomplished on a motor-cycle, or automobile of any description, stands to the credit of Osmont, the well-known Parisian motor-tricyclist. Recently he covered a mile on the road near Paris in the world's record time of 58 3-5th seconds, a rate of sixty-two miles per hour, his mount being an 8 h.p. De Dion bicycle shod with Dunlop tires. The distance was accurately measured off, and the time taken by two official timekeepers of the A.C.F.

COL. SIR HOWARD VINCENT, M.P., the Colonel Commandant of the Queen's Westminster Volunteers, in the Regimental Orders for the present month invites the members of the corps to submit designs for a carriage capable of being drawn by three horses abreast or propelled by oil, for the conveyance of one officer, one sergeant, and twenty infantry, with their rifles, great coats, and rations and forage for three days, and, if possible, three cycles and three saddles. The vehicle must not weigh more than 20cwt., and must be sufficiently strong to go over rough ground.

HERE AND THERE.

MR. J. I. THORNYCROFT drives a light 7 h.p. Panhard.

MOTOR-CARS will again figure in the Lord Mayor's Show to-day (Saturday).

MR. ARCHIBALD FORD is interested in the publication of a new book on "Automobilism" which will be ready at Christmas.

IN American automobile circles cars with the engine under a bonnet in the fore part of the frame à la Daimler are known as "Bay windows."

PRINCESS MAUD and her husband, Prince Charles of Denmark, are converts to automobilism. The Princess has recently received from Paris a well-appointed Panhard, which, it is reported, she already drives with considerable skill.

THE inaugural meeting of the winter session of the Nottingham and District Automobile Club took place on the 1st instant. An informal dinner preceded the meeting, at which Mr. E. W. Wells (Vice-president) presided. The Chairman apologised for the

unavoidable absence of the President, Mr. R. Millington Knowles, J.P., after which Mr. Henry Sturmey gave an address on matters generally of interest to automobilists.

AT the last meeting of the Southwark Borough Council, a resolution was adopted to the effect "that a sub-committee of the Works Committee or of the Council (as the Council may deem fit) be appointed to take into consideration the desirability or otherwise of using horseless vehicles for the work of the Council."

MR. C. J. WRIDGWAY writes us from Philadelphia, stating that he has severed his connection with the De Dion Bouton Motorette Company, of Brooklyn, and has taken up an

appointment with Messrs. Banker Bros., of the Automobile Palace, Philadelphia. This concern, in addition to acting as agents for a large numbers of motor-car builders, does the biggest motor-car storage business in Pittsburg.

MESSRS. DE DION BOUTON, Limited, who have removed to larger premises at 28, Brook Street, Bond Street, W., inform us that they are now prepared to let cars out on hire. They have had very many enquiries during the past season for cars on hire, but owing to the difficulty of filling orders in time and finding suitable drivers, they were unable to undertake this class of work.

THE opening of the Shank Bridge at Arniston, Dalkeith, which connects the Edinburgh district with the Gala and South of Scotland districts generally, will be a great boon to motorists, this being a favourite route. The erection has cost £10,000. In the presence of a large company of gentlemen, the bridge was opened the other day by Sir Robert Dundas, who drove across in his carriage and pair, followed by the 6½ h.p. Daimler of Messrs. Adam Young and Son, Eskbank, Dalkeith, in which were the representatives of the Press.

FIG. 6.—THE "BRITISH IDEAL" CAR WITH CANOPY. (See opposite page).

SIR WILLIAM MILLER, has, we hear, ordered a Wolseley car.

We learn that Mr. Leslie Bucknall, of Sevenoaks, Kent, has bought the 40-h.p. Panhard carriage driven by Mr. Jarrott in the Paris-Berlin race, which recently arrived in England.

THE UNITED MOTOR INDUSTRIES, Limited, have removed from 40, Holborn Viaduct, E.C., to larger premises, 42, Great Castle Street, Oxford Street, London, W., where they will be able to keep a still larger stock of motor accessories, etc.

We hear that M. Santos-Dumont, the well-known motor-balloonist, has signified his intention of coming to reside in England, and will, in all probability, become a prominent and active member of the new Aero-Club of the United Kingdom.

It is quite on the boards that a big automobile race will be held in Australia at no distant date. The Dunlop Company is interesting itself in the matter and it is said one of the Melbourne daily papers is likely to come forward with a handsome prize.

THE writer, last week, endeavoured to purchase in London a 960 x 90 mm. Clipper-Michelin outer cover, but was unable to do so, nor was he able to ascertain when it would be possible for him to obtain one. The supplies were stated to be very uncertain.

MESSRS. DENNIS BROS., Limited, of Guildford, ask us to mention that the new building in progress will alone be capable of finding employment for over 150 hands. This is in addition to their present factory, which finds employment for over 100 workmen.

At Dunmow, John Bagster, of Brook-end, Bishops Stortford, was charged with being drunk while in charge of a motor-car at Takeley, on September 29th. After hearing the evidence the Bench retired, and after a short consultation the Chairman announced that the case was dismissed.

MR. F. F. WELLINGTON informs us that he has returned to town and is now living in the house adjoining the works at 36, St. George's Square, Regent's Park, N.W. He will be pleased to give assistance and attention to any motorist who may be in difficulty at any hour of the day, including Sundays.

MR. J. H. KNIGHT, lecturing on "Two Years' Motor-car Progress," on Thursday, last week at the Camera Club, said that the most noticeable fact was that English manufacturers had come to the front. He thought that motor-cars might be allowed to go a little faster than twelve miles an hour without police interference.

CANDIDATES for municipal honours are nowhere without the motor-car. At Stockton last week one of the elected pressed a motor-car into his service, and found the new mode of conveyance an admirable attraction to the working class constituents in the ward, who, eager to enjoy the sensation of riding in a motor-car, went willingly to the poll.

ANNOUNCEMENT is made that a number of wealthy automobilists in New York, who own country places out on Long Island, will build a private road from Roslyn and Hampstead to Long Island City, in order that they may drive their cars as fast as they choose in coming to the city. The road, which will be 23 miles long, will be fenced in.

THE NEW YORK TYRE COMPANY, LIMITED, has been registered with a capital of £10,000 to carry on the business of manufacturers and vendors of, agents for, and dealers in rubber and other tires for cycles, motor-cars, and vehicles, and the business of cycle and motor-car builders, engineers, rubber merchants, etc. The registered office is at Tavies Inn, Holborn, E.C.

It would be seen from our last issue that there was a likelihood of two Aero Clubs being brought into existence. We are glad to learn, however, that the difficulty has been overcome. Mr. Simms, who has been at work on his "pet" scheme for some time, was unaware that the Committee of the Automobile had taken the matter up. Henceforth all energies will be centred on the Aero-Club of the United Kingdom, which has already about 80 members.

THE SOUTHSEA ANNIVERSARY RUN.

THE following is a list of the vehicles that have so far been entered for the Anniversary Run to Southsea, on the 16th inst.

Official Name.	Name of Owner.	Name of Makers, &c.	H.P. of motor.	Motive power.*	Number of seats.	
Allons	Mr. C. Cordingley.	Motor Manufacturing Co.	16	PS	4	NSC†

The following entries have also been received, but owners have not yet selected names:—

Mr. Mark Mayhew, 20 h.p. Panhard.
 Mr. Dick Farman, 8 h.p. Morisse.
 Mrs. S. F. Edge, 6½ h.p. Gladiator.
 Mr. C. Jarrott, 40 h.p. Panhard.
 Mr. Walter G. Cromlie, 12 h.p. Knowles Chainless.
 Mr. H. T. Cave, 6 h.p. Panhard.
 Mr. G. St. M. Willoughby, 3½ h.p. New Orleans.
 Mr. Alan Hickman, 8½ h.p. Decauville.
 Mr. H. Bevan Swift, 2½ h.p. De Dion tricycle.
 Mr. A. W. Armstrong, 6 h.p. Daimler.
 The Motor-Car Co., Ltd., 8½ h.p. Decauville.
 The Motor-Car Co., Ltd., 8½ h.p. Decauville.
 Mr. G. H. Smith, an Empress car.
 Mr. M. Brooke, a Daimler car.

THE CRUSADE AGAINST UNREASONABLE PROSECUTION.

MR. MOFFAT FORD, the organiser of the Brighton Road Motor Patrol, writes us this week as follows:—

"In my operations for the purpose of combating the unfair action of the police towards motorists, which, I am glad to say, have proved a complete tactical success, I have discovered a very curious phase of automobile human nature, and that is, that until a motorist has actually undergone the process of being summoned and fined he cannot be made to appreciate the danger he runs from this source in every journey he undertakes.

"Two questions arise out of this discovery, which are as follows:—

"(1) Is every automobilist to be allowed to purchase experience in this way, because if he does the results will be (a) victory for the police and (b) death to the motor industry.

"(2) How are funds to be obtained to carry on the crusade; because however benevolent the purpose of a private individual with a red flag towards an advancing motorist may be, he cannot be persuaded to stop his machine for the purpose of contributing his mite towards the general funds established for his benefit. His reasons for not stopping, I presume, are somewhat as follows:—(a) There are police about. Good! Where are they? Thanks. This information he can obtain without stopping. (b) Nonsense. If there are police about I am quite smart enough to see them and slow down in time. I am not going to stop for anybody. And so on they go, because the road has been cleared for them by private enterprise.

"Now then, I think question 1 will be answered by everyone who has the interest of the industry at heart by an emphatic no. But question 2 needs a little thought before a reply is given. We have seen that the idea of making the path straight for the motorist and collecting a subscription from him towards the funds for that purpose is impracticable.

"I do not think that the automobile public generally will subscribe towards a general fund, for the very reason, as I have stated, that they

can in only one way be made to appreciate the danger such a fund would be utilised in obviating; although I am certain that the more public spirited amongst automobilists would be only too happy to contribute towards such a fund. As a matter of fact, I have received several offers of this nature which I have not yet been able to accept, because I hardly think that I, personally, am the proper party to receive such subscriptions.

"I venture, therefore, to suggest that this is a matter for manufacturers, agents, and the trade generally to take up for themselves, because if no one takes it up the trade will suffer and if it is properly taken up the trade will benefit.

"Let us see what an organised motor patrol for the three principal roads radiating from London itself for a distance of fifty miles would cost. We must bear in mind that the police have nothing else to do but lay in wait for motorists, and that they are prepared to do this every day for a twelvemonth if they wish to; consequently, our motor patrol must be prepared to do the same, and motorists can get no men to work for them on such permanent duty unless they pay them for doing so. Now I think that one cycle patrol man for every ten miles of roadway would be sufficient; that means five men for fifty miles of the Portsmouth road, and five men for fifty miles of the Great North road, and five men on the Brighton road, at say, 26s. per week (policeman's wage). Fifteen men at 26s. per week each would cost, say, £20, and this sum would make these roads 'safe' for motorists for one week. The question is, are those manufacturers and agents, who are largely interested in the London trade, prepared to subscribe amongst themselves £20 per week for six months for the purpose of preventing their trade being damaged and assist in its greater development. This is just an idea of mine for getting the necessary funds, and those automobilists to whom I have already proposed this idea seem to think pretty well of it.

"We have a practical scheme before us, but it needs funds, as I have shown, to carry it out."

FURIOUS DRIVING CASES.

At Towcester, William Sheppard, of Towcester, was summoned for furiously driving a motor-cycle at Abthorpe, on October 22nd. Defendant pleaded not guilty. P.C. Warman said on the date in question he was on duty in Abthorpe parish when he saw defendant driving a motor-tricycle towards Towcester at a very furious rate. By Mr. Sheppard: There was no one in the road. It would have been a dangerous pace if there had been. Mr. Sheppard said he had full control of the machine, and he did not endanger anyone, for there was no one in sight. The machine would not travel anything like twenty miles an hour. The magistrates said it was necessary to warn drivers of motor vehicles, but as there was no one about at the time, they would inflict no penalty, but only ask the defendant to pay the costs, 3s. 6d.

At Bakeswell Petty Sessions, Alfred James Poole, of London, described as a motor engineer, who did not appear, was charged with furiously driving a motor-car at Taddington on September 4th. Police-constable Wright said he timed the car, which went 700 yards in fifty-two seconds. He saw the defendant the same night going eighteen miles an hour. Orlando Hambleton, shoemaker, said "there was just a whirl of dust and the car was past." It was going at least eighteen miles an hour. Wm. Bown, farmer, said defendant was travelling at twenty miles an hour, and he could not see the car for dust. Harry Store, a coachman, swore defendant was travelling fourteen or fifteen miles an hour. The Chairman said he regretted that Poole was not in the dock, which was the proper place for him. It was a scandalous thing for a man in his position to drive about country villages and make himself a general nuisance. He would be fined £10 and costs.

At Brentwood, Mr. C. K. Peache, of Byfleet, was fined £3 and costs, for driving a motor-car at more than twelve miles an hour. The defendant, the police said, travelled from Ingatestone to Brentwood at twenty-one miles an hour.

At Hythe, William Barron was summoned for driving a motor-car at Selloe at excessive speed. P.C. Patrick said about 4.45 p.m. on October 1st he saw defendant on the Ashford Road, near Selloe, driving a motor-car at twenty miles an hour, having covered a quarter of a mile in forty-five seconds. Witness was accompanied by P.C. Haines. They were both at the end of the distance and both had watches with ordinary second hands. The Chairman: Were you expecting motor-cars to come by?—Witness: Yes, sir. We were there for that particular duty on account of numerous complaints. The defendant, who gave evidence, said that to the best of his belief he was travelling eleven miles an hour. It was impossible for him to go twenty miles an hour. The Bench inflicted a fine of £5 and 13s. costs.

At Ashford, Harold L. Cash, of the Clarendon Hotel, Gravesend, was summoned for driving a motor-car at Challock on the 12th ult. at a greater speed than twelve miles an hour. Defendant pleaded guilty to travelling above the limit, but said he was not going at the rate the policeman said he was—twenty-nine miles an hour. Sergeant Dann, of Ashford, stated that he was on duty on the Canterbury road between Challock and Chilham, with Corporal F. Fowle and P.C. Chandler, when he timed the defendant in travelling over a distance of a fifth of a mile, which was previously marked out. The defendant covered the distance in twenty-five seconds, this being at the rate of over twenty-eight miles per hour. A fine of £5 and 11s. 8d. costs was imposed.

At Huntingdon Petty Sessions, Randolph Wemyss, of Wemyss Castle, rifehire, was summoned for furiously driving a motor-car on the North Road. The hearing of the case occupied nearly three hours and ended in a fine of £3 3s. being imposed. Mr. Staplee Firth, who defended, gave notice of appeal.

At Ashton-under-Lyne, Frank Stockton, engineer, of Stalybridge, was summoned before the bench for furiously driving a motor-car. Police-constable Bratt proved seeing the defendant driving from Stalybridge to Ashton at the rate of twenty-five miles an hour. He was fined 10s. and costs.

At Guildford, Oscar Heindorff, of Witley, was summoned for driving a motor-car through Witley at a greater speed than twelve miles an hour, on the 13th ult. Sergeant Jarrett said that about 4.15 p.m. on the day in question he saw the motor coming along the Milford-road. He had measured a distance of 176 yards, and the car covered that distance in fifteen seconds, which gave about twenty-four miles an hour. Defendant stopped when asked, but said he did not think he was driving too fast. Mr. R. J. Cooke, who appeared for defendant, said that as there were only ladies on the car, and as they objected to come to a police-court, defendant must plead guilty.—Defendant said he was not intentionally going too fast.—Fined 50s.

At Altrincham, Ralph Jackson, of Altrincham, was summoned for having furiously ridden a motor-car at Baguley on October 2nd. The case was stated by a constable, who said defendant was driving at a rate of between twenty-six and twenty-eight miles an hour. Defendant denied driving at an excessive speed. He was testing a motor-cycle designed by himself, and it was not a motor-car. Defendant, who had been previously fined, was now fined £3 and costs.

At Kingston, Mr. Rowland Brown, of Earl's Court, was summoned for driving a light locomotive at a greater speed than twelve miles an hour, at London Road, Coombe, on October 3rd. Defendant was represented by Mr. Staplee Firth, who asked for an adjournment of the case, as his client was involved in civil action through a collision with a stone-cart at the time he was stopped by the police. The Bench acquiesced in the application, and the case was adjourned for a week.

At the Bolton Police Court, T. H. Thwaites, of Astley Bridge, was summoned for furiously driving a motor-car in Blackburn Road, Astley Bridge, on the 24th ult. Police-sergeant Plimmer deposed to seeing defendant's car travelling at the rate of twenty miles an hour. This was denied by Mr. Fielding, on behalf of the defendant, who with a witness stated that the gear of the machine precluded a greater speed than ten miles an hour being obtained. Defendant said he had travelled 7,000 miles with the car, and at the speed he was going on the 24th ult., when the officer saw him, which was not more than eight miles an hour, he could pull up within six feet. A fine of 10s. and costs was imposed.

Reported above are 10 prosecutions for furious driving. In 1 case the summons was dismissed, while in 9 cases fines amounting to a total of £32 13s. without costs were inflicted.

RUN DOWN BY A MOTOR CAR.

At Brompton County Court, last week, before Judge Stonor and a jury, Mrs. Sarah Goddard, a sempstress, of Markham Terrace, King's Road, Chelsea, brought an action against Mr. Edgar G. Lister, 78, Cheyne Court, Chelsea, claiming damages in respect of personal injuries, and loss sustained, owing, it was said, to the defendant's negligent driving of a motor-car. Mr. Hemmerde, counsel, appeared for the plaintiff, and Mr. Herbert Jacobs, counsel, defended. The plaintiff stated that on 28th April last she was crossing Brompton Road, near the top of Sloane Street. Before stepping off the kerb she looked both ways, and only saw a 'bus in front. On reaching near the middle of the road the defendant, in his motor-car, came along from Piccadilly towards her at a very fast rate. She stood for a moment, and when the car was within a yard or two of her she was startled by the loud sound of the horn; the next moment the car dashed into her. She was knocked down with great violence, and dragged along a considerable distance. Her right knee and ankle were badly bruised, and her face and shoulder also were slightly injured. After being treated at St. George's Hospital she was attended by a private practitioner, but had not yet fully recovered. The defendant stated that he had pulled up to allow some people to pass, and had only just started again when the plaintiff, who appeared to lose her head, ran back right in front of the car. He had two efficient brakes upon his car. The Judge: At what pace were you going? The defendant: I should say four miles an hour at the outside, and if the woman had not turned back, it would have passed safely. The jury found that the plaintiff "lost her head," and ran back in front of the motor-car, so contributing to the accident. This was a verdict for the defendant, for whom judgment was accordingly given. Counsel for the defendant intimated that his client intended making a payment to the plaintiff.

THE HORSE THAT DIDN'T LIKE MOTOR-CARS.

At the Brighton County Court, in a claim for compensation for the death of a valuable horse, the question as to the responsibility of a hirer when in charge of such an animal was the chief point in dispute. The plaintiff, Mr. James Stuart Smith, a livery stable keeper in Steine Street, Brighton, claimed £50 damages from Mr. Cecil Witherby, of Hanover Park, Peckham, on the ground that the latter had last August "wrongfully" driven the horse which he had hired from Brighton to Ringmer, whereas he had

only hired the animal from Brighton to Bramber; and that in consequence the horse met with an accident and had to be killed. Plaintiff stated that the horse in question was a "funny one with motors," and that had he known that defendant intended driving to Ringmer he would have sent another horse, as there were usually many motor-cars on that road, whereas the Bramber road was comparatively free from them. Expert evidence was called to prove that the horse was killed after injuries sustained by shying at a motor-car. It was agreed on both sides that there was no negligence in the actual driving, so that the point on which counsel argued at most length was as to whether or not a special route had been prescribed for this particular horse. His Honour decided in favour of the plaintiff, being of opinion that the horse had been let out on the understanding that it should go to Bramber only, and that the defendant, in deviating from that route, practically made himself the "insurer" of the horse.

A DISHONEST MOTOR-BUS DRIVER.

At the South Western, London, Police Court, William Fenver, a motor-bus driver, was charged with stealing 2s. 2d. belonging to Mr. F. J. Bell, proprietor of the motor-omnibuses plying between Putney and Piccadilly. Police-sergeants Moore and Mew, attired in civilian clothing, entered the defendant's 'bus at Putney and tendered a shilling for their fare. The prisoner was seen to put the coin in his pocket instead of into the box provided for the purpose, and gave the officers 4d. change. Another passenger handed him 6d., and this he also put into his pocket. The fares of five other passengers he put into the box. On the return journey the officers handed him 2s., and after he had given them 1s. 4d. change, he pocketed the florin. At the end of the journey the two officers arrested him, and he was found to be possessed of 18s. His explanation of his conduct was that he had no coppers for change, and was therefore unable to put the fares in the box. Mr. Bell said every driver was provided with change, and there was a stringent rule that all fares should be put into the box by the passengers themselves. The prisoner was sent to gaol for twenty-one days.

DAMAGES FOR A DOG.

At Dundee, last week, proof was led in an action raised against a cycle agent, in which pursuer asked for £6 in connection with the death of a collie dog, which was run over by a motor-car driven by defender in the Lochlee Road on August 27th. Pursuer alleged that the accident was occasioned through the negligence and fault of the defender in driving his motor-car in a reckless and unwarranted manner and at such a rate of speed as prevented the defender having the motor-car under proper control. Defender, on the other hand, said the dog dashed in front of the car, and it was impossible to avoid the accident. The Sheriff said he was of opinion that if defender had not been going so fast the accident could have been avoided. Dogs and cats, blind people and drunkards, had as much right on the streets as motor-cars. He thought there should be guards in front of wheels of motor-cars, so as to drive a dog aside if it collided with it. He awarded the pursuer £3 damages, with 10s. expenses.

PANHARD ET LEVASSOR v. THE MOTOR MANUFACTURING COMPANY.

MR. JUSTICE COZENS-HARDY, in the Chancery Division, last week ordered this action, with the consent of both parties, to stand out of the list until November 25th. It was stated that the plaintiffs sought an injunction to restrain defendants from using the words "Panhard and Levassor" in connection with motors manufactured in this country. The defence was that the words did not denote that the motors were made by plaintiffs, but meant a particular kind of manufacture. Negotiations were on foot for a settlement.

MERCERS' COMPANY v. THE AUTOMOBILE AGENCY.

ON Wednesday Mr. Justice Kekewich acceded to an application to postpone the hearing of this action until the 19th November. The action was one to restrain the defendants from carrying on business in such a manner as to cause a nuisance to the plaintiffs.

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, NOVEMBER 16, 1901.

[No. 141.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE anniversary dinner of the Automobile Club is to take place at the Whitehall Rooms, Hotel Metropole, as we go to press. It is understood that the principal speakers of the evening will be the Rt. Hon. the Earl of Onslow, Under Secretary of State for the Colonies, who will reply to the toast of His Majesty's Ministers, which will be proposed by the Rt. Hon. Sir Francis Jeune, K.C.B., president of the Probate and Divorce Court.

The toast of the evening, viz., The Automobile Club and its Affiliated Clubs, will be proposed by the Rt. Hon. Henry Chaplin, M.P., who, as president of the Local Government Board, introduced the Locomotives on Highways Act of 1896, and will be replied to by Mr. Roger W. Wallace, K.C., chairman of the Club and Sir Alfred L. Jones, K.C.M.G., the chairman of the Liverpool branch of the Club. Amongst the guests are the Duke of Sutherland, member of the General Council of the Club, the Rt. Hon. G. Shaw-Lefevre, Sir Lewis M'Iver, Bart, M.P., Col. Elmslie, President of the Experimental Sub-Committee of the Mechanical Transport Committee of the War Office, and Mr. Williams Benn, chairman of the Highways Committee of the London County Council.

The Anniversary Run to Southsea.

WE are informed by the Automobile Club that 190 vehicles have been entered for the run to Southsea, to-day (Saturday). The run will take place irrespective of the state of the weather. The Committee of the Automobile Club, whilst in no way authorising any speed in excess of the legal limit, are instituting a minimum time for each stage of the journey, in order to prevent wilful and flagrant defiance of the law. If a vehicle arrives at the end of a stage before the expiration of the minimum time, the vehicle will be disqualified from obtaining a non-stop certificate, and the driver of the vehicle may be disqualified from taking part in any future trial run or race held under the competition rules of the Club. Further, there will be intermediate timekeepers, and if it be found that a vehicle has been driven at a high speed for the first part of the stage, thus necessitating an absurdly low speed for the latter part of the stage, the vehicle and driver will be subject to similar disqualification. Speaking generally, therefore, it is hoped that so long as the vehicle in front is not in obvious difficulties the drivers will refrain as much as possible from passing. The Club Committee beg that, in view of the fact that this is the largest collection of vehicles which has ever been seen in this country, drivers will co-operate with the Committee in making the run a success, in avoiding all risks and possibilities of accident, and especially in avoiding the causing of inconvenience to other users of the road.

Two Cups Offered.

In connection with the run, Mr. C. Cordingley offers a prize of a ten-guinea cup for the car having the best appearance, both as regards the car and its occupants. The prize to be given in accordance with the votes of competitors to be recorded at Cos'am. Mr. Edmunds, Chairman of the

Tours Committee, being anxious to encourage the moderate driving of motor-vehicles, is also giving a cup to the member of the Automobile Club owning the car among those receiving the diplomas under non-stop conditions, which starts punctually from Horse Guards Avenue and arrives last at the end of each stage. In case of ties, this cup will be given to the car running nearest to the twelve miles per hour average over the whole run.

A Scotch Anniversary Run.

WHILE motorists down south will be wending their way to Southsea, the western section of the Scottish Automobile Club will be enjoying a run from Glasgow to Luss, starting from Woodside Crescent, Charing Cross, at one o'clock in the afternoon. The Committee invite all automobilists, whether members of the Club or not, to take part in the run, and it is hoped that members will make a special effort to enlist the support of their friends. Mr. H. M. Napier has extended a general invitation to the party to afternoon tea at Luss.

The Aero Club.

THE inaugural meeting of the Aero Club of the United Kingdom took place on Wednesday evening at Whitehill Court. Colonel Templer occupied the chair, and there was an attendance of forty members and friends. The chief business of the evening was the election of M. Santos-Dumont to the honorary membership of the Club, and the decision to invite this distinguished aeronaut to a banquet to be held towards the end of the present month. On Friday two of the members most active in the formation of the Aero Club—Mr. F. H. Butler and the Hon. C. S. Rolls—were, weather permitting, to make a balloon ascent from the Stamford Bridge grounds.

A New Series of Articles.

IN view of the increasing attention which is being devoted to the question of navigating the air, we are glad to be able to announce that we have arranged with an expert to write for us a series of articles on "Mechanical Flight Up to Date." The articles, the first of which will appear shortly, will be fully illustrated. Much useful information of a reliable nature will be embodied, which should serve as a guide to the many tyros who are no doubt contemplating an early flight. In the course of the articles it is proposed not only to deal with the experiences of aerial navigators, past and present, but also with the construction of air-ships and the motors by which they are propelled.

The Automobile Club's Winter Session.

THE first house dinner of the winter session of the Automobile Club will take place on Wednesday, December 11th, at 7.30 p.m. It is hoped that after the dinner, Professor Hele-Shaw, LL.D., F.R.S., may be able to arrange to read a paper on "roller bearings." The reading of the paper will be followed by a discussion. In 1902, house dinners will be held and papers will be read on the second and fourth Wednesdays in every month, up to and including March. Messrs. Longman

intend to publish next year, as one of the Badminton Series, a book on motoring. The book, which has been undertaken by Mr. Alfred Harmsworth, who will enlist the assistance of some of the members of the Automobile Club, is intended for the guidance and assistance of ladies and gentlemen who have no technical knowledge, and who are about to purchase, or have recently purchased, motor-vehicles. The Club Committee feel that it would be in the interests of the motor movement if members of the Club were to render assistance in making the important parts of the work as clear and as perfect as possible. Five papers will therefore be read after house dinners during the forthcoming season, which will be specially written for the Badminton book, and members will be invited to discuss the papers with a view to bringing them to perfection. The subject of the papers will be:—(1) The possible idiosyncrasies (other than ignition) of the petroleum spirit engine. How to discover and remedy them. The Hon. C. S. Rolls is to be invited to read this paper. (2) Ignition in petroleum spirit engines. Systems. Possible failures and how to discover and remedy them. (3) Reminiscences. This chapter, while intended to convey instruction to beginners, is at the same time designed to contain amusing incidents of the early days of motoring. These incidents might, if not recorded very quickly, be forgotten. A member of the Club will read a paper comprising the most amusing and, at the same time, instructive incidents within his knowledge, and other members will be asked during the discussion to relate additional incidents in order that the best incidents may be selected and included in the book. (4) Electric vehicles. (5) Steam vehicles.

A Chance for Motor-Cars.

RECENTLY we commented on the growing network of tram-lines with which London was becoming surrounded, and deplored, from the point of view of the pleasure-loving motorist, the difficulties that are being added to an easy and safe way out of the great Metropolis. Those who had feared the further destruction of the roads in Middlesex will regard with complaisance the refusal of the Light Railway Commission to sanction the scheme of the Middlesex County Council tramway scheme from Wembley to Harrow, the Cricklewood to Harlesden proposals, the Harrow to Edgware system, and the Kilburn High Road tramway. Surely, with all these proposals receiving some degree of local support and not finding favour with the Commissioners, there ought to be a splendid opening for a public motor-car service in some of these districts.

Motor-Bicycles.

AT the Coventry Technical Institute on Friday, last week, a lecture was given upon motor-bicycles by Mr. G. D. Leechman, Hon. Secretary of the Cycle Engineers' Institute. In the course of his lecture Mr. Leechman said the motor-bicycle was the smallest and lightest automobile vehicle made. As such it possessed certain advantages, and he thought, taking the horse-power into consideration, it was the fastest and most economical to run. The motor-bicycle could not be regarded as a single entity, but as consisting of two separate and distinct parts—the motor and the bicycle, or, rather, the bicycle and the motor. Two points to decide were, which wheel to drive, and where to place the motor, so as to drive the bicycle easily and avoid side slip. Some people supposed it was an advantage to have the centre of gravity low, but he held that purely from a balancing point of view on a bicycle it was desirable to have the centre of gravity as high as possible in order to avoid side slip. There were two causes of side slip. First, from riding over uneven, greasy surfaces, and in this case if the centre of gravity was low the rider would not have a chance to recover himself. The higher the centre of gravity the slower the oscillation and the more chance of correcting any disturbance. The other source of side slip was set up by counteracting the centrifugal force in turning round corners, but in regard to this matter the position of the centre of gravity did not make any difference and did not enter into the calculation.

Mr. Leechman went on to consider such points as the position of the motor, inclination of the cylinder, the question of brakes, and the durability of belts. A number of slides were shown to illustrate the various types of motor-bicycles which have been introduced.

A Cure for Insomnia.

WHEN the medical profession seriously studies the effect of automobilism on the health of those who indulge in the sport, we believe a great impetus will be given to the progress of the motor-car. The average Englishman is a utilitarian, and if he is assured that he can secure a healthy body while rapidly doing his business he will be all the more easily converted and conquered. It is said that the use of the motor-car has practically cured a tendency to insomnia from which His Majesty the King had suffered for some time. The frequent motor-car trips in which His Majesty indulged while on the Continent, some of which were pictured as well as described in our columns, were not unassociated with the desire to get rid of sleeplessness; and apparently they proved most successful. As an appetiser the motor-car is a boon to hotel proprietors; as a preservative of health it will not prove so lucrative to the doctor.

Another Warning.

DESPITE the insistence with which we have endeavoured to persuade motorists to conduct themselves in a reasonable way, there are still drivers who ignore the feelings of others and persist in disregarding ordinary courtesy. They are a small minority, it is true; but the majority suffer because of their foolishness. The other day, a Panhard car, driven by a Frenchman and carrying two passengers, stopped at the establishment of Mr. H. L. W. Lusted at Alresford (Hants), for petrol. After being supplied the driver started the engine, and in turning round drove right on to the pavement, almost pinning a sergeant of police to the wall. Had the driver reversed about ten yards, there would have been ample room for his evolution. Not satisfied with that, he started off quickly, and ere the town was left was reported to be travelling at the rate of sixteen miles an hour. The wonder is that the policeman did not wire forward and have the driver summoned. Such conduct is most reprehensible, and we sympathise with motor-car repairers and others who are friendly with the local police, for incidents such as this tend to create bad feeling; and in these days of threatened legislation motorists cannot be too careful with regard to inciting the forces of ignorance and prejudice against them.

The Regulation of Motor-Vehicles.

ON August 1st last the Club Committee of the A.C.G.B.I. appointed a Special Legislative Committee to consider what should be the provisions of a new Act for the regulation of motor-vehicles. The Committee includes, among others, the following gentlemen:—The Right Hon. Sir Francis H. Jeune, K.C.B.; the Right Hon. Sir J. H. Macdonald, Lord Justice Clerk of Scotland, and Mr. Eric Chaplin. The Committee first met on August 22nd, and have since held several meetings. It has been found that the matter is one which requires most careful consideration, and it is possible that the suggestions of the Committee may be submitted to the members of the Club at an evening meeting during the forthcoming winter session.

The 1902 Nice Week.

WE have received a copy of the preliminary programme of the week of fêtes organised by the Automobile Club of Nice. The "week" will be opened by a *Corso Fleuri*, or procession of decorated automobiles, on Sunday, April 6th. On Tuesday, April 8th, there will be a speed contest over the Nice-Aix-Senas-Salon-Nice road, the distance being 462 kilometres, and a race for tourist cars over the Nice-Druguignan-Nice road.

(193 kilometres). On Wednesday and Thursday the various competing cars will be placed on exhibition in the *garage* of the A.C.N. Friday, April 11th, will see the mile and flying kilometre speed contest on the Promenade des Anglais, Nice. The annual La Turbie hill-climbing contest will be held on Saturday, April 12th, the festivities being brought to a close on Sunday, April 13th, by a *Concours d'Elégance*.

Half-Penny Motor-Buses.

THE syndicate interested in placing motor-buses on the streets of Birmingham is now awaiting the sanction of the Watch Committee to run the new vehicles over the six selected routes. It is hoped that this will be obtained in time to allow of the inauguration of the service on New Year's Day. The vehicles are seated for fourteen passengers, and it is estimated that the time occupied by each journey will be half that of the larger horse-drawn vehicles. A three minutes' service is proposed each way, on the six routes, each of which is from a distant suburb to the heart of the city. It is also proposed to institute halfpenny fares for workmen in the small hours of the morning. With such a liberal programme the popularity of the motor-bus should be assured.

Names, not Numbers.

THE humblest little sea-craft is deemed worthy of a name, which is ornamental as well as useful. Our horses, dogs, cats, and all other pets are also given quaint or affectionate titles; why not motor-cars also? If any system of classification comes into force for motor-cars, the advisability of adopting names instead of numbers might be considered by the authorities. Whilst such a brand as "X 112" disfigures a car, it is not very distinctive as a means of quick identification, and yet is an eyesore to the owner. But he would be rather proud to see a sweet-sounding name gracing his car. A few enthusiasts have already adopted that custom, and there is no reason why it should not be general. A list of ships' names, or race-horses', would supply the necessary materials amply, and the custom of adding the native place, nautical fashion, might be followed. Thus, "Iris, London"; "Nancy, Edinburgh"; "Mercury, Liverpool," would look well in neat lettering on the back panel, and would give a sense of closer proprietorship to a vehicle than when it is a nameless one, known only by the title of its species.

Ludicrous Law.

To an Irish County Council stands the credit of having brought into force one of the most absurd local laws ever set down. The enactment, which came into existence a month ago, is due to the genius of the County Council of King's County, and runs to this effect:—"Any cyclist or person driving a motor-car, on approaching a car, carriage, etc., drawn by a horse, mule, etc., which shows signs of restlessness, must, on being signalled to do so by the person in charge, dismount and must remain dismounted as long as may be deemed necessary." It may be difficult to guess how such a law came into force; but it is due to the amateur law makers following an old model drawn up years ago for the regulation of cycle traffic in the days when horses regarded bicycles with terror. The King's County solons added the words "driver of motor-car" after "cyclist," and thought they were thoroughly up to date. Now, the regulation as to cyclists dismounting, has been vetoed many years since in England and Scotland, as it was shown to be needless. At the time originally formulated, it may have served a useful purpose; but it is the height of stupidity to revive the rule now and make it applicable to motor-cars. Yet the law to that effect is now in force in King's County, and every motorist passing through it is liable to prosecution if he does not dismount at the behest of any apprehensive driver. It is evident that the law-makers hold the idea that extra control is obtained over a motor-car when the steersman dismounts! There will be extra amusement, too, for the lookers-on, in that the other passenger on the front seat has generally to be shed to enable the *chauffeur* to

comply with the law. The regulation is monstrous, ludicrous, and the Automobile Club of Ireland should at once see to the matter, as other County Councils may at any moment take it into their heads to pass similar laws.

The Dust Nuisance.

AT the last meeting of the Committee of the Automobile Club a report was submitted from Professor C. Vernon Boys, F.R.S., and Mr. Worby Beaumont, M.Inst.C.E., as to the devices submitted in competition for the prize of £100 offered by the Club for the best method of preventing dust raised by motor-cars causing annoyance to other users of the road. It was decided that, as the report was to the effect that none of the devices submitted were satisfactory, the period for the submission of devices for competition for the prize should be extended.

MR. W. CREBER ON HIS ALBION CAR AT PERTH POST OFFICE.

A Winter Run.

To settle a friendly wager, Mr. W. Creber undertook to drive two passengers to Perth and back on a twelve-miles-per-hour motor-car on a fixed date. Leaving Gorbals, Barrhead, at 5.30 a.m. on the 31st ult., the journey was made through Glasgow, Stirling, and Auchterarder. The roads in places were heavy from recent rains, and the fact that four different steam road-rollers, with their accompanying patches of new metal, were passed, will speak for itself. A cold east wind had to be faced during the whole of the outward journey, but with all, as the day advanced and the sun came through occasionally, the trip

became more enjoyable; and after a good run without stopping, except for policemen's signatures when leaving Glasgow, the party landed at Perth post office at 11.35, where the photograph under the clock, reproduced herewith, was taken. After lunch the journey home was resumed at 1 p.m., and with only one stop for petrol at Stirling, home was reached at 7.40, after a very enjoyable run of 134 miles. The car used was the Albion, which ran so successfully through the Glasgow Trials as A 6.

Second Thoughts are Best.

IN consequence of the announcement of nine motor cases at Guildford, several automobilists not directly concerned looked in last Saturday on the proceedings, but the nine were absent, and Hamlet was performed with the Prince of Denmark omitted. Inquiries as to the source of the false news, with which the reporters of the local papers were taken in, were unsuccessful, though rumour had it that the summonses were all in order for distribution, but a magistrate could not be got to sign them, some being for the heinous offence of walking ten yards from one's car and thus leaving it unattended. If this be true, it would appear that a dim idea of the technical meaning of the adjectives "frivolous" and "vexatious," as applied to legal proceedings, is beginning to reach the minds of the rural tribunes, which—is it too much to hope?—may in due course percolate to those of the inferior representatives of law and order.

Mending their Ways.

THE instructions of the Surrey County Council appear to be bearing fruit, at least in the Godalming district, as when about a mile from the latter town on Saturday, en route for Guildford, we noticed no less than three steam-rollers at work together within a space of two or three hundred yards, rapidly reducing about that length of fresh-laid stones to the smoothness of a track. Nor did the similarity end there, for that very bit of road had been previously carefully surveyed and measured by the police with a standard bit of string, and though there were no timekeepers on duty at the moment, they had only the previous day successfully recorded their prowess at the Godalming Borough Bench, at the expense of a well-known member of the A.C.G.B.I. It is evidently intended that no material obstacles shall lie in the way of well-attested records on this motodrome, though we are glad to see that the one referred to is to pass the scrutiny of a higher court.

A Glasgow Protest.

THE recommendations of the Automobile Club as to the awards in connection with the recent motor-car trials at Glasgow have not been received with unanimous favour, and the Hozier Engineering Company, Limited, has submitted a letter to the Council of the Glasgow Exhibition which will doubtless receive adequate attention. In this letter complaint is made of the exclusion of the climb of Whistlefield Hill from the official programme. It is pointed out that the Argyll voiturette built by the Hozier Company did not lose a single mark in the whole 535 miles and carried its full complement of four passengers over every hill on all the routes. In the Fintry hill-climbing test it received 110 marks and in the Gleneagles hill test it was credited with 152 marks. An average speed of 5.21 miles per hour was attained by the Argyll voiturette in ascending the Whistlefield Hill and that while carrying four passengers. The weight of the car is 10 cwt. and alongside these points in its favour are given some of the results obtained by other cars. Comparing these the Hozier Engineering Company feels some perplexity at the decisions arrived at and suggests that before the awards are made absolute the Council of the Exhibition should be furnished with further information so that it may have a complete return on which to base the awards.

Hampshire and Motor-Cars.

THE question of the regulation of the speed of motor-cars was considered by the Hampshire County Council on Monday. The Earl of Portsmouth remarked that the real way of putting a stop to reckless and unprincipled driving was to give magistrates power, where there was a previous conviction for such an offence, to impose on the driver a large fine or commit him to prison. Owners of motor-cars were rich people, and it was no penalty to them merely to inflict a fine of £10. Mr. Evelyn Ashley considered that no one should be allowed to take charge of a motor-car without a certificate of competency, and he did not think it right that the roads should become schools for persons to learn to drive and steer automobiles. The Council decided to support a proposal that motor-cars should carry an identifying number, but refused to adopt a motion in favour of granting certificates of competency. A proposition by the Earl of Portsmouth, that in cases where the driver of a motor-car had been three times convicted of furious driving, the magistrates should have power to impose a fine not exceeding £100 was defeated; but, on the motion of Mr. J. Gathorne Wood, a resolution was adopted to the effect that the present maximum penalty of £10 was not sufficient.

Hunting and Automobiles.

THE motor-car is likely to be much in evidence in the hunting field this year. Young though the season is, accounts of its appearance come from all quarters, particularly the Midlands. Of course, the automobile does not follow the hounds across country, but by sticking to the roads may enable its occupants to get a fairly good idea of what is going on. It is also a valuable auxiliary to the man in pink, inasmuch as it conveys him to the meet, where he finds a fresh horse awaiting him, and whisks him rapidly home again after the excitement of the run is over.

A MOTOR-LORRY is the latest innovation at Billingsgate Market. The Anglo-Tagus Company have decided in future to transport the oysters from their beds at Rainham, Kent, to the market by means of an automobile. The first lorry left Rainham at half-past ten on Thursday night last week, and reached Billingsgate Market at half-past five the next morning, with its freight of three tons of oysters.

MR. E. J. COLES, of Upper Holloway, is about to put a new petrol car on the market under the name "Belle." The vehicle will be built somewhat on the lines of the Benz gear-driven cars, but the engine—of 6 h.p.—will be located in the front of the frame, which will carry a *tonneau* body. In the run to Southsea to-day (Saturday) Mr. Coles will drive a novel form of locomobile steam car. The car is a standard one as regards under frame and mechanism, but the body, which has been designed by Mr. Coles, takes the form of a hansom cab.

IN their annual report to the shareholders, the directors of the new Centaur Cycle Company, Limited, Coventry, remark that, whatever may be the future of the motor-car trade, profits appear to be unattainable in its present stage of evolution, and the only asset makers have to place against large expenditure is the experience gained. In their experiments they have endeavoured to purchase experience as cheaply as possible, and the experimental expenditure has been provided for out of the profits of the cycle department.

AT the last meeting of the Standing Committee of the A.C.G.B.I., a letter was submitted from the secretary of the Sports Committee of the A.C.F. stating that all the clubs concerned, with the exception of the Belgian Club, were in favour of the rule limiting the weight of racing vehicles being applied to the race for the Gordon Bennett cup. The standing Committee recommended that if this club be the only one that is in favour of there being no limit in the weight of vehicles for the Gordon Bennett cup it should not oppose the introduction of the weight limit.

AUTOMOBILISM AND AEROMOBILISM.

THE somewhat sudden recognition of the importance of the problem of aerial navigation as one (to put it cautiously) within measurable distance of scientific, if not of economic solution, is a noticeable event at the present time, which the remarkable and well-deserved success of M. Santos-Dumont has done not a little to bring about. It is true that there have been recurrent waves of interest in the subject—if we include aerostation as its minor but less theoretical branch—ever since the inauguration of the latter 118 years ago; but they have broken to little or no practical end, and the societies that have been formed since Marey Monge advocated a European Aeronautical Society in 1847 have, with nothing but ballooning as a *raison d'être*, mostly died of inanition or survived in a semi-comatose state, while the advances that have been made are almost entirely due to a few able and—too often literally—self-sacrificing experimenters. There have been many obscurer workers, nevertheless, in whom the happy combination of zeal, means, and knowledge has been lacking, and perhaps in no other branch of human progress has so much valuable time and money been fruitlessly expended through ignorance of the work of previous investors in the same line.

Thus it is that a certain amount of distrust—almost of discredit—has attached to the ardent worker in this field, and his appearance as a would-be *confrère* of the automobilist almost, in the eyes of some, needs an apology, a view which Dumont's achievement, far as it seems to some of us from the real solution of the problem, has, as an apparent and tangible success, done much to dispel. But apart from this, the steps made in other directions towards the desired end are far greater than is generally believed. The valuable data collected by Lilienthal, and extended by Pilcher, both martyrs to the cause; the records of Maxim, Langley, Chanute, and Herring, and especially the latter's contributions to the chief remaining problem of the aeroplane, namely, the difficulty of balance against the irregularities of the wind, show a better case for the "heavy" air-ship than outsiders generally realise. Both sections are aware of their debt to automobilism in the matter of evolving light and manageable sources of power, and only request tolerance and encouragement until they shall have more fully justified their claim to be enrolled under its banner; an end which will need all the assistance that a combined body of enthusiasts can offer. Much can doubtless still be done by experiments with models; but from the nature of the case these are less instructive and reliable than in most matters of mechanical construction, and costly and elaborate experiments will be necessary on a large scale, the encouragement of which, together with the circulation of knowledge and the exchange of views on the subject, should be the primary object of an Aero Club. In the meantime, ballooning *per se* is an inexpensive and healthy pastime, so long as its votaries are not led to neglect the principal object of their organisation, to hasten the evolution of the "airy navies" of the twentieth century, and to ensure that a fair proportion of them at least shall be the outcome of British enterprise. R.W.B.

At the Law Courts, on Wednesday, an order for the compulsory winding up of the Autocar Supplies, Limited, was made on the petition of Mr. G. W. Gorden Tamplin.

MR. G. H. WARNE, of Warne's Hotel, Worthing, has invited the members of the Automobile Club to luncheon on Sunday next, the 17th inst., to inspect his hotel and new motor garage.

THE three days' "At Home" held by the Locomobile Company of America at their new depot at South Kensington, last week, resulted in a great success, close on 400 people visiting the same. The company had the showrooms for the three days specially decorated with flowers and plants, and had a part of them converted into a miniature drawing-room, tea and coffee being handed around by the lady typists. Among the number of well-known people who called were the Baron and Baroness Campbell, and Miss Barber, daughter of Mr. A. Lorenzo Barber, the president of the company.

CORRESPONDENCE.

MOTOR-BICYCLES FOR 1902.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As many cyclists will be thinking of being "pushed by a pint of paraffin" next season, it may be of benefit to some if I give my experience as a bicycle motorist during the present year, and may be a guide to the uninitiated respecting the kind of machine to be sought after without having to pay for one's own inexperience, or for the experiments of the manufacturer. Anyone who has tasted the delights and recognised the feasibility and possibilities of the motor-bicycle will have little difficulty in acquiescing in my opinion, that this machine will soon be more popular than the more expensive and luxurious motor-car.

Now for my experience. I have travelled nearly 1,000 miles on a Bayliss, Thomas and Company's "Excelsior"; have also tried the "Singer," the "Werner," and the "Kitto." The engine of the first-named (reputed as $1\frac{1}{2}$ h.p.) is altogether inadequate for English hills. I found my machine unable to climb gradients of 1 in 25 without pedalling assistance; and also an acclivity of 1 in 12 (unless a very short steep one which might be rushed by impetus) without having to dismount altogether. The "Singer" is much better in this respect, and the "Werner" and "Kitto" are far superior hill climbers. My chief objection to the "Singer" I tried was its liability to side-slip. The "Werner," though effective, is a noisy machine; besides which, owing to the close proximity of the engine to an unnecessarily wide and also unadjustable handle-bar, considerable vibration is communicated to the hands and arms. The "Kitto" also errs somewhat in this matter of vibration, but has a lively little engine of good hill-climbing ability. I lay great stress on the importance of hill-climbing power, for a motor-bicycle enables its possessor to travel so far afield that one is bound to soon encounter all kinds of country and hills. The "Kitto" and the "Singer" are the most silent of the machines I have mentioned, which is a very vital matter to both rider and driver in the present unsatisfactory state of equine education. Regarding speed, I have attained on the "Excelsior" speeds of twenty-four and twenty-six miles per hour on a good level road. The engine (Minerva) I found soon got "tired"—any motorist familiar with air-cooled motors will know what I mean—in fact, I have known a certain gradient which the machine would climb when cool, which it could not climb when the engine became hot, except with pedalling assistance. There is, however, one good feature about this machine, and that is that the bottom bracket position of the engine gives great immunity from side-slip and freedom from vibration.

The foregoing practicable observations have naturally given rise to certain points which I commend to the notice of every cyclist who may be contemplating becoming a motorist. I have embodied them in a description of what my experience would define as an ideal (and I am sure not impracticable) machine; at any rate, it is that machine which most nearly approaches it that I shall order for next season:—

Horse-power.—Eschew the so-called $1\frac{1}{2}$ h.p. machines, the net horse-power of which often does not equal even 1. Insist on having $1\frac{1}{2}$ "net," "actual," or "brake" h.p. If 2 b.h.p., all the better. To be doubly sure upon this all-important point, ask the maker whether he will guarantee that the machine will carry a twelve stone individual up a gradient of 1 in 12 or 1 in 15 without assistance, and, with pedalling, a gradient of 1 in 8. If you have to dismount for 1 in 7 you need not grumble. Manufacturers do not begrudge these guarantees with motor-cars. A low-power engine has no reserve to cope with the following likely contingencies: Natural decline in efficiency through heating, especially in warm weather, the ideal time for motor-ing, hill-climbing, indifferent petrol, weak ignition, and extra luggage weight.

Ignition.—To avoid the inconvenience of recharging accumulator have the Simms-Bosch magneto ignition; or a combination of dynamo and accumulator, such as the Avery dynamo,

constantly feeding a small accumulator, by being operated by small friction wheel off the back rim.

Trembler.—See that trembler and contact screw are durable. I found that the Minerva required renewing at the end of nearly every hundred miles at a cost of about 4s.

Petrol Tank.—Capacity to travel at least 120 miles without refilling.

Carburettor.—Spray or pulverising type.

Transmission.—Chain drive; but if belt, then the twisted hide pattern with well-cut transversely corrugated motor pulley to prevent slipping.

Gear.—Eighty or ninety, to avoid being "winded" by the necessarily rapid pedalling when assisting, as speed must always be brisk to maintain engine power.

Frame.—Reinforced "flexible" or other strong spring frame.

Brakes.—Two Bowden brakes.

Tires.—2½ "Clinchers," which are splendid non-slipppers.

Exhaust.—To have a silencer nearly silent.

Levers.—"Sparkling Advance" and "Quantity" levers to be operated from handle-bar.

General.—In addition there should be automatic lubrication, two speeds, with free engine (otherwise exhaust-lift) outlet cocks (not nuts) for old petrol and for refuse lubricant.—Yours truly,
PETRO.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I can fully endorse all that Mr. Fawcett states regarding desirable improvements in motor-bicycles generally, but in the Werner particularly. This type of machine is found to possess ample power, in fact at times too much power to be able to get a low speed for town riding. With everything in the best order, I should say it is the fastest machine on the market; but, alas! I should also say the worst finished in detail. Before I could get anything like good results I had practically to overhaul every part of mine. A few of the worst features were: First, the motor pulley not in line with driving wheel, causing much trouble with the V belt, necessitating the fitting of a new motor pulley; second, sparking gear badly fitted and coming loose, owing to bad threads on the screws and nuts, etc.; third, exhaust box worthless as a silencer, the noise when running at fair speed being distressing; fourth, accumulator sent out with the plates imperfectly "formed"—mine took fifteen repeated charges and discharges to get into anything like proper order. The capacity, as stated by the makers ("Dinen," Paris) is 20 ampère-hours, tests with accurate instruments proved it to be only twelve. I seriously doubt whether this would mean 500 miles running, let alone 1,500. The brake is most defective, and I had to fix a spring to help it to release from the drum, as it nearly caused a serious accident through jamming. A reliable belt-fastener is also much needed, also better work in the carburettor—mine leaked at the top. These details being improved, the Werner would, in my opinion, become very popular.—Yours truly,

ELECTRICAL ENGINEER.

BROKEN CONES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can any of your readers throw light on following? I ride a 2½ h.p. water-cooled De Dion tricycle. Nearly every two weeks I break a cone, it is always the same one, that is, the outer bearing on the right hand driving shaft next to wheel. The collar is torn off and the balls have grooved the shaft. It has been replaced about six times. What is the cause?—Yours truly,
PUZZLED.

THE NOMENCLATURE QUESTION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I cannot agree with your correspondent, Mr. Sennett, that "Motor-Running Store" would be an ideal English substitute for the French word *garage*. Everyone seems bent on

having an English equivalent, however, so I would suggest that it would be preferable to have a simple and not a compound word. In this light the suggestion is most obvious. We have "cooper-age," "anchor-age," "vicar-age," etc., therefore why not "motor-age"?—Yours faithfully,
H. S. HALFORD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—"Garage" is awful. We have "coach-house," "gig-house"—why not "car-house" or "motor-house"? Again, we have "cart-lodge"—why not "motor-lodge" or "car-lodge"? Any simpleton would know what these words mean.—Yours truly,
ANTI-FOREIGN.

POPULAR-PRICED CARS WANTED.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The opinions expressed by Mr. Cecil Jackson's letter in your last issue will be readily endorsed by a great many readers of your interesting journal. We have constantly before us your tabulated statement of prosecutions for furious driving. A steady twelve miles per hour run should be quite sufficient speed for all ordinary purposes, which is far beyond what we get from our hay-motors. This would make us law-abiding users and baffle the man in blue if drawn into the vortex of the law courts.

The popular light car for two persons, to be generally serviceable and lasting (although light), in my opinion, cannot be produced at so low a price as £75; but certainly such may be constructed with a motor, say, of 3½ or 4 h.p. and geared to 4, 8, and 12 miles per hour, with light combination wood and iron wheels and solid tires (if not too rigid for light cars), and supplied at or below £100, subject to a fair cash discount. If a car of this description was brought into the market and fairly advertised, that your readers might know where obtainable, there certainly would be a plethora of orders received. At present none of the manufacturers advertise such cars at popular prices.—Yours faithfully,
GEORGE S. BRIDGMAN.

THE Clipper Pneumatic Tire Company, Limited, write:—"We have read Mr. Phillips' letter published in your issue of November 9th. As to the letter which Mr. Phillips states he addressed to this company, and the memorandum stated to have been made upon it by someone in our employ, we can only say that we have no trace whatever of any communication of the kind, nor can any of the officials of the company recollect anything of the circumstances alleged by Mr. Phillips. However, accepting Mr. Phillips' statements as correct, what do they amount to? That he asked for immediate delivery of certain tires, and that he was informed that the tires in question were not in stock, but were expected the following week. Could anything be more reasonable than such a reply? Surely if Mr. Phillips was as anxious as he professes to be not to infringe the patentees' rights, he would have taken the common-sense precaution of ordering his licensed tires at the same time as he ordered his car, instead of waiting until his car was finished, and then purchasing infringing tires, because forsooth he was unable to purchase a pair of tires across the counter."

[We cannot insert any more letters on this subject.—ED. *Motor-Car Journal*.]

THE Eastbourne Town Council at a recent meeting adopted a resolution "that the Committee take into consideration the advisability of obtaining powers for electric trams or motor omnibuses."

AN annual challenge cup for motor-cars propelled by alcohol is announced from France. M. Pierre d'Arenberg, an enthusiastic advocate of alcohol as a motive power, has endowed the cup, which will probably be run for simultaneously with the Paris-Bordeaux race.

THE Scarborough syndicate, recently formed for providing a service of motor-cars at Scarborough, has now had the first of the cars on the streets for a month, and pronounces the result of its working to be quite satisfactory. Two more cars are expected in the course of a week or two, when some of the most distant suburbs will be regularly connected with the town.

The Truffault Racing Car.

(La Locomotion.

FLOTSAM AND JETSAM. BY "FLANEUR."

A MACHINE—we use the term advisedly—which attracted considerable attention at the recent race meetings at Deauville and Ostend was that designed and driven by M. Truffault, and of which we are able to give a very clear illustration herewith. At the first glance the machine appears exceedingly complicated, but after inspection is found to be very simple. The frame, which is of strong tubular construction, measures 6ft. by 3ft. The rear wheels are 4½ ft. apart and are fitted as on a car, while the front ones are carried between spring forks of the cycle type, 2½ ft. apart. The driver's seat is located right at the rear, projecting behind the frame. The motor—a two cylinder 12 h.p. Buchet, is supported on the frame exactly midway between the front and rear road wheels; it transmits its power by a single belt to a pulley on the rear axle. Although only one mechanical speed is available, it is claimed that by the variable electrical ignition and a jockey pulley acting on the belt any speed from ten to 100 kilometres per hour can be attained. At the Deauville race meeting in September last M. Truffault came out first in his class, covering the mile in 1 min. 28 2-5 sec.

THE executive of the Rhenish Automobile Club decided at a recent meeting to abandon races, the last having resulted in financial loss. In future it is proposed to apply the resources of the Club to acquiring motor-cars for the use of members who do not possess cars of their own. The first vehicle which the Club proposes to purchase is a large one, seated for twelve passengers.

THE Northern Motor Company, acting in conjunction with Messrs. John Hutton, Sons, and Co., of Dublin, have just established themselves in new premises in Montgomery Street, Belfast, for the sale of motor-cars. The Northern Motor Company inform us that they are willing to lend a motor-car to any owner of horses in their district for the purpose of enabling the animals to become accustomed to automobiles.

THE way of transgressors is hard, but the way of motorists is harder. Ere long they will have lost all confidence in the administration of justice. From unpaid magistrates it is, of course, useless to expect much; the fact is regrettable, but is none the less devoid of ambiguity, the experiences of the last few years having left no possible room for doubt. Where the High Court is concerned, however, the time for callous indifference has not yet arrived, but it is certainly coming, despite the traditional respect which the average Englishman entertains for the statute law. To be asked to regard as "luminous" the judgment in the Mayhew appeal case is too much for even the long-suffering automobilist; his lexicon suggests a word that is in every sense more apposite, and that is "puerile." Any lingering doubt that may remain is as to whether it is not an insult to the schoolboy to rate his intelligence so low.

A PLAINER issue never came before a court. The judges were simply asked to state whether fast driving was *per se* to the "common danger"; that is to say, assuming the absence of all animate obstructions, is high speed of itself a menace to the public safety? The case was destitute entirely of collateral issues. There was no necessity for the sifting of evidence as to whether any "passengers" were on the road or not; it was admitted that no one was even in sight with the exception of the policeman, and it was not attempted to prove that he in his own person represented the menaced community. As Mr. Mayhew, moreover, was summoned and convicted under the "common danger" clause, there was no chance of dragging in the other three under which he might have been arraigned.

An automobilist is subject to four regulations affecting speed. He may not drive "at any speed greater than is reasonable and proper, having regard to the traffic on the highway." He may not drive "so as to endanger the life and limb of any person." He may not drive "to the common danger of passengers"; and lastly, of course, he may not drive "at a greater speed than twelve miles an hour."

OBVIOUSLY, had the original prosecution been under the fourth of these regulations the result would have been unmistakable. The police, however, chose to lay the information under the third, and must abide the consequences. Now, in what manner did the distinguished judges approach the question to be decided, and in what way did they display that subtlety of analysis, that masterly penetration that one regards as the essential characteristics of the judicial mind? The plain man would scarcely have failed so pitifully. They simply burked the issue, and did the very thing that the layman might be expected to do, but which we specially employ our judges not to do, and that is not to run off at a tangent. The Lord Chief Justice combated the contention that a man driving on a straight road free of passengers was not driving to the common danger by asking, "Suppose there was a passenger round the corner who would be inconvenienced by a motor coming at this pace?" To the plain man, less overburdened with ponderosity of intellect, it is obvious that once round the corner the driver would be amenable to the common danger clause if there were passengers round the said corner, but not before. Every driver of a fast car must of necessity slow up before the corner is neared, and even if this were not essential to his own safety, and left merely to his own consideration and good feeling for others, he cannot be accused of the offence until he has actually committed it by rounding the corner at full speed. Lord Alverstone's hypothesis would suggest that, if there were a lights by-law in Surrey and none in Middlesex, a driver approaching the boundary on the Middlesex side was *ipso facto* an offender, because he *might* be about to cross over without stopping to light his lamps. This is precisely the type of reasoning that policemen and the average unpaid magistrate habitually display; from the judges of the Court of Appeal we look for higher logic.

MR. JUSTICE DARLING's scintillating wisdom is, of course, a matter of universal knowledge. Experience so profound as his and judgment so mature, so sobered by years of experience on the Bench, would lead us to expect nothing in the way of ill-considered comment. Did he disappoint us? "Supposing," he said, "that there were two or a dozen passengers, and it was found that what was done endangered only one, would you say that that was not an offence, because it was not a common danger?" There is only one possible answer which the plain man can make in the wholesome simplicity of his sanity. If language has any meaning at all, the word "common" implies plurality, and if only one person were endangered the danger could not be common. Judges may affect to think differently, but the English language will retain its significance none the less, however much it may be judicially burlesqued. Nor can the plain man see what bearing this ridiculous hypothesis had upon the issue when no evidence whatever was given as to "two or a dozen passengers," the policeman being the only person on the road.

As for the ultimate decision, voiced by the Lord Chief Justice, it can only be described as one of the most extraordinary deliverances that ever dumbfounded the lay mind. "A consideration of the rule under discussion," he said, "showed, at any rate, that the justices, upon evidence before them of a high rate of speed, might say that such a high rate of speed was to the common danger of passengers, though no particular passenger was shown to have run out of the way or to have fled for his life, or to have taken steps to avoid being run down. Therefore, even on uncorroborated evidence, it was open to the justices to say in this case

that the driving was to the common danger." The magistrate can do no wrong; that is the sum and substance of this judgment. The validity of evidence is of no account. A policeman may bring a man into court and charge him with intent to murder because he carried a sharp knife. The magistrates may say that the possession of such a weapon implies a desire to kill. Proof is superfluous of any killing or murderous desire alone; the magistrates think the man is guilty, and that is enough. What is an Appeal Court for, anyway? Magisterial surmise is all-sufficient. *O tempora! O judices!*

"THEY overturn, they explode, they run away, they run backwards, they stop short, they charge into things, they knock down people, and apparently quite of their own innate wickedness, and quite regardless of the most strenuous effort on the part of their drivers to control their erratic movements." This terrible indictment of automobile vehicles appears in an article by Miss Clifford in a sixpenny magazine published by the Datchelor School at Brixton. The medium is scarcely influential or authoritative, but the matter is perhaps the most unconsciously amusing that has ever been written about motor-cars. It is probably expressive, moreover, in concrete form, of what a good many people think who have no practical knowledge of the subject, but may have seen an odd car or two of an old type struggling up a steep hill in the first speed, or doing that which does more to alienate the uninitiated than anything else, namely, standing in the street with the engine left running. Miss Clifford's capacity for drawing the long bow, however, is diverting in the extreme. She describes the advent of an automobilist who called on a brother *chauffeur* residing two doors away from the fair maligner. The first car "snorted for some minutes" every time it was driven home, but the visitor's was of a different kidney. It arrived at three o'clock, and its occupants entered the house. Then the owner and the man on whom he had called came out again to try to stop the snorting. "They got on the car, and in the car, and under the car, first both together, and then one in and one under, and *vice versa*; the snorting increased rather than abated." Various other evolutions are described by this veracious chronicler, who solemnly avers that the car snorted for over four hours, and "all the time two able-bodied men were straining every nerve to stop the annoyance."

It is useless to inform the lady concerned that the engine could have been stopped in a second, and that the men were probably endeavouring to locate some trouble while keeping the motor at work. But her charitable attempt to find "one good point" in the motor-car is the most amusing item of her paper:—"It keeps its owner out of mischief when he is not riding it." This forcibly reminds one of the schoolboy's essay on pins. "Pins," he wrote, "have saved thousands of lives." He was pressed for an explanation, and thereupon added, "by people not swallowing them." The summing up of our vitriolic critic, however, would gladden the heart of a parish councillor of the Arbuthnot type. "I consider them nuisances," she loftily observes, "and would propose:—(1). All motor-cars to be heavily taxed, and the revenue so derived to be devoted to giving pleasure to non-drivers. (2). No motor having an objectionable smell to be allowed anywhere on any pretext. (3). Any motor-car driver driving over anyone to be executed immediately. (4). Any motor-car frightening anyone—not absolutely in the last stage of nerves—to be heavily fined or imprisoned." Now we know what to expect. But Miss Clifford really ought to have explained how she would fine or imprison a car!

THE Commercial Attaché at H. M. Embassy at Berlin reports that the motor-car industry is undoubtedly making much progress in Germany, and improvements are continually being made, not only in style and general appearance, but also in thoroughness of manufacture. There is an increasing demand for such conveyances all over the country, especially for delivery vans in large towns.

A WINTER RUN IN 1900.

(Concluded from page 645.)

WE reached Aix (en Provence) going strong and in the best of spirits. A fine town, the modern part well laid out and well lighted, we thought, as we passed along the main street between the trees and under the electric lamps which are hung above its centre line. But our hopes of enjoying a drive in the moonlight were dashed before we arrived at the end of it. It was the old trouble. We searched for the cause of leakage, and finding a good sized hole, determined to retrace our steps and make an early start again in the morning. The faulty tubes were to be patched before turning in, so as to give ample time for the solution to dry. The procedure of the previous night was repeated with the waiter, and had a similar excellent result. We were all at the door, muffled and goggled, before it struck six. At first, however, it seemed as if our exertions were to be thrown away. Ill-fortune dogged us. We were down on the rim before the sun had fairly risen. In the circumstances my readers will understand that it was not easy to be philosophical. After a delay of twenty minutes, perhaps, we ran on a few miles, and then it happened again. This time we thought that we were really done for. All the tubes brought from Clermont were burst, and we had nothing left but those that were mended, and these in our previous trial had not stood up for more than a dozen kilometres. We had a second additional consignment at Nice station, but we scarcely dared to hope that our stock would carry us on so far. It looked as if the trip was to end in failure just as we were entering upon the last and most beautiful stage of it. It proved to be a case of luck changing at its very worst moment. The tube we put in now endured the rest of the journey, though it kept us a little anxious and compelled us to go slowly over bumpy bits. For the most part the surface was well-nigh perfect, but here and there we came suddenly upon stretches full of hollows two or three inches deep all across the road, looking as if the upper layer had been neatly sliced off. The crust of the earth, as one can see in exposed sides of broken hills frequently, is formed of very shallow strata of brittle material, and this material seems to be employed for the road mending. This sort of thing is very hard upon pneumatics when bearing the weight of three persons, and luggage probably weighing not far short of another.

We pushed on through Brignolles and Draguignan to Fréjus, where we took our noontide meal and had some conversation with a French automobilist upon the subject I have just mentioned. We knew the amphitheatre well, so went on at once to tackle the long ascent over the Esterelles Mountains. It is a steady rise of some six miles, and at the bends the gradient is frequently sharp; yet we took the entire incline from bottom to top at an average speed of twelve miles, timing ourselves by the kilometre stones with a chronograph. It was as good an instance as one could have of the gain in a day's run from really sufficient power. Following our usual practice, we took the other side cautiously. One or two of the corners where accidents have occurred through reckless or incapable driving are pointed out; indeed, my friend had himself been witness of one case in which a *chauffeur*, not allowing enough for the slip of his wheels in getting round at high speed, had let his car, a brand new one, shoot over the edge and smash itself to atoms in the valley below. Mercifully everyone jumped clear, and their excitement, he said, as they danced about and gesticulated, was extremely funny. Cannes was remarkably empty, and we heard the same story at all the ordinary resorts of our countrymen. Soon after leaving the last of the straggling villas there was a straight of perhaps a couple of miles, where the railway line keeps close company with the road, and there happened to be a train coming along in our direction. It caught us up, and we went for all we were worth, and, running beside it, gained considerably before we had to slacken for a cart blocking the way. The trains along the coast are not excep-

tionally good, but, such as it was, we certainly beat this one, as it steamed freely between stations, and the engineer gave us a friendly wave of the hand. Nice was decorated with Venetian masts and flags for the impending automobile carnival, but here again the usual signs of the British occupation were not evident. As we were going gently along the Promenade des Anglais I was amused to see my friend, in saluting the driver of a coach whom he knew, take off his mask, and this, he afterwards explained, was because the gentleman in question had told him that his horses had no stupid prejudices against motor-cars, but could not be induced to pass quietly a face in goggles. Our lame tire had been behaving so admirably that we did not lose any time in going to the station for the reinforcements awaiting our need. The Corniche was less dusty than I have generally seen it, and the lovely gardens of Monte Carlo were even fresher than usual; the feature everywhere was the mimosa in the first glow of its golden glory. We chanced to get a glimpse of two big German Daimlers. Monsters they looked, and the former, which we saw in motion, left an imposing idea of what it might do. It was but little further to Mentone, and we pulled up at the Cap Martin in time for a good tub before tea was brought in. We had had a perfect day, and had come a couple of hundred miles over what we both agreed must be the most magnificent road for scenery and surface anywhere to be found. The day before we had covered a similar distance—over 400 miles in two days; and I do not see why we should not have maintained that average from the first and arrived in three days, instead of four and a half, if we had not had more than the average delays on account of tires.

ARUNDELL WHATTON.

THE Locomobile Company of America have made a donation of ten guineas to the funds of the Motor Union.

THE Salon de l'Automobile organised by the A.C.F. will open its doors to the public on December 10th at 1.30, when M. Millerand, the Minister of Commerce and Industry of the French Republic, will preside at the inauguration.

STATE SENATOR COCKS has told the farmers of Long Island that he would throw a board studded with nails before any motorist whom he saw riding rapidly. Long Island is supposed to be a civilised State, and Mr. Cocks is a State Senator.

THE transportation of a huge statue of Vercingetorix, by Bartholdi, from the sculptor's studio in Paris, to Clermont Ferrand, a distance of 400 kilometres, has been much discussed. Both railway and boat offered many inconveniences, but the difficulty has been solved by the construction of a special steam-motor by Messrs. De Dion-Bouton. It is expected that the journey will occupy four or five days.

THE magnificent old Corniche road from Nice to the convent of Laghet, passing by La Turbie, is to be served by a system of electric motor-cars taking the necessary current from overhead wires. One feature of the system is the ease with which the motor-cars will make way or pass round any carriage they encounter, the connecting wire being sufficiently long to allow of such deviations.

THE Pawtucket Steamboat Company, of Pawtucket, R.I., U.S.A., have introduced an attachment for steam carriages that prevents the fire from blowing out or burning back, and does away with the smoke pipe. It is claimed that by the use of the device no amount of wind will affect the fire. It keeps a current of air flowing up through the burner, keeps it from warping, and increases the draught and steaming capacity.

THE four Locomobile steam-cars which are being sent out to the Malay States to the order of Mr. Zacharias all had to be refitted with the Clarkson burner and other improvements. As the temperature in the shade in that district in which they will run frequently reaches 90 or 100 degrees a petrol-fired car could not be used, it was only by the application of the Clarkson paraffin burner that the use of these cars was possible for carrying the mails in this part of the world.

CONTINENTAL NOTES.

BY "AUTOMAN."

VISITORS to the Paris Automobile Exhibition will be able to see Santos-Dumont's navigable balloon No. 6, the Committee having prevailed upon him not to take it away from Paris until late in December. M. Santos-Dumont hesitated somewhat before consenting, but it was represented to him that he owed to the Parisian public, who have so enthusiastically taken his part in the various troubles he has gone through, an opportunity of seeing the famous air-ship which successfully sailed round the Eiffel Tower and won the £4,000 prize. This decided him, and certainly the most interesting exhibit will be this balloon, which will be suspended from the roof of the Grand Palais.

TALKING of the troubles of poor Santos-Dumont they seem to have continued to the end, and even when he went to the Aero Club to receive the well earned Deutsch cheque the Committee of the Club tried to saddle him with the expenses of a lawsuit which is being brought against the Club for the nuisance and damage caused by the residue from the manufacture of the hydrogen which filled the famous balloon. In the meantime, the energetic young Brazilian is to be at work on his No. 7, which is to make its *debut* at Monaco, where the Prince has placed at the disposition of M. Santos-Dumont a piece of land on the seashore. The Prince also intends to build a balloon shed and a hydrogen manufactory at his own expense, and so place all the facilities possible at the disposition of the young aeronaut. No. 7 is to be a much larger airship, with two motors of 45 h.p. each, and a propeller at each end of the keel. The balloon, which will still be of the familiar shape, will cube 832 metres, and be 44 metres long by 6 metres in diameter. It is to be ready early next February, so that those who winter on the Riviera will have an additional attraction in following the fortunes and adventures of No. 7, which it is estimated will be able to travel at a rate of forty miles an hour, and will also be able to take passengers on board.

THE experiences of M. Santos-Dumont have created quite a movement in the direction of aeronautics, and there is to be another big money prize offered for competition. This time M. R. Lebaudy, who is a wealthy sugar refiner, has come forward with a prize of £1,000, and M. Henri Deutsch has offered a similar sum. The Aero Club, on the other hand, are proposing an air-ship race from Paris to Meulon and back.

A NEW candidate for aeronautical honours has turned up, and, strange to say, he too is a Brazilian, M. Augusto Severo by name. His air-ship is said to have already been tried successfully in the harbour of Rio-de-Janeiro. It cubes 2,000 metres, is thirty metres in length, can take several passengers, and beat up against a strong wind—so it is said. M. Severo has fixed his headquarters at Vaugirard, and expects before the end of the month to sail over Paris, and show off the capabilities of his invention, which differs somewhat from that of his fellow-countryman.

I MUST not finish with aeronautics without mentioning to the readers of the *Journal* the first annual exhibition of "Gravity Flying Machines," organised by the *Auto-Velo*, under the patronage of the Aero Club, and which took place on Wednesday and Thursday last week at the Velodrome of the Parc des Princes, near Paris. There were some twenty entries, about which I hope to be able to give some further details next week.

TO-MORROW (Sunday), from 12 till 4, the hill-climbing competition on the Côte de Gaillon will take place. There are 73 entries. The record is held up to now by Béconnais, who did

the kilomètre of nine per cent. gradient in 58½ seconds. This year the record will probably be lowered by several competitors. Every kind of motor vehicle is represented, from a bicycle up to the 50 h.p. Napier.

THE *Auto-Velo* is organising a tourist motor caravan to leave Paris and travel to Nice at the time of the Nice races. It is proposed that it shall be organised on similar lines to the tourist section of the Paris-Berlin race, that is to say, with two classes, one controlled and the other not controlled.

HERE AND THERE.

THE Duke of Manchester has just purchased a 12 h.p. Darracq car from the British Automobile Commercial Syndicate.

WE understand that the Anglo-American Oil Company, Limited, have reduced the wholesale price of Pratt's motor-spirit in London 3d. per gallon.

A NEW small motor, with accessories suitable for motor-bicycles, has just been put on the market by the Empire Autocar Supply Company, of Marylebone Road, London, W.

MR. H. M. FLETCHER, a member of the A.C.G.B.I., warns motorists against using the road between Woking and Chertsey. Mr. Fletcher says about a mile and a half of this road has been thickly covered with loose, sharp, flinty gravel, and that no steam roller has been used.

THE Wolseley Tool and Motor-car Company inform us that they recently received, within fourteen days, orders for no less than thirty-seven cars of 5.10 and 20 h.p. Amongst others who placed their orders during that period were Lord Willoughby de Eresby, Colonel the Hon. C. Bingham, Major Cotes, Colonel Isherwood, Sir Hickman Bacon, Bart., and Mr. E. Gray.

ON Saturday last a somewhat serious accident befel Mr. T. J. Stevens, of Coventry, whilst riding a motor-bicycle on the Coventry road. Some passers-by discovered him in an unconscious state near his machine, which was uninjured, and took him into Kenilworth. Subsequently Mr. Stevens was taken home in a carriage suffering from severe wounds about the head.

THE second general annual meeting of the Aberdare Valley Motor Company, Ltd., was held on Friday last week, when again a satisfactory balance-sheet was presented. The company is one of the oldest public service concerns still at work in the country, having commenced operations in October, 1899. The manager and engineer of the company is Mr. W. Parker-Thomas, and it speaks much for his management that the company should have done so well.

A new design of body for motor-cars has been registered by S. J. Lilley, carriage builder, Welford Place, Leicester. It is an elegant design of motor-gig, and is convertible to a *tonneau* to carry either two or four passengers. There is ample room in the carriage, and each passenger can secure a very comfortable position, and perfect freedom from cramping of legs. Mr. Lilley has had considerable experience in body making for the motor trade, and is agent for the county of Leicester for the Motor Manufacturing Company, Ltd.

IN the latest type of motor-coat designed by Mr. T. H. Holding, of Maddox Street, W., he has embodied points of such great advantage that we cannot help calling attention to them. Think of a coat that shall sit well and a man may walk about in, or wear as an ordinary coat off the "box" and yet has the following advantages when he sits down:—No strain on the lap, freedom for the knees, and yet costing but a trifling more than an ordinary over-garment, and having nothing to render it unsightly as an ordinary coat. The coat is made of splendid material, and so scientifically constructed as to render it absolutely impervious to wind and cold air, and yet is so comparatively light that a man may walk in it. Another remarkable novelty is Mr. Holding's motor-vest, which is practically a suit of clothes in a vest. It is made of leather, soft and delicate to the touch.

ON Wednesday next, the 20th inst., a meeting of manufacturers and sellers of electric motor-cars will be held at the Automobile Club to consider the question of trials.

THE Automobile Club is offering a prize of £5 for the best design for the Club plaque, to be attached to hotels and to the establishments of repairers appointed by the Club.

THE second annual dinner of the Yorkshire Automobile Club will be held at the Great Northern Hotel, Leeds, on Friday, December 6th.

IN addition to motor-bicycles, the Quadrant Cycle Company, of Birmingham, are, we hear, about to bring out a new motor-tricycle, constructed on novel lines.

THE British Automobile Commercial Syndicate have received the first of the new type of De Dion-Bouton voiturette, and it is now to be seen at 97 and 98, Long Acre. We understand that this firm have ordered 200 of these cars.

THE four Daimler public service cars and the 6 h.p. Cannstatt Daimler 'bus of the Aberdeen District Motor Service Company,

THE Austrian War Minister contemplates bringing a Bill before Parliament which will render every motor-car liable for service in case of war. All vehicles will have to be registered for this purpose, and once a year brought before a military commission to decide if the car is to be retained on the service roll, or if it is useless for military purposes. The owners of the cars will receive compensation in case their vehicles should be commandeered.

THE New Grappler Pneumatic Tyre Company intimate some important changes in the process of manufacture and in goods marketed since the issue of their last catalogue a year ago. Perfect immunity from tire troubles is claimed under the new process, though attention is called to the fact that users frequently fail to obtain this owing to their fixing tires to cars which are much heavier than the tires were designed to carry. Grappler motor tires range from Class A, capable of carrying 120 lbs. per wheel when loaded, to Class E, which will carry 500 lbs. per wheel under similar conditions. Each class is made in a large variety of sizes. Motor-bicycle tires up to 28 in. diameter are also made under the same process.

LAYING OUT THE FOUNDATIONS FOR THE LOCOMOBILE CO. OF AMERICA'S NEW WAREHOUSE AT SOUTH KENSINGTON.

Limited (in liquidation), are to be put up for sale by auction to-day (Saturday).

THE Southfields Laundry, Southfields, S.W., is about to put in service a 7 h.p. Daimler motor-van. The car was brought up from Coventry by road, and is now being fitted to a van body specially constructed by Mr. S. Tilley, coach builder, Merton Road, Wandsworth.

WE learn that the recently-formed Motor Cycling Club will hold its first general meeting at the Champion Hotel, Aldersgate Street, E.C., at 7 p.m. on Tuesday, the 19th inst., when the recommendations of the Provisional Committee will be considered. All motor-cyclists desirous of joining the new Club are invited to attend.

THE Turin correspondent of the *Velo* states that Mr. Cecil Rhodes met with an accident on Saturday last while on his way from Milan to Turin, the motor-car in which he was seated having collided with a carriage coming in the opposite direction. Mr. Rhodes was thrown out, but, happily, escaped with a few bruises on the arms and forehead. Both the motor-car and carriage were much damaged.

IN our issue of September 28 we announced that the Locomobile Company of America had decided to control their English business at South Kensington, and that with this view a large area of land at the back of their depot at Sussex Place had been acquired. On this land, as will be seen from the accompanying illustration, a large building is now in course of erection, consisting of two floors, each 180 feet long by 60 feet wide, the height from the basement to the peak being 39 feet. This building, where the shipping business is to be handled by direct delivery on to the main floor, is led up to by a wide roadway from the main street, the whole of the cars and parts being delivered direct on to the floor, where they will be stored prior to being transferred to the showrooms as required. The basement of this building will be devoted to repairs and the assembling of the parts as they arrive from America. In addition, branching off the main entrance, is a 12-foot roadway at the back of the depot, leading up to a special storage building, measuring 68 feet by 21 feet, where arrangements will be made for cleaning, oiling, and storing vehicles belonging to private owners at a fixed monthly or annual rate.

THE CARLTON BICYCLE MOTOR.

THE accompanying illustrations show a general view and section of a new petroleum-spirit air-cooled motor, intended for use on motor-bicycles, which has just been put on the market by the Carlton Motor-Company, of Elm Grove, Cricklewood, N.W. The engine, which comprises a number of special features, develops $1\frac{1}{2}$ h.p., the normal speed being 1,400 revolutions per minute. By means of the variable electrical ignition this can be increased up to 2,000 revolutions. A neat form of contact is fitted, also a novel design of spray carburettor. The latter, which is being made in several sizes, is mechanically controlled, the feed of petrol and air being regu-

main shafts are made of steel, while the crank case is of aluminium. The latter metal is also used for the silencer. The engine, which weighs 30lbs., is made in two patterns—one with clips, to allow of its being fastened below the bottom cross tube of the frame, and one arranged for attachment above the main tube, the latter form also having a detachable clamp to attach to the seat tube. The Carlton Company are also building complete motor-bicycles and constructing larger types of water-cooled engines from $3\frac{1}{2}$ h.p. single-cylinder up to 9 h.p. double-cylinder.

IN view of the satisfactory results obtained by motor-cars during the recent automobile tour of Italy, the Italian Minister of War has decided to award prizes each year to manufacturers who

ELEVATION.

lated automatically. The makers inform us that they have tried ordinary paraffin oil, methylated spirits, and petrol with the new carburettor and that the engine has given identical results without any alterations. It will be noticed that the sparking plug is located in the centre of the head and that the compression cock is at the side of the plug. The cylinder and other castings are made from a special pot metal mixture of iron which results in a tough material specially adapted for light work. Phosphor bronze bearings of large size are used throughout and great care has been devoted to the question of lubrication. On the top of the flange of the engine-shaft bearing is cast an oil cup, from which the oil is conveyed to the bearing by means of a hole through the latter, the oil cup being kept filled by the splash of the oil in the crank case. The connecting-rods, pinions, and

SECTIONAL ELEVATION.

have applied themselves to the perfection of the motor-vehicle with conspicuous success.

The municipal authorities of Aix-la-Chapelle have lately acquired a motor street-watering cart. The vehicle was built by Messrs. F. Scheibler, of that town.

THE directors of the Edinburgh Autocar Company have issued a report asking the instructions of the shareholders on the question of "whether the business is now to be finally wound up, or whether the shareholders are prepared to adopt some scheme for obviating enforced realisation to meet the remaining debentures, and preserve the business and goodwill until the motor-car may be perfected to such an extent as to justify the company conducting its business on the scale originally proposed."

THE SOUTHSEA ANNIVERSARY RUN.

TO-DAY (Saturday) the motoring world will celebrate the fifth anniversary of the coming into operation of the Locomotives on Highway Act, 1896, by a tour to Southsea. The event, which has been organised by the Automobile Club of Great Britain and Ireland, has brought forth no less than 192 entries, a full list of which is given on another page. From this list it will be seen that not only are steam and petrol cars well represented, but that it includes a couple of electric cars which will essay to make the long run.

The vehicles will draw up and start in the order of their arrival in Horse Guards' Avenue, Whitehall, S.W. The first car will be on the near side of Horse Guards' Avenue, close to its junction with Whitehall, and facing the Horse Guards' clock. The other vehicles should, on arrival, be driven into position immediately in the rear of the last car in the procession. The start will take place at 9.30 a.m. Time-cards should be filled in by the timekeepers on passing the starting point. No passing will be permitted until beyond the top of Egham Hill, the speed of the procession to that point being regulated by the leading car. If a vehicle, during the procession, cannot be kept close to the vehicle immediately in front of it, the driver must draw to the near side and sign to the drivers following to pass him; otherwise breaking rank prior to the top of Egham Hill or at starting places will involve disqualification for certificates. On arrival at the top of Egham Hill vehicles must draw up close to the near side of the road; they must keep in the same order as on arrival, and gradually move up to the starting flag, where they will be re-started at quarter minute intervals in order to avoid inconvenience to other traffic. Vehicles arriving there after the starting flag is removed may proceed on their journey without halt. Speed must be carefully moderated to eight miles per hour in passing through all town and villages, and within them passing or speed in excess of eight miles per hour are prohibited. The Committee of the A.C.G.B.I. beg that drivers will respect the law as to speed; will use every caution in turning corners and passing through towns and villages; and will show every consideration for other users of the road, especially those in charge of restive horses. The tour is in no sense a race, and, as it is desired by its means to popularise motor-vehicles, drivers are besought to avoid driving at unlawful speeds. At the stopping flag outside Winchester, stop for time cards to be filled in. Luncheon will be taken at Winchester. The signal to re-start will be given on the outskirts of Winchester at 3.15 p.m. No vehicle will be permitted to start before that hour, and vehicles must draw up in single file on the near side, and on no account abreast, in the order of their arrival at the re-starting point. Cards should be presented to the timekeepers on starting from this point in order that time may be recorded. On arrival at seventeenth mile stone from Cosham (on R.) before entering Cosham, the vehicles must draw up in their order of arrival on the near side of the road. Cards should be presented to the timekeepers there in order that times may be recorded. The vehicles must remain at the seventeenth milestone from Southampton, outside Cosham, until the signal is given to start, and will then proceed in procession to the Gordon Road on Southsea Common.

Stops that are made to light carriage lamps, or stops made to render assistance in the case of accident or serious personal injury, will not be counted as stops, subject to the satisfaction of the Committee that such stops were necessary, and that no repairs, adjustments, or lubrication, etc., were effected to the vehicle during such stops. Stops for punctures will disqualify for a non-stop certificate.

A dinner will be held at the Portland Hall, Kent Road, Southsea, at eight p.m., which all those (including ladies) taking part in the tour may attend. The Hon. John Scott Montagu, M.P. for the New Forest Division of Hampshire, will take the chair.

Below we give an outline of the route which will be followed, together with the intermediate mileages:—

Miles from London.	THE ROUTE.	Intermediate Mileage.
—	London (Whitehall)	—
—	Putney Bridge	—
—	Richmond Park	—

THE RIGHT TO STORE PETROL.

IN the King's Bench last week, the appeal in the case Godfrey v. Napier was heard. The appellant, a County Council inspector, summoned the respondent, Napier, who was a motor-car manufacturer, for storing a quantity of petroleum otherwise than in pursuance of the regulations of the local authority. It appeared that, prior to the Highways and Locomotives Act of 1896, which laid down the conditions under which motor-cars or light locomotives might be used on highways, the regulations as to storage of petroleum and liquid fuel was left, under the Explosives Act, in the hands of the local authority; but under the statute of 1896 it was put under the Home Office, and the Secretary of State was required to make regulations, and had done so. The respondent, however, the inspector alleged, had rendered himself liable to penalties, because he had kept a quantity of petroleum spirit, in regard to which it was urged, that he should have taken out a licence. The metropolitan police magistrate, before whom the matter came, declined to convict, and hence the present appeal.

Mr. Daldy appeared for the County Council in support of the appeal, while Mr. Minton Senhouse appeared for the respondent. In the course of Mr. Daldy's argument, the Lord Chief Justice asked: Is not this really an attempt by the County Council to substitute their own regulations for the Secretary of State's regulations? Mr. Daldy: That is what my learned friend might say. I left it to him to say it.

The Lord Chief Justice, without calling upon Mr. Minton Senhouse, after considerable discussion, delivered judgment. He said that under the Explosives Act of 1871 nobody could keep petroleum, except in certain quantities, unless under a licence of the County Council, who had power to annex to it such conditions as to storage as the local authority might deem expedient. Then came the Act of 1896, which for some reason—probably because road locomotives—required special regulation independent of local authorities—provided that the keeping of petroleum, etc., for the purposes of light locomotives, should be subject to the regulations of the Secretary of State, which should have effect notwithstanding the provisions of the Explosives Act. What he was deciding was that it was not the County Council who were to fix the regulations, but the Secretary of State. The summons here was not for not keeping petroleum in accordance with the Secretary of State's regulations, nor was it contended that, even if it were kept in accordance with those regulations, there were other conditions beyond those which the County Council might lay down. He gave no decision as to whether there might not be some other conditions, because the Secretary of State had not covered the ground. But in this case the respondent was summoned because it was said the petroleum had been kept otherwise than in pursuance of a licence, which he understood to mean kept under conditions not authorised by the County Council. In his opinion the County Council were not entitled to impose upon the keepers of petroleum different regulations to those imposed by the Secretary of State. Then it was contended that this was not kept for the purposes of light locomotives, because respondent only manufactured them; but the magistrate had found that it was used for testing locomotives in running along the roads in the neighbourhood. The words of the Act, "for the purpose of light locomotives," were perfectly general, however, and it was perfectly possible for the magistrate to come to that conclusion. If the contention was that the County Council was still to have the power to make regulations inconsistent with those of the Secretary of State, he thought it was wrong. The other Judges concurred, and the appeal was dismissed with costs.

It is therefore now definitely settled that manufacturers, merchants, and agents of motor-cars may store petrol, or may use or keep the same on their premises for use, and for the purpose of running their cars, without a licence. If, of course, any of these should commence to sell petrol they would then have to have a licence under the Petroleum Act.

MOTOR-CAR COLLISION.

AT Cardiff County Court, Richard Powell, boilermaker, Barry, sued Walter Mules, of the Albion Hotel, Penarth, for £20 damages caused to a horse and trap while the defendant was driving a motor-car—negligently, it was said. Plaintiff said that while driving along the Sully Road, which is only some 9 ft. wide, the motor-car came round a curve 50 yards away at about fourteen miles an hour, and, though he put his hand up and shouted, "Stop," pulling the pony aside, a collision occurred. No warning was given by the motor party. The defence was that the motor-car when it touched the trap was "crawling," and that the damage was due to the rearing and running away of the pony. His Honour gave judgment for plaintiff for the full amount, attributing the accident to the motor-car running round a corner without care.

THE SOUTHSEA ANNIVERSARY RUN.

THE following is a list of the vehicles that have so far been entered for the Anniversary Run to Southsea, on the 16th inst.

MOTOR-CAR DRIVER IN TROUBLE.

At Plymouth, Thomas Walter, motor-car driver, was charged with being drunk whilst in charge of a motor-car in Union Street the previous evening. P.C. Ormes said at the tram terminus he saw defendant, who appeared to be intoxicated. On being spoken to he became abusive, and was locked up. The Bench remarked that it was very dangerous for a man not sober to be in charge of a motor-car, and fined defendant 20s. and costs, or seven days. George Cooker, engine driver, was charged with obstructing the police in Bank of England Place. The motor-car which had been driven by Walter was standing in the place pending the arrival of its owner, Mr. Mumford, of Mutley, and defendant was alleged to have interfered with P.C. Burrow for twenty minutes whilst he was clearing the street, and he also disputed the right of the police to take away the driver. Defendant said he was only looking after

the motor car, and thereby prevented an explosion by putting down the lever. Fined 5s., or three days.

LICENCES.

At Preston Police Court, James Walmsley, coachbuilder, was summoned for keeping a motor-car without a licence on September 25th. Mr. Child, supervisor of inland revenue, said there had been considerable correspondence with the defendant, who had refused to take out a licence. The defendant said the car and several others were the property of James Walmsley and Co. He had made and patented the carriage bodies, and had taken the cars out for experimental and demonstrative purposes, running to his residence in the suburbs and as far as the Lake district. The Chairman said the case was brought as a test case, and defendant must pay a fine of 20s. and costs, or one month.

AN APPEAL DISMISSED.

In the King's Bench Division, before the Lord Chief Justice, Mr. Justice Darling, and Mr. Justice Channell, the case of Mayhew v. Sutton was heard. The appellant, Mr. Mark Mayhew, sought to set aside a conviction by the Justices of Bucks, who had fined him upon an information preferred by Police-superintendent Sutton for driving a motor-car to the common danger of the public at Denham. It was set forth in the information that Police-constable Payne stated at the hearing that about 7 p.m. on Sunday, April 28th, he was on duty at Denham and saw a motor-car coming down Red Hill at a terrific pace. He walked into the centre of the road and held up both arms, and when the car came round the corner, about 340 yards from where he stood, the driver could see him, and drove straight up to him, and he just had time to step on one side when the car passed him, and the driver brought the car to a standstill sixty yards away from where he passed him. The driver was, he said, the appellant. No evidence was given before the magistrates that at the time in question there were any passenger or passengers on the highway, or that any passenger was endangered. The magistrates convicted and fined Mr. Mayhew 10s., with 8s. 6d. costs. The Lord Chief Justice, in giving judgment, said that the Justices upon evidence before them of a high rate of speed might say that such a high rate of speed was to the common danger of passengers, though no particular passenger was shown to have run out of the way, or to have fled for his life, or to have taken steps to avoid being run down. On the uncontradicted evidence it was open for the Justices to say that in this case the driving was to the common danger. The other Judges concurred, and the appeal was dismissed.

RUN DOWN BY A MOTOR-CAR.

THOMAS ALFRED AUSTIN, licensed victualler, of Euston Road, N.W., sued the Motor Mart Company, Limited, to recover £50, damages in respect of injuries sustained through being run down by a motor-car belonging to defendants. Plaintiff stated that on Saturday, August 17th, he was riding on his bicycle along Euston Road, and proceeded into Woburn Place for the purpose of getting into Russell Square on the north side. He had just entered Russell Square, when a motor-car dashed into his machine and threw him violently to the ground. When he got up the motor-car was on the hind wheel of his machine. He was on the right-hand side of the road, about four yards from the kerb, when the collision took place. Cross-examined, witness admitted that he had not held up his hand whilst trying to cross the road in front of the motor-car. Other witnesses having been called by plaintiff, Harry Lindop, the driver of the motor-car, was called for the defence. He stated that when driving towards Russell Square he saw two carts and two cyclists travelling in front of him. In endeavouring to pass the carts he had to pull out to the off side, and in drawing out he continually rang his bell. At the corner of Woburn Place he noticed plaintiff pulling out to the right, without giving any warning. He (witness) saw that a collision was likely to occur, so in trying to avoid it he directed his car in the same course as taken by plaintiff, in the hope that he would be able to steer clear of him. In that effort he was unsuccessful. The Judge, in summing up, drew attention to plaintiff's admission that he gave no signal as he pulled out to the right on entering the square. The jury found for the plaintiff with £15 damages.

TWO MOTOR-CAR FATALITIES.

EAST SUFFOLK was recently the scene of two fatal accidents, in both of which a motor-vehicle figured. Mr. John Henry Skipper, cycle manufacturer, of Lowestoft, who was riding a "motor-quad," was killed at Kessingland through a bolting horse and tumbril colliding with his cycle. The other occupant, Mr. Norton Sawyer, escaped with an injured head. The driver of the tumbril, Mr. Frank Cutts, a Benacre farmer, admitted that he had no light, and the jury blamed him for his neglect. In the second case, Ernest William Aldred, a carter, whose horses were frightened by a motor-car owned by Mr. Mulholland, of Worlingham Hall, was endeavouring to stop them bolting when he was knocked down, and a wheel went over him, causing death. It was not observed that Aldred's horses were giving him trouble till the motor-car was nearly up to them. "Accidental death" was the verdict, but the jury thought the driver of the motor-car should have exercised more care.

FURIOUS DRIVING CASES.

At Wigton Police-court, Mr. W. Fletcher, of Cleator Moor, Cumberland, was fined £1 and £1 4s. costs for furiously driving a motor-car at Aspatria on October 16th. A coachman named Stalker said the car was travelling at a speed of twenty miles an hour through the town. Mr. Brookbank, of Whitehaven, the defendant's advocate, admitted the fact, but said that the defendant had driven all over England and a greater part of Scotland without previous interference by the police.

At Solihull, Gilbert Burnett, of Stoke Green, Coventry, was summoned for driving a motor-car at a furious rate on September 25th, so as to endanger the lives of passengers. Mr. Maddocks, of Coventry, appeared for the defence. From the evidence of Sergeant Rose, it transpired that he saw a motor-car on the Coventry Road, near Sheldon, being driven at the rate of twenty-five miles an hour. In the car was Mr. Belcher, the managing director of the Humber Company. The officer signalled to the defendant to draw up, and the car was brought to a standstill in about a dozen yards. Defendant said he had no power on, and that the car was not going more than twelve miles an hour. There were no persons on the road at the time, and the officer had made an admission to the same effect. Mr. Maddocks commented on the admission, and said that the summons should have been taken out for travelling at an excessive speed, if there had been any offence. People, he said, were accustomed to judge the speed of motor-cars by the noise the car made, and imagined that they were travelling at a greater speed than was the case. Under the circumstances the magistrates dismissed the case.

At the Morpeth County Petty Sessions, Arthur E. George, engineer, of Newcastle, was charged with driving a motor-car furiously at Longhorsley, on September 25th. P.C. Batey stated he saw the defendant driving a motor-car at Longhorsley at a rate of not less than eighteen miles an hour. Defendant, who was fined £5 and costs, said that, with four engines going the top speed of the car was twenty-five miles an hour; two of the four engines were broken, and the car could not get more than half that speed.

BEFORE the Kingston County Bench, Mr. Roland Brown, of Earl's Court, was summoned for driving a light locomotive down Kingston Hill, on October 3rd, at a greater speed than twelve miles an hour. Mr. Grimwood Mears, barrister, appeared for the defendant, who, he said, was travelling on the Continent. Constable Winter said that, in his opinion, the car was going at the rate of about seventeen miles an hour. Witness called upon defendant to stop. Mr. Brown put on the brake, swerved to the side of the road, and ran into a tip-cart, breaking the axle of the cart, and otherwise damaging it. The two men in charge of the tip-cart stated that in their opinion the defendant was driving at the rate of seventeen miles an hour. Mr. Mears held that the evidence of these witnesses was not admissible. They stated that "in their opinion" the defendant was driving at the rate of seventeen miles an hour. But no "opinion" could be evidence against a defendant unless it was the opinion of an expert, and he submitted that a policeman and two labouring men were not experts on speed. He would have accepted the evidence of the constable if he had timed the defendant with a stop-watch. The Chairman: But I saw a case the other day where the time by a stop-watch worked out at 125 miles an hour. Mr. Mears: In that case, sir, there was something wrong with the escapement. The Bench imposed a penalty of £3 11s. 6d., including costs.

At Cranbrook Police Court, Charles Whittington was summoned for driving a motor-car at excessive speed near Ashford. According to police evidence defendant covered a measured quarter of a mile in 57 seconds, which worked out at a speed of over fifteen miles an hour. Defendant obtained an admission from the constable that it was not a stop-watch that was used for timing the car. In defence it was stated that the constable was in plain clothes and rushed out with a stick and stopped the car. Mr. Whittington said it was unreasonable to expect motorists to stop for every man who rushed after them with a stick, as the man might be a robber. Defendant added that his brother was with him riding a bicycle which was not being pedalled at the time, and therefore could not have been going at the rate of fifteen miles an hour. Fined 10s. and costs.

At Dunster, A. Ducros, of 14, Regent Street, London, W., was summoned for driving a motor-car, in the parishes of Selworthy and Culbone, on the 3rd August last, at a greater speed than twelve miles an hour. Defendant did not appear. Seven persons gave evidence, and defendant was fined the maximum penalty of £10, and also ordered to pay £3 7s. 6d. for witness and court fees.

At Godalming, Mr. J. H. Gretton, of London, was summoned for driving a motor-car beyond the legal speed of twelve miles an hour, on Sunday, the 27th ult. Defendant pleaded not guilty. P.C. Cheesman deposed that on Sunday, October 27th, at 12.55 p.m., he was on duty in Meadow, where he saw the defendant driving a motor-car at a greater speed than twelve miles an hour. Directly it passed him he signalled to P.C. Galloway, at the same time starting his stop-watch. Immediately P.C. Galloway signalled that the gentleman had passed him witness stopped his watch. It registered 20 sec., and the distance was 176 yards. He made the speed of the car eighteen miles an hour. Cross-examined: He admitted the hour on the watch was 12.20 instead of 12.55. The Mayor said the Bench thought these points were quite immaterial; the constable had given his evidence

very clearly, and they perfectly understood what he meant. P.C.s. Galloway and Finch having corroborated, defendant called Ernest Instone, who said he was one of the managers of the Motor Manufacturing Company. He examined the car which defendant was lent on the Saturday, and which was in witness's show-room, at Holborn Viaduct. He found it was not in a satisfactory condition, and it was not capable of going more than twelve miles an hour. The carriage would run from ten and a-half to eleven miles. By the Bench: It was not customary to lend out carriages not in condition, but defendant expressed a wish to have this one. In perfect condition the car would run at fifteen miles an hour, and not more. The valves were probably wrong. Robert Bunkall, a motor driver, in the employ of the Motor Manufacturing Company, deposed to accompanying defendant. When they were stopped the defendant asked the constable to show him his watch. He said it was not right. On the journey they had to stop to overhaul the car. He should say it could not go twelve miles an hour. Witness brought the car away, and examined it subsequently. It was a new one, but the engines required overhauling. Defendant himself then gave evidence, and stated that he had driven a motor-car for four years, and had never been stopped before or had the slightest complaint against him. He could assure the Bench that he never travelled on this journey more than twelve miles an hour, and pointed out how easily the constables might have made a mistake in the distance, considering the way in which they measured it with a piece of string. The Bench, after a brief deliberation, said, according to the evidence, it was very clear that the motor-car was travelling beyond the legalised speed, and the fine imposed would be £2 2s. and costs. Defendant gave notice of appeal.

At Reigate, Albert Arthur Jordon, of London, was summoned for furiously driving a motor-car. Defendant did not appear. Inspector Pullen stated that on October 27th the defendant was driving a motor-car at Merstham in the direction of Brighton. He covered a measured distance of 176 yards in 16 sec., which worked out at 23 miles an hour. The Bench wished to know how the timing was carried out. The inspector replied that he stood at one end of the measured space, and a constable at the other. When the car passed him the constable signalled to witness, who then took the time with a stop watch. Fined £2 and costs.

At the same court, Henry Ward, of South Norwood, was said to have been travelling at twenty miles an hour. Police-sergeant Southcott said he stood at the beginning of the measured distance, and with a newspaper signalled to Inspector Pullen when the defendant's car crossed the beginning of the measured distance. This was at a different part of the road, and was on a hill near Merstham. A representative of the defendant pleaded guilty, and the defendant was fined £2 and costs.

At Eastbourne, James Davis, of Terminus Road, was summoned for furiously driving a motor-car in Latimer Road and Eshton Road, on October 23rd. Mr. Lawson Lewis defended. Detective Sergeant Ransom stated that at 4.30 in the afternoon of October 23rd he saw defendant driving a motor-car down Latimer Road. He turned the corner very sharply into Eshton Road, scattering some children who were in the road in all directions. The car was going quite twelve miles an hour. Cross-examined by Mr. Lewis: Defendant did not blow the horn of the car until he had scattered the children. In witness's opinion, it was a miracle some of them were not run over. Other witnesses having been heard, defendant stated that the car was travelling at that time about seven or eight miles an hour. There was scarcely any traffic about, and he blew the horn before turning the corner from Latimer Road into Eshton Road. He always turned corners slowly. If he did otherwise the tires of the motor-car would come off. Mr. Gustave Naussier, a visitor to Eastbourne, said he also was in the car on October 23rd. While passing through the town the car travelled at the same pace as an ordinary hansom cab in London. Mr. Davis blew the horn to such an extent as to amount to a great nuisance, and he turned the corners as carefully as any man could do. The pace throughout the journey was nine miles an hour at the outside. Mr. Lawson Lewis, addressing the Bench for the defence, said the case was one of opinion against sworn testimony. The Bench retired to consult, and on returning the Mayor said: We are unanimously of opinion that the pace this car turned round the corner was neither reasonable nor proper, and that it was to the common danger of the passengers. We shall impose a fine of £5 and costs.

At Romford, Mr. William Astell, of Twickenham, was summoned for driving a motor-car at a greater speed than twelve miles an hour, at Romford, on October 8th. P.C. Brown, of Brentwood, said that at 7.48 p.m. on Tuesday, October 8th, he was on duty near Brentwood Post-office, when he saw a motor-car proceeding in the direction of Romford "at a most furious pace." He called to the driver to ease up, but he was going so fast that witness expected he could not hear. Witness went to Brentwood Police Station and telephoned to Romford for the car to be stopped. Superintendent Creasy said P.C. Brown's telephone message was received at 7.50 p.m. He sent instructions for P.C. Putman to stop the car at the Golden Lion corner and take the name and address of the driver. Witness went towards the Golden Lion Hotel and passed Romford Post-office at 8.5 p.m. He reached the corner just as the motor-car was stopped. Defendant was the driver. The distance travelled by the car from the place where P.C. Brown saw it to the place where it was stopped was just over six miles. Defendant gave evidence, and said he brought the car from Chelmsford for a friend. They lit up between Chelmsford

and Brentwood, and did not stop again until they reached Romford. He did not see P.C. Brown, and he absolutely denied that he travelled through Brentwood at a furious pace. He was prepared to swear that P.C. Putman told him he had come from Brentwood in twenty minutes. It was absolutely impossible for the car to travel the distance in the time. He was prepared to swear that he did not travel more than twelve miles an hour. The Chairman: The Court are fully satisfied. You will be fined £1 and 19s. 10d. costs. We think it is very desirable that the police should stop motor-cars when they are going at extreme speed.

WHEN IS A MOTOR-CAR NOT A MOTOR-CAR?

This conundrum was put to the Justices sitting at Dewsbury, one day last week, and in a roundabout sort of way was "given up." There was a case, of course—that of the Police v. Fitton's Brick and Tile Company, Limited, the defendants being charged under the Locomotive Act of 1896 with using a light locomotive, to wit, a motor-car, which, when on the highway at Thornhill on the 15th October, emitted dense black smoke from its chimney. Under that Act, said Mr. Wardell, from the County Council Office, there must be no smoke or visible vapour, and a breach of the measure rendered an offender liable to a penalty of £10. He stated that he should prove the offence, and then Mr. Nicholson, who was for the defendants, intervened, and said no offence had been committed under the Act in question, and that, if there had been an offence, it was under the Locomotives Act of 1878. Mr. Wardell said the owners of the car had clearly committed an offence under the first named Act.—Mr. Nicholson denied that, and remarked that the vehicle was a locomotive. The Bench, under the advice of their Clerk, dismissed the summons.

DAMAGES.

In the Sheriff Court at Forfar Mrs. Ann Cather Mitchell, or Lumsden, sued Alexander Ross French, dentist, Forfar, for £75 on behalf of herself and £25 for her child in respect of personal injuries caused by being knocked down by a motor-car driven by the defender on July 13th, 1900. The pursuer contended that the car was driven in a negligent manner. Sheriff Substitute B. P. Lee found that the defender was not at fault, and absolved him, but without expenses. On appeal Sheriff Johnston recalled, and gave decree for £20 to the pursuer and £10 to the child, with expenses. The Second Division, on appeal, affirmed the judgment of the Sheriff-Principal.

A PARTNERSHIP DISPUTE.

In the Durham Court of Chancery, the case of Metcalfe v. Duncan, a claim by Alfred Michael Metcalfe, of Sunderland, for a sale of partnership property, the defendant being Sydney Duncan, also of Sunderland, was heard. Mr. Gawan Taylor, in making the petition, said the plaintiff and defendant were lately partners in a company known as the Northern Motor-car Company, and the action was brought to obtain an account of the sale of the partnership property. The partnership was dissolved in June, 1900, and the only asset was a Daimler motor-car, which was in the possession of Mr. Simpson, coachbuilder, Sunderland. The plaintiff took legal advice, and the result was the issue of a writ on August 13th, 1901. The Registrar in Chambers made an order for accounts, and an inquiry as to profits, but counsel was instructed that the registrar had no power to order a sale. He (counsel) was perfectly willing that the costs of both parties should be taxed and paid. Mr. Mundahl, for the defendant, said the latter was willing that the motor-car should be sold, and he had used every effort to dispose of it by advertising. They were willing to pay the incidental expenses, but the plaintiff had taken legal advice, and incurred legal expense which was not necessary. Defendant was not willing to pay the costs of the plaintiff's private solicitor. His Honour, in his judgment, said he saw no reason to depart from the usual course, which was to make the usual order of winding-up, for the sale of the assets, and for the paying of costs, taxed by registrar in Chambers. The amount which then remained must be divided between the parties. An order was made accordingly.

ROAD MENDING AND MOTOR-CARS.

At the Bullingdon Petty Sessions, James Dew, of Reading, was summoned for driving a motor-car on the footpath at Culham on October 11th. Defendant did not appear. Mr. Bromley Challoner prosecuted for the Culham Rural District Council, and said that the defendant drove along the road from Culham Station to Abingdon, and when he came to the place where the road was being mended went on the footpath. Although the road was not sufficiently comfortable for the defendant to pass over it he could not be allowed to get out of the road and drive on the footpath for 150 yards. An engine driver employed by the Oxford Steam Ploughing Company, named Bennett, said he saw the defendant come along the road with a motor-car. Defendant asked him to go back and roll the stones down for the motor-car. He said he could not as he would waste too much time. Defendant then took the car out of the road and drove along the footpath. When defendant returned he again went along the footpath. Mr. Tompkins, District Surveyor to the Council, said he saw defendant drive a four-wheel car on the footpath for 150 yards. He got on to the footpath 100 yards before he came to the stones. The stones did not obstruct the road to other people who went along it. Fined £2, the full penalty, and costs.

NO LIGHT.

At Westminster Police Court, George Edgley was summoned by the police for failing to comply with the orders made by the Local Government Board with respect to lights on a motor-car. Police-sergeant Hawley, deposed that at five minutes to ten on the night of the 2nd ult. Mr. Edgley was driving a light locomotive without a rear red light at Broad Sanctuary, Westminster. A solicitor for the defendant pleaded guilty to the offence, and Mr. Sheil imposed a fine of 40s. and costs.

THE EXHIBITION QUESTION.

THE Secretary of the Automobile Club asks us to publish the following:—

"In the advertisement columns will be found an important announcement by the Committee of the Automobile Club on the Exhibition question. It will be recollected that on June 11th representatives of all the manufacturers of and agents for motor-vehicles in this country were asked to meet at the Automobile Club for the specific purpose of deciding whether there should be more than one Automobile Exhibition in London per year, and, if so, which Exhibition should be the only one to be recognised by the trade. A decision was come to, *nemine contradicente*, in favour of one exhibition only, and that the Automobile Club's Exhibition at the Agricultural Hall, and the Automobile Club was empowered to refuse space at that Exhibition to those who acted disloyally to the trade in this respect.

"It has been pointed out that this arrangement might act unfairly on British manufacturers, as foreign firms might exhibit at a Crystal Palace exhibition, and their agents here might exhibit at the Agricultural Hall Exhibition, while the British manufacturers could exhibit only at the latter. It will be seen by the announcement of the Club Committee that this is to be prevented. The announcement amounts to this. There is a manufacturer in France called (say) 'Paris and Co.' He appoints in England agents called (say) 'London and Co.' They again appoint agents in the provinces (for the sale of 'Paris' cars) called 'Manchester and Co.' Then (a) If Paris and Co. exhibit at the Crystal Palace, London and Co. cannot exhibit at the Agricultural Hall. (b) If 'Paris and Co.' permit anyone to exhibit 'Paris' cars under any name at the Crystal Palace, London and Co. cannot exhibit at the Agricultural Hall. (c) If Manchester and Co. show 'Paris' cars at the Crystal Palace, or if London and Co. allow 'Paris' cars to be shown under any name at the Crystal Palace, London and Co. cannot exhibit at the Agricultural Hall.

"The reservation is, however, rightly made that if London and Co. can prove that the display of 'Paris' cars at the Crystal Palace was carried out against their wish, that they protested against it and took such steps as they were able to prevent it, then the Club Committee may allot space to London and Co. for the exhibit of 'Paris' cars at the Agricultural Hall. The decision of the Club Committee is clearly in furtherance of the decision which the trade came to and asked the Club to carry out. Promoters of other exhibitions must not grumble at the Club, but must recollect that the Club is acting at the request of the trade."

A NON-STOPPING CASE.

At Derby Police Court Frederick Turner was summoned for failing to stop his motor-car when requested to do so. The Chief Constable said this was the first case of the kind brought before the Bench. Mr. Salmond, of Blomfield, Breadsall, said the car belonged to him. The defendant was a most careful driver, and complained that persons sometimes put up their hands unnecessarily. The case was not pressed, and defendant was fined 2s. 6d. and costs.

COMMENTS.

WHEN we speak of "the Club" every motorist knows we refer to the institution in Whitehall Court, which held its annual dinner last week at the Hotel Metropole. As will be seen from the report on another page, the event was a repetition of former successes. With the Earl of Onslow, Sir Francis Jeune, the Rt. Hon. Henry Chaplin, M.P. (the author of the Light Locomotives on Highways Act of 1896), the Hon. J. Scott Montagu, M.P., and other public men as speakers, the after-dinner oratory was naturally of a high order; while the importance of the speech made by Mr. Chaplin gave the occasion something of the glamour of a historical event in the annals of the Automobile Club. Mr. Chaplin recognises that the regulations framed in 1896, when fifteen miles an hour was a high speed for motor-vehicles, are antiquated hindrances to the industry now that machines have been constructed capable of speeding along at sixty miles an hour. We do not advocate—nor does any motorist—that the highways should be made the scenes for the display of such powers; but we do ask that in place of the twelve-mile an hour restriction there should be a reasonable allowance where danger to the public is clearly impossible. All the speeches at the Club dinner emphasised that view, and also reiterated the advice to motorists to respect the feeling and prejudices of those whose nerves have not proved sufficiently strong to regard an automobile with indifference.

The Southsea Run.

SATURDAY'S run to Southsea was a veritable triumph for the motor-car. As the vehicles wended their way through the dense London fog they demonstrated their utility in a remarkable degree. While drivers of horse-drawn vehicles timidly reined in their steeds, those at the steering wheels of the motor-cars went boldly along, and finally emerged—just before reaching Staines—into a clear atmosphere that was quite a relief. In cold and heat, in clear and foggy weather the motor-car has proved itself a vehicle far exceeding the horse for reliability and certainty of temper. All accounts agree that the run to Southsea was even more successful than that of last year; the few stoppages on the way were mainly for minor adjustments, and absolute breakdowns were almost reduced to a minimum. In such a foggy morning as that of Saturday, any other gathering but that of automobilists would have been impossible. As it was, everyone felt confident of getting away from an unpleasant Metropolis, and the run—which the public regarded as impossible under the circumstances—proved popular as affording some sort of escape from the fog. The only unpleasant incidents of the day were the three patches of newly-laid stones over which the cars had to go before entering Winchester. "An enemy hath done this," remarked one of the travellers—and it certainly had that appearance. But we are glad to be able to say that the Surveyor of the district regretted the circumstance, which would not have occurred but for the fact that a steam roller had broken down; hence the delay in rolling the roads. This explanation may afford some sort of consolation to those whose tires were punctured in consequence.

Motorists at Worthing.

WORTHING was full of motor-cars on Sunday last. At the invitation of Mr. G. H. Warne, a number of members of the Automobile Club extended their Southsea run to Worthing, where they were entertained to luncheon at Mr. Warne's private hotel on the sea front. A better day for the visit could scarcely have been desired at this time of the year, and the fact that the town also possesses in Mr. Warne's establishment a first-class hotel, replete with every accommodation both for the storage and repair of motor-cars, will no doubt do much to popularise Worthing with automobilists. A large number of people were gathered together on the parade about noon in anticipation of the arrival of the cars, but although a few put in an appearance soon after twelve, it was not until after one o'clock that they began to arrive in any number. Altogether about forty vehicles were stored in the new garage and other outbuildings attached to the hotel, and as the invitations issued to the members of the Club also included any friends who happened to be making the tour with them, the actual number who sat down to luncheon during the afternoon was not far short of 150.

Sunday Trains.

DECIDING to return to Winchester on the Sunday following the run, to have a look at the ancient city, two of the venturesome motorists bade farewell to their drivers on the Saturday. In their hotel at midnight, they pored over time-tables to discover that, once in Winchester, there they would remain till late in the evening. There were no trains at all to Bishops Waltham, and a visit to Chichester or Arundel meant imprisonment in either town till nightfall. So they trained to Shoreham, and walked six miles to Brighton, passing on the way many privately-owned motor-cars going to Worthing, and also four of the public-service vehicles successfully plying along the front. At Hove the 40 h.p. Panhard recently owned by Mr. C. Jarrott was discovered suffering from ignition troubles. Once in Brighton it was easy to get to town. But the warning has been sufficient. When on motoring trips you decide to return on a Sunday by train, always look up time-tables before dismissing cars.

The Manchester Automobile Club.

IN celebration of the fifth anniversary of the date on which the Locomotives on Highways Act came into operation, the members of the Manchester Automobile Club held a dinner on Thursday last week, when an interesting speech was delivered by the Chairman, Mr. W. E. Rowcliffe. This gentleman is acting on the "Special Legislation Committee" of the A.C.G.B.I., formed to consider what steps should be taken to protect motorists from unnecessary restrictions. While not desiring to disclose the suggestions that had already been made in that matter, he remarked that it was safe to say it was the special desire of the Club, whilst seeking to protect motorists from unnecessary restrictions, not to oppose such restrictions on the use of motor vehicles as may be necessary to prevent dangerous driving, and it was indispensable that any proposals submitted should not only deal with the subject from the point of view of the motorist, but include such provisions as from the experience of members appeared to be necessary for the pro-

tection of the public. It is hoped in the near future that the Manchester Club will acquire suitable premises with the necessary accommodation for the storage of cars, where the members, who now number nearly one hundred, can hold social gatherings.

A Slight Misconception.

THE announcement in one of Saturday's papers, with regard to the preparations for the anniversary run, that, "by the kindness of the Countess of Ayr, the roads had been specially rolled for the occasion," surprised a good many readers, some of whom, if automobilists, and uncritical, may have been inclined to act as the Highland traveller to General Wade, while others, finding the lady in question unknown to *Debrett*, must have been still more mystified. The drivers on this occasion may be disappointed to learn that they are not after all the subjects of condescending sympathy from the Peerage, that the phantom Countess exists only in the brain of a confused reporter, and that their thanks are after all due to that useful, if not so picturesque, personage, the *county surveyor*!

A Good Start.

THE inaugural ascent of the newly-formed Aero Club took place on Friday afternoon last week at the Stamford Bridge Athletic Grounds, where Mr. Frank Butler, the originator of the Club. Miss Vera Butler, and Mr. Stanley Spencer, of the firm of aeronauts, ascended in a balloon, named the City of York, of 40,000ft. capacity. The Hon. C. S. Rolls was to have been one of the party, but at the last moment it was found impossible to accommodate him in the balloon, as there had been considerable condensation in the gas owing to the cold

MOTORISTS AT THE BALLOON ASCENT.

weather. A great height was attained, and a good descent made at Watlington, near Maidstone, at half-past three o'clock, after an excellent voyage, though the cold at high altitudes was severe. From the large number of friends, mostly automobilists, who witnessed the departure it is evident that interest in aerial navigation is keen. The winter months are not altogether favourable for such excursions, but with the return of warmer weather there is every indication that the new Club will enter a stage of considerable activity.

The Scottish Automobile Club.

THE Western section of the Scottish Automobile Club, formed less than six months ago, had a run on Saturday last from Glasgow to Luss. The run was arranged to celebrate the fifth anniversary of the coming into operation of the "Light Locomotives and Highways Act, 1896," and was the first organised run of the section. Despite frost and fog, twenty-one cars, carrying about seventy passengers, were on their way to Luss by two o'clock. Travelling *via* Clydebank, Dumbarton,

Bonhill, and Alexandria, the automobilists found the roads in good condition, and the weather outside of Glasgow ideal. The speed of the cars was kept well within the limit, and there was no reckless driving. Mr. H. M. Napier, a member of the Committee, entertained the Club in the hotel at Luss. Speaking on behalf of the Committee, Mr. Nisbet expressed his gratification at the large attendance of members and friends. The Club, he said, had a lot of uphill work before it. Much prejudice had to be lived down, and many laws inimical to automobilists required alteration. Automobilists were indebted to the Hon. Secretary, Mr. R. J. Smith, for services rendered to the Club and the movement generally, and he congratulated that gentleman on the recognition to be conferred on him by the Automobile Club of Great Britain and Ireland for his work in connection with the Glasgow trials. After a vote of thanks to Mr. Napier had been given and a telegram of greeting despatched to the A.C.G.B.I. at Southsea, the cars moved homewards. A feature of the turn-out was the large preponderance of Glasgow-built cars, these consisting of Arrol-Johnstons, Argylls and Albions, there being no less than seven of the latter. The procession through the city at a very busy hour caused much attention and favourable comment.

Yorkshire M.P.'s.

MOTORISTS must keep a watchful eye on some of the members of Parliament representing Yorkshire constituencies. Recently the Yorkshire Union of Agricultural Clubs and Chambers of Agriculture adopted a resolution with regard to the driving of motor-cars, which was one to which no practical motorist would assent. This was forwarded to all the Yorkshire M.P.'s, and its receipt has been acknowledged by Messrs. Grant Lawson, C. H. Wilson, Wilson-Todd, and J. C. Rickett. Mr. Luke White, M.P., was not content with an acknowledgment of the resolution, but also assured the Union that he would do all he could to urge the Government to act in the matter, as he was in thorough sympathy with the views expressed. Mr. J. G. Butcher, who sits for York, also wrote, and declared his belief in the necessity of regulating the driving of motor-cars to avoid a public danger. Certainly some of the many motorists in the county of broad acres should take these gentlemen in hand—or on a car.

Caution Boards Wanted.

THE Lancashire County Council has adopted resolutions in favour of numbering motor-cars, licensing drivers, and the fixing of caution boards at dangerous places on the roads. To the two latter points little disagreement need be expressed, but all three proposals are being submitted by the County Councils Association to the various Councils throughout the country, and their views will be considered at a meeting of the association to be held on the 27th inst. The Bucks County Council has had a long discussion on the subject, and ultimately the matter was referred to a special committee of the Council to report upon. There seemed to be unanimity with regard to the fixing of caution boards, but considerable diversity of view arose on the suggestion as to numbering motor-cars, a matter which, in view of the activity and ingenuity of the police, is of comparatively minor importance, and one that the Councils might well leave alone. Judging by the number of summonses recorded every week the police have quite enough cases to deal with without giving further opportunity for the exercise of their wonderfully vivid powers of imagination.

The Price of Petrol.

BOTH Mr. W. M. Letts, of the Locomobile Co., and the Anglo-American Oil Company, are to be congratulated on the decision of the latter to reduce the price of petrol in the London district 3d. per gallon. Mr. Letts has been in communication with the company on the subject for some time, and has apparently been able to convince them that this is a wise course to adopt. Anyhow, users of petrol will read the announcement with pleasure and owners of cars living in the North and

Midlands will probably be encouraged by some reduction in the rates now charged to them. But the cost of transport will militate against any such substantial reduction as has just been made in the Metropolitan area.

Beware of Frost.

QUITE a number of motor-quadracycle owners have during the past season had their engines converted from air to water-cooled. To them, and, in fact, to all motorists who have water-cooled motors, we would recommend the draining off of the water from the tanks, pipes, and jackets at this time of the year immediately on bringing home their cars or cycles after a run. We hear that several motorists have had the annoying experience of burst heads and jackets as a result of the freezing of the water during the severe touch of frost last Saturday and Sunday. In one town alone, about twenty miles from London, we know of two water-cooled quads. with burst heads and one car with a cracked cylinder jacket, due to this cause alone.

Why not Reprisal?

WRITING to a contemporary a Farnham correspondent says: "During a round of twenty miles in this district a few days ago I passed eleven carts and horses unattended, and not even tied up. Some were frightened, some were not; but why, in any case, should their owners be allowed by the police to break the law with impunity?" He may well ask why such a flagrant and dangerous breach of the law is so constantly overlooked by the police and other sticklers for the letter of the law, when a motorist is concerned. A well-organised crusade against this particular evil, undertaken by a few public spirited automobilists in Surrey and other places, might have the salutary effect of forcing upon some dull intellects the advantages of acting up to a time-honoured maxim, which says "live and let live."

Wasted Police Energy.

OF a somewhat similar nature is the complaint of an Ashford correspondent. "I certainly think," he writes, "that after the warning to motorists 'not to go to Ashford,' it is high time the 'powers that be' ceased from spending their time in hiding behind hedgerows and attended to their duties in the town; stopping some of the nuisances such as hoop-rolling on the pavement and footballing in the streets. This would be appreciated far better than their efforts to drive a growing industry from the district." Ratepayers generally are likely to endorse such a view of police duty. If there is really no more useful employment for the men in blue than loafing about in country roads in gangs on the off chance of catching an occasional motorist, it is certainly time that a reduction of the police vote, on the ground of economy, be moved in many quarters.

Welsh Approval.

ALDERMAN T. WINDSOR JACOBS, J.P., is an influential member of the town council of Cardiff and has watched the progress of the automobile movement with studious care. In the columns of a leading Welsh journal he has been descanting at length on the merits of the motor-car for delivery purposes, for pleasure trips, and for the requirements of the general contractor. Some time ago the Health Committee of Cardiff appointed a sub-committee to inquire into the suitability of the motor-car for use by the local health department; but came to the conclusion that there was not a satisfactory vehicle on the market. But Alderman Jacobs has since then watched the progress of the experiments in Westminster and the Strand, and recognises the improvements that have been made, so that it is not too much to hope that Cardiff will soon be among the enterprising towns collecting dust and distributing water by means of mechanically propelled vehicles. Perhaps that time would be hastened if the motor-vehicles could be made a little more silent than now.

Woman and the Motor-Car.

AN interesting article on "Woman and the Motor-car," from the pen of Mr. C. L. Freeston, appears in the *Lady's Magazine*, and it is illustrated with some effective photographs of Mrs. Kennard, Mrs. Weguelin, Mrs. Edge, Mrs. Copland, Miss Weblyn, Miss Butler, Miss Bacon, and other lady automobilists. Mrs. Weguelin has driven over 30,000 miles, and we are informed that Mrs. Copland, after four lessons of about an hour each, was able to change speed without "scraping the gear." Lady Wolverton, Lady Stanley, Lady Cecil Montagu, Lady Jeune, and other members of the aristocracy are named as enthusiastic motorists, and altogether the article furnishes ample evidence to prove to general readers the great strides that motoring is making.

A Representative Cargo.

It is but rarely that one sees grouped together in a motor-carriage a company of men so well known in widely different spheres of life as that depicted in the accompanying illustration. At the wheel, and representing the automobile world, is Mr. E. M. C. Instone, of the English and French Automobile Clubs, while seated beside him is Mr. J. B. Joel, whose name is a power in the world of finance and South African enterprise. The stage is represented by Mr. Lewis Waller—one is almost apt to write

Don Caesar de Bazan—also a member of the Automobile Club, and in the person of Mr. S. Loates, the famous jockey, sport has a worthy representative. The photograph was taken by the fifth member of the party, Mr. Louis Edwards, whose military pictures and sketches are so much appreciated. The car is a 12 h.p. M.M.C.

The Speed of Motor-Cars.

At a meeting of the Croft Rural Council, Colonel Wilson, C.B., moved:—"That motor-cars in future be registered and carry a visible number; also that the driver hold a certificate of competency; and that a copy of the motion be sent to the Local Government Board." He said it was probably the wish of the Council that some notice should be taken of the speed at which motor-cars were run. When President of the Local Government Board, Mr. Chaplin made certain regulations, but in a speech made the other evening he admitted that he was wrong in limiting the speed at which they should be driven in a clear road, as they could be pulled up instantly. It was doubtful whether it was possible to limit the speed. He, therefore, thought

they ought to take a broad view of the matter, and insist on registration, and that each driver was competent. After some discussion the motion was carried.

The King.

THE King, who has naturally been much occupied with weighty affairs of State since his return South, has taken to his motor-car once more. On Saturday the last stage of the Royal journey from Windsor to Sandringham was undertaken in an automobile. A special train left London at a few minutes past four. Wolferton Station was reached at 6.25, in a thick fog. His Majesty, accompanied by the Prince of Wales, entered a covered motor-car and proceeded to Sandringham, and thus experienced the same anniversary sensations as his loyal and motoring subjects in the South.

World's Champion.

IN the hearing of a charge against a motorist for furious driving at Highgate, a constable, examined as to how he estimated speed, replied that he had been an athlete and a cyclist, and could run a mile in a minute! Another constable called declared that if that was the maximum speed of his brother blue he could certainly beat him!! The motorist was acquitted on the first charge, but paid heavily on a second, of riding without a light. Yet in many another court the "opinion" of just such an intelligent brace of Bobbies turns the scale of justice against the sworn evidence of an English gentleman.

The Motor-Cycling Club.

A GENERAL meeting of the members of this Club was held on Tuesday evening, when the recommendations of the Provisional Committee were considered. It was resolved to register the Club as a limited company, the liability of the members being restricted to 5s. Afterwards the memorandum and articles of association were approved, and a committee of five gentlemen appointed. Mr. T. Underwood and Mr. G. Tripcony were elected to the offices of secretary and treasurer respectively. The Club is to be of a social character, and the preliminary programme provides for the holding of district runs on Saturdays and Sundays, with occasional general and extended trips, non-stop and hill-climbing trials, and tours at Easter and Whitsuntide, etc. The question of Club headquarters was broached, the general feeling of the twenty or so gentlemen present being that such were particularly desirable to enable members to meet together and have talks, informal or otherwise, on motor-cycling matters. The membership list will comprise four categories—ordinary, country, honorary, and life members. The annual subscription for ordinary and honorary members is a guinea, while for country members, defined as members residing over twenty miles from Charing Cross, it is half-a-guinea. Those motor-cyclists desirous of joining the new Club should communicate with the Secretary, Mr. T. Underwood, 13, Colville Mansions, Talbot Road, Bayswater, W.

About Breakages.

THERE are some people who seem to think that there is no excuse for any part of a motor-car breaking down, and that if breakages occur it is gross carelessness in construction or poor material. It is possible to build a machine—on paper—with all strains and stresses nicely calculated and allowed for which should not prove weak at any point, but which, with "every part as strong as the rest" should run until it falls all to pieces like the deacon's wonderful one-horse chaise. As a matter of fact this is in practice neither possible nor desirable. We have been building carriages for several hundred years, and yet, as every driver knows, they are not free from breakage. The locomotive has had the careful attention of mechanics for nearly a hundred years and though it runs on a steel track and is looked after as carefully as a horse, it frequently breaks down in various parts.

Frames, axles, piston rods, cross-heads, cylinders and other parts fail when least expected, and yet no one claims that they are poorly designed or built. Any machine will wear and sometimes break in spite of every theory to the contrary, and a motor-car is not exempted from this rule.

Danger Boards.

THE proposed erection of danger-boards on certain hills for the special behoof of automobilists is an undertaking which, although desirable in the abstract, requires a large amount of consideration and judgment. Such warnings as already exist, though too scanty in some localities, are somewhat overdone in others, and there are survivals from the early cycling days which are positively misleading; while a short study of the Contour Road Book will show how different are the estimates of dangerous hills in different parts of the same work, hills of 1 in 14 being so stigmatised in the home counties, while in Devon and the Peak district a hill generally has to exceed 1 in 12 to be so marked. Generally speaking, the quality of unexpectedness is the principal source of danger in the case of cyclists. With a motor-car, however, though this is, of course, to some extent also the case, great length in a steep incline is the most to be dreaded, most good brakes being sufficient to cope with the worst gradients unless they are prolonged, while few even of those that may be called by comparison good are capable of long sustained action without firing or showing weakness. After all, a good map or contour, with such hills marked, is, if studied before a run, a better safeguard than danger-boards, which sometimes escape observation when they are most needed.

Motors v. Trams.

THE project, which has been for some time in the air, for an electric tramway between Farnham and Hindhead, has not unnaturally aroused some opposition in the neighbourhood from the artistic interest, though the desire for better means of communication is almost unanimous. Under these circumstances a correspondent of the *Surrey Advertiser* repeats the obvious suggestion that a service of motor-cars would meet all necessities, and greatly conduce to the development of a picturesque and popular locality. In towns, trams may be a necessity, though an objectionable one, but in country districts, which owe their popularity chiefly to the beauties of Nature, it would certainly seem advisable to work motor-cars for all they are worth before admitting the need for costly and disfiguring electric tramways.

MR. C. B. KELLOW, of Melbourne, has just received the first 6½ h.p. Darracq car imported into Australia.

THE Deering Harvester Company, of Chicago, Ill., has lately built an automobile grass mower. It is propelled by a 4 h.p. petrol motor, and is said to have cut twenty-two acres in nine hours, using a five-foot sickle bar. The motor is placed in front of the driver's seat and rests upon a leading third wheel. The cutter bar is at the side, as is usual in machines drawn by horses.

THE Locomobile Company of America have issued a second illustrated pamphlet with the avowed object of demonstrating the ability of the little vehicle, which figures on its pages, to perform striking feats. The ubiquity of the Locomobile is just as striking as the feats which it performs. From one of them General Brabant is seen addressing the Volunteer Defence Force at Cape Town. We have another glimpse of it at the sixty-ninth milestone from Hobart Town, Tasmania; at Land's End, after a run from John o' Groat's; up to the axle in Californian mud; climbing a hill as steep as the slanting roof of a house; and crossing the ice below Niagara. All these and many other feats of a marvellous order, also depicted, the Locomobile appears to glory in.

Anniversary Run to Southsea.

THE START.

NEVER was November morn truer to its meteorological traditions than that which marked the fifth anniversary of the legal existence of the motor-car on British highway. Black, impenetrable gloom hung over Whitehall, and a temperature many degrees below freezing point covered the surface of the road with ice. But the genuine automobilist has no more respect for the elements than they have for him, or her. Shortly after midnight, and throughout the early hours of the dawnless day, automobiles of every description converged from all points toward Whitehall Place, for to the vehicle first on the spot would fall the honour of leading the 202 motor-cars and cycles entered for the anniversary run to Southsea. To "Le Limacon,"

ing to the automobile. "Dick" and "Daisy" were fair samples of a homelier type, whilst natural history supplied many more, and others, such as "Daydreams" and "Atalanta," suggested anything afloat, from a house-boat to a battleship. In not one single case did a name suggest the remotest idea of that propensity to law-breaking or intimidation with which certain ill-informed people are wont to associate the automobilist. If anything the gloom deepened as the moment of departure, announced by a general taking of places, arrived. Punctual to the second the "Sluggard," with Mr. C. Johnson, secretary of the A.C.G.B.I. on board, swung round the corner with a warning hoot, and disappeared in the fog of Whitehall. Close in her wake, and before the Horse Guards' clock had finished striking the half-hour after nine, followed a score of cars, each with a full com-

A GROUP OF CARS AT EGHAM HILL.

Photo byj

[Argent Archer.

Mr. S. F. Edge's 9 h.p. Napier, which crawled into Whitehall Place at 1.15 a.m., and drew up at the corner with head-lights glaring into the fog that hid the Horse Guards opposite, fell the coveted honour. By nine o'clock, half an hour before the time of departure, a large number of cars had arrived and taken up their position, and still the hoot of the horn and the now familiar sound of an invisible car told of yet another and another arrival, feeling its way like a fog-bound ship to the far end of the ever-lengthening line in which every type of automobile—petrol, steam and electric—was to be found. Never has such a variety of cars been seen together before, ranging as they did from a powerful 24 h.p. Mors, down to the modest motor-bicycle. Time was nearly up, and weird fur-clad figures, like bears, stole in and out of the fog, whilst trusty leather-coated mechanics made final adjustments or examined critically the delicate mechanism on which so much depended. Friends and well-wishers moved from car to car, inspecting the names in black letters on white cards with which all were decorated for the day. For many of these the French language was responsible, as it is for much pertain-

plement of smiling fur-clad passengers. Automobilmism begets a serenity that not even the prospect of a ninety-eight mile run through fog and frost can dispel. But that which would, in spite of adverse elements, have proved a really imposing spectacle was somewhat marred. The stream of cars, swinging gracefully round the corner in mechanical precision and perfect order, was broken. Whitehall Place is usually as deserted a thoroughfare as one could find in all London, but on Saturday morning for some unaccountable reason all London traffic seemed to have been diverted that way. Lumbering coal-carts, costermongers' barrows, cabs, in short every type of vehicle except the 'bus, wedged in with, and between, the motor-car. A laudable but ill-timed interest in automobilism, and a desire to accustom the steeds which drew these vehicles to the smell of petrol, may have prompted their drivers to put in an appearance. Whatever the reason, the rounding of the corner into Whitehall, always well filled with traffic, was with the aid of these unwelcome additions to the procession, and the crowd of spectators that thronged the road, rendered a feat of no mean skill. To the credit of the motor-men be it noted that no

accident occurred, and the utmost good temper prevailed. Singly and in groups the cars continued to struggle through for the next half-hour and disappear westward in the fog. About the Automobile Club there lingered for some time a number of cars, the lingering being probably due to the reluctance of their owners to start under such unfavourable atmospheric conditions; or perhaps in some few cases to a little temporary stupidity on

A SNAPSHOT AT EGHAM HILL.

the part of the cars themselves. Out of the number of vehicles entered, 143 bearing the name cards issued by the Automobile Club were timed to have left Whitehall by ten a.m.

ON A "STEAMER."

BY PHANOMEN.

"THE car will be named 'New York,' and will be at the starting point at nine o'clock. Hope you will have a fine time"—such were the contents of a brief note I received from Mr. Letts, of the Locomobile Company of America, on Friday last week. It may possibly be remembered that a year ago my intention of journeying to Southsea by steam car was frustrated very early in the run by the breakage of the driving chain. The desire for a long run on a "steamer" still remaining, I looked forward to better luck this year, and was more than rewarded. My previously-arranged plans provided for an early arrival at Whitehall, so that I might have an opportunity of inspecting the several new cars, such as the James and Brown, Gillet-Forest, and the Cannstatt-Daimler voiturette, which were making their *début* as it were on the anniversary day. But previously-arranged plans were all quickly upset by the thick fog which made itself painfully evident from the time of awakening. A hasty breakfast, a sharp walk to the station, a long wait on the platform, and a slow journey to London ensued. Many times in the course of the latter, I wondered whether I should even reach Whitehall in time to pick out my car ere it started. Frequent glances at my watch gradually dispelled all idea of inspecting new cars, or noting who of the 202 entrants were plucky enough, having regard to the severe meteorological conditions, to face the ordeal of the run—for such it appeared at the time. After several stoppages on the line our engine-driver apparently decided to make Waterloo or die. A sigh of relief went forth as, on leaving the train, I found I had just a quarter of an hour to spare. A few minutes brought me to Whitehall, and after a short search the "New York" was located, and the pleasant discovery made that

the gentleman in charge of the same was Mr. Ginder, probably the smartest steam-car driver in the country. Having found the vehicle which was to convey me to Southsea I decided not to lose sight of it, so whiled away the time of waiting for the start by chatting to one of the many policemen on duty at the time. Space prevents me detailing all that the man in blue had to say about the progress of motor-cars; suffice it to mention that this constable at least was not an anti-motorist, but looked forward to the more general adoption of automobiles, inasmuch as they would not only relieve the crowded London traffic, but tend to make the streets and roads much cleaner than at present. One point that amused me was elicited by reference to the action of the Surrey police against motorists. "Oh," said the constable, "they are only County police, they are not the same as the Metropolitan force!"

All this time cars were coming and going, many with their powerful Bleriot's lighted, the whole forming a scene of animation not likely to be forgotten. Without having any idea of the hour, an indication that it was time to be moving was given by the disappearance in the mist of some of the cars in front of us, so aboard I climbed and made myself as comfortable as possible under the circumstances. Quietly we moved along, and turned into Whitehall between a thick double line of humanity. So dense was the fog that all the public clocks were hidden from view, and the actual time of our start was not noted. Through Great George Street and Birdcage Walk we were soon opposite Buckingham Palace, and here several cars got astray, following a motor-vehicle not participating in the run up Constitution Hill. We, however, were not to be misled, and although the running was very slow we passed safely across Grosvenor Place into Eaton Square, where "Swift," Mr. J. E. Waller's 8½ h.p. Decauville, was seen to be stopped. Across Sloane Square into King's Road we went, and although we were now travelling at a fair speed the drivers of several vehicles, probably cyclists, passed us, regardless of the Club's regulation. On to the foot of Putney Bridge, where we found that the rise had proved a stumbling block to a couple of cars—"Voiture" and "L'Avenir." Once over the bridge a sharp turn to the right was made, and soon we were on Barnes

"VALKYRIE" AT EGHAM HILL. BUSY WITH THE TIRES.

Common, where a scene presented itself of the most wintry and dreary character. On the bridge at Barnes Railway Station an accident had occurred to "Bubble," Mr. Bayldon's Reading steam car, apparently due to a collision between it and a petrol car, whose name we were unable to decipher as we sped by. The rear off-side wheel of the steam car was completely buckled and

broken off, the vehicle lying with the back part of the body on the ground. The accident caused a temporary block, but our car and those in front and behind got safely though slowly by. Ere entering Richmond Park a nasty piece of road was encountered. The park itself, so pleasant in summer, was white with mist and frost, and although the roads were in good condition, it needed careful driving to be able to keep to them. Mr. Ginder was more fortunate than many drivers in knowing the right turning to take for Richmond Gate. Several in front of and behind us went straight ahead, with the result that they found themselves at Kingston instead of at Richmond. Richmond Hill was very carefully negotiated, and so far as vision carried through the fog, I am glad to report that no motorist attempted to pass another car while on this dangerous—having regard to the fact that the road was up at several points—down grade. In summer time we know of no finer view near London than that from Richmond Bridge, but as we crossed it on Saturday all that could be seen was white mist. Over the bridge, the Twickenham road was taken, and the old riverside town gave the motorists a hearty welcome. A

Mr. Percy Richardson, who, on his Daimler, "Valkyrie," was travelling very slowly owing to a punctured tire. The ascent of Egham Hill did not seem to affect "New York" in the slightest, it being made easily without any apparent diminution in speed, and in a few minutes we found ourselves at a halt behind a long *queue* of cars at the control at Egham Hill. Here we had a brief opportunity of inspecting not only some of the cars but also their passengers. And what a curious sight the latter presented! In view of the arctic conditions of the weather everyone—with probably the exception of a certain rider of a motor-bicycle—had wisely made some provision in the way of extra clothing "to keep the cold out." The fog, which had now fortunately been left behind, had, however, left its trace on everyone's face, and what with this and the various get-ups—for, on occasions like Saturday, comfort counts much more than appearance—we doubt if ever a more strange-looking collection of men and women were seen in that neighbourhood. In the interval of waiting for the departure signal, many of the drivers of the cars made little necessary adjustments, while the amateur photographers, like ourselves, did a little

ANOTHER GROUP OF CARS AT EGHAM HILL.

[Argent Archer.

nasty turn had to be negotiated at this point, the task of doing which was not facilitated by the driver of a large Daimler dashing forward and passing several cars. Near Kneller Hall, the military musical academy, we passed Mr. Parsons on the roadside engaged in studying the mechanism of the Holden motor-bicycle he had been riding. After another mile or so the main road to Staines was joined, and with a wider thoroughfare and a slight lifting of the fog, a little faster speed could be safely indulged in. Bedfont, with its attractive church, invisible, however, on this occasion, was soon left behind, and Staines reached. Here a couple of Locomobiles, which had kept us company for some miles, turned into an hotel yard to obtain fresh supplies of water. The "New York," which, by the way, was the identical car which won the gold medal in the Glasgow Reliability Trials, was, however, fitted with extra water carrying capacity, and at Staines we had sufficient water for a further run of from ten to fifteen miles.

As we crossed over the river at Staines one could not help remarking on the change that had come over the scene. At Richmond, we could hardly see ten yards ahead. At Staines there was hardly a trace of fog, and the sun was beginning to chase the frost rapidly away. At Egham we overhauled

snapshotting, only to have a pang of disappointment on seeing later on the poor pictures obtained.

Immediately in front of us were Mr. Leith on his Century tandem, "Cherub," and Mr. Armstrong on his solid-tired 6 h.p. Daimler, "Sundayboy," both vehicles having made the run to the control in good style. Moving on by degrees, we at last found ourselves close by the time-keeper, who notified us that the next stage was to Blackwater level-crossing (12½ miles), and that we must not do the distance in less than a certain time—I forget the exact time allowed for the moment. Away we sped, and soon were travelling past Virginia Water in fine style. Although the roads were in excellent condition the scene bore a somewhat naked aspect, as compared to what it did when last we journeyed that way during the past summer. Passing "Aluminium" and "Friend"—both stopped by the roadside—some spectators called out a warning—"Look out for the police near Bagshot." Naturally our driver kept his eyes open and his hand on the steam control lever ready to pull back the latter instantly should a man in blue become discernible in the distance. Passing "La Dormeuse" and "Egalité"—both stopped near Sunningdale—at a pace less than the legal limit, we were surprised to see some

distance ahead a police-sergeant on the road with both hands uplifted. Feeling sure that no infringement of the law as to speed had taken place on our part Mr. Ginder pulled up at once, only to have his name and address taken for emitting steam. While the policeman who was with him booked the name, the sergeant interested himself in the details of the car, and on giving us permission to proceed wished us a pleasant and safe journey! It was only a few hundred yards to Bagshot, and here we made our first halt, outside of controls, to refill the tanks with water. The official itinerary gives the distance to Bagshot as 30½ miles, so that adding the distance from the Locomobile depôt, where the tanks were first filled, it may be said that "New York" had covered a distance of roundly 35 miles on one charge of water.

Our stay at Bagshot was not a long one, but as cars kept on passing steadily we found ourselves in fresh company on restarting. Nothing of a special character occurred before Blackwater level crossing was reached, although we passed a Century tandem and Mr. Percy's New Orleans "Hotspur" both stopped for some reason or other. Another timekeeper presented himself at the crossing and notified us of the minimum time allowance

teen miles to go to Winchester—and lunch. On this stage several cars were passed, to wit, "Sundayboy," "Muriel," "Romsey," and Secretary Johnson's "Sluggard." So far we had had little, if any, trouble with horses, but one cart horse—in charge of a boy, by the way—was inclined to be a little restive as we approached the village of Kingsworthy. Glancing over the official programme on the way down, we had come across the note drawing attention to the breakdown of a steam roller at Winchester, and to the consequent patches of unrolled metal on the roads some distance before reaching the city. Consequently, there was nothing to do but to make the best of a bad job and tackle the patches with care. Giving a sigh of relief, when they were after much jolting safely negotiated, we soon found ourselves at the Winchester inward control, where our time was recorded as 2—7 p.m., so that we had completed another stage at a fairly good rate. We felt somewhat proud when, arriving at the foot of the new and imposing King Alfred statue in the Broadway, we were informed that we were the first "steamer" to arrive. That we were in the first flight was also ascertained, as only about twenty or twenty-five cars were in front of us. A word of praise may here be

A SISTER CAR TO THE LOCOMOBILE CO.'S "NEW YORK" IN THE ISLAND OF TASMANIA.

for the next stage of 15 miles to Basingstoke. The sun was now shining brightly, and with no sign of fog. A quick run across Hartford Bridge Flats was enjoyed, although a slow down was made when a couple of mounted police were sighted, one on each side of the road. They proved, however, to be friends instead of enemies, and gave us a wave of the hand as if to urge us on. Shortly afterwards we bore down on the "Powerful," the only electric car in the run. The vehicle was running well, and at a good speed, but we soon left it to the rear, as we did also "Pioneer," whose only passenger was the driver; "Patricia" and "Primrose" were seen to be at a standstill near Hook, the latter suffering from tire troubles. Nothing seemed to daunt "New York"; the steam gauge remained remarkably steady, and everything went as merry as a marriage bell. Just 45 minutes after leaving Blackwater we pulled up at control in Basingstoke, so that on this stage of the journey our average for the fifteen miles was—on second thoughts I will leave readers to work it out for themselves! The keen air had given us an appetite, and we looked longingly at the various hotels as we passed through the High Street of Basingstoke. We had, however, still seven-

given to the police of Winchester, for the care and attention they gave to the motorists. Having travelled from Bagshot to Winchester (36½ miles) on one filling of water, a fresh supply was necessary, so we did not stay in the Broadway, but made our way at once to the yard of the Royal Hotel.

After lunch, we ran slowly down the High Street to the Broadway, where a most imposing sight presented itself. Cars had been arriving in rapid succession until fully a hundred, of different types and sizes, were gathered together in one seemingly inextricable mass under the shadow of the huge statue of King Alfred. Winchester has been the scene in times gone by of many an imposing spectacle, but probably none so great as the immense collection of automobiles which rested in the Broadway on Saturday last. Being directed by the police to take up a position towards the end of the *queue*, it seemed as if—with cars in front of us and cars behind us—we were never to make a fresh start. By the kindness of Mr. Johnson a way was made for us, and just as the Town Hall clock recorded 3.30 p.m. we started up the High Street. There was no need to ask the turning—the dense crowd at the corner was sufficient indication. At the outward control we were informed

that the next stage was to Bishops Waltham—a short one of ten miles. For several miles the route was lined with large crowds of school boys, who cheered us on our way. At Twyford we made a momentary stop to relight the fire, which for some reason or other had become extinguished. Off again in a minute, we overhauled "Guiltless," stopped near Fisher's Pond, and "Vixen," also at a stand at Lower Upham. By the time the control at Bishops Waltham was reached the temperature became somewhat cooler, but the run was none the less enjoyable, as with the light of the setting sun on the autumn-tinted leaves of the trees the landscape was of a most picturesque order, and as we passed the fine ruin of the palace, which belonged to the Bishops of Winchester, we made a mental note that this was a place to be specially visited on some future occasion. Near Wickham, "Perfection" was seen to be in a temporary difficulty, and shortly afterwards we had some trouble in passing a horse—again in charge of only a boy. We were now on practically the last free-running stage of the journey. Our car showed no signs of fatigue—on the other hand it looked as if we should reach Cosham in less than the time allotted us, so we reined in and passed slowly through the town of Fareham, enjoying the comments of a large crowd that had gathered there

broken-up road to Southsea the long string of red lights formed an interesting sight. The nearer we got to Portsmouth the denser became the crowd, and it must be admitted that the inhabitants gave the hardy motorists a right royal welcome. At the Town Hall, illuminated by numerous blazing beacons, the Mayor, Major Dupree, welcomed us all in turn as we ran slowly by, and in a few minutes we found ourselves out of light into the darkness of Southsea Common, where I parted company with Mr. Ginder and the faithful "New York." Notwithstanding the unpropitious start, the run was of a most successful character. That great improvement has been made in the construction of motor-cars is evidenced by the relatively few vehicles seen in difficulty along the route, which extended to close on 100 miles.

And ere I close, a word should be said for the car which carried me safely through. The water tanks were only filled twice during the whole journey—at Bagshot and Winchester, and except to relight the fire at Twyford, not a single stop was made *en route*, excepting, of course, at the appointed places. On former anniversaries it has generally been my luck to be among the late arrivals. This year, thanks to the Locomobile, I was one of the early birds.

MORE SNAPSHOTS AT EGHAM HILL.

[Mr. Louis Edwards.

to greet us. Keeping steadily along at a good pace, we heard the toot-toot of a horn, and ere we had time to draw to the side a big red-painted *tonneau* car flew by at a fearful speed. Had I only been able to decipher the name of the car as it sped by us on a bend I should have given it publicity, for the pace, having regard to the winding road, and to the fact that twilight was now upon us, was undoubtedly dangerous, and at least treble that of the legal limit. We were now at Porchester, and skirting the upper reaches of Portsmouth Harbour a lovely view presented itself, the light of the setting sun being reflected in all the colours of the rainbow in the water. From this pleasing scene a turn in the road brought us to another of not so agreeable a nature, a car—the name of which we could not see—lay in a state of collapse on the beach, due, as I ascertained later, to a collision with a horse-drawn vehicle.

A mile or so more, and "New York" pulled up quietly at the control at Cosham at 4.53 p.m., the timekeeper again imparting the satisfactory information that ours was the first steam-car. About forty vehicles preceded us, but as, so far as we were concerned, no racing had been indulged in, but a steady pace up hill and down dale maintained, we were well satisfied with our position. During the brief stop at Cosham lamps were lighted, and as the procession wended its way along the much

THROUGH FOG TO SUNSHINE.

BY LOLLIVS.

SATURDAY morning dawned sulkily, and a fog—a typical November London fog—hung over the Metropolis, as though ardent members of the Aero Club had disturbed the heavens, bringing clouds of sulphurous fumes to annoy those whose walks have an earthly tread. The postmen were late; the trains were delayed; the enthusiasm of footballers was obscured; and ordinary mortals condemned to travel by rail or tram, or accustomed to journey behind horses, realised that fogs did not exhaust themselves in the last century. No, the fogs of the twentieth century have similar characteristics to those of yore. They are murky, uncomfortable, and distressing to all who travel by ordinary means—or whose business leads them to perambulate the thoroughfares of our great city.

But the motorist is not unnerved by fog. Relying on his trusty engine he dares the darkest hour, and with his lamps shining like two far-reaching eyes he can go where horses are led at snail's pace. Such was demonstrated on Saturday—the occasion of the run of the Automobile Club to Southsea in

celebration of the fifth anniversary of the passing of the Light Locomotives Act, 1896. I have already given my impressions of the morning, and to arrive at the rendezvous in time for the start I left a suburban locality at 7 a.m., reaching Horse Guards' Avenue—a distance of about eight miles—by five minutes past nine. Others who started earlier got there later. It was a scene of "darkened splendour," and merry was the music of the engines, throbbing and panting as though the fog was getting on their chests, and lung troubles were likely to arise. As the minutes went by the fog grew thicker, until, anticipating lighting up time, lamps were lit, and it was possible to see a few cars. Altogether 143 assembled near the club-house, overflowing on to the Embankment and into adjacent streets. It was an interesting gathering, but to the man searching for his vehicle general impressions were easier than a critical examination of the many cars there. I was to ride to Southsea on an "Atom," this being the cognomen of a "Gladiator" which Mrs. Edge was to have driven. But the hill-climbing contests across the Channel had attracted her thither, and Mr. E. A. Perman was to take the helm. The first thing was to find the "Atom." Had it been "Ablaze" or the "Beacon," it would have been easier of discovery in the fog, or had it been located on Parnassus the task would have been fairly comfortable. But an "Atom" in a crowd, and on a foggy morning—well, I came

THE SCENE AT WINCHESTER.

across it accidentally. For, starting at the head of the "long thin line" at which was Mr. Cecil Edge on his Napier, that had stood there since 1.30 a.m., I came upon Mr. Perman a few yards along the Avenue, and on his neat little $6\frac{1}{2}$ h.p. Gladiator we were soon prepared for the arena.

Amid all the lights that peered forward from the vehicles, those of the electric car "Powerful" were the most attractive and penetrating. They were really brilliant, and as the car silently glided by lit up the scene for a moment—and were gone. We quickly got into the running, and were soon along the main road of Chelsea and across Hounslow Heath, the fog insisting on the drivers being on the alert all the while. A car ahead dropped by—apparently to pick up a friend—and we gained a place; but that did not make us any happier, for it was immediately behind "New York," and we could have imagined it was washing day in that city. For the car of that Transatlantic name was a steamer, and the cold atmosphere chilled the vapour till it appeared in fleecy clouds all around us. It was even denser than the fog, and, confining our language to Parliamentary limits, we plodded along to Staines. By that time the fog had lifted; but we had the steam. Of the latter fact there was no denial. So far the affair had been somewhat of a procession, and the halt at Egham Hill was welcomed

as the signal for less restrictive running, and also, in the case of the "Valkyrie," for attending to the tires.

The signal for a re-start having been given, all went merrily forward to Sunningdale. What a contrast to that drenched detachment of weary motorists that returned from Southsea along this very road last year! That dreary ride over Hartford Flats with the rain pelting obliquely in one's face the whole way was an experience never to be forgotten. But this year the clerk of the weather was, if more chilly, at least less tearful—and that was compensation enough. Just beyond Sunningdale a cheery cyclist informed us that there was a measured mile at Bagshot, and that the police were watchful and unfriendly. The news was received, but, seeing we were acting strictly to rules and willing to do anything we were told, what need for information? Anyhow, "Romsey" slowed down and gave the "mighty 'Atom'" a chance of gaining on "Peggy"—a sister car driven by Mr. Manville. Between these two cars there was little to choose—for both are Gladiators, and Gladiators have a persistency of running that does them credit. The next car seen was "Muriel," an $8\frac{1}{2}$ h.p. Decauville, and then "Odear" was punctured. As if to compensate for the excellent running of "Muriel," a similar car named "Xenia" rested awhile and "Patricia" came along in lordly style. And so we went on to Blackwater, doing the distance in the exact time allowed by the Controls.

We soon got across Hartford Bridge Flats after leaving Blackwater, and on the three miles level road towards Hartford Bridge saw a car by the roadside. It was a very exposed position and with a modesty that was hardly becoming, the name of the vehicle was completely hidden by rugs which had possibly been blown thither by the wind. Anyhow, it destroyed identity, and one wondered if "numbering" would have given any better result. Getting beyond the Hartley villages—Hartley Row, once an important coaching centre, and Hartley Wintney, an ecclesiastical place in olden days—Mr. F. R. Simms came along on "Pioneer" and then we had the road to ourselves till just beyond Hook "Hotspur," "Patricia," and "Primrose" were espied, the latter a New Orleans car like the "Sluggard," which the Secretary drove. Mr. Johnson has a sense of the humorous and in thus naming his car was as modest as ever.

Now and again we saw him—once when going down hill—and Mrs. Perman, who was also on the "Atom," will give him credit for celerity of movement. The four miles of road into Basingstoke are of an undulating nature and the scenery was delightful although the land was marshy. Again we came into the Control exactly to the minute; and here the whole population seemed to be prepared for our coming.

So far—save for the rumours at Bagshot—the police had been friendly. Outside one Metropolitan police station a patrol was seen standing holding his horse, and on one of the commons we passed mounted policemen were training their horses. Private individuals brought their horses to know the motor-cars and even dogs seemed to be in training, several large collies being led quite close to the cars and accustomed to regard them as things to admire and not to bark at. A notable feature of the journey was the number of cars whose owners, not taking part in the run, came out to see the vehicles that were doing the pilgrimage. They were to be seen at nearly every important cross road, and between Sunningdale and Basingstoke I counted forty-eight such vehicles. And then I ceased counting.

The road from Basingstoke to Winchester is very hilly in places, and commonplace in others, the few villages passed through being uninteresting. So well were we travelling that only the higher powered cars had a chance of gaining, while we overhauled several of equal power. "Anadyomene," with Mr. Freeston on board, seemed to travel well; and Mr. J. D. Hill's 6 h.p. Panhard waited for no one. "Cumfy," an 18 h.p. Daimler, belonging to Mr. Ernest Owers, went along in fine style, and Mr. Oliver Stanton's "turn out" was a notable one, and never before was a "Chat Noir" with such mudguards. On his little Renault car Mr. F. H. Butler (having returned to earth from somewhere in the sky) did well, and Captain Corke's "Fraternite"

was also in view. Throbbing as though its heart would break, Mr. C. K. Gregson's De Dion voiturette made a good pace, and Mr. E. G. Harrison on "Luigi" made some grand sport, but he had not entered for a non-stop diploma. "Rotifier," "Split Pin" and "Tired Tim" made good running when seen from the "Atom," and "Sundayboy" alternately occupied positions to the front and rear for some distance. In the morning, "Canary" was to be seen, but had long since flown—probably to join the "Jenny Wren," if not the "Robin."

About six miles this side of Winchester we came upon a prime selection of freshly laid stones over which the steam roller had never been. A couple of hundred yards further were another assortment and then nearer the city was a further stretch, well calculated to make incisions into vulnerable tires. Last year a similar set of stones were encountered on entering Winchester from the Portsmouth end, and it was certainly a curious coincidence that the same thing should happen on two distinct occasions.

Fareham. From Wickham there is a sharp rise. Fareham is a pretty little place on the extremity of Portsmouth Harbour, and here a car slipped on to the beach—a very untimely performance. Then through Porchester—long since shorn of its ancient glory—we gained Cosham, the last twenty yards having been done on a flattened tire. Having entered our time, and thus secured a non-stop certificate, we spent a few minutes in re-tiring that back wheel, thus losing our good place in the procession. But we were soon away again, and, dodging over tram-lines through a badly-lighted district, got into Landport and Portsmouth in time to see that the reception had been hearty and spontaneous.

From Southsea to the Drill Hall was a few minutes' run, and there we found about fifty cars before us. Seeing that we were the thirty-sixth to arrive at Winchester and that quite sixty cars left before the "Atom" started in the morning, such a position was excellent. When the run was to Brighton there was plenty of incident in the stoppages and troubles of cars, but nowadays the workmanship is so good and the reliability so well assured

Photo by

UNDER THE SHADOW OF KING ALFRED'S STATUE AT WINCHESTER.

[Argent Archer.]

At Winchester there was an animated scene in front of King Alfred's statue, and from the Town Hall steps the local photographer worked with a will. It was evident that some had made good progress, for going towards the city for luncheon we encountered Earl Russell, the Hon. S. C. Rolle, Mr. C. Friswell, and many others who must have been early birds. The rest gave one a chance of seeing the large proportion of ladies that were participating in the run. Evidently the raiment question is settling itself, for the hideous garments of five years ago have given place to taste and utility. Two ladies appeared particularly graceful in their long cloaks and small fur hats, securely pinned. Both on the car and in walking in Winchester their appearance occasioned favourable comment.

Leaving King Alfred's city we wended our way past a cheering group of young Wykehamists—for they recognised the "Gladiator" as figuring in their most interesting lessons in history—towards Bishop's Waltham, whose ruins we would have photographed, but we were in for a non-stop run—so negatives succumbed to certificates, and we continued our way to

that difficulties are few. That 143 should start from London and 110 be entered at Southsea by 8 p.m. is a tribute to the progress that has been made, and evidence of the greater things to follow.

THE CARS AT COSHAM.

SOUTHSEA, on Saturday, was evidently in anticipation of an unusual spectacle, and the fine and clear, though rather cold, day seemed to warrant the anticipation of a good muster of cars, though expectations would not have been so sanguine had the state of the weather in town that morning been known. As it was, however, expectations were more than realised, and the seemingly endless procession of cars—the largest ever hitherto assembled in this country—produced a profound impression. On our way out to the Cosham Control, at about 4 p.m., the road was covered with pedestrians and cyclists, and some time before the cars were expected a dense

crowd filled the streets of the little village, and, before the first arrival, had surrounded the Control. It was well we were in good time, as, at 4.23, the leading car hove in sight, proving to be the 16 h.p. Milnes, with Mr. Burford up, closely followed by Messrs. Owers (18 h.p. Daimler), Butler (5 h.p. Renault), Pugh (10 h.p. Lanchester), Munn and Gray (4½ h.p. De Dions), and Hooydonk (bicycle). Then came Mr. Kenyon with a 6 h.p. Darracq, who did not wait, being bound for Havant; Messrs. Friswell and Toovey (Peugeots), Fuller (4½ h.p. De Dion), all before 4.33; Messrs. Bramson (12 h.p. Buchet), Instone (12 h.p. M.M.O.), Astell (7 h.p. New Orleans), Critchley (16 h.p. Daimler),

"LA PANNE" AT BISHOPS WALTHAM.

with Mr. Simms (Milnes) following, Gregson (3½ h.p. De Dion), Bartlett (10 h.p. Mors), Cornell (7 h.p. Benz), Rolls (20 h.p. Panhard), and Austin (20 h.p. Wolseley) completed the number which had arrived by 4.40; but now the cars were coming in thick and fast, and the line was lengthening to an extent that gave the two timekeepers quite as much work as they could manage, and Mr. Scott Montagu, who was to lead the procession into Southsea, arriving at that moment we hastened to find a seat in his car, and, duly arrived at the Town Hall, which we heard the first car had reached at the exact minute predicted, creating an excellent impression of the reliability of the modern motor-vehicle! Over sixty of the cars were included in the procession, and the police arrangements, over a route which included nearly two miles of solid crowd, were excellent, as the punctual arrival of the leading cars indicated.

Adjourning to the Drill Hall, where a proportion of the cars were to be housed, we found it also invaded by an interested concourse, rendering the due and orderly disposition of tenants a matter of some difficulty, until, after a liberal concession to public curiosity, the order was given to clear it, after which later arrivals kept dropping in until the large hall was completely packed, and, as might have been anticipated with a total invasion of about 200 cars, nearly every available "garage" in the place was filled. Altogether, as far as I have heard, the effect on local opinion has been all that could be desired, and the benefits which follow the encouragement, instead of the persecution, of the growing sport and industry have been fully realised by "sunny Southsea," a result on which the Automobile Club is to be sincerely congratulated.

AFTER THE RUN.

AFTER the day's run an enjoyable reunion was held at the Portland Hall, Southsea, the Hon. J. Scott Montagu presiding over the dinner. The company was representative of every

section of automobilism and there was a larger number of ladies than at any previous gathering.

After the repast, the Chairman proposed the toasts of "The King" and "The Queen and the Royal Family," and remarked upon the favour which they had all shown towards automobilism. These healths having been heartily drunk, Mr. Montagu gave "the Mayor and Corporation of Portsmouth," and remarked upon the friendliness always shown to motor-cars by the people of Southsea. It was in pleasant contrast to the action taken in some other boroughs, and it was a great thing to thus get the boroughs and County Councils on their side. The improvement that had taken place in the quality of the driving was as notable as the advance in the cars themselves. Everyone recognised that the twelve-mile limit was absurd, but motorists should show by their every-day conduct on the road that they respected other users of the highways.

Major Dupree, the Mayor of Portsmouth, was well received on rising to respond to the toast. He expressed his belief in the future of the automobile movement, and made reference to the Christian name of a leading automobilist who had been the second to arrive at Portsmouth as indicating something of an explosive nature. And yet, said the Mayor, he did not explode, nor did his motor car. Perceiving that this was a joke a smile stole round the tables. Ere the company had quite recovered Major Dupree proposed the health of the Automobile Club.

To this toast Mr. Roger Wallace responded, and made an interesting announcement to the effect that the Club was about to secure better premises. The members would shortly be asked to approve of one of two schemes—one was for a very large club-house with a small garage, the other was for a garage to which a small club was attached.

The health of the Chairman having been honoured, Mr. Scott Montagu gave some figures with regard to the run. One hundred and forty-three cars had started from Whitehall in the morning; at Egham 148 cars had passed by 1.30 p.m.; at Basingstoke 143 had been reported; 132 had reached Winchester

EN ROUTE.

Photo by

[Mr. T. B. Percy.]

before 4.30 p.m.; 123 had gone through Bishop's Waltham; 122 had been entered at Cosham, and 110 had reached Portsmouth by 8 p.m. Such figures proved the success of the run. He read a telegram from the Secretary of the western branch of the Scottish Automobile Club, which (as we were alone in announcing last week) was holding a similar run, and which

conveyed the greeting from seventy members and friends assembled on Ben Lomond. The Head Constable of Winchester had also wired to the effect that the cars all passed through Winchester without accident. Mr. H. Edmunds then gave the toast of "The Secretary," to whose energy in organisation the Club owed so much. The toast was drunk with great heartiness, but when called upon to respond Mr. Johnson was not to be found. It was the only time during the day that he acted up to the designation of his car, the Sluggard. And then, breaking up into small groups for petrol talk, the company separated in good spirits, and much satisfied with the results of the day's adventure.

the Committee is in possession of records made at intermediate stages.

DISQUALIFIED VEHICLES.

[Argent Archer.

RESULTS OF THE RUN.

THE Committee of the A.C.G.B.I. will doubtless be grateful to the representatives of manufacturers and agents of motor-vehicles and to members of the Club who loyally assisted the Committee in its efforts to make the run a popular success by strictly adhering to the speed regulations. It is regrettable that some drivers appeared to have preferred to gain prominence by driving without regard to the speed regulations which were clearly set out in the programme. It would be obviously unfair to those who adhered to the speed regulations that they should be placed at a disadvantage by those who defied the speed regulations, and consequently arrived earlier at the end of stages. Accordingly the under-mentioned vehicles have been disqualified.

The timekeepers at the beginnings and ends of the various stages were not instructed to fill in the time cards, as it was thought probable that drivers would prefer to use the time cards for entering the time at which their vehicles arrived at the beginnings and ends of stages; but at each point there were at least two timekeepers, and both of these made notes of the names of cars and the times of their arrivals or departures. Further,

Southsea. Non-stop certificates have been claimed in respect of the following vehicles:—

Edna.	Powerful.	

The following admit one stop from causes other than failure of mechanism:—Blake, Castlenau, Guiltless, Traveller, Swift.

Objections to the above claims should be lodged (in writing) with the Club Secretary, 4, Whitehall Court, London, S.W., not later than Tuesday, November 26th, at noon. Apart from the eighteen vehicles which are disqualified, and in addition to the

forty-one vehicles in respect of which non-stop certificates are claimed, and the five vehicles for which it is claimed that they completed the run except for one stop from causes other than failure of mechanism, the following vehicles are known to have arrived at Cosham before the timekeepers left there :—

MISCELLANEA.

THE New Grappler Pneumatic Tyre Company are removing their Birmingham dépôt from 76, Bath Street, to more central premises at 201, Corporation Street, where all classes of motor-car and motor-cycle tires will be on view.

THE Beedle Patent Navigable War Balloon Company, Ltd., has been formed, with a capital of £3,000, to acquire the rights for making the Beedle war balloon from W. Beedle, the inventor, and to develop and turn to account the same.

THE Lancashire Steam Motor Company, of Leyland, near Preston, have, we hear, secured an order from the Liverpool Corporation for six steam-wagons. In order to cope with the increasing demand, the company has decided to erect new works, which, when completed, will cover an area of about six acres.

A TOPICAL joke appears in the Christmas Number of the *Royal Magazine*. A motorist is seated in a car, and above him an air-ship is flying. "Great Scott!" he says, "what a fool I was to spend two hundred pounds on this car. That," pointing to the air-ship, "is what I want."

THE Stafford City Council has approved of the general principle of a resolution of the Lancashire County Council in favour

HOMEWARD BOUND—AT THE ROYAL HUTS, HINDHEAD.

It is also known that the following vehicles arrived later at Southsea :—Dragon, Ripple, Choice, Whizzer, Le Limacon.

Owners of vehicles, the names of which are not mentioned above, are requested to communicate with the Club Secretary as to their arrival at Southsea, or state the reason why they failed to arrive there, as it is desired to obtain an accurate return of the performances of all vehicles which arrived at Southsea from London.

THE French Academy has admitted the word *automobilisme* into its dictionary.

of the abolition of the maximum speed limit for motor-cars, leaving the general law of the land to operate, provided that drivers should have a licence of competency, and that an identifying number be fixed to the car.

MESSRS. BRAMPTON, BROS., LIMITED, of Birmingham, have sent us a most elaborate wall hanger giving illustrations and full particulars of their largely-used motor roller and block chains ranging from 4in. pitch downwards. The illustrations depict the chains in full size. Particulars are also given of the chain wheels and also the cutters for making the same, of both of which Messrs. Brampton's make a speciality.

MOTORISTS in the Eastern Counties will be interested to learn that a large dépôt will be opened in a few days at 5, Prince of Wales Road, Norwich, by Messrs. Mann, Egerton and Company. The last named partner in this firm is well known in connection with his "end to end" trips on Werners, Locomobiles, etc., and has during the last six years had a wide and varied experience of all types of cars. The premises which are in the centre of the town, are capable of accommodating from forty to fifty cars, and include showrooms, stores, and large repair shops. A large stock of motor-cars and bicycles will be kept, as well as a complete selection of all accessories required, and of course a large stock of petrol, lubricating oils, etc.

CONTINENTAL NOTES.

BY "AUTOMAN."

IN last week's issue I promised the readers of the journal an account of the First Annual Exhibition of flying machines (heavier than the air), held at the Velodrome of the Parc des Princes at Paris, and organised by the *Auto-Velo*, under the patronage of the Aero Club of France. I accordingly went to visit it on the second and last day of its existence, when wonderful feats were announced, including the launch of a new aviator with a passenger on board. To say that I was disappointed would not represent adequately my feelings, for a more ridiculous exhibition can hardly be conceived. It is true that there were some men and boys, and even girls flying kites of various sizes and shapes, but one need not go out to the Parc des Princes to see kite-flying. There was a very primitive-looking structure of bamboo and calico, something of the shape of two spread-out wings and the tail of a bird, suspended from which a hardy aeronaut proposed to jump from the top of the grand stand, but he, unfortunately, as I have no doubt he would say, stuck his foot through the calico, and decided not to make the attempt. I think his decision was wise and the accident opportune. There was also a construction of shafts and pinions and a Bucht motor, which was said to be an embryonic airship, but it totally lacked a rather important part—namely, the means of raising itself from the ground, and thereby lacked interest. Last of all there was an electric machine suspended from a football goal-post, and when the motor was set to work from the accumulators of an electric automobile through a flexible wire the fan revolved at the end of its cord, and raised itself to the level of the cross bar of the goal-post. I noticed, however, that a start had to be given to it, and that left to itself it simply behaved like an ordinary fan placed on a table. It seemed to me that its raising when once started round its point of suspension was due more to centrifugal force than anything else.

ON Saturday last the Minister of Agriculture inaugurated the Exhibition of Alcohol used for motors in the Grand Palais, and President Loubet also visited the exhibition. There were not very many exhibits of motor-cars, but my attention was particularly drawn to the Schweitzer automobile combined flour mill and bakery, which was in full working order in the exhibition, literally taking in grain at one end and turning out bread at the other. The motor was working three mills and two dough mixers, and dealing with 200lbs. of corn an hour. The whole is very compact and on artillery iron-shod wheels, with a seat in front for the driver. I noticed also a neat and complete Aster set, including motor and carburettor, on a cast-iron base, to be used as a fixed plant for driving a dynamo or any other machine. The Distillerie La Couronne exhibit an engine on the Durr system, which looks exactly like the ordinary portable engine used for agricultural purposes, and would be mistaken at first sight for a steam engine, for the explosion motor, which has two pistons working in opposite directions, is contained in a long metal cylinder, which looks just like a boiler.

AT one end of the Grand Palais a track had been railed off, and round it the motor-cars were circulating as they did at the Agricultural Hall the last two years. The track was undoubtedly a great draw to the Parisian public, and I heard many interested in the trade wishing it could be used for the Automobile Show next month.

THE Paris-Vienna race is the subject of violent attack by a portion of the Vienna press, and at one time last week it was rumoured and reported in several papers that it would not be authorised by the Austrian Government. Happily, however, the rumour turned out to be incorrect, and from inquiries at the A.C.F. there seems a strong probability that the event will come off.

THE results of the alcohol contest organised by the Minister of Agriculture were published on Saturday last, and

the first prize of every class of vehicles has been accorded to cars using a 50 per cent. carburetted alcohol. Amongst the thirty-six competitors nine used pure alcohol, two a 75 per cent. mixture, and the remaining twenty-five a 50 per cent. mixture, so that it may be inferred from the results that up to the present a 50 per cent. mixture is the best. The winners of the different sections were as follows:—First section, motor-cycles and light cars up to 250 kilos.: Lamaudière on a motor-bicycle; second section, voiturettes and cars between 250 and 650 kilos.: Georges Richard with a 4 h.p. single-cylinder car, weighing 426 kilos.; third section, cars above 650 kilos.: Delahaye with a 7½ h.p. two-cylinder car, weighing 1,042 kilos.: fourth section, vans and lorries: Société Naucéenne with a 10 h.p. four-cylinder lorry, weighing 2½ tons and carrying over 2 tons load.

THE results are very peculiar, and differ entirely from racing results. In the second section a 7 h.p. Panhard and Levassor scored the fewest marks of all its section, and a 10 h.p. Mors with a four cylinder motor was last but one in its section, though it came in first. Even in the goods vans, Panhard and Levassor and Peugeot had to play second fiddle.

THE question of the limit of weight in the Gordon-Bennett race for 1902 has at last been definitely settled by the A.C.F. All the clubs except the A.C.G.B.I. were in favour of the limit of 1,000 kilos. for this race, and the A.C.F. referred the matter to the donor of the cup, Mr. Gordon Bennett, who has written a letter to the A.C.F. entirely approving the proposition, which now becomes official. It is unfortunate for England that this rule disqualifies the 50 h.p. Napier cars, which are the only ones that could possibly compete, unless some English sportsmen will come forward and be the "Lipton" of the motor-car world.

AT the same meeting, at which the final decision in the Gordon-Bennett cup was taken, a new category of racing bicycles was created for the Paris-Vienna race, in which the weight of the bicycle must not exceed 105lbs. The entrance-fees for the Paris-Vienna race were also fixed as follows:—Heavy cars (1,000 kilos. to 650 kilos.), 400fr.; light cars (650 kilos. to 400 kilos.), 300fr.; voiturettes (400 kilos. to 250 kilos.), 200fr.; motor-cycles (250 kilos. to 50 kilos.), 100fr.; bicycles (not exceeding 50 kilos.), 50fr.

MR. PAUL MEYAN, of *La France Automobile*, announces the fact that he is willing to organise a "Course des Pannes," or "breakdown race." The race is to be held on a private estate entirely surrounded by walls, and situated some nine or ten miles from Paris. The course is nearly two miles long, and contains steep hill, bad turnings, and bad roads, so that it will be a question of the survival of the fittest, and I believe that the least breakdown or stoppage for any reason whatever will disqualify a competing car. The competition is to be held during the last half of March.

THE King of Italy has announced his intention of offering a valuable prize in connection with a proposed motor-car race from Paris to Rome.

MESSRS. SHIPPEY BROTHERS have, we learn, secured the contract for the supply of Diamond rubber tires of special construction to be used on the "Locomobiles" recently supplied to the order of Mr. Zacharias for carrying the mails for the Malayan Transport Company of Kuala Lumpur. The results of the working of these vehicles for postal service will be looked forward to with interest.

A PROSPECTUS of the sixth Liverpool Cycle and Motor Show has reached us from the secretary. The show will be held at St. George's Hall in the first week of February, 1902, under the auspices of the Liverpool Self-Propelled Traffic Association. Motor firms exhibiting at any show within twenty miles of Charing Cross, other than the Automobile Club's Exhibition at the Agricultural Hall, will be ineligible for space at Liverpool.

HILL-CLIMBING CONTEST AT GAILLON.

ON Sunday last the third annual hill-climbing trial known as the Côte de Gaillon was contested. The contest was originated by *Le Velo*, and Gaillon was chosen—for two reasons, first, because the hill allows a full kilomètre of an average of 9 per cent. incline in a straight line, and, second, because a little beyond the summit there is a by-road leading down to the start. It is, therefore, an ideal situation for the

side of the road—Mr. S. F. Edge with his 50 h.p. Napier, Jenatzy with his 100 h.p. combination electric-petrol car, and Mr. Mark Mayhew with the 50 h.p. Napier which competed for the Paris-Bordeaux and Paris-Berlin races, quite unrecognisable with its *tonneau* body and fine carriage work. There, too, was Mr. Jarrott. The fog extended just to the starting post, and beyond it the hill appeared bright in the sunlight, but as we turned and looked back when half way up the hill we looked down on a sea of mist, which covered the country in every direction, whilst all above us was bathed in warm sunshine, with a clear blue sky overhead.

READY TO START.

MR. S. F. EDGE ON THE 50 H.P. NAPIER.

TACKLING THE HILL.

THE TWO 50 H.P. NAPIERS READY FOR THE FRAY.

purpose. The village of Gaillon is situated about sixty miles from Paris towards the west, and the hill lies just outside of the village and leads up to a low range of hills which separate the valley of the Seine from the valley of the Oise.

The morning was frosty and a heavy fog of wet mist covered the land in every direction. Gaillon was decorated with flags and the scene was most animated. In the yard of the hotel where I lunched M. Buchet was testing and arranging the engine of his car, a tiny vehicle with a 16 h.p. motor. The competition was advertised for noon, and just about that time my party arrived at the foot of the hill and found three big cars lined up at the

Never have I seen anything more weirdly beautiful than the whole panorama, with the racing motor-cars suddenly appearing out of the mist below and bursting into the light.

Edge was the first to come up, and he flew past me before I had time to get my camera ready. Then came a regular procession. Mark Mayhew, with Mrs. Edge, Jarrott and a *mecanicien*, made a good start, but just about half way up the hill slowed up, and I thought he was changing speed, but was afterwards informed that the gears had slipped out. It spoiled his time completely, however. A 40 h.p. Panhard did just the same thing. Jenatzy's car passed me with

De Caters driving, but did not seem to go very fast, and afterwards I learned that a wire had fused. Krieger's electrical car did very fairly, and so did the little 6 h.p. Gardner-Serpollet, with M. and Mme. Serpollet on board. A 16 h.p. Decauville came by at a tremendous speed, and then came the extraordinary vehicle constructed and driven by Truffault, of which an illustration was given in the *Journal* last week. The car seemed to me to go faster than anything else that passed me except the tricycles. It was easy to see that these latter beat everything in the competition without waiting to hear the results.

The Mercedes, which should have competed, was *hors de combat*, and so was last year's winner, Beconnais, and both for the same reason. I heard the story from Rigal, the winner of the competition and the holder of the record for this year, and I will give it as I heard it. It seems that on Saturday the Mercedes had been trying the hill, and was racing down again, and Beconnais, who was also coming down, was in front of the car on his tricycle. Both were going at racing speed when Beconnais suddenly turned off his electric contact without any warning, and the Mercedes at, according to Rigal, sixty miles an hour, ran into Beconnais taking a wheel off his tricycle and throwing him into the air; the Mercedes itself turned aside into the trees and was literally broken to pieces. There was nothing left whole but the hind-wheels. The two *chauffeurs* were badly bruised and cut, but I saw Beconnais on the station as I was returning to Paris. The driver of the Mercedes, I learn, is suffering from internal injuries as he was thrown against the steering pillar which snapped clean off under his weight.

M. Serpollet offered me a seat on his car coming down the side road and there I heard of the new engine which the former is about to bring out and which is to give double the power and much better results. At the foot of the hill I was surprised to find Mr. J. S. Critchley being piloted by Mr. Selbach and I returned to Paris with them to find that great city completely enveloped in fog.

As a result of the competition the winners of the various classes are as follows:—

Category.	Driver.	Car.	Min. Sec.	Miles per hour, about.
Heavy cars	S. F. Edge ...	50 h.p. Napier	1 3 3.5	36
Heavy cars (4 passengers)	De Beiglique..	40 h.p. Panhard	1 14 2.5	30
Heavy cars (6 passengers)	Degrais	16 h.p. De Dietrich	2 58 1.5	13
Electric cars	Krieger	Krieger	1 15 1.5	30
Steam cars	Rutishauser ...	Serpollet ...	1 15 1.5	30
Combination cars ...	De Caters	Jenatzky	1 53 2.5	20
Light cars	Thery	16 h.p. Decauville	1 5 3.5	35
Light cars (4 passengers)	Rebeyrolles ...	16 h.p. Darracq	1 27 0	26
Light steam cars ...	L. Serpollet ...	Gardner - Serpollet	1 12 3.5	31
Voiturettes.....	Truffault	12 h.p. Truffault	1 1 0	37
Voiturettes, steam...	Blake	Locomobile ...	1 34 1.5	24
Quads	Osmont	10 h.p. De Dion	0 54 1.5	41
Tricycles	Rigal	12 h.p. Darracq	0 50 2.5	45
Motor-bicycles ...	Demester	Bourdiaux.....	1 24 2.5	27

Mark Mayhew's time was 1 min. 33 2.5 sec.

SPAIN has added to the number of our foreign contemporaries by the production of the *Revista de l'Automobilismo*, an attractive journal hailing from Madrid.

THE driver of a French motor-car who recently ran through a covey of partridges on the high road near St. Quentin was visited at his hotel by a gendarme, and was asked if he had a shooting licence. No such document being forthcoming, the motorist was served with summonses for two distinct offences—killing and carrying off a partridge, and failing to declare game on passing through the octroi barrier. It afterwards transpired that one of the partridges had become entangled in and was killed by the radiator of the motor-car.

THE PROGRESS OF A NEW INDUSTRY.

AUTOMOBILISM has gained great popularity in England, and continues to meet with marked success in all its branches. To the commercial world it has already proved a boon, while for sport and recreation the motor-car is without a rival. His Majesty has, upon several occasions, discarded horseflesh and the railway-train for the motor-car, and this preference of itself has already had a far-reaching, beneficial effect upon the industry. Moreover, our very "conservative" War Office has made use of the automobile with most satisfactory results; and, further, the Chief of the Fire Brigade now speedily travels upon his motor-car to any point where his presence may be required. In fact, a welcome is slowly but surely being extended to the cause, and the principal reason is not difficult to discover. The public are now recognising the fact that it is not necessary to become a mechanic to master the few simple details connected with the propulsion of the new form of road vehicle. The stage-coach was good enough until the advent of the railway train, which, of course, became the speediest means of travel. Yet, again the old order changeth, for, strictly speaking, it is fastest no longer. *Chauffeurs*, mounted upon vehicles of wondrous power, and travelling over the fine straight roads that are to be met with on the Continent, have repeatedly beaten some of the crack expresses. The lumbering omnibus had to be accepted till the "Twopenny Tube" and the electric tram arrived with their rapid, clean, and economical advantages. But finality has not been reached, for Progress never sleeps, and the automobile may penetrate where the sound of the whistle or beat of the gong is unheard.

As everyone knows, prior to November, 1896, the self-propelled road vehicle was not allowed to proceed at a pace exceeding four miles an hour, with a man holding a red flag before it and preceding its passage for the benefit of nervous horses. Owing to this short-sightedness upon the part of our legislature, the making of automobiles in this country may be said to have but just begun, and it is astonishing, even to the casual observer, how rapid our advance has been. On the Continent, a different view was held. The construction of the self-propelling vehicle was proceeded with apace, and its utility was watched with discerning interest by the public and politicians alike. Accordingly, not being handicapped but aided in every possible manner, the constructors made great strides with their ever progressive improvements. The result is that many believe the French to be our masters. If this be so, we shall have to learn from them still, before we can satisfactorily place our products in competition with theirs. We now have several excellent manufacturing concerns in this country, which appear to vie with each other in bringing the motor-car to as near perfection as is possible.

In conclusion, much to the pleasure and approval of all well-disposed motorists, the "great B.P." are not now content to sit upon the fence, but desire to learn something of the ways of the "new-fangled" machine. It behoves, then, the aforesaid motorists to becomingly display the paces of their iron-steeds to the uninitiated. They will not find the seeds thus sown to be without effect, and soon the murmurings of the unbelievers will be set at rest. We must remember, also, that the British engineer is no fool, he means to be first, let him progress but a little further, and he is bound to succeed. HUGH OWEN.

AN Italian correspondent informs us that Mr. Cecil Rhodes was not involved in the motor-car accident near Turin as reported. Mr. Rhodes was at Venice at the time of the accident and did not arrive at Turin till three days later.

MR. MCTAGGART, one of the directors of the Centaur Cycle Company, Ltd., Coventry, speaking at the shareholders meeting on Saturday last, said that he listened with interest to the suggestion that no further risk should be run in cost of motor-car making; but it was only fair to state that the company had at last produced a car of which he believed more would be heard in the future. Enterprise of this sort was generally started by private individuals, and he thought the Centaur Company would be justified in going further.

FLOTSAM AND JETSAM.

BY "FLANEUR."

ALL'S well that ends well"; but it was a thousand pities that that murky fog appeared last Saturday morning, for it robbed the Southsea tour of all its spectacular value to the London public. It would have been a magnificent sight, the procession of more than two hundred cars along Whitehall, or twice the number that had figured in any previous run; but the turn-out was reduced by one-fourth, and the public could see nothing in the gloom, with the exception of those who, moved by curiosity or sympathetic interest, went to the Horse Guards' Avenue itself and witnessed the actual start. And it was little enough that was discernible there. To find one's own car was difficult enough, and to hunt up one's friends on other cars for the exchange of greetings was quite out of the question; it was equally impossible, moreover, to make mental notes on the new types of vehicle, of which not a few were on the list of entries.

APART from the unpropitious start, however, the run must be pronounced an immense success, and as such it was clearly regarded by the good folks of the towns and villages through which it passed. At Winchester I heard a bystander remark that the railways were doomed, so impressed was he by the sight of the cars assembled in the Broadway! Portsmouth's reception was a right royal one, and the arrival of so many cars in good time must have had a potent influence upon the spectators who lined the streets so thickly. Had they but known the extent to which the cars had been throttled down for the most part throughout the journey, in conformity with the Club regulations for the tour, they would have, perhaps, entertained still more respect for the potentialities of automobilism. For, in truth, the time-keeping limits had been somewhat severe, particularly on the stages from Egham Hill to Blackwater crossing, and from there to Basingstoke. Thenceforward the allowances were more reasonable, but previously they were somewhat trying, for, in spite of moderate running from the outset, one found one's self reduced to the necessity of crawling in on the bottom speed, with the throttle closed and the spark retarded as much as was possible without stopping the engine altogether. A car running under these conditions was hardly calculated to impress the waiting public on the outskirts, for example, of Basingstoke. How the big cars liked the limitation of pace I can only imagine, but personally I found even my modest "seven-horse" too powerful for the occasion, so far as concerns the stages named.

IT must be placed to the credit of the Automobile Club, nevertheless, and is a testimony to its increased authority, that the regulations were observed by a number of competitors; I say "competitors" because the majority of the tourists had entered for a non-stop run. Some were by no means impeccable, however. On Egham Hill, for example, the single file was broken without any justification. I was going up like a bird, but caught up to a slower car in front and forebore to pass, although my run up was grievously spoiled by conformity to the regulations. Immediately afterwards, however, a big car sailed by me on the inside, with a train of half a dozen others who followed its evil example, and the whole group got up to the timekeepers before the car which I had refrained from passing and my own. This was scarcely sportsmanlike; neither was the conduct of the driver of an electric car who bore over to the right in order to prevent my passing when on the open road, many miles after the single-file regulation had expired. As for not passing down-hill, that was a proviso decidedly more honoured in the breach than the observance.

NEWSPAPER descriptions of the tour, as a whole, were doubly valuable this year in view of the dismal circumstances attendant on the start and the resultant absence of a decisive impression on the public mind. On the whole, the various correspondents appeared to be a little better educated to the possibilities of automobilism than in previous years. *The Times* had only a third of a column report, and the *Morning Post* merely ten lines, but the

Daily Telegraph had three-quarters of a column, the *Daily News*, *Standard*, *Daily Mail*, *Daily Express*, and *Daily Graphic* also producing the same quantity, but of varying quality. In the latter respect the *Daily Telegraph* was undoubtedly the best. The *Daily Mail* was absurdly hard on British cars, and the *Daily Express* was flippant, and lacked its usual sobriety in dealing with automobile topics. The *Daily Graphic's* sensible report was usefully supplemented by a half-page illustration of the start from Whitehall Court in the fog. Sundry errors in the *Standard* and *Daily News* accounts require correction. In the former it was stated that "although English cars were well represented, it was noticeable that the majority of vehicles were of foreign manufacture." Including the American steam-cars there were just a few more cars of all nations combined, than the purely English; but England had the largest representation of petrol-driven vehicles, and the largest show made by any country singly.

THE *Daily News* man made the interesting discovery that Bagshot is in Hampshire (*sic*), and descanted on the activity of the police in that county on the strength of what was seen north of the borough named. He also re-baptised Mr. Burford's car for him by calling it the "Walloup." Nevertheless the *Daily News* acknowledged the tour to be a triumphant success, and barely succeeded in concealing its own surprise thereat. It is characteristic of what "policemanism" has done for this country that the following sentence should appear even in a report intended to be sympathetic:—"Magistrates and police will be under the necessity of at once making up their minds and framing necessary regulations to apply to a new feature of English life." What appalling ignorance of the constitution of this country that one sentence reveals! When a newspaper man himself does not know that magistrates and police have no power to make laws and regulations, but are the servants of the public, it is small wonder that the latter know no better themselves the power that rests in their own hands, and endure so much of the tyrannical from the village policeman and the rural justice. Regulations indeed! The bare idea of magistrates and policemen becoming law-makers is too ludicrous for words.

TAKEN altogether, however, the descriptions of the tour were satisfactory, for the simple reason that the newspaper men went out to see with their own eyes instead of evolving phantasmagoria from their own imaginations. The type of leader writer, however, who writes of that which he does not understand still lingers in sundry places. A week or two ago the *Daily Chronicle* had an editorial dispute against automobilists which, for downright bigotry and blind refusal to look at facts, eclipsed anything that has been seen for many a long day. Last Saturday, too, the *Daily Graphic* had an article headed "The Scorching Car," in which it was declared that so great had become "the nuisance of furious motoring on some of the main thoroughfares from London to the South Coast, that the magistrates have been compelled to adopt extraordinary measures for its suppression." The police tactics at Reigate and elsewhere are quoted with approval, in the matter-of-fact way, which takes for granted that whatever the magistrates and the police do is necessarily right. Now, if the *Daily Graphic* had any cognisance whatever of the actual state of things prevailing round Reigate, Cobham, Ripley, and other ambuscaded spots it would learn how notoriously unjust these prosecutions are, for drivers of the slowest of cars have been summoned and fined, on worthless testimony, and before a bench that, so far as Reigate is concerned, does not even pretend to administer justice, but serves out fines like an automatic machine. Perhaps the *Daily Graphic* will not mind reading the Earl of Onslow's speech at the Automobile Club dinner. Being a Surrey magistrate he, of course, knows much less about the subject than a London daily; but his outspoken comments on the police "spy and common informer" may be commended to our contemporary none the less.

A PUBLIC service of motor-cars is about to be started at Plymouth.

CORRESPONDENCE.

POPULAR-PRICED CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reference to Mr. Jackson's and Mr. Bridgman's letters, *re* "Popular-Priced Cars," I should like to state my experience. I have made a small car on the Century tandem lines, but with a body dropped on the frame, which is $1\frac{1}{2}$ steel tubing, with motor bolted in front, driving through chain to countershaft, and from countershaft to back wheel. Everything is simply arranged, there are no complications, and when you have got the mixture right there is no further trouble from the carburettor. Now, I maintain that a car *can* be made for £75, if (and a big if) people would be satisfied with such a car. I am only a working man, but if anyone likes to try the experiment I will guarantee to turn out a car costing no more than the price I state. In support of my statement I will give a list of the biggest items in such a car:— $3\frac{1}{2}$ water-cooled motor, £15; three wheels and tires built up complete, £12; small body, painted and upholstered, £5; two-speed gear and chains, £2 10s.; ignition and carburettor, £5; steel tube frame and springs, £3. As will be seen the above are finished articles, and only require putting together. The total comes out at £42 10s., which leaves a big balance for extras and work connected with the building. I am aware that there are a few items not included in the above, but all the biggest are mentioned.—Yours truly,

A WORKING MAN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I think the advice of Mr. Cecil Jackson *re* the abolition of high-powered cars should receive prompt attention from manufacturers, as the presence of such high-flyers on the roads gives to the public a very repulsive feeling as regards motor-cars generally. On the other hand, a neat little pleasure car skimming gracefully along the road creates in the public mind only a feeling of envy.

I see some of our English sporting youths down for the shooting season flying along with their big Continental motor-car as if the road was all their own. Little wonder the authorities and public are so much down on motor-vehicles. They get very little sympathy from passing pedestrians when they are having a roadside repair or being hauled into town.

As regards popular-priced cars, I think the Glasgow firms are making a big hit in that direction, to judge by the Dumbartonshire and Ayrshire roads, which are alive with neat little Phaetons, Victoriettes, and John o' Groats, costing from £100 upwards, and made by the Hozier and Stirling Motor-Carriage Companies. The little vehicles glide along the roads and mount the hills in a truly astonishing manner. I think that prospective motorists before placing orders for high-powered and high-priced cars should have a look at these little John o' Groats, the workmanship, stability, and general finish of which will compare favourably with those of any Continental production.—Yours truly,

ALISTER MCLEUD.

MOTOR-BICYCLES FOR 1902.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Seeing in your correspondence columns letters *re* the Werner motor-bicycle, I might mention as a rider of same that I have never had cause to complain of my machine. Although I have ridden several thousand miles I have never been stranded through faults of the machine. The motor is most simple to manage, is very powerful, and will climb hills 1 in 10 and average 20 to 25 miles per hour on a good give-and-take road. As to finish, the motor and its parts are well made, although a little more external finish might be added. The sparking plugs being of De Dion pattern no trouble is found in replacing them in case of failure.

Some of the American motor-cycles are fitted with a special plug which costs about 15s., thus making motoring expensive for spare parts. The accumulators do all that the makers claim, and as any electrician knows, an accumulator is at its prime after being charged a few times. I do not sing the praise of the Werner for

any personal gain but from the experience of a rider of some two years' standing.—Yours truly,

HENRY KENNETT, JUN.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Letters such as those of "Petro" and "Electrical Engineer" will prove very valuable to your readers, and, I hope, stimulate the makers to further enterprise. I agree with "Electrical Engineer" that the Werner might become very popular. My own machine has been timed to do a mile at over 32 on the level, and has taken a gradient of 1 in 7 (with hard pedalling). But though these results are very good, the machine is roughly put together, requires constant attention, and in point of reliability cannot compare with an up-to-date motor-tricycle. Reports to hand from two experts condemn the workmanship in the motor, while, as already said, the bicycle parts of the machine leave everything to be desired. It is said that improvements are to be made in respect of the lubrication, carburettor, brake, general finish, etc. Well, we shall see at the shows, and after. There is also a new centre-frame motor pattern to be introduced, doubtless to meet the side-slip difficulty. I may here state, after unpleasant autumn experiences, that the existing pattern machine simply cannot be ridden with safety in wet weather on South Devon roads with limestone "grease." As an ex-racing cyclist I may be supposed to know how to ride, and I can only say that I shall never ride a Werner except in fine weather in Devon again. Of course, all roads are not as ours.

I have ridden Minervas and a Singer—the latter, by the way, is too high-priced for the results got out of it—and found the former very weak on hills and the latter slow, but, I should say, useful to non-expert wheelmen. I am now in hopes that the new 1902 Minerva engine is what it claims to be—of net $1\frac{1}{2}$ h.p. If it is, we may find the Minerva type of motor very useful. Up to date these engines have proved weak, and my experience of a $1\frac{1}{2}$ h.p. (?) Minerva bicycle at Coventry can only be described as that of sitting on a toy which hung fire at every slope. Of course, if we get a real $1\frac{1}{2}$ h.p. Minerva on a well-finished British-made machine—I should prefer 2 h.p. myself—the advantages of this type of cycle will be obvious. It will be effective, and will, an all-important matter, not betray its rider by slipping.

As to "Petro's" suggestion of chain-drive, everyone will recall belt failures with disgust. In this hilly county the Werner belt stretches so as to need most frequent adjustment; the grip is unsatisfactory at the best, and the business of cutting, piercing, and hooking together the leather, messy and troublesome. But a Werner with a chain-drive would cause intolerable vibration, and probably increase the already too frequent breakdowns, such as are due to the pulling through of the carburettor tank supports and the like. But for a back-wheel driver a chain might be better, economising as it does the working power of the engine.—Yours truly,

E. D. FAWCETT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A recent issue of yours contained a letter by Mr. E. D. Fawcett concerning the motor-bicycle of 1902 and what it should be, and I remarked that he said it would be interesting to have various riders' experiences of their machines for 1901. As he has a Werner, he may be interested to hear that my 1901 machine has carried me 2,400 miles since I purchased it in the month of June last, and with absolutely not a single breakdown. I have renewed nothing but a trembler, which I broke by drilling a larger hole in it for the platinum contact. I travelled 2,000 miles without touching either of the valves, and I am confident that the engine is in almost better condition than when I first had it. On one occasion, my longest ride, the machine carried me from London to Barnstaple (215 miles) actual distance, covered in eleven hours running time, with but an adjustment of the trembler *en route*. I am sure that Mr. Fawcett will agree with me that this is about as much as we can demand reasonably from the motor-bicycle as we know it at present.

Being desirous of taking advantage of each year's improve-

ments, I have now bought three Werners, and in the course of my three years' riding I have travelled more than 10,000 miles. I have always stuck to the same make, for I have never seen a better, nor its equal, so far as that goes, without taking into consideration the probability that the makers who made the first practical motor-bicycle sold, and who have now been making them for five years, are likely to produce the best machine, all round, after all.

Mr. Fawcett, then, will forgive me, I hope, if I, with the above experience of the machine, venture in turn to criticise his criticisms, for I have ridden other makes besides the Werner. As regards cleanliness, how can the Excelsior and Minerva be cleaner? It is merely a question of seeing that the joints and bearings of the motor are oil-tight, and your engine remains as clean as can be desired. As for mud, the Werner is absolutely out of its way, which cannot be said of the other makes, least of all the Singer. My carburettor holds about three-quarters of a gallon, which carries me 120 miles, which is surely far enough, apart from the aid of a two-litre spare reservoir sufficient for another eighty miles. Will the Minerva carry one further? As for the general finish, I freely admit it *was* not all that could be desired, but the 1901 machine is excellent, and will be surpassed by that for 1902, from what I hear.

Mr. Fawcett says his machine is the best at hill-climbing! Why, that is just where the Singer is good, for I have tried it on stiff hills, but it is hopelessly out of it on the level, and the Werner beats them all easily, so he evidently has reason to congratulate himself on the capabilities of his bicycle. I can assure him that his "ridiculous band-brake" is a very powerful one indeed, for as he can easily see, the drum is wider and of larger diameter than those thought sufficient by makers of ordinary safeties in England, but I much object to the method of linking the brake-band to the brake-handle. The wire loops pull open under a great strain. Bowden wire is a great improvement when used in place of the spoke-wire now employed. Two brakes *are* fitted in Paris when asked for. An exhaust valve-lifter is much wanted, and, above all, a head-lock. The free-wheel clutch he condemns is the familiar Morrow, which is generally held efficient, and if it runs "as if clogged with mud" the chain must be too tight or lubrication is needed. The wiring of the 1901 machine is as much hidden as on any non-magneto ignition motor in the market, I think. The horse-power of the 1902 machines *will* be optional. The carburettor is to be changed for one of the spray type pattern, but Mr. Fawcett will find that he has introduced with it another possible source of breakdown. I can assure him that the present surface-type one is not the capricious thing he conceives it to be, if only he will see once for all that the reservoir is airtight when closed and that the tap and two passages of communication are in proper condition. As for projections between the knees, I know of no machine, bar the Singer, as free from them as the Werner. Let Mr. Fawcett try a hot cylinder there as well, and see the difference. As regards the throttle valve and advance levers working loose, there is a lock-nut on the latter and a single one on the former, and they can be tightened at will. Such difficulties as these are no greater than those involved in the use of any mechanism, and are easily overcome. I know of no cleaner method of lubrication to be found anywhere than that used for the Werner motor, and one which is identical with De Dion's system, and admirable it is. If a properly secure gear-case is provided, it is practically hermetically sealed. As regards Mr. Fawcett's other suggestions, I agree most fully with him.

With regard to delay in supplying spare parts and their interchangeability, I should advise Mr. Fawcett to make a few inquiries concerning the woes of automobilists in general on this point, and he will be greatly comforted. In conclusion, I venture to think that if Mr. Fawcett—whom, by the way, I believe I once had the pleasure of meeting for five minutes or so at the Crystal Palace, during the Motor Reliability Trials—had ridden some other type of machine for an equal distance, he would have had a longer list of difficulties and deficiencies to tell us of. The little motor-

bicycle, already a marvel of engineering skill, is yet far from perfect, but still it is the lightest, cheapest, and easiest automobile to operate on our planet—a position of distinction, and no mean triumph for the inventor!—Yours faithfully,

A. L. BENETT.

ASBESTOS IN SILENCERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the method of lining exhaust boxes with a sheeting of asbestos, I find that after 2,000 miles the asbestos has perished and burnt away, especially near the inner tube of box. I mention this to save trouble to others who may be inclined to try the process. It is efficient while it lasts, but a trouble to keep renewing.—Yours truly,

W. P. SHAW.

IMPROVEMENTS TO WERNER BICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have just had fitted to my Werner motor-bicycle an extra casing over the usual silencer, also a small silencer on the compression tap, which makes the machine practically noiseless. The advantages of these improvements cannot be over estimated, the compression tap silencer enables the machine to run exceedingly slow and silent in traffic without having to pedal. The additions were made by H. F. Harding, 283A, Brixton Road, S.W., at the small price of 12s. 6d.—Yours truly,

J. R. W. PATTISON.

REFERRING to the description of the Carlton bicycle-motor in our last issue, Messrs. James Rickard and Co., of Brentford, write:—"We take the liberty to state that it is impossible for the makers of this motor to substantiate some of their claims. We particularly refer to the claim that they can run this motor with ordinary paraffin oil, as well as with petrol, with identical results, without any alterations. We have been making petrol motors and ordinary paraffin oil motors for over five years, and well know the difference that must be made in any motor if it is to be run with petrol or paraffin."

DURING the month of October the United States appraisers at New York passed twenty-three foreign motor-cars into the country, of a total value, with duty added, of £24,000.

AN international motor-car and cycle show is to be held in Turin, Italy, in May and June next year. The offices of the exhibition are at Palais de la Chambre de Commerce, 28, Rue Ospedale, Turin.

VARIOUS French motor manufacturers, including the firms of Panhard, Mors, Clement, Richard, and others, are said to have come to an agreement regarding standard frames which will make it possible to fit the body of one to the frame of another vehicle. Panhard frames have been adopted as the standards.

MR. T. P. O'GRADY, works manager of the Lewis Cycle Works, Adelaide, South Australia, writes us regarding the car illustrated in our issue of the 24th August last, stating that the vehicle has since been fitted with a water-cooled motor in place of the air-cooled engine formerly used. Since the change was made the car has been subjected to some extensive trials with successful results, both as regards hill-climbing capacity and speed on the level.

THE Petroleum Institute, the newest institution established in London, was opened on the 8th inst., under circumstances which augur well for its future success and usefulness. The oil school, as it has been called, is housed in commodious premises at 24, Bevis Marks, E.C. It is largely the creation of Dr. P. Dvorkovitz, who, in explaining the objects of the institute, pointed out that the science of petroleum and its production, storage, distribution, and manufacture finds no place in modern universities and colleges, although the subject is becoming more important yearly.

HERE AND THERE.

THE Doherty Motor Accessories Company, Days Lane, Coventry, recently showed our Midland representative some very fine specimens of motor-bicycle tanks, of which they are making a speciality.

MESSRS. DE DION-BOUTON, LIMITED, inform us that they have now received a delivery of the new De Dion cars (1902

THE KOPPEL PHAETON (*See issue July 20th, 1901.*)

pattern). They claim that these are the first actual vehicles to reach this country.

By command of the King the British and Foreign Electrical Vehicle Company, of Bloomsbury Place, W., on Wednesday, despatched to Sandringham for His Majesty's inspection two electric motor-cars of the "Powerful" design.

THE Collier Twin Tire Company, Ltd., of 8, The Broadway, Ludgate Hill, E.C., are issuing a new illustrated catalogue in which are set forth the many undeniable advantages claimed for their tires, as well as a complete price list and many testimonials of a convincing order.

WERNER MOTORS, LTD., is the name of a company which has been formed to exploit the new Werner (1902) pattern motor-bicycle in this country. Among the first directors are Messrs. S. F. Edge, C. Jarrott, H. O. Duncan, and the two brothers Werner. The offices of the company are at 28, Brook Street, W.

OUTSIDE Messrs. Gamage's the latter part of last week was an animated scene in which motor-cars played the main part. We understand that the Holborn firm now stock practically everything a motorist can want for himself or car. We are further informed that petrol can now be obtained there at 1s. per gallon.

MR. E. BARUCH BLAKER, of Worthing, writes us in an enthusiastic strain regarding his Speed King tricycle fitted with 2½ h.p. water-cooled engine. During the past summer he has put it to some very severe tests on the road and path. His longest journey in the day was from Worthing to Bath and back.

"PATENT Notes for Inventors" is the title of a handy little pamphlet put together by Reginald W. Barker, a well-known authority on patents. The pamphlet, which is published at Vul-

can House, 56, Ludgate Hill, E.C., contains in concise form all the information which the embryo patentee requires, and should be read by all who seek to derive the full benefit of an inventive brain.

THE Kensington Motor-Car Company, Limited, are opening offices and works at 64, Hammersmith Road, London, W., where they will be found in full swing on and after December 1st. Motors for cars and launches with their component parts are the main features of the work to be undertaken. Of these and various other important parts of motor-cars the well-illustrated catalogue just issued represents some very good specimens.

AMONG the cars which figured at the start of the run to Southsea on Saturday last was a new vehicle in the form of a miniature brougham—the latest production of Stirling's Motor Carriages, Limited. The motor and mechanism of the car is identical with the Stirling Parisian phaeton, but the frame is fitted with a closed brougham body of comfortable design and finish. Another new Stirling car is a light parcels delivery van capable of carrying loads of from 5 to 6 cwt.

ON Monday evening next, the 25th inst., the Aero Club of the United Kingdom will hold a banquet in the Whitehall Rooms of the Hotel Metropole at which M. Santos-Dumont, the well-known motor balloonist, will be the guest of the evening. As we go to press (Thursday) we learn that M. Santos-Dumont arrives in London on Friday morning. He will be met at Victoria Station by the banquet committee of the Aero Club of the United Kingdom, and during his stay in London will be the guest of Mr. Paris Singer at the Carlton Hotel.

THE Motor Manufacturing Company, Limited, inform us that they are the sole agents for Great Britain and Ireland, the British Colonies and Dependencies, for the sale of the Werner motor-bicycle and its parts. Moreover, they are licensees of the patent rights for the Werner motor and parts for Great Britain

THE KOPPEL DELIVERY VAN, BUILT BY THE COMPAGNIE BELGE DES VELOCIPÉDES, LIEGE.

and Ireland and all British possessions. In order to protect the public they are arranging with Messrs. Werner that all machines made for England shall have the following inscription stamped upon the motor:—"Specially made for the Motor Manufacturing Co., Ltd., London and Coventry, sole agents for Great Britain and Ireland, the Colonies and Dependencies."

THE Brazilian Congress has voted £5,000 to be awarded to M. Santos-Dumont in recognition of the important services rendered by him to aerostatic science.

MR. F. O. SEYD, of the International Motor Car Company, Ltd., has decided to celebrate the cycle show week in a novel manner, to wit, by holding a two-days' sale by auction of motor-cars at the depot at 76, High Street, Marylebone. The auctions will be held on Tuesday and Thursday of next week, commencing at 2 p.m. About fifty vehicles, both new and secondhand, will be offered, the cars consisting of several well-known makes. A new departure that is to be made is the giving of a written guarantee with all new cars sold under the hammer, so that provincial agents who are in town next week, and who are on the look-out for bargains, would do well to put in an appearance at the auctions on the days named.

THE New Hudson Cycle Company, Limited, Summerhill Street, Birmingham, have made arrangements in their factory to turn out a large number of motor-bicycles during the coming season. They are adopting the Minerva motor, which has been

greatly improved for 1902. We shall give further details as to the construction of the machine and of its merits from a rider's point of view later on.

THE Motor Traction Company, Ltd., write:—The 6 h.p. Cannstatt Daimler voiturette "Albatross," after successfully fulfilling the conditions of the Automobile Club's non-stop run to Southsea on the 16th inst., left Southsea the following morning at ten for an actual non-stop run back to London via Petersfield, Godalming, Guildford, Ripley, Kingston, and Wandsworth. The run was most successfully made, the road wheels not once stopping between Southsea and home. We may mention that no adjustment whatever had been made from the time of leaving London on Saturday morning, the only work done being the replenishing of the petrol tank and lubricators at Southsea. On arriving in London the engine was beautifully cool, also all the other heavy parts. The solid rubber tires gave entire satisfaction. The petrol consumption for the round journey, viz. 165 miles, was 6½ gallons, cost per car per mile a fraction under one half-penny.

MR. W. M. HODGES writes:—I think it may interest some of your readers to know that of the cars which took part in, and successfully accomplished the run to Southsea on Saturday last, three at least left the builders' hands as long ago as 1897; the "Owl," "Dolores," and "Lady Mary," all being built at the Daimler Works, Coventry, during that year. "Lady Mary" made one stop in addition to those necessary for controls, this being caused by carelessness in not having petrol tank filled before the start; nevertheless, with three passengers up, the time occupied on the journey works out well up to legal limit. I wish to add that this car commenced its career as a van, and, fitted with such a body, was familiar all round London, up to the end of last year, as Messrs. Hy. Lovibond and Sons' motor brewer's dray. It was only in April last that a new body was fitted and the brewer's dray became a phaeton. I should like to know if there is in this country any foreign-built car which can show such a record.

ANNUAL DINNER OF THE AUTOMOBILE CLUB.

NEARLY two hundred gentlemen sat down to dinner in the Whitehall Rooms of the Hotel Metropole, London, on Thursday of last week. It was the occasion of the annual dinner of the Automobile Club, and under the genial chairmanship of Mr. Roger Wallace, K.C., a very pleasant evening was spent.

The toasts of the King, the Prince and Princess of Wales, and the other members of the Royal Family having been drunk with enthusiasm—for the Chairman reminded those present of the royal interest in automobilism—the toast of, "The Navy, Army, and Reserve Forces" was proposed by the Hon. J. Scott Montagu, M.P., who referred to the interest that was being taken by the War Office in automobilism, while in the development of the submarine, which would play a large part in the naval warfare of the future, the experience of the motor-car builder would be valuable. In Germany, too, the Emperor recognised the importance of the automobile in military affairs.

Colonel Elmslie responded, and said that two great points had been brought out in the war. One was the great extension of front, and of the area occupied by operations, owing to the long range of modern weapons. Our own country was too small for military automobiles, because the operations were so limited that very often a horse could do all that was required. But where there were fronts of 40 to 50 miles the motor-car would be very useful. In the future a great deal of the distribution of the stores would be made by self-propelled vehicles. It could not be expected that any sudden adoption would be made, but experience was being gained, and members of the Automobile Club had rendered good service in that connection.

Sir Frances Jeune proposed "His Majesty's Ministers." Automobilists did not desire to plough in any furrows; they had no interest in "the shadow of independence" excepting they desired to claim as much independence for themselves as possible; they had nothing to do with "obstruction" except that sort of obstruction only too common just now. Several members of the Government had manifested great interest in automobilism. The other day he had the pleasure of taking Mr. Ritchie for a ride on his car, and he seemed very desirous of going at a high rate of speed. They owed to the present Government the charter of their liberties. Although many of those present owned cars, there were many who owned horses, and therefore they did not speak in a spirit of selfishness when appealing for fair play for motorists. They did not desire to rush about the roads, but they did desire to develop this great and growing and valuable industry. If properly developed automobilism would be a source of health, interest, and amusement for many generations.

The Earl of Onslow, Under-Secretary of State for the Colonies, congratulated motorists on the fact that the President of the Local Government Board was a gentleman who was courageous and thoroughly representative of all that was English. He could not throw out a hope that the Government was likely to deal with the question of automobilism at an early date. There was a great deal of prejudice throughout the country, and that would have to be dispelled before they could fairly ask the Government to deal with the matter. That work was being done by the Club. A full discussion in Parliament would enable them to place the facts before the country. They should do all they could to prevent furious driving. In France those who owned machines capable of travelling forty or fifty miles an hour had to have a number, and he did not see that they need object to that. Facilities should be given for the training of horses to regard the motor-car with indifference. He regretted the action of his brother magistrates of Surrey, and hoped more reasonable action would soon be taken in that county.

The Right Hon. Henry Chaplin, M.P., proposed the toast of "The Automobile Club and its Affiliated Clubs." He regretted to hear there was little chance of the Government dealing with the question during the coming session. But if the Club would exercise its great influence, the Government would probably recognise the great importance of the question. Prejudice had been aroused by the want of consideration which some drivers of motor-cars had shown to other users of the highway. This was especially the case in the north of England. Recently he was on a car the driver of which showed every consideration to those in charge of horses, and, although they stopped several times, they performed a journey of fourteen miles under three-quarters of an hour. Motor-cars would play a part in the housing problem, and also in the development of agriculture—the largest and the least prosperous of our industries. As the author of the regulations under the Act of 1896, he reminded them that the conditions were different then from those of to-day. No new invention had ever developed with the same startling rapidity as the motor-car since 1896. Then the highest speed was 16 miles an hour; in 1900 it was 53½ miles. The regulations may have been proper at that time, but they were not equal to the requirements of the present day. With regard to the future, he agreed that the rules as to passing persons on the road were adequate, but he was not quite satisfied with the rules as to turning corners. But the chief difficulties centred round the question of speed, and here he asked motorists to agree among themselves. If people wanted to travel 60 or 70 miles an hour they should construct motor roads for the purpose. Where there was a clear and open road a speed of 20 or 25 miles an hour might properly be permitted. If that was so, the present limit of 12 miles would have to go. Everyone knew it was broken. In its place he would insist that every

motor-car constructed to go beyond that pace should be capable of effective identification, or registering and numbering by counties. He would also like to require a certificate of efficiency for the drivers, and for that they had a precedent in France. With regard to safety, an electric brougham was safer than one that was horse drawn. Either the matter would have to be left to the provisions of the Highways Act or some specific limit of speed imposed. He would prefer the first alternative. Much would depend on the good feeling of owners and drivers of motor-cars, and he hoped they would be loyal to the new and promising method of locomotion coming into vogue in this country.

Mr. Roger Wallace responded to the toast, and said the speech of Mr. Chaplin, who was the author of the regulations, showed great-mindedness. All they asked was that the Act of 1896 should be amended by striking out the speed limit. They would be content to rely on the common law if the common law was always the same. Motorists wanted to know what they might do as well as what they might not do. They desired to assist those who had to administer the law, and the Automobile Club had nothing to do with efforts of a contrary kind. Reverting to a recent visit to the United States, Mr. Wallace said the American Club had adopted a similar attitude towards automobilism that they had.

Mr. Mark Mayhew, L.C.C., proposed the health of "The Visitors," for whom Mr. J. Williams Benn, L.C.C., responded in a witty little speech.

EDINBURGH AUTOCAR COMPANY, LIMITED.

At the second annual meeting of the Edinburgh Autocar Company, Ltd., shareholders were called upon to decide whether they desired to have the company at once wound up, or were prepared to put in further capital to conserve the business and its prospects. Mr. Edwin Adam, in moving the adoption of the report, said at the last meeting the directors were instructed to realise the assets, and they had explained why this had not been carried out to the full extent. They had sold all their cars with the exception of seven, which were at the present time doing good work for the company. The company was having three times the number of applications for hires of the cars than they could supply. The Board had not been able to sell the stock as a going concern, and it was for that meeting to decide whether they should proceed to extreme liquidation. Mr. Hay, of the Shareholders Advice Committee, submitted the report of that body, and in doing so he said they were still of opinion that the company could still be made to pay, with a little new capital. He moved that they resolve to adopt the committee's recommendation, subject to the £5,500 of new capital being subscribed within a month, and that they advise the directors to take what steps they thought proper for raising the capital; and, failing its being raised, resolve that the company be dissolved, and the directors take all necessary steps to carry out the liquidation. In answer to a shareholder, Mr. Hay stated that the cars were working at a profit from the 12th April till the end of June. Mr. T. White seconded the adoption of the report. After a discussion, and on a vote, the motion was declared carried by a large majority.

BAYLEY'S LIMITED. v. MOTOR-CAR COMPANY, LIMITED.

Mr. Justice Ridley, sitting without a jury in the King's Bench Division, heard this action, in which the plaintiffs sought to recover judgment for the balance of an agreed price for two steam motor trolleys built by them to the order of the defendants. Plaintiffs also sought to recover the price of extra fittings and packing, and £1 per week for the storage of each trolley. The trolleys were ordered by the defendants for a Mr. R. O. H. Beamish, who wanted them for the transport of tea in Ceylon, and the price was to be £700 per wagon, less 10 per cent. discount. £420 was paid with the order and Mr. Beamish paid another sum of over £400, and the balance was to have been paid when the wagons were ready for delivery. Plaintiffs said Mr. Beamish, as agent for the defendants, ordered extra sets of gearing and packing, but defendants denied that Mr. Beamish acted as their agent. Plaintiffs claimed £170 balance of purchase money, £140 which had been agreed to be discount, but which plaintiff alleged was not earned, as the contract was not completed by defendants within the proper time, and £14 for storage—£14 having been paid into Court for storage at the rate of 10s. a week. Evidence having been given on both sides, Mr. Justice Ridley said it might be the fact that Mr. Beamish was not the agent of the defendant Company in ordering the extras, but he was held out to be, and was understood either to be agent or to be identical with the defendant Company. He therefore thought that the action was maintainable for the goods ordered by Beamish. He was of opinion that the proper sum to be awarded to the plaintiffs would be £223 5s. 10d. on all the claims, and he gave judgment for the plaintiffs for that amount, with costs. An application for a stay of execution was refused.

SPACES AT THE MOTOR-CAR EXHIBITION.

In the Chancery Division of the High Court of Justice, last week, Mr. Justice Joyce had before him a motion in the action of Farman v. Cordingley and Company, by which the plaintiff sought an injunction to restrain the defendants from letting space at the forthcoming Motor-car Exhibition at the Agricultural Hall, which plaintiff alleged had been let to him. Counsel stated that every material allegation of fact on one side was point blank denied by the other. Under these circumstances it was

arranged that the motion should be set down immediately for trial, with witnesses, and that an application should be made to advance the hearing.

MOTOR-CAR ACCIDENT AT PERTH.

ON Saturday night a serious motor-car accident occurred at Perth, whereby a lad lost his life and four other persons were injured. It appears that about nine o'clock a motor-car, driven by Thomas Gourdie, a blacksmith, and belonging to Mr. John M'Arthur, spirit dealer, Perth, was proceeding up High Street, when, it is stated, without warning, it turned into Scott Street, dashed into several persons and injured five. The car was at once surrounded by several hundred people, who refused to let it move on. A constable had to mount the car, and escort the driver along the street. James Cross, 11 years of age, son of a labourer, who was removed to the infirmary in a dying condition, succumbed to his injuries half-an-hour after admission. Wm. Fyfe, and his daughter, Christina, were also removed to the infirmary, the former suffering from a deep cut at the back of the head, and the latter from severe injuries to back and limbs. Daniel Foley (10), son of Stephen Foley, sanitary officer, was taken home, his injuries consisting of bruises and severe shock. James Henderson, vanman, was cut about the head, but was able to walk home. At Perth Police Court, on Monday, Gourdie was charged with having on Saturday night driven a motor-car against a lad named James Cross and four other persons, killing Cross and injuring the others. On the motion of the Burgh Prosecutor, accused was remitted to the Sheriff, who sent him to prison pending further inquiries.

BEHIND THE HEDGES.

Now the leaves are turning brown,
Mark the scorching motor down,
Behind each hedge are hiding "peelers,"
Watching for the fast four-wheelers,
With penny tape, and "Waterbury" nobby,
And whistle, too, the sly old "Bobby,"
Disguised as a yokel, 'tis a fact,
Waiting to catch 'em in the act.
If they come along too quick,
He'll "nab" them by this nasty trick;
But if the car is going lame,
"By Jove!" he'll have him just the same.

J. R. E.

ORIENT EXPRESS CAR SYNDICATE v. HARRIS.

In the King's Bench Division, last week, the plaintiff company claimed to recover from Mr. Frank Harris £60, the balance of £160, the price of an Orient Express motor-car supplied to him. Mr. Rose Innes said the other day an application was made for the adjournment of the trial, and an affidavit was produced to the effect that defendant was ill and unable to attend. The application was not acceded to, and he had no further affidavit. Since then, however, the defendant, acting upon his doctor's advice, had gone south for the benefit of his health. He therefore asked for a postponement for a few days. Mr. Justice Ridley: The defendant has gone away in defiance of the order of the Court, and I cannot postpone the case. What I did was to refuse the application unless the doctor came to support it, but the defendant has gone away in the teeth of that order, and he must take the consequences. Evidence was then given of the sale of the motor-car to the defendant for £160, he paying £100, and undertaking to pay the remaining £60 in three months, and there was no ground, it was said, for the suggestion made on the pleadings by the defendant that the car was not made of good material or in a workmanlike manner. Verdict and judgment were entered for the plaintiffs for £60 on the claim and also on the counter-claim.

MOTOR-CYCLE WARNINGS.

At the Rotherham West Riding Police Court, Arthur J. Blyde and Hubert Hobson, of Sheffield, were summoned for riding motor cycles without giving warning. Mr. Gichard defended. John William Johnson, of Masbro', said, that on 10th October, between three and four p.m., he was driving towards Wickersley, and in the direction of Maltby. The defendants passed him on motor-cycles, and did not ring an alarm. His horse was frightened and jumped to the left. He afterwards spoke to the defendants, and Blyde said he could not ring an alarm as his bell was broken. The defendants were at the time doing something to their machines. He told them that if he saw a policeman he should report the matter as he might have been thrown out of the conveyance and injured. Mr. Gichard said there seemed to be an impression that when motor-cycles or light locomotives travelling on the road were approaching a horse it was necessary some noise should be made by bell or other alarm. He read the order of the Local Government Board under the Locomotives on Highways Act, 1896, sub-section 7 of Article 4, by which it was provided that a driver, whenever necessary, should sound a bell or other instrument. It was therefore a question of what construction the Bench would put upon the words "whenever necessary," and he argued that in this instance the circumstances justified the defendants in not sounding a bell or instrument. Blyde was called, and denied that his bell was out of order. He said that he thought the persons in the vehicle saw his approach, and he therefore refrained from sounding

the bell when close to the conveyance lest doing so might startle the horse. He did not believe the pony shied, and did not see it. Blyde was fined 25s., including costs, and Hobson was dismissed.

UNLICENSED.

At Highgate Petty Sessions Leopold Hedgecock, of Hornsey, was summoned by the Inland Revenue for keeping a carriage without a licence on September 10th. Defendant was seen in charge of a motor-car on that day, and inquiry revealed the fact that he had no licence. The licence was taken out the next day. The defence set up was that the car was not purchased until September 13th, and an invoice in support of that fact was produced. On September 10th defendant was having a trial trip on the car. The Bench dismissed the summons.

ATTACK ON A MOTOR-CAR.

At the Sheriff Court, Dundee, Alexander Latto, farm servant, Newmiln, was charged with having, at Balboughty farm, steading on November 2nd, assaulted Captain Ralph Slazenger and Frederick Jenkins, motor-car driver, residing at St. Martin's Abbey, by striking the Captain with his fists and trying to pull the driver off the car. He pleaded guilty. The Sheriff imposed a fine of 10s., with the alternative of seven days' imprisonment.

A FEW DON'TS.

THE following rules for the operation and care of a petrol car have been compiled by J. W. Packard, of the Ohio Automobile Company. They will be incorporated in a book of instructions soon to be issued by that company:—Don't forget to turn on petrol and spark before attempting to start. Don't forget to turn oil on and close compression after starting. Don't try to run carriage without oil in oil cups. Don't try to run without water in tank. Don't try to run without petrol in tank. Don't leave car to freeze in winter. Don't jerk in your clutches; bring them up gradually. Don't change gears on hill until car is nearly to a standstill. Don't start down hill at a rapid gait and then jam on brakes. Don't try to turn corners rapidly with brakes on. Don't forget to turn off oil cups when shutting down. Don't neglect to turn off petrol at night. Don't tighten clutches so that they drag or bite. Don't pull carburettor to pieces without carefully noticing how it is put together. Don't screw up governor contact points too tightly. Don't tinker with adjustments of governor, or if you should, don't advance spark from centre point when turned over by hand. Don't neglect to keep contact points clean. Don't allow any bell-hanger or cycle repair man to add improvements to your car. Don't use cheap or poor lubricating oil. Don't let your engine race at any time or run at excessive speed when using slow speed gear. Don't leave your car unattended with engine running. Don't expect that all you will have to do is to pull the lever. Learn to thoroughly understand the mechanism and adjustment of your machine.

FURIOUS DRIVING CASES.

At Brighton, Max R. Lawrence, of Birmingham, was summoned for furiously driving a motor-car in Gloucester Place and St. George's Place on the 20th ult. Defendant did not appear, but sent an apology for his absence and admitted that he was travelling at a fair pace. The chief constable invited the magistrates to inflict such a fine as would have a salutary effect upon other persons. He regretted to observe repeatedly that motor-cars were driven at a furious pace, especially on Sundays. Defendant was fined £5 and costs, or a month's imprisonment.

In Aberdeen Sheriff Court, William Hampton, motor-car driver, of Maryculter House, was charged with having, on October 25th, when in charge of a motor-wagonette, near Monearn House, failed to stop when asked to do so, and further, with driving at a greater speed than twelve miles an hour. Mr. Ruxton intimated that he would advise Hampton to plead guilty to the second charge, and the Fiscal, in the absence of the chief witness, withdrew the first charge. The Sheriff imposed a penalty of £6.

At Highgate, Henry Turner, of New Southgate, was summoned for riding a motor-car furiously and for not having a light upon it. Police-constable 423 Y stated that he saw the defendant riding a motor-tricycle by the Colney Hatch Asylum at 10.30 on the night of the 30th ult. He was riding at sixteen miles an hour, and had no light. Another constable gave similar evidence. The defence was that the light went out and the defendant was going for some matches. The speed did not exceed ten miles an hour. Mr. Reynolds fined the defendant 40s. for being without a light, and dismissed the other summons.

At Carlisle, William Wilmshurst, motor-car driver, employed by Mr. Claude Lowther, M.P. for North Cumberland, was fined £5 and costs for driving a motor-car at greater speed than twelve miles an hour. For the defence it was contended that a policeman looking out of a narrow window could not possibly have identified the defendant or estimated the speed, if it was true that it was going at twenty miles an hour.

Reported above are 4 prosecutions for furious driving. In 1 case the summons was dismissed, while in 3 cases fines amounting to a total of £16 without costs were inflicted.

POINTS FOR THE PERSECUTED.

MR. STAPLEE FIRTH has had many encounters with magistrates and others with regard to automobilism, and his experience should be very serviceable to our readers. Here are some useful precautionary hints for the persecuted motorist which are recommended by the well-known legal motorist:—

Do not lose your head, and do not argue with the constable. Ask him why you were stopped and the specific nature of the complaint against you.

If his complaint, whether as to furious driving, exceeding the legal limit, or whatever its nature, is untrue, make an instant denial.

If the constable complains of excessive pace, ask him how he calculated the speed. If by a watch and landmarks, note the kind of watch, immediately identify the landmarks, and measure the distance.

The distance may easily be determined by running the car between the landmarks with a handkerchief or a white rag tied on the rim of the wheel. Then measure the outer periphery of the wheel and multiply by the number of revolutions between the two points.

If the watch is of the ordinary type, the constable should also be asked where the second hand was when he commenced to time, and where when he finished.

If stopped by a man in plain clothes claiming to be a constable, who, however, is not accompanied by a man in uniform, a motorist is perfectly justified in refusing to discuss matters with him unless he is able to show some emblem of authority.

If it is felt that it is a case of police oppression, it is advisable to obtain the names and addresses of any bystanders who may have witnessed the act complained of.

MESSRS. DURKOPP AND Co., of Bielefeld, Germany, are introducing a new light car fitted with a vertical two-cylinder motor. The general arrangement adopted is very similar to that of the Panhard and Daimler vehicles, the car, with tonneau body, has a neat appearance.

SOME remarkable motor-car racing was witnessed on Saturday last in the presence of 30,000 spectators on the boulevard running from Prospect Park, Brooklyn, to Coney Island. This road was closed to the public in order to give the competitors a clear course. It is one of the finest tracks in the vicinity of New York, straight and flat as a billiard table, and it had been put in specially fine condition for the races, which were held after a parade of upwards of 100 automobiles. Two miles and a half of the roadway were used by the competitors—one mile to get under headway and half a mile to slow down. The rules permitted two trials by each competitor. M. Fournier, on his 40 h.p. Mors, made the mile in 52 seconds. Trembling with excitement, he declared that he could beat that, and did so by one-fifth of a second. Mr. Foxhall Keene, driving a similar car, made the mile in 54 2-5 seconds. Mr. Albert Bostwick, on his 40 h.p. Winton, made it in 56 2-5 seconds. Mr. Riker made the mile in 63 seconds. The world's record for an electric car was made by Mr. Davy, and that for a steam car was 75 seconds for one mile, done by a 4½ h.p. Locomobile.

THE Motor-Car Journal.

VOL. III.]

LONDON, SATURDAY, NOVEMBER 30, 1901.

[No. 148.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

M. SANTOS DUMONT was entertained at a banquet by the Aero Club of the United Kingdom on Monday last. The chair was taken by Major-General Lord Donald, and a large and influential company was present. After the loyal toasts had been honoured, the chairman proposed the toast of "The Republic of the United States of Brazil," to which the Brazilian Minister replied. Mr. R. W. Wallace, K.G., then proposed "The Naval and Military Forces of the Empire." Sir C. Champion de Crespigny responded for the Navy, and Colonel Templer for the Army. The Chairman, in proposing the health of the guest of the evening, said they were there that night to celebrate an event in the history of the world in the person of their honoured guest. For the past century those who had made a study of aeronautics had endeavoured to solve the problem of how to steer a balloon against the wind, and a great amount of brain power had been devoted to its solution. Many clever men had endeavoured to solve it, but it had been left to M. Santos Dumont to illustrate by his remarkable and daring feat the solution of the problem. He felt sure that their guest was far too generous a man to overlook the efforts of others in the direction in which he had proceeded so successfully, and that more especially he would give credit to that far-seeing and illustrious Frenchman Henri Giffard, who in 1851 tried to navigate a cigar-shaped balloon by means of a steam engine against the wind. He would also recognise that had it not been for the great advancement in the construction of light and powerful engines suitable for motor-cars, the propelling power which he had so ably utilised might not have been otherwise accessible. M. Santos Dumont's feat marked a milestone on the onward march of the world. The man who accomplished it they admired for his successful scientific endeavour, for the splendid courage which he had so often displayed, and he could assure him that not only those in that room, but the whole British people earnestly hoped that his future efforts might be crowned with the success he so richly deserved.

M. Santos Dumont's Promise.

M. SANTOS DUMONT, who met with a most enthusiastic reception on rising to reply, said:—I wish to thank you for so kindly conferring on me the title of honorary founder and member of the Aero Club of the United Kingdom. When I return to London in a few months I hope I shall find your young society in full progress. The sympathetic reception which you have accorded to me will encourage me to return in the summer, after my aerial voyage from France to Corsica. I shall then be happy to make some trials in a steerable airship above London, and thus to contribute my modest part to the work of a society which will count among its members such distinguished aeronauts as Colonel Templer, Mr. Charles Rolls, the youngest and at the same time the oldest of your aerial pilots, and such sportsmen as Mr. Wallace, the Chairman of the Automobile Club, and Mr. Paris Singer, one of the first pioneers of automobilism in England.

A Visit to Aldershot.

THE Aero Club arranged a visit on Wednesday to the Army Balloon Factory at Aldershot, a special authorisation having been obtained from the War Office to that end. M. Santos-Dumont, the first honorary member, was driven down by the Hon. C. S. Rolls in his 20 h.p. Panhard, and they were accompanied by other "aeromobilists." Arrived at Aldershot the party were escorted over the factory by Col. Templer and Major Trollope, and subsequently a captive balloon was sent up with M. Santos-Dumont on board. The Hon. C. S. Rolls then ascended with the operator, the balloon being cast off, but a telegram received later stated that owing to the breaking of a valve the balloon dropped at Elstead, near Petersfield, after a somewhat exciting descent. M. Santos Dumont was driven back to town by Mr. E. M. C. Instone on a 15 h.p. M.M.C. car.

The Speed of Motor- Cars.

AT a meeting of the County Councils Association on Wednesday, at the Westminster Guildhall, a resolution submitted by the Lancashire County Council in regard to the speed of motor-cars was, after amendment, carried. The resolution as passed set forth that the general law for all vehicles, as extended by the special regulations issued requiring the drivers of motor-cars to stop on the request of any police-constable or any person having charge of a restive horse, if scrupulously observed and rigorously enforced, was at present sufficient to secure the public safety, subject to drivers' licences and numbered cars.

The Old Bath Road.

THE Local Government Act of 1894 reduced the highway authorities in England and Wales from 7,000 to 1,879, and the effect was quickly seen in an immediate improvement in the standard of highway maintenance. We believe that if a further reduction in the number of such local authorities were made, there would be further developments. The result of having so made authorities responsible for the public highways is that the main arteries are really unconsidered, and travellers have to be satisfied with the old high roads that meander through decayed villages and do not touch great towns. The trips which the King has lately taken from London to Windsor on his motor-car have drawn attention to the old Bath Road, which goes through a narrow neck at Kensington to another at Hammersmith. Mr. W. Rees Jeffreys suggests that a new road to Windsor should be made starting near the terminus of the Tube railway at Starch Green—where the Goldhawk Road takes a sharp bend to the south. This would go due west and strike the old Bath Road between Colnbrook and Slough.

Proposed New Road.

THIS idea, if carried out, would relieve the congestion of traffic on the old Bath Road and also on the old Oxford Road, and it would also open up new suburbs for the overcrowded dwellers in the great city. But it would also be useful in admitting of an experiment by allowing of the provision of three tracks—one for electric trams, a second for motor-cars and bicycles, and a third for vans, carts, etc. We have made improvements in our methods of road locomotion, but full advantage

age of that development cannot be taken until new highways are made on lines that recognise the new conditions of traffic. Hence we welcome the contribution that Mr. Jeffreys has made in the *Surveyor*, and hope the idea will not be readily forgotten.

Prejudice in Bucks.

LAST week we referred to the discussion with regard to motor-cars, which had taken place at a meeting of the Buckinghamshire County Council. This county has been noted for its antipathy to new ideas. A century ago one of the Bucks surveyors said it was impossible to have good roads without ruts, and the county further distinguished itself by opposing the introduction of railways so successfully that many parts of the county are, even now, badly served. The prejudice against motor-cars is therefore not so surprising; but it is nevertheless lamentable.

Motor-Buses for Birmingham.

MR. DAVID BARR, of Cherry Street, Birmingham, is advocating the institution of a service of motor-omnibuses in that city. There is a great deal of opposition to some proposed new tram routes, and hence the suggestion for motor-vehicles. Here are some very good reasons for the innovation:—(a) It will save a heavy expenditure of capital in laying down the rails; (b) it will not interfere so much with ordinary and carriage traffic; (c) there will be no risk of cycle wheels getting into the rail grooves; (d) motor-omnibuses could run where the street is not wide enough for tram rails; (e) the route could also be easily diverted, or extended, when necessary; (f) there would be no risk of cruelty to animals; (g) there would be the saving of wear and tear of the roads from horses' hoofs; (h) it would keep the streets much cleaner and save considerable expense in sweeping up horse manure; (i) motor-omnibuses could be worked at less expense than trams or horse vehicles.

"Motors 11 P.M."

SUCH will no doubt shortly be the foot line of many an invitation card issued from Belgravia. Meanwhile the hostess in search of a novel form of intimating the hour at which she wishes her fashionable crush to disperse has been anticipated. To the Battersea branch of the Amalgamated Society of Engineers, who hold their fifteenth annual concert at the Grand Hall, Battersea, this (Saturday) evening, falls the honour of having first rung the changes on the time honoured formula. The sub-heading to this paragraph is to be seen at the foot of the posters announcing the event.

The Automobile Club of South Africa.

ONE of the most recent additions to the clubs at the Cape is the Automobile Club of South Africa. At a meeting recently held in Cape Town, called for the purpose of forming a club, it was decided to constitute one with the title named above. The following officers and committee were elected: Vice presidents Messrs. J. Percy Fitzpatrick, H. M. Arderne, and A. T. Hennessy; hon. secretary and treasurer, Mr. A. C. Fuller; committee, Dr. Arderne Wilson, Messrs. J. H. Shillito, B. Bartholomew, and W. M. Jenkins. The election of a president and fourth vice-president was postponed till later. It was resolved to adopt a constitution and rules on the basis laid down by the Automobile Club of Great Britain and Ireland. The aim of the Club is to promote the development of motor and allied industries in South Africa, to encourage and foster automobilism, to give members facilities for storing machines, obtaining requisites, and becoming thoroughly acquainted with the mechanism and proper working of motors, and perform the ordinary functions of a club. We wish the new association every success, and are glad to learn that already twenty-six members have been enrolled. Of these about sixteen own motor vehicles, the number including a 12 h.p. Daimler, an 8½ h.p. Decauville, a 6 h.p. Benz, three 4½ h.p. De Dions, and several Locomobiles and motor-cycles.

Round the World.

THE "circumnavigation" of the globe is about to be undertaken by Mr. E. V. Wilbern, of Cincinnati, who says he will leave New York next spring, and circle the globe on a motor-vehicle in three hundred days. He will go by steamer to a French port and cross France, Germany, and Russia, and taking advantage of the Trans-Siberian railroad, will reach the Pacific Ocean. After touring Japan he will cross the Pacific to California, thence returning home. Should Mr. Wilbern favour England with his presence, we shall be glad to welcome him in Shoe Lane.

Motor-Omnibus Services.

THERE is a great responsibility placed upon the shoulders of those who are fostering schemes for motor-omnibuses in connection with municipal enterprise. So far the experience has not been wide; hence any slight hitches are apt to be magnified into great troubles. At Southampton the attempt has been made to run a service with only one omnibus, with the result that the Corporation are now anxiously awaiting the arrival of two more, so that an adequate service can be established. Mr. A. A. Swinton, who is promoting a tramway scheme at Scarborough, believes that motor-cars will be the method of street locomotion in the future, and other authorities are similarly inclined. Liverpool is probably one of the few cities of this country where the complete tramway system will militate against any general adoption of the automobile as a public-service vehicle.

A Claim for Damage.

WHILE motoring on the main road from Farnham to Bagshot recently Earl Russell came upon a long patch of stones freshly put down. They had sharp edges, were spread to a depth of six to eight inches, and covered the entire width of the road. He was compelled to drive his car over these stones and although the tires—which cost £50—escaped puncture the car was caused (owing to the depth and looseness of the stones) to swerve and run into a steam-roller, which was employed in rolling a portion of them. The front axle was damaged and a claim will be made against the County Council in due course. We wonder that the Hampshire authorities do not follow the custom of those in Surrey, and roll one side of the road before putting stones down on the other. This would certainly be to the advantage of traffic—whether horse-drawn or self-propelled.

Graphospasm.

DRIVING motor-cars is said to have given rise to attacks of graphospasm with many of the symptoms of scrivener's palsy, or writer's cramp, in the United States. Some cases were examined by a physician, who discovered that the principal muscles of the forearm, the flexor profundus digitorum, the flexor sublimus digitorum and the thumb muscle, the flexor longus pollicis, showed signs of contraction. All of which is sad for the motorist but profitable to the physician.

Loyalty to the Trade.

DESPITE the blandishments of those who would seek to disturb the mutual loyalty of the motor-car trade there seems a really earnest desire to maintain the spirit of the resolutions adopted at representative gatherings of the industry. Only a few firms have been represented at the cycle shows held during the past week, and although these will, of course, be ineligible for exhibiting at the official show that exhibition will be fuller and more complete than ever before. More than 150 firms have entered for the Automobile Club's exhibition at the Agricultural Hall next year—so that the success of that enterprise is already assured.

**"One Crumpled Rose
Leaf still—"**

AUTOMOBILISTS have many grievances to ponder over, the spread of tram-lines being a minor, but not altogether negligible one, and doubtless they look forward to the time when they will be able to drive their flying-machines where, with apologies to the poet, "bobbies cease from troubling, and roadmen are at rest"; but it would appear, according to M. Santos Dumont, that even "the way of a bird in the air" is not altogether devoid of inconveniences from a lower sphere. His particular bane is overhead wires, especially "live" ones, which, he fears, will be some obstacle to his promised evolutions over the metropolis. It is open to question whether even with a damp guide rope a live wire could do much harm to an otherwise insulated aerostat; but it may be recalled in this connection that the spread of telegraph wires spoilt a sport that must have been the nearest approach to present-day automobilism available in the early years of the last century, namely, the use of kite-propelled carriages. These attained speeds of from twenty to twenty-five miles an hour under favourable circumstances—this about 1825!—could sail fairly near the wind, and were used, among others, by the then Duke of Cambridge. Moreover, there were points about some of them that it is a pity to have lost sight of, as, for instance, a combined ground-brake and devil, hinged just back of the king bolt (of course, they steered with a single-pivoted axle), and extending nearly the length of the car. Had overhead wires not been an effective bar to their further development, many points in motor-carriage work would have been readily settled by the time the oil-engine came to make use of them.

**Milk by
Motor-Cars.**

THE suggestion which we have often made in these columns that the motor-car might be the means of conveying milk direct from the producer to the consumer seems at last to have attracted the attention of those most concerned. At a recent meeting of the Cheshire Milk Producers' Association, the idea was received with warm approval. At present, dairy farmers get barely one-half of the prices paid by consumers for milk, and even making full allowance for the toll levied by middlemen, the disparity seems to be unnecessarily great. The use of the motor-vehicle would establish direct touch between producer and distributor, while, at the same time, largely reducing the amount of handling during transmission. When dispatched by railway, milk cans have first to be conveyed to the nearest station, then placed on a train, next delivered to the consignee, and, finally, distributed among the retail customers. At each of these several stages there is necessarily some increase of expense, the chief portion of which has to be borne by the producer, as he undertakes free delivery to the consignee.

**Automobiles for
Agricultural
Purposes.**

A FRENCH contemporary gives an interesting account of some experiments made at Vitry-sur-Seine with a motor-plough by a company which has for its object the introduction of self-propelled agricultural implements. The machine used carried six ploughshares, which penetrated to a depth of 15 to 20 centimètres. The earth selected to experiment upon was heavy and sticky as a result of days of rain, and was also overgrown with rank weeds, the roots of which tended to clog the shares. In spite of the double difficulty thus presented the plough, with its 8 h.p. two-cylinder Pygmée motor, did remarkably well. The adherence of the motive wheels was perfectly assured by the cross pieces with which the felloes were provided, and which acted on the soil as a cog does to a toothed rack. On the whole the experiment was regarded as highly satisfactory, though it is admitted that some improvements might with advantage be made in the attachment of the plough to the motor. French agriculturists of advanced ideas are looking forward to the time when they will plough their land with an implement driven by alcohol which it will help to cultivate.

**An Invalid's Motor-
Car.**

AN ingeniously-contrived motor-car has been visible recently at Cobham. The owner, Herr E. La Pierre, a well-known character at Wiesbaden, was thrown from his horse while a lieutenant in the German army fifteen years ago, the accident resulting in the loss of the use of both legs. The car in question, of which we give an illustration on page 707, was built by Herr Fritz Scheibler, of Aix-la-Chapelle; it is of 6 h.p. and has a movable floor, which is not only much lower than usual, but is also pivoted in such a way that it can be dropped at one end until it touches the ground. Herr La Pierre, who uses a specially-made chair running on rubber-shod wheels, is wheeled up to the back of the car, and he and the chair are then drawn into the vehicle by a chain and pulley. The floor itself is then wound into a horizontal position, and the invalid sits quite comfortably, with writing desk before him and an awning overhead. In this manner he travels long distances by road. He has recently toured through Holland and after visiting England, set out by road for Berlin.

**A Horse that doesn't
like Motors.**

THE heading "The horse that didn't like motors," which prefaced our report in a recent issue of a Brighton action, having attracted the attention of Mr. E. M. C. Instone, he sends us the photograph which we now reproduce. It was taken last August by Mr. Instone from his M.M.C. car when drawn up by the roadside near to Andoversford, and it makes a capital picture of "the horse that doesn't like motors." "What is it?"

thinks the noble steed, as with head thrown up and uneasy steps he approaches his mechanical rival and, "what's it got in its inside to make it shake and hum like that?" No satisfactory answer being forthcoming to all these inward questionings the poor "gee gee" becomes still more perturbed, and it requires all the persuasive power of his driver to coax him by.

Duplicate Parts.

IN the desire to carry as little as possible on their cars, motorists often do not carry enough to help them when break-downs occur. And such accidents will happen, even with the most modern motor-car. A good assortment of small duplicate parts should always form part of the equipment on every journey, and sad must be the plight of the man who tempts fate by venturing on a long trip in a new country without a few spare parts. Every novice should first learn what extra nuts, washers, etc., should be carried—and never venture out without them. The man who has had experience in motoring is never at a loss for these; it is the novice who often learns their importance—when they are left at home.

The French Races.

It is generally considered now that the recent decree concerning motoring in France will not hinder the holding of these great automobile races which have become almost classic. The only changes made are that special permission must be got from the authorities beforehand, and where the course lies through more than one department, permission must be obtained from the Minister of the Interior. The wisdom of allowing these contests on the roads is very questionable, but it is an undoubted fact that they have helped to develop the motor-car in the most rapid manner possible. It was the fierce competition of the race path which encouraged bicycle builders to keep constantly striving after lightness and strength. Actual testing in races has taught the makers how fallacious were the text-book theories on the strength of materials. It is so, in a way, too, with motoring. The French makers in their fierce desire to win races never cease to seek out fresh improvements, whereby the power of the engines can be increased or the weight of the car decreased. There is room for immense improvement yet in the present system of power transmission. The maker who wishes to win a big race must look after every ounce of power. He must also pay increased attention to every vital part, for failure in any one of them would be fatal. The test of running a car at express speed over hundreds of miles of road, and even maintaining high speeds over the vilest *parcours*, is absolutely the hardest trial of a vehicle. The strains and vibrations are terrific; and the results are of immense value to the makers. A few days of such trials teach more than months of ordinary testing. The trials are inconvenient to the public, but the French are too wise to close down an industry giving employment to many thousands by any harsh restrictions.

Our Highways.

MRS. M. E. KENNARD, whose love of the motor-car is as strong as her love of the horse, points out the various uses to which our public thoroughfares are often put without hindrance from the police. Children frequently use the main road as a public playground, vehicles are frequently left unattended, sleepy carters often allow their horses to draw their carts along without any regard to regulations as to roads. Surely if the police would take these and kindred matters in hand they would be rendering a greater public service than in harassing the devotees of a new industry which is destined to prove a valuable national asset.

In a Drain Pipe.

IN connection with the attack on motoring in Surrey, we notice that the *Express* declares that policemen have been hiding in drain pipes in order to catch motorists. Whether this is to be taken literally we hardly know, but it is certain that some very un-English practices are being resorted to in the county. But while searching for a few who may commit a technical offence, the police are apparently ignoring the many criminals at large. And surely that is where the legitimate function of our county constabulary is most concerned.

Loss to Surrey.

Truth brings out some strong adjectives in referring to the fact that the Automobile Club avoided Surrey on the occasion of the annual run. To capture a motorist, says our contemporary, "the police go more elaborately to work than they would to capture a gang of forgers, long-firm conspirators, burglars, or pickpockets." The local tradespeople cannot appreciate the "asinine attitude of the county potentates," for the loss to hotel-keepers on the route must have been pretty considerable. A run such as that of the 16th inst. circulates hundreds of pounds, and by the stupidity of its magistrates Surrey was that much the poorer when the motorists went to Southsea, *via* Basingstoke and Winchester.

A Needful Lesson.

THE temporary boycott of Surrey towns on the Anniversary Run has not been without its effect, and we heard much lamentation on the subject in Guildford and Godalming, with severe criticism of the police methods that brought it about. Local automobilists have taken care that there shall be no doubt about the cause thereof, and it behoves them to "rub it in" as much as possible while the opportunity occurs. The hotel interest has a good deal of original prejudice to get rid of in the matter of motoring, as is only to be expected, but the excellent arguments for doing so are having a rapid effect, as may be deduced from the openly expressed condemnation of the local magistracy and police which we have heard from those affected by the results of its action.

Coachbuilders Awakened.

It has taken the coachbuilding trade—with the exception of a few enterprising firms here and there—many years to become persuaded as to the possibilities of the motor-car business. Apparently there is a general awakening on the subject, and a discussion that is going on in trade circles shows that efforts are being made to enter the lists. Mr. James Young, of Bromley, Kent, suggests that a syndicate of coachbuilders should be formed for the supply of motors to its members. The syndicate would, he says, be able to obtain better terms from the makers than would individual coachbuilders. By such a combination the difficulty of providing ready cash for motors could be got over, and the syndicate and the motor makers would soon get on good terms. The fact that such a proposal is made demonstrates that wealthy people are not paying such heed to coachbuilders as was the case before the Light Locomotives on Highways Act came into operation.

Motor-Cars and Insurance.

ONE of the surest indications of the harmlessness of the automobile is to be seen in the change of aspect presented by insurance companies towards both car and owner. A few years ago there was a tendency on the part of companies to regard the motorist much in the same light as the balloonist, and to charge a prohibitive premium when including motoring amongst risks to be insured against. Statistics were wanting, and the element of risk an unknown quantity. To-day we have statistics, and, contrary to general expectation, they prove that motoring cannot be ranked amongst that class of occupations or sports labelled dangerous. The result is keen rivalry amongst insurance companies, all of whom are willing to grant for a small premium special policies covering not only the rider and his car, but indemnifying the former in the event of claims for damage from other parties. It is also worthy of note that the extra fire risk is not considered great. A slightly increased premium will cover any building in which a car is stored.

"Take your Portrait, Sir?"

WITH an alertness that does not seem natural in the case of the English photographer their brethren of the United States have utilised the motor fashion in a profitable way. Along the main roads the ordinary photographers have made special preparations for the automobilist, and, having camera ready, are able to induce many a driver to have his photo taken. The picture is produced in a few minutes, and the motorist speeds on his way again. Some of the leading *chauffeurs* have collections of photographs of themselves and cars taken in various cities, and this is becoming almost as great a craze as the picture-postcard hobby.

It has been noticed that the American motorist who pays a goodly sum for an imported automobile, no matter what its type or horse-power, immediately becomes imbued with the idea that he possesses the fastest automobile in the United States.

MOTORING IN THE FOG.

NO doubt most motorists who were out in the recent foggy weather were more or less inconvenienced thereby, but we doubt if any more so than Mr. Albert Murray, of Messrs. Pearson and Son, Limited, of Nottingham, to whose lot it fell to drive a 5 h.p. Benz from London to Nottingham, *via* Reading, during the "plague." A quarter of an hour after leaving the Metropolis he was more surprised than pleased to find himself back in the same place. Off again, and better progress was made, Hounslow and Maidenhead being soon left behind. At the latter place he failed to distinguish the tollkeeper, and quite unwillingly passed him. All went well to Reading, but as Oxford was neared the fog thickened, and a drop to second speed became necessary. By the time he had partaken of refreshments darkness had set in, but, undaunted by this, he lit up the lamps and struck out for Towcester, being bent upon getting there that night to facilitate an easy run through to Nottingham next day. Alas! man proposes and God disposes.

Towcester was still in the dim—very dim—distance, when the most conspicuous incident in the run happened. Driving along very cautiously, Mr. Murray suddenly experienced the thrilling sensation of rushing on a downward path leading to what he thought ruin, but subsequently investigation, with the aid of a lamp, proved it to be a dyke, which he had escaped by a few feet only—in fact, it was only by presence of mind and quickness in slipping off the belt and applying the brakes that a cold plunge was avoided. Now came the difficulty how to get the car upon the road again. Single handed this was impossible even with the aid of the Crypto gear, so the only course open was to wrap himself up and wait until help came along. After about an hour a good Samaritan turned up in the driver of the Mail, with whose assistance the foundered car was hauled up the embankment. No more damage was sustained than a slight injury to a lamp which got slightly disfigured in an interview with a projecting bough. When Buckingham was reached the motorist decided not to tempt fate by endeavouring to penetrate any farther through the impenetrable mist, so retired to bed after eight hours' severe tension. The next day the fog had considerably lifted and the remainder of the journey was uneventful and to a certain extent compensated for the previous day. No, there is nothing very fascinating in driving through a thick, black fog at any time, but when one does not know an inch of the road it is decidedly unpleasant.

We are informed that the car in question, which is the property of Sir Hervey Bruce, never gave one moment's trouble except with regard to the usual effect of the damp weather upon the belts.

THE Collier Twin Tire Company, Limited, are now making a special pattern of their tire for motor-bicycles.

HAVING regard to the way in which the streets of London have been "up" during the past few months, we learn with interest that both the Corporation of London and the London County Council are about to seek Parliamentary powers giving them full control of the streets.

THE CUDELL LIGHT CAR.

THE Gesellschaft für Motor und Motorfahrzeugbau, (Cudell and Company), of Aix-la-Chapelle, Germany, have just brought out a new light car, of which we give an illustration herewith. The motive power is supplied by a vertical double-cylinder petrol engine, developing 8 h.p., the diameter of the cylinders being 90mm., and the stroke 100mm.. The cylinders are water-jacketed, the circulation being maintained by a pump and radiator. Electric ignition by dry battery and induction coil is adopted, while a centrifugal governor fitted in connection with the engine, regulates the quantity of gas allowed to pass to the explosion chamber. The motor is located under a bonnet in the fore part of the frame and transmits its power through a friction clutch to the variable-speed gear box. From the latter a universally jointed longitudinal shaft transmits the power of the motor to the rear live axle through bevel gearing. Three speeds forward and a reverse motion are controlled by a single lever at the side of the car. Ample brake power is provided; the road wheels are all 23in. in diameter, and shod with pneumatic tires. The rear part of the tonneau body of the standard car is readily detached, rendering the vehicle suitable as a touring machine for two persons, with ample luggage accommodation. Complete, the car weighs between ten and eleven cwt.

THE CUDELL LIGHT CAR.

BARON EDMOND DE ROTHSCHILD has hitherto been in the habit of employing horse traction for the transference of rare plants and flowers from his country estate to his house in Paris during the winter. The journey there and back took two days. Recently, however, the Baron had made a motor-wagon, which performs the double journey in one day, thus effecting a considerable saving in

time and money. The motor is of 8 h.p., and by means of a special arrangement of pipes the hot water is utilised for heating the travelling conservatory.

THE Coventry Chain Company, of Coventry, are now making a motor roller chain of $1\frac{1}{2}$ inch pitch with the bushes integral parts of the side plate, which is claimed to eliminate stretch, elongation being due to actual wear and tear only.

SINCE the "Mabley" car, of Messrs. John Marston, Ltd., Wolverhampton, was described in our issue of the 24th August last a number of modifications have been introduced, the most noticeable being the reversal of the position of the engine to permit the use of a straight instead of a crossed belt.

A DEPUTATION, representing firms engaged in the motor-carriage of heavy traffic, waited upon the Watch Committee of the Manchester Corporation last week to ask that the same privileges which are given to two-horse traffic in the city shall be allowed to motor lorries. It is proposed by the Committee to exclude heavy traffic from certain thoroughfares, and the owners of motor-lorries desire to be on the same footing as the class of two-horse vehicles mentioned. The representations of the deputation were favourably considered by the Committee, who will report upon them in due course.

CORRESPONDENCE.

MOTOR-BICYCLES FOR 1902.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—With your kind permission I should like to add a few more remarks and also interchange a few hints and ideas with the writers of the highly interesting and valuable letters on motor-bicycles. One remarkable feature of the Werner, I find, is the extraordinary wear that takes place on the front tire. Noticing how serious this was becoming after 350 miles running, I fixed a Smith's protecting band on the tread, and was astonished to find this worn completely through in less than 100 miles. The tires are 26 in. by 2 in. special Clinchers. At this rate a tire will wear out in no time. On motors driving on to the rear wheel the wear is not much greater than on a tandem bicycle, judging from a Minerva type of motor-bicycle I have seen that has run a thousand miles. Perhaps your able correspondents would state their experiences on the subject of tire wear. Now, regarding the V-belt problem, the one I got with the machine proved a nuisance through stretching, and no matter how carefully joined with the hook, it broke time after time. I then determined to try a half-inch round cat-gut band. This I cut to exact length, and then joined with a steel hook and eye. This gave good results, and I found it very easy to tighten by giving it a half twist or so. Thus no cutting and piecing are necessary, but still the drive is somewhat harsh; and I am now experimenting with a raw hide V belt, which has had the stretch taken out by hanging a 100 lb. weight on to it for about a week. This will then have to be carefully spliced and permanently stitched.

Then, as to the destructive sparking at the platinum contacts on trembler. I have found this can be greatly reduced by placing 10 in. of "Manganin" resistance wire, No. 18 S.W.G., in the primary circuit. This cuts down the current a little, but not enough to reduce firing spark.—Yours faithfully,
ELECTRICAL ENGINEER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Following on "Petro's" letter in your last, perhaps my experience of the Werner bicycle may be of use. My machine is the 1900 pattern, bought in July that year, and has, therefore, had two seasons' work; the mileage to-date is 2,010. About three weeks since I had the connecting rod re-bushed; this is the only repair that has been made to the engine, except a new valve lifter guide to replace a faulty one. The same trembler and contact-pin are still in use, a platinum rivet having been put in trembler when connecting-rod was re-bushed. My Dunlop tires are still in use; the trailing tire is as good as ever; the driving tire wore through after 600 miles, owing to the absence of a regulating valve. This I put in myself, and at the same time a band $\frac{3}{8}$ -in. thick was vulcanised on to the driving tire. This, after 1,410 miles, is still in excellent condition.

As to side slip, I find no more tendency to this than in the ordinary bicycle, and as I enter next year on my fortieth year of cycling, I speak after some experience of the latter. The workmanship of the Werner is open to criticism in some particulars. No doubt this will be remedied. On three occasions I have done seventy-seven miles in one journey, only stopping to oil engine and get lunch. This year the machine has been remarkably regular in working, and has given no trouble at all.

"Petro" complains of the machine being noisy. I have altered my silencer so as to justify the name, and have utilised the exhaust to warm the petrol. As long as the temperature is not much below 40 deg. this answers well; with the temperature above 60 deg. of course it is not required.—Yours truly,

T. FREDK. HUNT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Fawcett's experience is not unique. My Werner reached me, after some weeks' delay, minus the switch-handle.

One terminal of the coil was not properly connected with the coil wire, and the trembler case touched the trembler terminal and had to be filed away. I ordered mud-guards, the machine came without any, also without spare sparking plug and trembler, as ordered more than a month before. Now that I have remedied its faults, I must admit that the machine goes splendidly, with the aid of a piece of brass wire in place of the switch-handle, which has just turned up—five days after the machine, sent by rail. To crown all, I was astonished to receive by post this morning a bill for the switch-handle. As Mr. Fawcett aptly remarks, "Such carelessness ought not to be traced to the Viaduct."—Yours truly,
GERALD A. CHILD.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have been interested in the recent revival in your correspondence columns of criticism of motor-bicycles. Some of your readers may recollect that nearly a year since I ventured to question the comparative utility of the Werner machine on Devonshire roads, and I was quaintly reminded of this fact some time since, when I sold my Werner, by a post card—evidently from a constant reader—which ran as follows:—"I offer £—; I think this is quite enough after your running it down so in the *M.C.J.*" However, I need hardly say that the opinions I then expressed were given in good faith and were only arrived at after a three years' experience of four-wheelers, three-wheelers, and two-wheelers in the county of Devon. This being so, I was much interested in Mr. Fawcett's letter (in June last, was it not?) giving such an extremely favourable account of this machine as ridden by him in the very same district, and I could not help speculating at the time as to whether his subsequent experience, which was then limited I believe to a few weeks of a very fine summer, would be as favourable.

We now have Mr. Fawcett's more mature opinion; and I think he is to be congratulated on the frank way in which he has practically rewritten his former letter and controverted the views he then expressed. Your readers will now be able to form an opinion as to whether those who criticised the design and performances of the Werner were justified, because the announcement has just been made that the makers have entirely remodelled the machine and those features which have hitherto been distinctive of the Werner, and, we have been told, have made it the best motor-bicycle on this planet—such as the position of the engine and that wonderful carburettor, have gone by the board. Although, therefore, I note that Mr. Benett is still more than satisfied with this machine, it is evident that the makers are not, and I think we may now say, "The Werner is dead—long live the Werner" (of 1902).

There is one thing that I have never been able to understand about the Werner of the past, and that is the wildly optimistic statements (all evidently *bona fide*) that have so constantly appeared in your columns. For instance, one correspondent, when his motor was temporarily out of action, could do thirteen miles an hour with the pedals alone; another felt sure that his motor developed 2 h.p.; another thought the Werner was the only suitable vehicle for the Swiss passes and the Lake district; another found it invaluable for drawing a trailer. I have a theory that many motorists make their first plunge with a Werner, and that they, as it were, concentrate on this—their first love—the enthusiasm which they will subsequently distribute more evenly over the whole field of automobilism. I need hardly say that I do not include in this category Mr. Benett's long ride of 215 miles, on which he is to be congratulated. But is he justified in assuming that others would be equally fortunate in accomplishing these long runs without a hitch?

It is usual, I believe, to put down the critical moments that some of us have gone through with our Werners to bad handling; and I was therefore amused to notice a little incident at the last Agricultural Hall Show. Amongst other motor-vehicles running round the arena was my old friend, the Werner, ridden by an expert who wore that nonchalant, a-child-could-ride-me expression which is rather taking. My attention was momentarily distracted by a Locomobile, with a milk-can hung on its condenser, sailing

round a corner at twenty miles an hour. On looking round again a change had come over the scene. The Werner had assumed a horizontal position, and its rider was just alighting from a short aeronautical trip. On examining the machine, I found that the silencer had gone and had taken with it part of the combustion chamber; the front of the carburettor had also been crushed in. Now it would have been awkward if this had happened on Mr. Benett's run.

Another point to which I take exception in Mr. Benett's letter is the statement that the system of lubrication is identical with the De Dion. In the latter, the lower rim of the piston dips into a recess in the top of the crank chamber, which is kept filled with oil thrown up through a narrow aperture in the same; therefore the piston receives a more or less constant quantity of oil at each stroke. In the former, the piston dips into the crank chamber. When there is plenty of oil in this, it receives a good splash; when little, a little splash; and, when none, it goes without. Further, there is a ball-valve or vent in all De Dion crank chambers, which allows a portion of the air in the latter to pass out on the downward stroke of the piston (thus preventing compression), while on the up stroke it closes, thus causing a partial vacuum. The effect (or one effect) of this arrangement is to prevent the oil being blown out as in the Werner, and running in a steady trickle down the trembler.

May I conclude with a word of advice to those who contemplate motor-bicycling—and, as we are told that we are on the edge of a motor-bike boom, the latter will probably be many. Before purchasing make sure that you will enjoy the pastime. The way to ascertain this is to take your present safety to the top of a good hill—let us say half a mile long. Now coast down at twenty-five miles an hour. Do not shirk the vibration, but sit well down in the saddle, bearing in mind that, if you are going to do the thing properly and take 215 mile rides, you will not be able to balance yourself on the handles and pedals for eleven hours at a stretch. Having got to the bottom, examine yourself introspectively and ascertain if you feel comfortable all over. There is a technical name for this logical process; it is called reasoning "a posteriori." Having gauged the amount of vibration due to inequalities in the road surface, you must add 100 per cent. for the engine vibration. To ascertain this, push the machine up (this will be useful practice for the future), and coast down again at fifty miles an hour. Now you will know how you will feel after half a mile on a motor bike; and, to find the sum of your sensations by the time you would reach Barnstaple, you have to make a mental effort and multiply by 430, adding 25 per cent. for shock due to collisions with carts, side-slips, and running over dogs, though of course these incidents would come more naturally to you after a bit.

If you still feel equal to facing the music, you should go at once up to London to examine some machines. If you feel drawn towards one with belt transmission, there is a simple test not to be omitted. Shut the compression tap, or jam the small pulley and see how much force is required to turn the driven wheel and make the belt slip. Just this power and no more will you get out of the motor. Now, if you take my advice, you will decide not to purchase; you will return, after a few pleasant days in town, with the satisfactory feeling that you have saved money; and you will probably live to a good old age.—Yours truly,

W. E. TESCHMAKER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to recent letters in your journal, *re* motor-cycles, I have for some months, after trials of the Minerva type, been constantly using a Werner. I think that the question of liability to side slip is much exaggerated and depends to a great extent on the rider. It seems to me that the driving power being always applied in the same direction as the steering is greatly in its favour. With additions to the silencer and half compression, and improvements in the carburettor and trembler as used by me it has given excellent results. The additions, as mentioned by Mr. Pattison in the last edition of the *Journal*, and which he finds so satisfactory, were copied from the machine used by myself.—Yours faithfully,

H. GASSON.

AERIAL NAVIGATION AND THE RECENT PARIS SHOW.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In order that those readers of your journal who are not already sufficiently well informed may not jump to a hasty and erroneous conclusion on reading "Automan's" adverse report on the above regrettably meagre show, I deem it desirable to remark that the display in question was very far from being representative of aviation. Great Britain (with the Colonies) and America could make a far better show.—Yours faithfully,

SIDNEY H. HOLLANDS.

A QUERY *RE* STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—How long will a steam motor-car (the Gardner-Serpollet, for instance) run without showing steam from the exhaust? Even engines fitted with condenser and circulating pumps will sometimes, through insufficient circulating water, get a hot condenser and show steam, which, on the road, is against the law, and motor-cars are not fitted with circulating pumps.—Yours truly,

NAVAL ENGINEER.

POPULAR-PRICED MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with interest your correspondent's letter in the present issue. While agreeing with his remarks in the main, I do not think that, at present, at any rate, manufacturers or agents can fall in with his suggestion of their supplying cars at the low price named. My company were the originators of cars at a really moderate price, but we were speedily convinced that, cheaply as we desired to produce them, we could not supply, for example, a 3½ h.p. car at less than £120 net.

Automobiles will, undoubtedly, tend to become less costly as the supply increases in years to come. It is, nevertheless, very foolish for the many would-be motorists to sit upon the fence because they will not pay what is, after all, but a few pounds extra.

I would merely conclude by mentioning that there are not a few excellent cars now on the market, the demand for which increases apace, so that, perhaps, "he who will not when he may, when he can he shall have nay."—Yours truly,

HUGH OWEN,

Director and Manager The Automobile Transport Company.

QUERIES *RE* IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As very nearly the only trouble I have with my De Dion voiturette is the failure of the sparking (the trembler arrangement being very erratic in its action), I am contemplating trying some other method of ignition. Can any of your readers inform me if they have tried the Simms-Bosch, or any other more reliable means, instead of the De Dion trembler and platinum-tipped screw.—Yours faithfully,

TEN MILES FROM ANYWHERE.

PETROL FOR MOTOR-BICYCLES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In common with many others, I am now considering the purchase of a motor-bicycle, but I foresee a considerable difficulty in the purchase of small quantities of petrol *en route*. The spirit is now sent out by the manufacturers in two-gallon cans, and all the agents I have approached on the subject have declined to "break the can," or sell less than the full two gallons. On the motor cyclist this would press very heavily, as he might require two quarts or perhaps a gallon to replenish his tanks, and the remaining spirit he would be compelled to pay for and leave behind. Could not cycle agents be persuaded to stock petrol, at all events in one-gallon cans, or to fill a few half-gallon

screw-topped cans for the convenience of motor-cyclists, charging say 2d. or 3d. per gallon extra for their trouble.—Yours faithfully,
LOCK NUT.

"ANOTHER WORKING MAN" writes:—"In reference to a 'Working Man's' letter, in your last issue, on popular-priced cars, as I have got one similar to the one he has made, I should be very glad to know where the items he mentions can be bought. As I have an air-cooled motor with only one speed, I should be glad to have a $3\frac{1}{2}$ h.p. water-cooled engine, and two-speed gear and chains for the price he names, so perhaps he would not mind helping."

MR. A. GOWER, manager of the Carlton Motor Company, writes:—"Referring to the letter in your last week's issue, in which Messrs. Rickard and Company, of Brentford, stated that it is impossible to run a motor with paraffin oil, as well as with petrol, with identical results, I can only state that our carburettor will do all that we claim for it, and further, that it has been thoroughly tested for a year before we attempted to place it on the market. We can refer Messrs. Rickard and Company to its users, or would be pleased to arrange a trial with them. If Messrs. Rickard and Company have gone to the limits of their experiments with carburettors, the inventor of our carburettor has struck out on new lines, and gone one better. The word "impossible" is of little value in mechanical science to-day. I myself have for sixteen years been experimenting with all kinds of engines from cold air to cordite and can always find improvements. Engineering is a life's apprenticeship."

THE U.S. Post Office Department has awarded the contract for automobile mail service in Minneapolis, Minn., to the Republic Motor Vehicle Company, a concern which has so far been quite unknown in the automobile industry.

MESSRS. FALCONET, PERODEAUD, AND CIE., of Choisy-le-Roi, France, intimate that, having terminated the agreement by which the Scott Tyre Company, of Coventry, represented them, they are now prepared to sell tires on their own account in this country.

A NEW radiating coil known as the Audin is being introduced by the Begbie Manufacturing Company, Willesden Junction, N.W. The coil differs from most radiators in having an oval tube instead of a round one, the effect being that a little more water is carried, but the exposure of the same to the cooling effect of the atmosphere is very much greater.

ON Tuesday last the record competition for the best time on the Gaillon hill began again, and Traffault, on his peculiar machine, mounted the hill in 58 seconds, making the world's record for voitures. Rigal followed, beating Osmont's record by four-fifths of a second, climbing the hill in 46 seconds. Rigal, not satisfied with this time, made another try, making the marvellous time of 42 seconds.

SPEAKING at the general meeting of the Allday's and Onion's Pneumatic Engineering Company, Ltd., at Birmingham this week, Mr. Wm. Allday stated that they had been busily engaged on motor-cars for about three years, and had lost a lot of money in trying to get at the right one. At last they had succeeded, after very careful tests, and they hoped during the present year to be able to make up the loss.

THE other day we had an opportunity of inspecting one of the new Ariel 10 h.p. cars with tonneau body built by the Ariel Motor Company, Ltd., of Birmingham. The car, which is a splendid specimen of English workmanship, is fitted with Ariel 10 h.p. twin-cylinder governed engine, water-cooled, electric ignition, three speeds forward and one reverse, all actuated by the same lever. No chains or belts are used, the drive being direct by bevel gear from countershaft to the rear live axle. Worm steering is used, which renders the same irreversible. Another important addition is a self-starting arrangement. The fear box is designed with syphon lubricators, which, when once gilled with oil, require no further attention for 300 miles, so doing away with the multiplicity of oil tubes,

FLOTSAM AND JETSAM.

BY "FLANEUR."

THE hope may pardonably be expressed that Lord Onslow will see fit to revert to his original desire as to the possession of a 12 h.p. car, after his recent frank admission that he had contemplated ordering one, but abandoned his intention on account of the police persecution and bought a modest 4 h.p. instead. The more boldly men of position come forward and demonstrate the absurdity of the existing speed limit, the better it will be for their less influential fellow automobilists. There need surely be no hesitation now that Mr. Chaplin himself, the author of the twelve-miles regulation, has publicly declared it to be incompatible with present-day conditions, and called for a drastic alteration of the limit to twenty-five miles an hour, with number carrying for cars capable of exceeding that speed.

EARL DUNDONALD, who made so excellent a chairman at the Aero Club banquet on Monday night, drove a point home which can hardly be emphasised too often. This was the debt of gratitude which M. Santos-Dumont owed to the motor manufacturer in respect of the internal combustion engine, which so signally combines lightness with power. One of M. Dumont's predecessors, Henri Giffard, had tried steam, and all the force that he could get out of the maximum weight that he could carry was three horse-power. M. Giffard did not fly across Paris and return, it is needless to remark, nor would M. Santos-Dumont have reaped the reward of his illimitable pluck had he not been able to press the new force into his service.

EVERY day seems to bring new confirmation of my belief that the majority of the people of this country are still in ignorance of the significance of the automobile movement, and nothing that has occurred in recent years has been so useful an object lesson as this brilliant feat of M. Dumont's and the main cause of its success. It is strange enough to the inner circle who drive motor-cars, or ride other people's cars, or are in any way whatever interested about motor-cars and talk about them; but the fact remains that the average citizen of this country thinks that the Light Locomotives Act has made the automobile movement, and not that the course of inventive progress made the Act. Certain people, he appears to imagine, thought that they would like to build a lighter form of mechanically-propelled vehicle than the traction engine, and that road travelling would become supplementary to railway locomotion. But his ideas still run on electricity and steam, and he will go on thinking for long enough that it was the desire for a new method of progression, and not the discovery of a new power, which led to the birth of the motor-car.

IN other words, the average man still thinks that there are no forces but wind, electricity, and steam, and he does not—however much automobilists may think the fact is generally known—recognise that in internal combustion and explosion we have a new source of power. The story of James Watt and the kitchen kettle he probably learned at school, and knows that steam is produced from heated water; probably he also read of Volta and the frog, and has vague ideas on the subject of electric generation; but he certainly has not grasped the fact that vaporous explosion, properly directed, is a new and potent force, and that the engine in which it is employed is the lightest, most economical, and most effective that the world has yet seen. Until the man in the street has realised what work a pint of petrol can perform he will neither understand what automobilism has done, nor regard the motor-car with the respect that it deserves. Of course, the number of people who do appreciate the situation is increasing, but they are in an absolute minority, and the motor-car is generally regarded as a new vehicle, and not as the embodiment of a new force.

AN incident that happened to myself while driving the other day reminded me of one of the most amusing chapters in "Out

of the Hurly Burly," by Max Adeler. Whoever has not read that book ought to remedy the omission forthwith; it is one of the most mirth-provoking concoctions that ever left the press. The chapter to which I refer describes the irrepressibility with which an insurance agent named Benjamin P. Gunn pursued his avocation. It is one of his victims who tells the tale. The said victim was called upon fourteen times in one morning by the indefatigable Gunn with respect to taking out an insurance policy. Gunn waylaid him in the street, at church, at the opera, on the train, and at a funeral. The victim fled for a fortnight to a distant city, and returned at one a.m.; he had hardly got into bed when the door-bell rang, and there was Gunn with a doctor, ready for examination. In vain the window was slammed down; Gunn sat on the doorstep all night, and he and the doctor tried to undress the victim in the street. The victim locked himself in his garret; Gunn rented the adjoining house and talked shop through the partition. Then he climbed through the trap-door with the doctor in tow.

THE victim fled to the steeple of an adjoining church and sat on the ball of the weather vane; an hour later Gunn and the doctor crept up the steeple in a balloon. As soon as Gunn reached the ball he threw his grappling iron into the shingles of the steeple, and asked the victim at what age his father died, and if any of his aunts ever had consumption or liver complaint. Without waiting to reply the victim slid down the steeple to the ground and fled to Mexico. Mounting a mule, he paid a guide to lead him to the summit of Popocatepetl. Just before reaching the top he heard voices, and upon rounding a corner of rocks he saw Gunn on the very edge of the crater, explaining the endowment plan to his guide while the doctor was examining the other guide to see if he was healthy. Gunn said he was glad that they could now talk about the policy without fear of interruption, but the victim pushed him backwards into the crater, and he fell a thousand feet, screaming something about "non-forfeiture." A day or two later there was an eruption of the volcano, and out came Gunn, considerably scorched and with his hair singed off, but ready to resume business!

WHAT happened to me was less dramatic, but it showed that in fact as well as fiction the insurance agent is not without resource. I was driving along a somewhat slippery road, with all due care, and appeared to have got to the end of the grease. Then the necessity for passing between a stationary cart and an approaching "tram" caused me to forget the mud, and I was congratulating myself upon a successful manœuvring between Scylla and Charybdis, when I suddenly found myself floating on a mass of particularly bad slime, and performing the elegant gyrations of which a car is capable under such conditions. Clutch in or clutch out, it was all the same; the car slid bodily down the steeply-shelving road, and my front wheels were quickly over the kerb. As I got down to bring the car back again into the straight, but slimy

road which led to side-slips, a well-dressed bystander proffered his assistance—for I had no fellow passenger on the car. We pushed the car out of the gutter, the wheels skidding all the time, and then the stranger asked me for a lift, which, of course, I willingly accorded. I could see that he did not relish the passage over the still remaining hundred yards or so of grease, but he set his teeth hard until we got over it and on to drier ground. Then he got to business. He was the Benjamin P. Gunn, and I was the victim, for he announced that he was an insurance agent, and would be happy to insure myself or my car on favourable terms, etc., etc. Remembrances of the Popocatepetl episode flashed upon my mind as we drove across Kew Bridge, but I did not hurl him into the Thames, nor do anything more drastic than thank him for his offer and set him down where he wanted to alight. He had been much too kind, and I was almost taking out a policy on the spot; but, then, I was already heavily insured. It is not to be gainsaid, however, that the present-day insurance agent is quite equal to improving the occasion, and as I looked backward on the retreating form of my temporary "fare" I realised that he was returning to the spot where he had seen my unwelcome *glissade*, and had only asked me for a lift in order to make a convert.

A WRITER in a sporting weekly, whose unconsciously entertaining articles on motor-cars were recently referred to in this journal, expressed surprise, it may be remembered, that no provision had been made to put the burners of a tube-ignition car to culinary use. Baked meats, he opined, could be easily forthcoming from so convenient a range and oven as a Daimler bonnet and its interior apparatus. Be that as it may, a well-known *chauffeur* who drives "on his electric," but has also "tube" to fall back upon, did put the latter to good purpose during the recent frosty weather. Other people's carburettors were unconsciously freezing, but he removed the platinum

tubes and lit his burners, thus keeping a constant supply of hot air beneath his bonnet, which effectually prevented his carburettor from lapsing into a state of inconvenient frigidity.

MESSRS. E. DE POORTER AND CO., Great Tower Street, E., whose Derby motor-bicycle was recently described in these columns, are, we hear, about to put a new light car on the market.

MR. H. O. HALL, of Messrs. Hall and Company, of Tonbridge, in conjunction with Mr. A. Fordyce, have acquired the sole agency for Great Britain for the well-known Darracq cars. A new concern is being organised under the style of Messrs. A. Darracq et Cie. (Great Britain), and a large dépôt is shortly to be opened in London, where a large range of Darracq cars will be kept on show. The new 9 h.p. single-cylinder car comprises a number of new features, such as improved governor and inlet valve control, improved trembler, double rows of balls to axles, and greater seating accommodation, which we hope to deal with in a later issue.

AN INVALID'S MOTOR-CAR. (See page 701.)

[Automobil Zeitung.]

CONTINENTAL NOTES.

By "AUTOMAN."

THE readers of the *Journal* will remember that in the issue of September 7th I made some severe strictures on the author of the Lisieux accident, and also that I was called to account the following week by "An Occasional Motorist in France," who disputed my facts, and took up the defence of the Count de Villeroi and his son. In my notes of September 21st I again referred to this sad accident, saying that I could not accept the facts given by my critic, and preferred to suspend judgment until the truth should have been elicited at the trial. "An Occasional Motorist in France" would have done well to leave the matter alone, and not to have trusted to such an obviously *ex parte* statement as that given by the accused, which had no foundation in fact. The trial took place last Friday fortnight at Lisieux, and the judgment was rendered last Friday week, too late for me to refer to it in the last issue. Young Villeroi is condemned to two months' imprisonment, with application of the First Offenders Act, and the Count de Villeroi is acquitted because his son had a driving licence.

HERE is a translation of extracts from the judgment, compared with "An Occasional Motorist in France's" facts:—Judgment.—Seeing that the employee, Lucas, on duty at the entrance to the town, made an effort to stop the motor-car stepping in front and on the road to a distance of one metre and a-half from the edge of the footpath, and that he made a signal to the driver to stop, and that the latter, instead of obeying this injunction, continued at the same speed, and that Lucas was caught by the side of the car and thrown underneath the wheel, and that after having received first aid from more people he expired. Seeing that Villeroi *fils*, after having stopped at about ten metres from the place of the accident, set off again without going to the aid of his victim, thus shunning the responsibilities which he had incurred. Seeing that Villeroi *fils* does not deny the facts and only says he did not see the signals of Lucas, and only continued his journey because of the threats of the spectators, etc. "An Occasional Motorist in France" in his letter tells how Lucas "deliberately placed himself in front of the car, holding up his hands. The son avoided him by steering to the left, and still the stupid fellow repeated it again."

IN the evidence itself I find that only one witness says the car stopped, and he says it stopped for one minute, and Count de Villeroi himself in his evidence says that he wrote to the procurator of the Republic "several days" after the accident, not as "An Occasional Motorist in France" says, "on the same evening." Finally, with regard to the statement that the Count only continued his journey because of the threats of the crowd "brandishing of sticks and umbrellas and hurling of stones," there is not a particle of evidence to that effect, indeed there were very few people present. The bold facts, therefore, remain that the car passed the octroi (a place where every Frenchman knows he must stop) at full speed, knocked over the employee on duty and then deliberately bolted, leaving the man to live or die, and it was not until the newspapers raised a commotion, and in face of the certainty of being found out that the Count de Villeroi put himself in communication with the procurator. I can find no defence possible for such thoughtless and cowardly action, and I notice that the Count had to admit that he had already himself been condemned in the First Court for another accident, although the Court of Appeal quashed the condemnation.

A MATCH was recently arranged between his Royal Highness the Duc des Abruzzes, cousin of the King of Italy, and M. Coltelletti, who initiated the Duc des Abruzzes in the gentle art of motoring and who taught him to drive. The match was between the 24 h.p. Panhard, owned by M. Coltelletti and a new and powerful car which the Duc has ordered from an Italian company named F.I.A.T. The course was a non-stop run of 206 miles from Turin to Bologna, both cars to have their touring bodies and two passengers besides the driver.

THE race came off last Sunday, the start being fixed at Villa Nova d'Asti in order to avoid the crowds. M. Coltelletti was given the signal to start at 8.40 a.m., and five minutes later the Duc des Abruzzes set off. At Alexandria the Duc was only three minutes behind his competitor, having, therefore, gained upon him slightly, but the Duc was obliged to stop to repair the brakes, and seven miles further on the Duc's car struck a large stone in the middle of the road and broke down completely under the strain. The Duc was fortunately uninjured and returned to Milan by train. M. Coltelletti, unaware of the accident, continued his journey, and arrived at Bologna at seven minutes past five, having accomplished the 206 miles in 8 hours 29 minutes, averaging about twenty-six miles per hour. The roads were muddy and in very bad condition, and rain was falling. It is rumoured that the Duc will issue a new challenge as soon as he can get his car repaired and strengthened.

THE new flying machine in course of construction under the auspices of M. Augusto Severo has been christened the "Pax," and is fast approaching completion. It differs considerably from the "Santos-Dumont," and although of a cigar shape is double the circumference at the centre of the cigar. The car, which is to carry three passengers and two motors, one of which gives 20 h.p. and the other which is of 16 h.p., is not suspended, as is the case with the "Santos-Dumont," but is fixed to the folds of the balloon, and is constructed of steel tubes and aluminium. There are altogether four aluminium fans, two of which are employed to point the ship upwards or downwards or to keep it level, the other two fans are placed one at each end of the cigar-shaped envelope, the one in front is to overcome the resistance of the air and the one behind is to propel the ship.

THE Paris International Automobile Exhibition, which opens on December 10th next, will be full to overflowing with exhibitors, and although it is to be held in the Grand Palais—in itself an extensive building—it is already too big for its shoes, and it has been found necessary to install the Alcohol Section in the basement underneath the ground floor. Few people who visited the show in the Grand Palais last year are aware that there is a vast crypt or basement underneath the whole building, but such is the case, so that this year the exhibition will occupy two floors. M. Loubet, President of the French Republic, who takes a great interest in automobile matters, will visit the Salon on the opening day at two o'clock.

M. LOUBET, like many other Frenchmen highly placed, is very much interested in the question of the use of alcohol for motor-cars. The question is an all-important one in France, for whilst the alcohol is a national product, petrol pays a heavy tribute to the owners of the monopoly and benefits the country in no way. There is a project on foot to make the refinery of petrol a State monopoly, and everything points to the ultimate object of this scheme being to maintain a price which will just allow alcohol to compete favourable with it. There would then be an immense trade for the agriculturists and for the distillers of alcohol.

RIGAL'S glory as a "record man" has been of very short duration, for on Wednesday week last Osmont set off for Gaillon with the two official chronometers, Tampier and Gaudichard, vowing to lower the record. On Sunday week at the hill-climbing trial Osmont had very bad luck—twice he was obliged to slow up on account of obstacles. He was confident of doing much better, and as the results turned out his confidence was not misplaced for he beat the records twice in succession, the first time by 3 2.5 sec. and the second time by 3 3.5 sec., making the second time 46 4.5 sec. to do the 1,000 metres, or just over forty-eight miles an hour. His machine was an 8 h.p. air-cooled De Dion.

RIGAL, however, soon got his revenge, for on the day following he attacked the 1,000 metres on the level, for which Osmont

held the record. Rigal did the kilomètre, with a flying start, in 33 1-5 seconds, attaining a speed of 108 kilomètres 432 mètres, or over sixty-seven miles an hour, beating every record, including Jenatzy's famous time, and only excepting Fournier on his 60 h.p. Mors at Coney Island, who did the mile in 51 1-5 seconds, doing nearly 70½ miles an hour.

M. SANTOS DUMONT's new air-ship, which is being constructed at the works of M. Henri Lochembre, is to have a hydrogen envelope cubing over 1,200 mètres, and it is to be divided into three equal compartments by partitions of unvarnished silk. He will employ two Buchet motors of 40 h.p. each and weighing 4 kilos. per h.p. In addition to the movable balance weight, by which he was able to incline his No. 6 upwards or downwards at will, he is going to apply to his No. 7 a system by means of which he can withdraw air from the compartment at one end and send it into the compartment at the other end. In each of these two compartments he will have a small inner balloon containing air, and these two will be joined together by a tube which passes through a fan so as to be able to displace the air at will. By this means it is hoped that the unpleasant pitching motion will be obviated.

Warnborough, Alton, Bentley, Farnham, and Aldershot; reverse route next day. December 11, Aldershot, Farnham, Hog's Back, Guildford, Worplesdon, Bisley, Bagshot, Farnborough, and Aldershot; reverse route next day. December 13, Aldershot, Ash, Wyke, Puttenham, Compton, Godalming, Milford, Hindhead, Telford, Farnham, and Aldershot; reverse route next day.

THE GLADIATOR 12 H.P. LIGHT CAR.

TO meet the growing demand for a fast and powerful light car, the Clement and Gladiator Company, of Paris, and 14, Regent Street, S.W., in addition to their 6½ h.p. single-cylinder vehicle, have now taken up the construction of a twin-cylinder car of 12 h.p. We had an opportunity the other day of inspecting the first one to arrive in England, and give an illustration of the *tonneau* herewith. The engine, which is located under a bonnet in the fore part of the frame, is a twin-cylindered Aster, fitted with a simple and effective governing arrangement, acting on the intake of gas to the cylinders. The latter are water-cooled, having a water jacket over their whole extent, the circulation being ensured by a rotary pump driven off the fly-wheel. The water tank, which is carried out of sight at the back

THE GLADIATOR 12 H.P. TONNEAU.

MOTOR LORRIES FOR MILITARY PURPOSES.

THE War Office Committee on Mechanical Transport has now fixed the dates and the revised routes for the trials of motor lorries for military purposes in the neighbourhood of Aldershot, Guildford, Farnham, Hindhead, etc. The trials will commence on Thursday next week, December 5, and will conclude on Saturday, December 14. The number of lorries which will take part in the trials is not so large as was at first anticipated, and will not exceed a dozen. Each lorry will have a trailer attached, and will be in charge of a competent driver sent by the firm entering it, while officers will be selected to accompany each vehicle in order to report on its capabilities. Four different routes have been chosen, the journey being made in one direction one day and in the reverse direction the next. A start will be made from the Royal Engineers' establishment at Aldershot Camp at half-past eight on the morning of each day, and the lorries are timed to return by about four o'clock in the afternoon. The following are the dates of the trials and the revised routes. December 5, Aldershot to Hale, Odiham, Hartley Row, York Town, Bagshot, Frimley, Farnborough, and Aldershot; reverse route next day. December 9, Aldershot to Hale, Odiham, South

of the carriage, holds about six gallons, and as efficient radiators are provided, the water is kept cool for a great length of time. The ignition is electrical. The changes of speed are effected by the well-known Panhard type of gearing, giving three changes of speed and a reversing motion. From the counter-shaft the usual duplicate pair of sprocket wheels and chains convey the power to the rear road wheels. The petrol reservoir, which is carried under the driver's seat, holds sufficient petrol for a run of one hundred miles. A small reservoir for lubricating oil is set on the dash-board so that the engine can be lubricated at will, when running, from the driver's seat. Steering is controlled by an inclined hand wheel placed on a smartly raked steering pillar. There are two distinct sets of brakes, one being actuated by the right foot and acting upon a large drum on the countershaft, and the other being actuated by a hand lever acting on large drums on the driving wheels. Both brakes act either forwards or backwards. The rear road back wheels are 30 inches in diameter and the front wheels 26 inches, fitted with 3-inch pneumatic tires. Although the illustration shows a *tonneau*, the car we examined, while being identical as regards the chassis, was fitted with a Limousine body, the two back seats being completely enclosed, with windows on either side, and a glass in front, whilst the front seats are protected by a leather canopy with side curtains and glass screen. The weight of the *tonneau* complete is 14 cwt. and the Limousine 15 cwt.

HERE AND THERE.

MESSRS. JAMES AND BROWN, motor engineers, of 78a, Queen Street, Hammersmith, are about to open more extensive premises in King Street, where the manufacture of their new type of car will receive special attention.

THE Presto Gear Case Components Company, Ltd., of Frederick Street, Wolverhampton, are now making a special feature of motor bonnets, radiators, oil and water tanks, carburettors, etc., for the motor trade.

A MACHINE somewhat on the lines of the Century is being built by the Eagle Engineering and Motor Company, of Altrincham, Cheshire. The motor is a $4\frac{1}{2}$ h.p. De Dion, while a new departure is the fitting of inclined wheel steering.

NEW signboards are being put up by many local authorities, and at Woodcote Green, Epsom, is one of metal, with the caution painted red, "This road is dangerous to motor-cars"—whether because of the presence of police spies, unrolled stones, or steep decline the notice does not indicate.

ON Thursday Mr. C. Friswell held a sale by auction of several up-to-date Panhards in first-class order, including one 12 h.p. four-cylinder 1901 pattern Panhard, with lamp and electric ignition, tonneau body, and all the latest improvements; besides several of the later pattern Locomobiles, and other well-known types of cars.

IN addition to motor roller chains, Mr. Hans Renold, of Manchester, is now making an improved form of the silent chain. It is known as the block silent, and is specially designed for high speed work. It is made in pitches from $\frac{1}{2}$ in. to $1\frac{1}{2}$ in. As an indication of the strength and durability of these chains, it may be mentioned that the $\frac{1}{2}$ in. pitch is now running at 1,500 to 2,000 revolutions per minute, transmitting $3\frac{1}{2}$ h.p.

MR. STAPLEE FIRTH had a long and busy day at Chertsey Police Court on Wednesday, when a number of cases against motorists were heard. Two Locomobilists were summoned for exceeding a speed of four miles per hour—the first case was dismissed, and the other withdrawn. In two summonses against motor-cyclists for exceeding a speed of six miles per hour with motor-cycles and trailers, one motorist was fined and the other case dismissed.

MESSRS. ROSS, COURTNEY, AND COMPANY, LTD., Ashbrook Road, Upper Holloway, N., have just introduced a special motor tire pump constructed to give the high pressure required in a motor tire with the least possible resistance while pumping. It is fitted with a water jacket, which neutralises the heat produced by working the pump against the high pressure, and keeps the working parts cool, thus prolonging the life of the pump and greatly adding to its efficiency.

THE Aspley Engineering Company, Ltd., of Aspley Lane, Nottingham, have lately introduced a new condenser for use on motor-cars. It consists of a large number of small canvas tubes carried in a tubular frame; it is claimed to be 75 per cent. lighter, and more efficacious than any other condenser on the market. It is also arranged to work with an air pump to create a partial vacuum in the condenser, so relieving the exhaust steam from any back pressure.

THE Hart Accumulator Company, of Marshgate Lane, Stratford, E., are introducing a special line of ignition cells contained in strong boxes, and sealed at the top to prevent spilling of the electrolyte. There are six standard sizes, and these can be supplied in large quantities at short notice. The capacities vary from 9 to 90 amperes, and the internal resistance is very low. In dimensions the over-all height and the width are 8 inches and $4\frac{3}{4}$ inches respectively for all sizes, but the length varies from 13-16 inch up to 7 $\frac{3}{4}$ inches.

THE only electric vehicle that made the Southsea trip, as the "Powerful" of the British and Foreign Electrical Vehicle Company. The total distance of 95 $\frac{1}{2}$ miles was covered in 6h. 48m., giving an average of more than 14 miles per hour. The cost of the run was 6s. 3d., and the passengers carried were five. The car was a Krieger, fitted with Leitner accumulators, the total weight of car and batteries being 1 ton 15 cwt. Thirty units of electrical energy were taken in London before the start and 6 units at Winchester during lunch. No stops other than the official stops were made.

THE illustration on this page depicts the 10 h.p. Wolseley Siamese phaeton with canopy, lately completed by the Wolseley Tool and Motor Company, Limited, Birmingham. The car is fitted with the standard chassis, but has in place of the ordinary

THE "WOLSELEY" 10 H.P. SIAMESE PHAETON.

tonneau body one which will carry with ease and comfort five persons, including the driver. The rear seat is very comfortable; the entrance to it is effected through the front, the seat to the left of the driver being hinged so as to open outward over the side. The canopy is made of light framework covered with a weather-proof material; curtains are arranged on sides and rear, and a glass shield is fitted in front, which can be raised and strapped to the roof at will. The whole of the canopy can be readily detached by a suitable lifting arrangement supplied with the car.

THE Automobile Racing Association of the State of New York is a new organisation formed with the purpose of developing automobile track racing. The association, it is stated, has secured a tract of land at Syosset, L.I., where tracks of different nature are to be constructed. There is to be a speeding track of ample length, with graded turns that will permit of motor-cars developing their highest speed, a climbing track, a rough roads track, a water ford, stretches of sand roads, etc. A grand stand of ample dimensions is also to be built.

UNDER the name "Narbonne," the Whippet Cycle Syndicate Limited, of Clapham Junction, S.W., are introducing a new ignition gear for petrol motor-cars. The advantages claimed for this device are that the contact-breaker is removed from the engine and can be placed in such a position on the car that it can be easily inspected and readily adjusted. It also entirely does away with the trembler and its attendant troubles. It enables the contact points to be in a position where it is impossible for oil to get on them and prevent them from doing their proper duty. The contact points are of platinum, and are of ample size. They are arranged so that they not only meet to make and break contact, but a slight "rub" occurs with every contact that they make, keeping the surfaces clean and bright. The gear is capable of working at any speed, and can be fitted to cars of all makes.

THE Winton Motor-Carriage Company, of Cleveland, U.S.A., have so far built about 700 carriages, and expect to turn out at least 500 next year.

THE annual dinner of the Manchester Automobile Club will be held in the month of January next, when a number of special guests are expected to be present.

A PUBLIC motor-car service is about to be started in Greece between Athens, Theben, and Chalkis. Two cars for the service were recently received at the Piræus from Paris.

MOTOR-CAR weddings are becoming popular. Two automobiles, one day last week, conveyed the principals to a matrimonial contract and their friends to St. Simon's Church, Shepherd's Bush.

A CONCESSION for a public service of motor-cars between Brussels and the suburb of Schaerbeck has been secured by M. C. Jenatzky, who will use his combination petrol-electric cars for the work.

The Grand Duke Nicholas Mihalovich has recently made the first mountaineering tour in the Caucasus in a 10 h.p. Mors car. The journey was from Borjom, near the Persian frontier, to Batoum, a distance of 144 miles.

A SPEED contest over a straight course of 3 kilometres was lately held at Nimegen, by the Dutch Automobile Club. Herr Conrad proved the winner, he covering the distance on a Gobron-Brillié car in 2 min. 59 sec.

MR. A. C. BOSTWICK, whose interest in and study of automobilism has probably exceeded that of any other American amateur motorist, is now taking an active part in the affairs of the Pan-American Motor Company, of Mamaroneck, N.Y.

WE understand that Messrs. Roots and Venables, of 100, Westminster Bridge Road, S.E., are commencing the manufacture of 7 h.p. and 12 h.p. cars, the latter having a two-cylinder engine. In both cases, the motors will be located under a bonnet in the fore part of the frame.

MESSRS. PEUGEOT AND CO., of Paris, inform us that notwithstanding advertisements to the contrary, no one has as yet obtained an example of the Peugeot new model, and that the only source through which it can be obtained in England is Messrs. Friswell, Ltd., of Holborn Viaduct, E.C.

IN a remarkably short space of time the motor car has made the conquest of the Royal House of Savoy. The King, the Queen, the Count of Turin, and the Duke of the Abruzzi have all become enthusiastic *chauffeurs*. The latest convert to automobilism is Queen Margherita, who is said to be so delighted with a recent tour that she has decided to purchase a car for her own use.

MESSRS. ROOTS AND VENABLES have just completed a special car for a gentleman in Bombay. The body takes the form of a Victoria to seat four persons in addition to the driver. The car is propelled by a 6 i.h.p. single-cylinder engine, using ordinary paraffin, and has two speeds ahead and one reverse. Solid tires are fitted.

THE question of regulating the speed of motor-cars in the city has come before the City Council of Christchurch, New Zealand. The By-Laws Committee expressed an opinion that there was no reason why motor traffic should not be regulated in the same way as the ordinary traffic of the city. It recommended that a by-law should be prepared requiring every motor-car owner to procure a licence and to register the licence at the office of the Council. The report of the Committee was adopted.

MR. L. SCHLENTHEIM, a member of the Automobile Club, writes:—"With regard to import duties in Holland, Germany, etc., it may interest you to know that I took my car over to Holland, where I had to pay a duty of 5 per cent. on the value of the car, which was refunded to me without any difficulty on passing the Dutch frontier into Germany. The cost of the various papers was about 7d. In Germany, on my explaining to the Custom House officials that I only came into Germany for a tour for a few weeks, I had to pay no duty whatever. In France I had to pay £28 duty, being £2 for each 100 kilos. weight, which also was refunded to me on leaving France."

MOTOR-CYCLES FOR 1902.

ONE of the features of the present time is the rapidly-growing prominence of the motor bicycle. Tricycles and quadricycles are still being turned out by a few firms, but it cannot be said that they are meeting with an increasing adoption. A better fate is, however, anticipated for the two-wheel machine, to supply which there is hardly a single firm, big or little, in the cycle trade not laying itself out. There is certainly to be a large increase in the number of motor bicyclists in the country during the coming season, but so many firms are now catering for this prospective demand that it behoves them to act cautiously, so that the market shall not be over-supplied. A large number of motor-bicycles have been described in our columns during the past few months, so that where they remain unaltered it is not necessary for us to refer to them again on the present occasion. Our object is to briefly describe the many new or improved motor cycles that have made their appearance at the cycle shows or which are about to make their bow to the public. Hitherto the belt drive has been the only method adopted of transmitting the power of the engine to the rear road wheels, but now several machines are being put forward with chain driving in place of the belt. It is, of course, too early yet to forecast the result of the battle that is, as it were, during the coming season to be waged between the two methods of power transmission. Altogether the motor-bicycle is in an interesting stage of development.

THE Quadrant Cycle Company, Limited, Birmingham, in addition to the "Autocyclette," recently described in these columns, have now introduced a new form of motor-tricycle, of which an illustration is given herewith. The machine is exactly the same as the "Quadrant" motor-bicycle in every detail except the front fork. In place of the front fork and wheel of the bicycle the steering socket is elongated and stayed to the diamond frame. This elongated socket has a cross-bridge fixed rigidly at the lower end, each end of this bridge terminating in a short pillar about 4 in. high. A corresponding pillar, working parallel with it and joined to it by four links, is arranged to carry the side wheel. By this arrangement either end of the cross-bridge is able to descend below the horizontal with a corresponding rise on the opposite side. This rise and fall is obtained automatically in steering by means of a sloping

FIG. 1.—THE QUADRANT MOTOR-TRICYCLE.

cam and a grooved pulley wheel on each side of the machine. Steering is controlled by the handle in the usual manner, and by means of a pair of light rods running parallel with the fixed cross-bridge. The effect of this novel mode of steering a tricycle is (1) to cant over the back or bicycle part of the frame exactly as when a bicycle turns a corner, and (2) to bring the steering post an inch or so inside the true centre which it occupies when running straight, thus transferring the rider's weight to that extent to the inner side of the circle, and to the same extent counteracting the momentum and tendency to overbalance. The side wheels at the same time assume an outward sloping position, thus still further counteracting the momentum. The net result is to give a very high degree of safety when steering quickly, or turning corners. In case of need the driving band can be taken off in a moment and the machine ridden as an ordinary tricycle, plus the extra weight of a motor. The frame is 24 in. in height, the wheels being all 26 in. in diameter. The driving tire is 2 in., and the steering tires 1½ in. Back-peddalling band brake and a back wheel rim brake are fitted. The weight of the machine complete is about 100 lbs.

The motor-bicycle which Messrs. Calcott Bros., Limited, Coventry, are about to introduce will have the engine (1½ h.p.) located between the main down tube and the rear wheel, and will drive the latter by a belt. In addition to trikes and quads, the Ariel Cycle Company, Limited, Birmingham, are now turning out motor-bicycles on the lines of the Minerva. Provision for petrol, lubricating oil, accumulators, and coil is made in a case carried below the top tube. The bicycle itself has been specially built for motor driving, and is fitted with front-wheel hand-applied and rear-wheel back-peddalling rim brakes. The E. M. Bowden's Patents Syndicate, Limited, Dorrington Street, E.C., are making a bicycle of the Minerva type, but in which chain driving replaces the belt. The large chain wheel

on the hub is fitted on a friction clutch, which is thrown in and out of action by "Bowden" wires. The brakes are also regulated by this mechanism, and so also is the exhaust valve lifter.

A motor-bicycle, quite new to the English market, is the "Indian" illustrated in Fig. 2, and made by the Hendee Manufacturing Company of Springfield, Mass. The first one was brought over only last week by Mr. G. W. Sherman, the representative of the makers. The motor, which is of the high-speed air-cooled type developing $1\frac{1}{2}$ h.p., is built in, and forms part of the main down tube of the cycle frame. The carburettor or vaporiser is of a new type, and gives a steady quantity of

FIG. 2.—THE "INDIAN" MOTOR-BICYCLE.

"gas" under all conditions, an air valve only being fitted to regulate the quality of the mixture. One lever controls the ignition advance and retard, and the exhaust valve lifter. The battery is contained in a long cylindrical metal case which lies on the lower cross tube of the frame. The lubricating oil is carried in a small tank in front of the back stays, and is fed into a glass oil measure, fitted on to the crank case. This measure holds just enough oil to thoroughly lubricate the motor for about thirty miles, a cock being fitted to the bottom of the crank case to draw off the spent oil. By making the oil measure of glass there can be no question as to the oil reaching the motor, as it can be seen at a glance whether it is being fed or not. The entire drive is by chain. The starting or pedal drive is on the right side of the machine in the usual manner, and connects to a special free wheel clutch and back-peddalling brake in the rear hub. The motor drive is by chain from motor-shaft to a countershaft at the bottom bracket, at which point the first reduction is made, and from the countershaft back to the rear wheel, where the second reduction is made. In this construction a steady drive is claimed to be obtained without any slip whatever, allowing the entire power developed by the motor to be transmitted to the rear wheel. Provision is made for adjusting all the chains. The petrol tank is carried at the rear of the machine, and has a capacity sufficient for a run of thirty-five miles. Ample space is also available for the fitting of an extra tank. Complete, the machine weighs about 90lbs.

The Aurora Motor Manufacturing Company, Norfolk Street, Coventry, have been engaged some twelve months in bringing out a suitable motor for a bicycle, also in designing a frame that will carry a motor to the best advantage. The illustration (Fig. 3) is the outcome of their experience. The motor is very powerful, and is claimed to enable the machine to mount steep gradients without the assistance of pedal-

FIG. 3.—THE "AURORA" MOTOR-BICYCLE.

ling, and is so constructed that a slow speed of some five or six miles per hour can be obtained. This is of special value to a rider, as hitherto very few motor-bicycles could travel at a slow speed. The engine develops $1\frac{1}{2}$ nominal h.p., and drives the rear wheel by a small belt. A new motor-bicycle is about to be put on the market by M. De Breyne, Snow Hill, E.C. It is made by the Etablissements Pieper, of Liege. The motor, of $1\frac{1}{2}$ h.p., is supported from the bottom tube of the frame, also from the stays behind the bottom bracket. A carburettor of

the float-feed spray type is employed, while the power of the engine is transmitted to the back wheel by a round gut band. Messrs. Shakespeare, Kirkland, and Frost, Limited, Bradford Street, Birmingham, have adopted the Minerva system for their motor bicycles. The back-wheel hub, which is the Moderatum, made by the Garrard Manufacturing Company, provides the necessary free-wheel, and also a back-peddalling brake, so arranged that the machine may be wheeled backwards. The Enfield Cycle Company, Limited, Redditch, who are still making motor tricycles and quads, the latter with $3\frac{1}{2}$ h.p. water-cooled De Dion engine, are constructing two types of motor bicycles. One of these is of the Standard Minerva pattern, and has already been illustrated in these columns. The other has the motor arranged over the front wheel *à la* Werner. The power is transmitted through a crossed belt to the rear road wheel. The motor develops $1\frac{1}{2}$ h.p. at 1,500 revolutions per min. A mixing valve is arranged below the tank, and both the quantity of petrol and the quantity of mixture can be adjusted by vertical screws carrying finger discs on each side of the top tube. The end of the stem of the inlet valve is exposed, and an exhaust valve lifter is provided. Lubricating oil for the crank chamber is supplied from a pump conveniently situated to the left hand. A hand-applied band brake is fitted to the front wheel, and a foot-applied band brake to the rear wheel. The New Revolution Cycle Company, Limited, Loveday Street, Birmingham, are bringing out a bicycle fitted with $1\frac{1}{2}$ h.p. Mitchell motor, the feature being the employment of the New Revolution spring frame, which is claimed to reduce vibration to a minimum.

The Chapelle motor-bicycle, which was illustrated and described in the *Journal* in our report of the Paris International Exhibition of 1900, is now being introduced into this country by the United Motor Industries, Limited, of 42, Great Castle Street, W. The machine is made in two patterns, one having a two-speed gear and free engine and one having a plain belt drive. In both cases the motor is of $1\frac{1}{2}$ h.p., with both the inlet and exhaust valves situated on top of the head. The frame of the machine is of strong construction; the motor is located vertically in front of the bottom bracket, and in the case of the ordinary machine is connected with the rear wheel by a belt, the usual pedals and

FIG. 4.—THE "CHAPELLE" MOTOR-BICYCLE.

chain gearing being provided to start the motor and assist it on steep ascents. In the machine fitted with a two-speed gear no chain is provided, the pedals being connected with a spur wheel, which meshes with a pinion on the motor-shaft. An encased belt connects the rear wheel with the motor, which latter can be put out of gear by means of a device somewhat similar to that which was employed on the old Bollée—that is to say, the spindle of the rear road wheel is free to move under the action of a spring and lever forwards or backwards in slotted fork ends, so slackening or tightening the driving belt as desired. It is stated that the Chapelle, which has lately attracted great attention in France, holds the world's motor-bicycle records from one to one hundred kilometres.

The motor bicycle of the Crypto Works Company, Limited, 29, Clerkenwell Road, E.C., has already been referred to in these columns, but we may mention that the motor is supported on the lower cross tube of the frame. A special method of driving has been adopted, both the muscular power from the rider at starting, and the engine power, being transmitted through one chain. The bottom bracket chain wheel is mounted on a clutch on the axle: attached to the chain wheel is a large gear wheel, which meshes with a small pinion attached to the motor shaft. Means of readily throwing the engine in and out of gear are arranged. In the "Rex" motor-bicycle the engine—of $1\frac{1}{2}$ h.p.—is carried on the lower cross tube of the frame, the crank chamber being clamped to this and to the main down tube. The motor is of the air-cooled variety, the outer edges of the radiating ribs forming a square instead of a circle. From the engine shaft, the power is conveyed to a light metal pulley on the rear wheel by a small twisted belt. The machine complete weighs only 65 lbs., and can, it is claimed, ascend grades of one in ten without it being necessary for the rider to pedal. Messrs. Dennis Bros., Limited, Guildford, in addition to the "Speed King" motor tricycles and quads, have begun the manufacture of a motor bicycle. It is on the lines of the "Moto-sacoché," the motor being fitted in the diamond frame, and driving the rear wheel by means of a twisted leather belt.

THE accompanying illustration shows the new bicycle motor which has just been put on the market by the Century Engineering and Motor Company, Ltd., of Willesden Junction, W. This engine has been specially designed and constructed to meet the demand which has arisen for a practical article, capable of performing its work in an efficient manner with the least possible trouble to the user. The engine is of $1\frac{1}{2}$ h.p., and constructed upon the usual air-cooled principle with ample ribs or cooling surface. The bore of the cylinder is $2\frac{1}{2}$ in., and the stroke $2\frac{1}{2}$ in. The

FIG. 5.—THE CENTURY BICYCLE MOTOR.

compression tap has been dispensed with, and in its stead a neat exhaust-valve lifter worked by a Bowden wire has been introduced, which answers all purposes and is invaluable for starting noiselessly and stopping, also for coasting, cooling the engine, and economising petrol on down grades. The inlet and exhaust valves are of serviceable dimensions; the crank chamber is of aluminium, and so designed that it is oil retaining. The ignition gear is strong and reliable, the make and break being of the positive not the trembling variety. The quality of the contact blade and contact screw is such that the company claim that these parts, with fair treatment, will last considerably more than 1,000 miles without requiring to be renewed or even adjusted. A 10-ampere accumulator of four volts and a Century induction coil are supplied with the motor, while the carburettor is constructed under the Century patent, the claim for which is that it is perfectly reliable even under the worst conditions of road and weather. An important adjunct to the motor is the throttle; by means of this the quantity of "mixture" admitted to the cylinder may be regulated without in any way interfering with the quality.

Several improvements have been effected in the New Courier motorette for two persons, made by Messrs. Frank Parkyn, Limited, Wolverhampton. It is now fitted with a $2\frac{1}{2}$ h.p. motor, the drive being taken from the motor-shaft by chain direct to a chain wheel mounted on an extension of the single driving wheel spindle. Two powerful band brakes are fitted, one on each side of the rear driving wheel. The Sparkbrook Manufacturing Company, Coventry, is another concern taking up the construction of motor bicycles, their machine being on the lines of the Kitto. Messrs. Thomson and Heard, Limited, of Chalk Farm Road, N.W., in their Mohawk motor bicycle have adopted the Derby system, using, however, a special cycle frame. Under the name "Meteor" Mr. E. Baedeker, of Farringdon Avenue, London, E.C., is introducing a new motor bicycle, in which the engine ($1\frac{1}{2}$ h.p.) is carried on the lower tube of the frame. Both the inlet and exhaust valves are at the top of the combustion chamber, the exhaust being worked by a rod, actuated by the usual cam, raising a rocking lever, which at the other end depresses the exhaust. The fly-wheel is outside the crank chamber, and is combined with V-shaped pulley, a belt, with jockey, conveying the power to the rear wheel.

ANOTHER new petrol motor specially designed for use on motor-bicycles is the Simms, made by the Simms Manufacturing Company, Limited, Bermondsey. It is of the vertical air-cooled type, and fitted with the Simms-Bosch magneto-electric ignition. The motor will develop 2 h.p. at 2,000 revolutions per minute. A simple timing gear is fitted in connection with the ignition, by which means the speed of the motor may be regulated to a nicety. The carburettor used with the engine is of a modified surface type, with splash plates to prevent change of uneven level in the petrol. In the bearings extra large wearing surfaces have been allowed, and all bosses properly stayed. The lubrication of the motor is automatic, thus obviating the necessity of constant attention to the oil pump. The motor may be fitted to any ordinary bicycle, and may be placed in almost any position on the frame.

We learn from Mr. D. Citroen that considerable improvement has been effected in the new model of the now largely used Minerva motor for bicycles. The new engine is claimed to give double the power on the brake of the 1901 pattern, being $1\frac{1}{2}$ h.p. The bore of the cylinder is 62mm., and the stroke 70mm. The compression has been increased one and a half atmospheres, the old compression being three atmospheres, whilst the new is four and a half. The inlet valve has been enlarged, and is now made to ensure a sharp closure with the minimum needful lift. The exhaust valve has been enlarged in proportion with the engine dimensions, and can be removed without unscrewing the piece carrying the sparking plug. A cementless sparking plug is used, which, it is claimed, has a very much longer life than the ordinary pattern. The thread has been kept to the standard De Dion, so that any ordinary plug can be fitted if desired. The guide in which the exhaust valve lifter slides is now not only made of hard steel, but it is also automatically lubricated from the crank chamber. The ignition apparatus has been thoroughly revised, and the trembler has been thickened where screwed to the crank chamber. The platinum screw has been reinforced, and the quantity of platinum in both screw and trembler increased. The trembler has been altered so that it is lifted by the ignition cam instead of being pushed, thus preventing the bending and breaking of the trembler. A new process of hardening the trembler has been adopted, which is a great improvement on the old one, ensuring thereby a longer life. An automatic oiling apparatus has also been fitted so as to admit of lubricating the engine from the saddle for over 100 miles. A proper tap for waste oil is now employed instead of the hexagon nut previously used.

Many attempts have been made to place before the public an apparatus that would minimise the danger of cycle riding amongst traffic in slippery streets. After a deal of trouble and expense the Empire Motor Company, of James Street, Oxford Street, W., claim to have succeeded in perfecting an apparatus known as the "Lifebuoy," that is not only an emergency support for use when riding in streets crowded with vehicular traffic, but it may also be used as an ordinary cycle stand. As will be seen from Fig. 6, it is a device for bringing a pair of side wheels into contact with the ground by a back-peddalling operation, further back-peddalling operating the brake. It can be easily attached to any type of machine, and is so simple in construction that a novice can master the mechanism in a few minutes. It should certainly be a useful adjunct to motor-bicycles, as it enables riders to seat themselves on the machine before starting the motor. Any motor-cycle fitted with this apparatus can be instantly brought to a standstill by switching off the current and a light back pressure of the pedals, which immediately places the support in position and at the same time operates a powerful band brake, thus allowing the rider to remain seated on the machine. As soon as the pedals are pushed forward the support

FIG. 6.—THE "LIFEBUOY" PORTABLE STAND FOR MOTOR-BICYCLES.

automatically goes back to its former position, out of contact with the ground. The Empire Company have also taken up the manufacture of motor-bicycles.

(To be continued.)

RANCHI, the headquarters of the Chota Nagpore Commission, and its neighbour Hazaribagh, are two stations in India whose charms have been considerably discounted in the eyes of visitors by their only being attainable after the ordeal of a long road journey in a conveyance known by the suggestive name of a "push push." We learn, however, that some enterprising gentlemen of Hazaribagh have combined in a project to start a motor-car service between the railway station at Giridih to Hazaribagh and Ranchi.

IMPORTS OF MOTOR-CARS, CYCLES, AND PARTS.

SO many foreign cars and cycles are at present being imported into this country that we have for some time been endeavouring to obtain some reliable information regarding such imports, and are now able to announce that in future we shall publish a monthly table of the number and value of the cars, cycles and parts imported. This table is being especially compiled for the *Motor-Car Journal* by the Customs authorities, and includes all the ports in the United Kingdom, so that its authenticity is undeniable.

Below we publish the list of imports during October last. The large total will, we fancy, come as a surprise even to those engaged in the trade.

FURIOUS DRIVING CASES.

At the County Police Court at Peterborough, Mr. F. E. Burton, of Nottingham, was charged with driving a motor-car in the parish of Longthorpe, near Peterborough, on the 31st October, at a greater speed than twelve miles an hour. Mr. C. E. Welles Lucas, of Nottingham, defendant. The constable in charge of the case stated that he was on the road in the parish of Longthorpe on the 31st October last, when he saw the defendant driving a car at the rate of twenty-three miles an hour. In cross-examination by Mr. Lucas, he said he knew it was going at the rate of twenty-three miles an hour, because when the defendant was 560 yards away from him he pulled out his watch and timed him, and the defendant did the 560 yards in fifty seconds. He measured the distance from the place where he was to the place where he first saw the defendant and it was about 560 yards. His watch was at twenty minutes to three when he first saw the defendant, but he did not know where his second hand was at that time, nor could he tell where the second hand was when the defendant got to him. He timed the fifty seconds from the minute hand. Mr. Lucas objected that the defendant was charged with driving at a rate exceeding twelve miles an hour contrary to the Local Government Board Regulations and that such regulations had not been produced and proved, and, therefore, there could be no conviction. This objection was over-ruled, and Mr. Lucas then addressed the Bench for the defence. He pointed out the absurdity of a policeman who was no judge of pace and who had had no experience in timing speed, asking for a conviction on the evidence which he had given. Mr. Lucas said it was an impossibility for anyone to take the time of a man driving a motor-car from a point 560 yards away by such primitive means as the watch produced, which was not a stop watch. He appealed to the Magistrates not to take the uncorroborated statement of a policeman against that of Mr. Burton, who was a respectable citizen. Mr. Burton gave evidence and said that on the day in question his car was out of order and he could not drive it on the high gear, and therefore was driving on the second speed, and that he was not going when we saw the constable more than twelve miles an hour. The Magistrates dismissed the case.

At Bow Street, Albert Sheather, of Bourbon Street, Berkeley Square, was summoned for driving a motor-car to the common danger in the Strand. A police-constable stated that whilst he was assisting some ladies and children across the Strand from the Lyceum Theatre, a motor-car approached, which was driven by the defendant at the rate of about nine miles an hour. Witness held up his hand and shouted to the defendant to stop, but he took no notice. The ladies and children had to scatter in all directions to get out of the way. Defendant drove his car round witness, and did not stop until he collided with a cab. Defendant declared that he was not going more than five miles an hour, and said he did not see the policeman signal him to stop. Mr. De Rutzen imposed a fine of 10s., and 2s. costs, observing that if the police, whose duty it was to regulate the street traffic were disobeyed by drivers, no one would be safe.

At Cardiff, Mr. H. B. Widdows, one of the masters at the Grammar School, Cowbridge, was summoned at the County Police Court for furious riding on a motor-tricycle. P. S. Jones, Cowbridge, said the defendant passed through Abertthaw on the 2nd instant at the rate of sixteen miles an hour. Defendant, who said that he was only riding at the rate of nine miles an hour, was fined 25s., including costs.

At Huntingdon, Walter J. Hervey, of Newark, was summoned for driving a motor-car at a greater speed than twelve miles an hour at Brampton on October 13. Defendant did not appear. Police-constable Storey said that at midday on Sunday, October 13, he was near Brampton Hut and saw a motor-car coming from the direction of Alconbury at a fast pace. There were two gentlemen in the car, which he stopped, and he told them they were going too fast. The car covered 300 yards in 28 seconds, which was over 22 miles an hour. By the Bench: There were several persons about and the defendant slackened when witness held up his hand. The defendant wrote pleading guilty and apologising for the offence. It was his custom on meeting traffic or passing villages to slacken his pace. After the magistrates had retired the Chairman said he could not help expressing the Bench's opinion that this gentleman had treated both the constable and the county in a proper manner. He seemed to have taken the right view of the matter and they would mark their appreciation of that by fining him very moderately. They must inflict a fine, but he would only have to pay £1 1s. and 4s. costs.

In Edinburgh Summary Court, Arthur Brook, engineer, Greenend, was charged with having driven a motor-car on the public road between Nether Liberton and Liberton East Mains on September 30th at a speed of sixteen miles an hour, and driven the car on the Dalkeith Road, between Nether Liberton and the cross-roads at Liberton, twice on October 7th, at a speed of eighteen miles an hour. Superintendent Wright, the Deputy Chief-constable in Edinburgh of the Midlothian County Police, stated that in consequence of a complaint he instructed a couple of constables to detect the speed of the accused's motor-car. Constables Beattie and Macdonald brought out that they measured, by pacing, those parts of the Nether Liberton road mentioned in the charge, and they time the car on the three occasions. On the first occasion the speed was about sixteen miles an hour, and on the second occasion the speed of the car, both on the outward and return journey, was about eighteen miles. The accused, in his own behalf, stated that the car was geared for a maximum speed of fourteen miles. Expert evidence was called by

the defence to confute the evidence of the constables in regard to their measurements and timing. The Sheriff, in giving judgment, said, with regard to the first charge, where the constables only timed the car for a distance of a quarter of a mile, he would find it not proven, considering that it was very difficult for two men to be absolutely certain of the start and finish in so short a distance, and where a single second was of so much consequence. He was of opinion that the case had been made out in the other two charges, where the car was timed for three-quarters of a mile. Even had the constables made a mistake of two seconds this would not have reduced from eighteen to the statutory twelve miles. There were two grounds he had to consider in passing sentence, and these were that that was the first prosecution of the kind in Midlothian, and that the Prosecutor had not attempted to prove danger to the lieges. Had the contravention occurred in a crowded street the sentence would have been a very different one from that which he now passed—a fine of 5s. for each of the two offences.

Reported above are 6 prosecutions for furious driving. In 1 case the summons was dismissed, while in 5 cases fines amounting to a total of £3 1s. without costs were inflicted.

AN INTERESTING JUDGMENT.

The case of Young v. Bedwell was tried at the Cambridge County Court on October 23rd last before his Honour Judge Bagshawe, when he reserved judgment. It was an action by John Young, hay presser against Henry Alfred Bedwell, secretary of the Cambridge and Newmarket Autocar Company, Limited, for the sum of £5 18s., damages suffered by the plaintiff through the negligent driving by the defendant on May 27th, 1901, of a motor-car between Hedingham and Ridgewell. The defendant denied that he was negligent. His Honour's written judgment in the case was received on October 31st, and is probably one of the last he delivered, as his death has since taken place. It is as follows:—

"On further considering the evidence in this case, I continue of opinion that there was no evidence of any negligent or improper conduct on the part of defendant as driver of his motor-car, whereby the damage was caused which plaintiff sustained by the backing of a hay press, on the rear of which plaintiff sat, into a ditch. I have no doubt that the horse which was drawing the hay press and backed it into the ditch was frightened, and caused to back by the sight of the motor-car, but I find that there was no breach by defendant of any of the regulations imposed by law on the drivers of motor-cars, by the Light Locomotives Order of November 9th, 1896, nor of any other negligent or improper conduct. I find that he had seen the hay press some distance off as he came down a hill before turning a corner, which brought him ahead of the hay press; that by the time he was rounding the corner he had slowed down to four miles an hour; that as he rounded the corner he saw the horse which drew the hay press start and kick, and appear frightened; that he then stopped the motive power of his car and the noise it made; and that then his machine was brought to a stand about five yards ahead of the horse, which had then backed the presser into the ditch on defendant's rear, i.e., plaintiff's off-side of the road. I also find that no signal to stop had been made by the driver of the hay press. Under these circumstances I think the defendant cannot be held liable, unless it can be laid down as law that, whenever a motor-car, however moderately and properly driven, frightens any horse, its driver is liable for the consequences; but that, I think, cannot be laid down, as motor-cars are, clearly, when driven under proper regulations, legal occupants of high roads, and the only remedy for such risks as plaintiff encountered seems to me to be to train horses not to start at sight of a moderately-driven motor-car, which they do at many things to the sight and sound of which they have been left unaccustomed. I must make the costs follow the event, and, therefore, giving judgment for the defendant, must order plaintiff to pay his costs of the action."

THE DAIMLER MOTOR COMPANY.

The directors of the Daimler Motor Company, Limited, in submitting accounts for the year ended September 30th, 1901, state that the sales increased to £73,596. In the previous year they amounted to £63,737. A much larger business would have been done had there been a stock of completed cars ready for sale in the spring and summer of 1901. At that time there is a large demand for completed cars, and customers, as pointed out in the report for last year, declined to give orders for cars and wait several months for delivery when they can purchase cars elsewhere. A net profit is shown of £6,742. The greater portion of this profit is represented by cars and finished parts and work in progress, the value of which, including stores, etc., at the close of the year is shown in the balance-sheet as £48,717. This large accumulation of stock is explained by the fact that there was no stock of completed cars ready for sale in the spring of the year. The stock then in hand consisted almost entirely of finished parts. On April 10th, 1901, an extraordinary general meeting was held, at which the chairman (Mr. E. H. Bayley) announced the resignation of two directors (Mr. Thomas Bayley and Mr. Holt), and stated he "meant to remain on the board only so long as he saw the company would not suffer by his retirement." Acting on his advice, the shareholders elected Sir Edward Jenkinson to fill one of the vacancies. Subsequently Mr. E. H. Bayley sent in his resignation, and

Captain C. C. Longridge and Mr. J. S. Critchley were elected, and Mr. Thomas Bayley was re-elected by the board. At the commencement of the year the former directors borrowed £3,000 more on mortgage. The amount of the loan, therefore, now stands at £13,000. As working capital is now urgently required for carrying on the business of the company, the board propose to make an issue of five per cent. debentures.

THE MOTOR MANUFACTURING COMPANY.

ON behalf of the plaintiffs in the action by La Société des Anciens Etablissements Panhard et Levassor against the Motor Manufacturing Company, Limited, Mr. Walter moved, before Mr. Justice Farwell, for judgment by consent. Without stating the nature of the case, Mr. Walter said that his lordship had heard something about the matter in another action, not against the Motor Company, but against Panhard and Levassor. He had heard from Mr. Stewart Smith, who was briefed for the defendants; and the latter consented to an order for perpetual injunction, an inquiry as to damages, and to pay the taxed costs of the action. His Lordship made the necessary order.

MOTOR MANUFACTURER'S CLAIM.

MR. C. T. CROWDEN, Leamington, claimed £26 2s. from the Bournemouth Motor Company, Ltd., for work done by him in repairing six motor-car speed sleeves.—Mr. J. J. Parfitt, who represented the plaintiff, said the plaintiff had previously done work for the defendants, and they had paid at a higher rate than was now being claimed. Plaintiff stated that on the 16th January, 1901, he received from the defendant six motor-car change speed sleeves, which were to be altered and worked up as he had suggested. Witness had previously done similar work for defendants. The work on this occasion was of a highly technical nature, and to do it witness had to obtain special tools and employ trained men. Witness charged the defendants £3 10s. for each sleeve, 3s. less than he had previously charged them. He also charged 17s. each for six hardened speed wheels. Defendants did not appear, and judgment was given for the full amount claimed.

BREACH OF OMNIBUS BYE-LAWS.

AT Folkestone, Folkestone Motors, Ltd., were summoned for a breach of the Omnibus Bye-Laws in having no fares painted on the outside of a motor-car. Mr. English said the motor-cars had only recently been plying between Folkestone and Cheriton, and the board was being painted, a placard was placed on the back of the car. It must have either blown or had been torn off. They had no intention of breaking the bye-laws. A nominal fine of 1s. and 9s. costs was imposed.

DAMAGES FOR A DOG.

SIR CHARLES LAWES, who was recently ordered by the St. Albans city justices to pay the maximum fine of £10 and costs for furiously driving a motor-car so as to endanger the lives and limbs of passengers along a certain thoroughfare in St. Albans, was sued this week in the County Court by the owner of a pet dog which was killed by being run over by the motor-car on the same occasion. Judgment was obtained for the amount claimed—£10—and costs. After the accident to the dog Sir Charles wrote to its owner expressing sincere regret and stating that he would willingly make reparation for the loss; but after he had been fined by the justices he wrote to the purport that if he settled with the owner of the dog now he would be endorsing "deliberate perjury on the part of policemen and scandalous decisions of magistrates." Giving evidence in the case this week, Sir Charles explained that the accident to the dog was unavoidable. He did not dispute the speed at which it was alleged he was travelling—15 miles an hour—neither did he dispute the value of the dog, but he had allowed the case to come into Court in order that he might clear his character as a driver.

FAILING TO STOP.

AT Bristol, Richard Howard was summoned that, while the driver of a light locomotive, he failed to remain stationary when signalled to do so, on October 8. Mr. W. H. Wise said that on the day in question Mrs. H. W. Carter and Mrs. Duncan were driving in a carriage from the end of the Stoke Road to the end of Westbury Road. When near the top of Paddy Well Lane they observed a locomotive, driven by the defendant. As their horses showed signs of restiveness, the driver put up his hand for the locomotive to stop, and one of the ladies also waved her parasol for the defendant to stop. The horses were frightened, and turned back along the road upon which they had come. In reply to Mr. E. J. Pillers (who appeared for the defendant), the witness said the "locomotive" was a motor-car, and had accommodation for two. The defendant went into the witness-box and stated that he was going about three miles an hour when he turned the corner before meeting the carriages. When he saw the driver put up his hand, he put on the brakes and stopped. He was then about a hundred yards away. The bench said they were satisfied there had been a breach of the law, and the defendant would be fined 40s. and costs.

TO THE SCORCHER.

Oh, scorcher, who, bending forward, drives apace,
With melancholy stamped upon your face,
Pursuing Pleasure with a frenzied eye,
Yet mocked by her, however fast you fly,
Are you aware how horrible you look?
No guy invented for a picture book
Was ever a more painful sight than thou,
Lord of the bent back and the anxious brow.

Oh, sit up straight and try to wear a smile!
Be less intent to pile up mile on mile.
Enjoy the prospect as you ride along,
The trees, the sunshine, and the robin's song.
To us who view you scorching day by day,
Bent on your steering in such an awkward way,
You are the homeliest thing on earth, my lad.
Oh, sit up straight, and make the landscape glad!

The Motor World.

WHAT was it the voiturette? The fat spark.

WHY did the exhaust box? To silence her (silencer).

MR. C. JENATZY and Baron F. de Caters have entered their names at the A.C.B. as competitors in the 1902 Gordon-Bennett cup race.

A MEETING of the newly-formed Aero Club is to be held at 4, Whitehall Court, S.W., on Tuesday next, to approve the rules and to appoint an organising committee.

A REPORT from Stockholm, Sweden, conveys the news that the borough of Licksa, in Lapland, has asked Government permission to arrange a regular automobile service to the nearest railway station.

THE first Danish Automobile Exhibition is announced to take place at Copenhagen from April 11th to 27th next, under the auspices of the Danish Automobile Club and the Society of Industrial Arts.

ON the application of Mr. R. Macgregor Mitchell, the agent of Thomas Gourdie, blacksmith, Glenfarg, who is charged with having driven a motor-car against James Cross and four others, whereby Cross was killed, bail has been fixed for the release of the accused at £50.

RUMOURS of impending patent litigation in the American automobile trade are becoming rife. It is asserted that the Locomobile Company of America are about to begin proceedings against all other users of the side steering device, claiming infringement of their patents.

IN answer to several correspondents, who have asked for information *re* the quantity of glycerine to be added to the cooling water to prevent it freezing in cold weather, we may mention that it is usual to use one part of glycerine to every four of water. A little carbonate of soda may also be added to nullify any possible acidity of the glycerine.

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, DECEMBER 7, 1901.

[No. 144.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE War Office motor-lorry trials, the programme of which was outlined in our last issue, commenced on Wednesday with only the disappointing number of five vehicles present for the competition. These vehicles were:—A Foden, a Straker, and two Thornycroft steam lorries, and a Milnes internal-combustion car. The Foden and Straker vehicles are described in another part of the present issue. The Milnes, which is fitted with a 25 b.h.p. four-cylinder motor and has a capacity of five tons, comprises a number of special features, the fuel employed being common heavy kerosene. The engine is started with petrol, and as soon it gets warm the spirit is turned off, and thenceforward only heavy oil is employed. This is effected by the use of two carburettors, one for the refined spirit and the other for kerosene. So far as could be seen on the first day the car travelled very well and great hopes are centred on the success of the vehicle. One of the Thornycroft lorries is on standard lines, but the construction of the second is somewhat novel, inasmuch as the motor is carried over the rear wheels of the vehicle and strikes one at first as looking somewhat strange. It is claimed that it is specially adapted for use on rough roads and uneven ground. Only some half dozen private cars were on the ground on Wednesday evening. The vehicles are stored in the magnificent electrically-lighted shed of the Royal Engineers, where Captain Lloyd, Colonel Crompton, Colonel Holden, and others were all busy seeing to the loading and weighing of the vehicles. The practical road tests commenced on Thursday. These are to be of a most exhaustive character, and will not be concluded until Saturday, the 14th inst., while during the following week a series of speed trials, manœuvring tests, rough country tests, hill-climbing and brake tests (unloaded) are to be carried out.

Moderate Speed.

THE Automobile Club has adopted a suggestion made by Colonel Crompton that in view of the increased number of convictions for furious driving, and of the public misapprehension of the facts in connection with these convictions, the Club Committee should issue a circular to all members of the Club, pointing out that the chance of the speed limit being removed by Act of Parliament must depend greatly on the behaviour of motorists, and begging members to drive at a moderate speed, and to use their influence to induce owners of cars who do not belong to the Club to co-operate with them.

Next Year's Cars.

It is, perhaps, hardly the thing to discuss next year's cars till after the Paris show, but there is, of course, little that is not already known about the 1902 models, the conditions of automobile manufacture demanding an early preparation for the coming season. A consideration of the general line of development during the past year shows an increasing tendency

to uniformity of design and arrangement, not, unfortunately, yet accompanied by any great advance towards standardisation of parts. The light car is steadily growing in size, power, and popularity, till, except in the matter of luxurious seating accommodation, there is sometimes little difference between it and the heavier vehicle it has superseded, though the ever-present tire question will probably be effective in preventing its overgrowth.

The Question of Durability.

AND herein is a point hardly fully appreciated by some of our own makers, who in the reaction against over-lightness hardly realise sufficiently that there is a more serious objection to weight than the mere question of useful load percentage, or even of speed. Both these points, as far as the utilitarian purchaser is concerned, may well give way to the more important quality of durability, and it cannot be forgotten that such purchasers will form the mainstay of the industry, though the sporting motorist, who changes his car oftener, perhaps, than most people do their bicycles, may be contented with "a short life and a merry one" for it. But the former even will not be satisfied if his car is too heavy for economy as regards pneumatics, and every legitimate means of dispensing with weight is necessary. This would seem a point unnecessary to labour, but that grave excesses in such matters as coach-work are still not unknown. Pneumatic cushions, for instance, might well replace heavy springs and stuffing, and when it comes to such things as hoods and glazed fronts, undoubtedly desirable for an all-weather car, improvements are much needed, and it does not appear that in this country at least they can be expected from coachbuilders.

Trials of Electrical Vehicles.

A CONFERENCE between manufacturers and sellers of electrical vehicles and members of the Club Committee was held at the Automobile Club on the 20th ult. A long discussion ensued, after which it was agreed that the Club Committee should be invited to appoint a Committee to advise the Club Committee specially on matters affecting electrical vehicles. It was decided to defer consideration of matters in connection with the trials until after the appointment of this Committee. The Club Committee authorised the Standing Committee to select names and appoint the Committee above referred to, on the understanding that its functions should be purely advisory and not executive.

Cruelty to Horses.

AT Dover the other day a London bailiff was fined for cruelty to a horse. It was stated that he started at 9.30 at night from Wood Green, in the north of London, to drive to Dover—a distance of seventy-nine miles—and that the horse was not taken out of harness the whole of the journey. The animal was subsequently driven about Dover until it fell down exhausted. This is an exceptional case, but the general adoption of automobiles would save us from hearing of many cases of wanton cruelty.

The Control of Horse-Drawn Vehicles.

WHILE referring to this matter we cannot refrain from mentioning a case in which two horses (belonging to the firm in which Mr. Arthur H. Ashworth, the hon. local secretary for Bolton in connection with the recent trials of the Liverpool Self-propelled Traffic Association, is a partner) were killed. Three horses attached to a lorry carrying material weighing five tons were descending a steep declivity at Eagley, near Bolton. A "slipper" brake had been applied to the hind wheel in addition to the ordinary brake being brought into use. As the horses moved the chain holding the slipper snapped, and the lorry dashed off, passing over two of the horses and crushing the man in charge against the wall. This unfortunate incident bears out the report of the judges at the Liverpool trials, which declared that motor-cars were better for manoeuvring on hills than were horse-drawn vehicles. When descending hills the normal speed of motor-cars can be maintained without locking a wheel or using a slipper, thus obviating any such risk as is incurred every day by heavily-loaded horse-drawn lorries in hilly districts.

Good News from Brighton.

WE are glad to hear that the Brighton police are taking a reasonable view of motoring, and the accompanying photograph of the new Chief Constable of Brighton on Mr. Muhlenkamp's car is of general interest. Mr. Muhlenkamp recently took the Chief Constable for a short run, and the latter expressed himself as highly delighted with the experience. For

the sake of the good relations now existing between the local motorists and the Brighton police automobilists visiting the town should drive carefully along the King's Road and in and out the boundaries of the borough. This is a gentle hint that we hope will be taken in good part by all motorists journeying that way.

The Humours of Motoring.

THE members of the Royal Scottish Society of Arts met in Edinburgh last week, when the Rt. Hon. Sir J. H. A. Macdonald made some observations on motor-car accessories, and said that it was not a nice thing when one entered a motor-car to set his foot on a petrol can or water tank, and to find

the interior in chaos with small packets. The usual thing a motor-vehicle did when it stopped on the road, according to his experience, was to tumble everything outside higgledy-piggledy; while those in charge would take off nuts, lay them down in all sorts of places, and when the repairs were finished and all was ready to start again the essential nut would be found wanting. The Lord Justice Clerk of Scotland showed a number of clever devices for protecting the switches and gearing, as well as a tool bag, a method of rolling the spare tires and using them as foot-stools, a petrol storage can, luggage carriers, etc.

The Value of Union.

THE value of organisation is sufficiently apparent in many departments of activity, and it has just been demonstrated in an effective way with regard to motorists. Some time ago the Hon. Leopold Canning was motoring in Ireland when an accident happened to a milk-cart fifty yards distant from his car. Mr. Canning was summoned in connection with the matter, and he very wisely placed the matter before the Motor Union. That body decided that if Mr. Staplee Firth, an English solicitor, would be permitted to take up the case in an Irish county court he should defend it; otherwise the Union would contribute not less than five guineas towards the cost of the defence. This decision, on being communicated to the prosecution, had an excellent effect, for the case fell through, and Mr. Canning has given public testimony to the value of the offer made by the Motor Union.

An Old-Time Tatler.

NEWSPAPER enterprise in connection with the recent run to Southsea was hardly so apparent as in previous years, but the *Tatler* did exceedingly well with its illustrations. In addition to a photo of the two ladies who were referred to by "Lollius" as being the most effectively attired, our gossip contemporary had a photo of "the halt on Portsdown Hill," showing the scene at a well-known inn just outside Southsea, on the arrival of some of the vehicles. Seeing that the cars travelled *via* Cosham and avoided Portsdown, the *Tatler's* photograph appears all the more remarkable. To photograph any of the cars on the day of the run was a difficult matter; but to get a photograph showing the cars at a place which they never passed must have necessitated the employment of much skill. In fact we have an idea that the particular photograph reproduced in the *Tatler* on the 27th ult. was taken in November, a year ago. But the public did not mind.

To Remove Restrictions

APPARENTLY the Bexhill District Council is anxious to promote the popularity of the local motor service, and representations are to be made to the Hastings Council to get certain restrictions removed. On its part the Bexhill Council is prepared to adopt a give-and-take policy. At the present time, unless a passenger from Bexhill has a return ticket, purchased at Bexhill, he is unable to avail himself of the cars when returning. This is a great inconvenience and we hope the difficulty will soon be settled.

Mr. Lorkin's Resolution.

A WHOLE Empire and a great industry are waiting to hear the verdict of the Winslow District Council on the subject of motor-cars. Winslow, it may be added, is near Aylesbury, and one of its energetic and observant councillors is named Lorkin. Now Mr. Lorkin has testified in council assembled that he has "witnessed what might have been (but, we notice, were not) very serious accidents through the carelessness of motor-car drivers." And having witnessed what might have been Mr. Lorkin said he proposed to move a resolution on the subject—but, so that the matter should not be too sudden, he intended to do it at the next meeting. We await with interest

the next meeting, and an anxious Empire lists for the words of Councillor Lorkin.

British v. Foreign Cars.

A LETTER has been appearing in the general press in which is given a criticism of British v. foreign motor-cars. It is shown that the prejudice of a class discouraged the automobile pioneers of the early years of last century just as a similar ignorance now endeavours to thwart the progress of the movement. But the writer is also critical with regard to motorists themselves and wonders why there is a preference for cars of foreign make. He declares that the British car has all the good points of the foreign vehicle, while the material and workmanship of the latter will not bear comparison with the home-made article. This is a matter which is steadily righting itself, and the success of British-made cars in recent Runs and Trials has done much in the interests of the British industry.

The Anniversary Run Prizes.

At the last meeting of the Committee of the Automobile Club it was reported that, owing to the fog, competitors in the Anniversary Tour had not been able to examine the vehicles with a view to voting for Mr. Cordingley's prize. Only a very small number of votes had been received. The Committee decided that Mr. Cordingley should be asked to withdraw his prize and to offer it in connection with some future event. It was also decided that Mr. Edmunds' prize for the driver of the car which made a non-stop journey and arrived last of non-stop cars at the several controls should be awarded to Mr. W. Whiteway's Decauville "Slowcoach."

Engines for Motor-cars.

At a meeting of the Leeds Association of Engineers, Mr. F. G. Heseldin gave an interesting paper on "Internal Combustion Engines for Motor-cars." Since 1895, he said, when M. Panhard startled the world by his famous ride from Paris to Bordeaux, 744 miles, at an average speed of 15 miles an hour, the internal combustion spirit motor had proved itself without a rival for the propulsion of vehicles long distances at high speeds. The chief features of the engine were described in detail, and it was pointed out that the size of the wearing surfaces in many cases was quite inadequate, resulting in frequent break-downs and rapid wear. Improvements, Mr. Heseldin said, might be expected to be made in better balancing, the increasing to a considerable extent of the wearing surfaces, and the complete substitution of electrical for tube ignition. In the discussion which followed, several speakers pointed out that when a motor-car was purchased the fact was often overlooked that an intelligent appreciation of its working parts, together with a due amount of attention, was necessary to obtain satisfactory results.

The Aero Club.

SIR VINCENT BARRINGTON presided on Tuesday afternoon over a meeting held at the Automobile Club of the candidates of the Aero Club of the United Kingdom. The chief business was to appoint a temporary organising committee, to elect members, etc., and the proceedings would have been expeditious and harmonious alike but for the time wasted by one or two gentlemen whose proposals found no support, but who nevertheless absorbed the greater portion of the time of the meeting. In the end, however, the following were unanimously appointed as a temporary organising committee, the permanent officers to be elected in 1902, after the club is fully organised:—Sir Vincent Kennett Barrington, Sir David Salomons, Sir Claude de Crespigny, the Hon. John Scott Montagu, M.P., the Hon. C. S. Rolls, Colonel Templer, Colonel Crompton, Major Trollope, Captain Laycock, Lieut. Spaight, Dr. Boverton Redwood, Mr. B. Redwood, Mr. Paris Singer, Mr. A. M. Singer, Mr. Mark Mayhew, Mr. Frank Butler, Mr. Campbell Muir, Mr. Hugh Weguelin, Mr. Roger Wallace, K.C., Dr. Hutchinson, Mr. A. Paget, Mr. Nep-

tune Blood, Mr. Patrick Alexander, Mr. A. Pollock, and Mr. Claude Crompton, or twenty-five in all.

Civility Costs Nothing.

It is reported that the latest police dodge is for one of a duly-arranged pair of constables to bestow what appears to be an approving official salute on the peccant motorist, said action being the signal for Bobby No. 2 to take the time over the measured (?) distance. This recalls the old story of the French general, who meeting a brother-in arms on the field of battle, was making a ceremonious bow when he was just missed by a cannon-ball, which passed where his head had been a moment before. All the comment he made on his narrow escape was, "You see, one never loses by politeness." And if the motorist, in his turn, bears that maxim in mind, and devotes a due and sufficient pause to the acknowledgment of official courtesy, the truth of it will probably receive a double exemplification. Politeness, we may admit with regret, is not always a national characteristic of ours; but certainly such a misuse of it is un-English in the highest degree.

MR. PERCY RICHARDSON ON HIS DAIMLER CAR.

British Aeronautical Society.

THE opening meeting of the winter sessions of the Aeronautical Society of Great Britain was held on Tuesday evening at the Society of Arts, Adelphi. Mr. Eric Stuart Bruce, the Hon. Secretary, read a paper, prepared by Sir Hiram Maxim, on aerial navigation by bodies heavier than the air. In the paper Sir Hiram Maxim bore testimony to the personal pluck of M. Santos Dumont, who had taken advantage of the new and extremely light petroleum motors. He did not think there was much possibility of greatly improving upon what M. Santos Dumont had already accomplished. He had advanced the science further than it had gone before—in fact, they had come very near the boundary line beyond which it would be impossible for anyone to go. He described in detail the principles of construction of his own aeroplane and the accidents which befell it. He was strongly of opinion that very much better results could now be obtained with petroleum motors than he obtained with the assistance of steam. Mr. Wm. Marriott next read a paper on atmospheric currents, and this was followed by one by Mr. Eric Stuart Bruce, on navigable balloons and the scientific aspects of M. Santos Dumont's experiments. Having traced the history of the experiments made from time to time, and described the feat accomplished by M. Dumont, he said that he was the first who had steered a balloon from a given point around a given point and back within a given time. At the time he started the force of the wind was $4\frac{1}{2}$ metres per second, and when he rounded the Eiffel Tower it had increased to 6 1-10 metres per second. He

advocated the carrying of parachutes on experiments of this kind in future in the interests of the safety of the aeronauts.

Motor-Balloons to Order.

M. SANTOS-DUMONT'S daring flights have induced the Motor Power Company to make flying machines or steerable balloons for sale. Their production is called the Napier Flying Machine, and according to a letter received this week, they are prepared to take orders at once. The balloon will be 75 ft. long by 25 ft. greatest diameter, having a capacity of about 25,000 cubic feet; it will be fitted with air-bag for equalising the pressure. The under-frame will be 50 ft. long, and take the form of a latticed girder, made of aluminium or other suitable material. The motive power will be supplied by a Napier four-cylinder water-cooled petrol motor, with electric ignition, to give not less than 14 h.p. on the brake, connection with the propelling shaft to be by means of a friction clutch as used on motor-cars. Steering will be controlled either by a rudder or by altering the direction of the propeller. The propeller will be designed as may be found best with due regard to speed and power of motor, while an air-pump for maintaining pressure in balloon is to be arranged to drive off motor. The lifting power of the balloon, after subtracting its own weight, is estimated at about 1,400 lbs. From America also comes the news that for a retail price of £400 a machine which will be an automobile on terra firma and a flying machine in the air will be placed on the market within the next half-year by Mr. Gustave Whitehead, of Bridgeport. The Whitehead vehicle is operated by steam, and immense wings and a propeller move it through the air. It also has an automobile running gear, upon which it is speeded along the road until it has secured sufficient momentum to rise in the air, and upon which it again runs when it is brought to earth from the air. Whitehead says that when he first conceived the idea of a flying machine he noticed that birds run a few feet on the ground to gain headway before soaring, and he thereupon allied his invention with motor-cars for that reason. He is confident that his apparatus can make forty-five miles an hour. But *qui vivra verra*.

Brake Tests.

AT a recent meeting of the Committee of the A.C.G.B.I. the Secretary suggested that, in reference to the legislation question, a trial should be organised by the Club of twelve vehicles of varying types on, say, Hartford Bridge Flats, in the presence of the inspectors of the Local Government Board and the Justices of the Peace, with a view of obtaining accurate and incontestable records of the space within which a motor-vehicle can be stopped when driven at high speeds. He suggested that the vehicles should be driven over a mile, and the speed of the vehicle should be thus ascertained, and that witnesses on board the vehicle should certify that the speed of the vehicle remained unaltered until the signal was given for the vehicle to stop. The Committee decided that the suggestion should be adopted. It was also suggested that if possible this trial might be also utilised for demonstrating how impossible it is for bystanders to accurately gauge the speed of motor-vehicles, and it was agreed that if the Standing Committee found it feasible to carry out this suggestion it should be adopted.

The "Competent Repairer."

THE problem of the supply both of mechanics and repairers is one that may be expected to grow more acute with the ever-increasing use of motor-vehicles, while as yet no organised attempt to meet the question has been made beyond the mere cataloguing of such repairers as can obtain some testimonials to their ability from practical motorists. Really skilled drivers will probably remain for some time scarce enough to command a premium, and the majority of owners are necessarily content to provide or obtain some sort of training for their own men, in lieu of employing a qualified mechanic, at the risk of their making use of their newly-acquired know-

ledge to seek a better position. It is the more important in consequence that the services of a skilled motor mechanic should be available in every town, but the methods of attaining this desirable end have hardly yet been considered. It is not easy to get practical experience with the numerous and ever-growing variety of cars, and it is to the manufacturers of these rather than to any others that we should look for an attempt to meet the circumstances. An itinerant instructor, visiting the more promising of the local repairers, might do a good deal by instilling a more accurate knowledge of his type of vehicle, while the fact of such a method of benefiting the users thereof being adopted would be a good advertisement. We fear, however, that there is too little direct profit in the idea to appeal to British makers, though it would not be surprising if some of their Transatlantic rivals were to adopt it.

Versatility of the Automobile.

THE versatility of the automobile is second only to its ubiquity. We have heard of it in the desert, on mountain peaks, never trodden by horse's hoof, and seldom by the foot of man, and one is at present on its way to the North Pole. The uses to which it has been put are as varied as its travels. It can catch a thief or a horse-stealer, drive a threshing machine or chaff cutter, and generate power for an electric searchlight on a battlefield. But, perhaps, the most ingenious use to which it has yet been put is that discovered by some French poachers, who are with its aid well on the way to ridding their part of the country of its game. The motor-car is driven into a wood at night, and a powerful acetylene lamp with which it is provided set going. The birds of the air are immediately attracted by the brilliant light, and on approaching it are easily taken in nets. A record bag secured in a minimum of time, the poachers avail themselves of the high speed of their vehicle to place a safe distance between the scene of the *battue* and the disposal of their spoil. Operations are simplified by a trespass being quite unnecessary. The strong light exhibited anywhere near a wood is sufficient to attract the game in flocks.

Automobile Law in Portugal.

ALTHOUGH the motor-car is at present more conspicuous by its absence than its presence in Portugal, legislators have wisely framed laws which will regulate its inevitable circulation. Speed must not exceed thirty kilometres per hour in the open, or ten kilometres in towns, villages, or down hills. Two brakes must be fitted to all vehicles, each in itself capable of holding them on the steepest hill. Vehicles of over 350 kilos in weight must be fitted with a reverse motion. All must carry two side-lights, a green and a white, and when a trailer is used that must also carry a red rear light. Number plates will be carried by all, and both driver and vehicle must obtain a certificate, the former of his efficiency to handle his machine, and the latter in proof of government requirements complied with. A fine of ten to one hundred francs is the penalty for a breach of any of the regulations. Road-racing is allowed subject to permission from the governors of provinces through which the route selected passes.

A PROPOSAL has been brought forward in Paris to form a Société de Technique Automobile.

WHEN did the piston ring?—When it heard the band brake.

WHEN was it the wheel spoke?—When it felt the tire rub her (rubber).

IT is now announced that from March 1st, 1902, a motor-car parcels post service will be established between Manchester and Liverpool, serving Warrington and Prescott *en route*. At present the service is being carried on with horse vehicles, but the authorities have entered into a contract with the Motor Haulage Company by which the new arrangement is to come into force.

THE FODEN STEAM WAGON.

THE general design of this steam wagon made by Messrs. E. Foden, Sons and Company, Ltd., of Sandbach, and illustrated herewith, is of a novel and original character. The boiler, which is of the horizontal multi-tubular type, forms the front part of the frame work. The sides of the frame are constructed of strong channel steel tied and braced together in such a manner as to secure great strength in the complete lorry. The main platform of the vehicle is 9 ft. 4 in. by 6 ft. 4 in., and below this is another platform, or well, 9 ft. long by 2 ft. 9 in. wide by 15 in. deep, which can be used conjointly with the top platform, or separately, as a secret chamber for ammunition or valuable goods. The boiler is fired with coke or coal, but can easily be arranged for oil combustion. The wagon is driven by a compound steam engine fixed on the top of the boiler, so as to be readily accessible, and to work with "dry" steam. The cylinders are 4 in. and 6½ in. diameter, and are fitted with a patented high-pressure gear, by means of which both cylinders can in case of emergency receive live steam from the boiler, and each cylinder exhaust independently into the chimney. The reversing motion is of the ordinary link type, and the whole construction of

CONTINENTAL NOTES.

BY "AUTOMAN."

LAST week whilst the *Journal* was going to press the exciting competition for the record speeds for the Hill of Gaillon and also for the level mile were still continuing, and I was only able to send a little note, telling the brief results of the first of these two competitions, which left Rigal at the head of the list for motor cycles, both for the kilometre on the level and the Gaillon Hill. The tricycle on which Rigal has made these wonderful records is made by Darracq, but has a 16 h.p. Buchet motor. Late on the afternoon of Tuesday Rigal tried to lower Osmont's record for the flying mile, but unfortunately a passing carriage caused him to slow down, when he left Osmont's record unbroken.

THE object of these fights for records is self-evident; it is Buchet and De Dion who are struggling to have the best time on record for their motors when the Exhibition opens, and up to the last we may expect this struggle to continue. Such a competition has not occurred since the days when Jenatzy beat the Count de Chasseloup Laubat by thirty-four seconds, and esta-

GENERAL VIEW OF FODEN STEAM WAGON.

engine and steering arrangement is so similar to the Foden traction-engines that any ordinary traction-engine driver can, it is claimed, easily handle the wagon. The power is transmitted by a pair of spur wheels acting on a cushioned compensating gear by two extra strong block chains working side by side. The gearing is arranged for two speeds—9 to 1 and 24 to 1.

The boiler is fed by two pumps, one driven by the engine and the other a separate independent slow double-acting single-cylinder pump, which can be regulated from 2 to 150 strokes per minute. The road wheels are made with cast steel hubs and double dished steel-plate sides, with ¾ in. lapping plate, and shod with steel diagonals 2 in. by ¾ in. The car is mounted on laminated springs, with angle axle guards containing the sliding axle boxes, similar to those on the modern railway carriage.

VISITORS to the Salon de l'Automobile, shortly to be opened in Paris, will find, in addition to the usual good show of motor-cars, some extra attractions this year in the form of air-ships and balloons. M. Deutch's steering balloon, the military balloon, *La France*, and several devices of a similar nature will be on view, as well as many models, designs, and illustrations connected with the same science.

blished a record which it was thought at that time would never be beaten. Now, however, Jenatzy's record is left behind by the tricycles, which look as though they were going to be the fastest vehicles on the road.

WHAT adds interest further to the struggle is the great publicity that has been given to the Buchet motor by its being used in Mr. Santos Dumont's successful air-ship, which has raised such polemics before the Committee of the Aero Club, of which the Count de Dion is a leading member. Each of the competitors is straining every nerve and using every skill and artifice, and the public may calmly look on under the absolute certainty that this fierce competition will bring a benefit to the trade by forcing both these firms to create the best possible motor. It resembles the duel between Panhard and Mors, which has lasted so many years, and which has produced in a very short time a vast progress in automobiles. The *Auto-Velo* has now come forward with an offer of a gold medal for the highest speed attained by any vehicle for a distance of at least one kilometre.

ON Wednesday last week Osmont set to work to lower the record for 100 kilometres on the track, and was more than

successful until, at the 86th kilometre, his pneumatic tire burst, and he was obliged to stop. He was literally frozen. The long-distance records on the track must, I think, be a thing of the past, on account of the fearful wear on the pneumatic tires round the turns. The fact is, a set of tires is used up before a record can be obtained, and it becomes a serious danger to the rider.

THE Union Automobile de France has been liquidated, and the dispute between it and the A.C.F. therefore falls to the ground. There were, however, some good ideas brought forward by the defunct society, although the Committee was foolish enough to fall foul of the A.C.F. and get their organisation excommunicated. The A.C.F. now proposes to take up some of these ideas, and endeavour to put them into successful operation. The Committee has decided to form a new group which will be affiliated to the A.C.F., and which will have a smaller subscription in order to enable the great mass of *chauffeurs* and also provincial automobilists to become members.

THE Swiss Automobile Club has just decided to enter for the Gordon-Bennett Cup for 1902 from Paris to Bordeaux. The challengers are therefore so far, the Belgian, German, and Swiss Automobile Clubs. Germany will no doubt be represented by a Mercedes, and Belgium has several go-ahead manufacturers, and rumour says that Dechamps, who so pluckily contested the Paris-Berlin and the Gaillon Hill competition, will come forward with a new car, and try to wrest the Gordon-Bennett Cup from France.

THE Bordeaux Automobile Club held a hill-climbing trial last Sunday, during which a Serpollet 6 h.p. car driven by Barbereax did the best time, climbing up the 450 metres of 15 per cent. slope in 52sec. Taylor was second on a Korn 6 h.p. carriage, in 1min. 55sec. A 7 h.p. Peugeot and a 4½ h.p. Renault tied for the third place, in 2min. 2sec.

AN international hill-climbing trial in Switzerland seems thoroughly appropriate, and no difficulty should be approved in finding a hill-road with very steep, long, and straight gradients. The Swiss Automobile Club has, therefore, decided to organise next year an international hill-climbing trial, and has written to the A.C.F. asking for its co-operation, which will no doubt be given.

ITALY is the first country to seriously undertake a motodrome. An influential committee has been formed with the object of studying a project for the construction of a velo-auto-hippodrome. The spot chosen is at Monza, about nine miles from Milan, and it is said that the purchase price of the land has already been guaranteed by two rich gentlemen of that town.

AN engineer of the name of Kress, an Austrian, is working on an aviator. In his machine, as the name conveys, he does not employ hydrogen or any gas lighter than the air in order to diminish the comparative weight of his machine with the air, but trusts to powerful fans to raise the machine in conjunction with aeroplanes. He employs a Mercedes motor of 35 h.p. Mr. Kress is determined to continue the trials of his aviator on the Lake of Worth.

TALKING about aviators, I cannot help alluding, before passing from the subject, to the little note from Mr. Sydney H. Hollands with regard to my report on the Exhibition of Aviators held at the Parc des Princes some few weeks ago. My report of this show was not adverse in any way; all I could do was to report without fear and without favour what there was to be seen, and I can assure Mr. Hollands, who seems to have constituted himself as the "guardian angel" of aviators, that as soon as there is the slightest possible success in this direction to be recorded I shall hope to be one of the first to chronicle it if it comes within my Continental Department.

Later news from Italy informs me that in the race between

the Duke d'Abruzzi and M. Coltelletti, of which I have given the readers of the *Journal* an account in last week's issue, the breakdown of the Duke's car was not caused by a stone in the middle of the road, but by the motorist trying to avoid a hippo mobile coming round a corner. The Duke, it seems, was going strong, and only a few hundred yards behind his competitor, when, turning a sharp corner, he saw a carriage coming in the opposite direction at a great speed. In order to avoid a collision he suddenly swerved his car and struck a milestone, so damaging the car that, although a repair was attempted, it was soon seen that it would be impossible to continue. The Duke, I understand, is not discouraged by his accident, and means to issue another challenge very soon.

AN Italian, Count Almerico da Schio, is said to be making an air-ship after the style of the Deutsch prize winner. The hydrogen chamber is to cube 700 metres and to be 33 metres in length by 6½ metres in diameter. It is to have an aluminium keel which will accommodate three passengers, and a Buchet 12 h.p. motor, weighing 78 kilos.

ACCORDING to a telegram received from Vienna, permission to run the great motor race between Paris and that city has officially been granted by the Austrian authorities. No application has yet been made to other Governments on the subject, but it is hoped that the example set by the Viennese officials will be followed by the Powers that be in the other countries concerned. Preparations are accordingly being pushed forward for the great event, and routes have already been mapped out, though a final choice has not yet been made.

WITH the view of raising fresh capital, the Edinburgh Autocar Company, Ltd., is offering for subscription 5,500 7½ per cent. cumulative preference shares of £1 each.

WIND and weather permitting, Mr. C. P. Pollock and the Hon. C. S. Rolls were to make the second ascent of the Aero Club on Thursday, from the Crystal Palace, at 11.30 a.m. No professional aeronaut was to be engaged on this occasion, the balloon being under the management of the gentlemen named. The third ascent of the Aero Club will be made from the Crystal Palace at noon on Wednesday, 11th inst., weather permitting, the passengers being the Hon. C. S. Rolls and Dr. Hutchinson, the balloon being in charge of M. A. E. Gaudron.

THAT most attractive of motoring localities, the New Forest, is about to be equipped with a good repairing establishment. Messrs. Edward Morant, of Brockenhurst Park, Brockenhurst, and Hamilton Dent, of Buckland, Lymington, both members of the Automobile Club, are the originators of the scheme, which is to receive their joint and personal supervision. Lyndhurst is the spot chosen for the works, which will be opened, under the name of the New Forest Motor and Cycle Repairing Works, early in the new year. Accessories and spare parts will be stocked, and a staff of experienced workmen will be in constant attendance.

WE formed one of a half-dozen who on Saturday last attended at the Crystal Palace track to assist at an attempt on making an hour record for the Eagle motor-tandem, a machine very much on the lines of the Century. The attempt was made by Mr. R. Jackson, of the Eagle Engineering and Motor Company, Limited, of Altrincham. Unfortunately, the machine had met with an accident the previous day, as a result of which the frame was slightly strained. Getting away about mid-day in a cold wind, Mr. Jackson covered the first mile in 1 min. 43.1-5 sec. Several of the succeeding miles were done at a faster pace, one being done in 1 min. 37 sec. Ten miles were reeled off in 17 min. 46.1-5 sec., and twenty miles in 34 min. 52.4-5 sec. Just as Mr. Jackson had completed twenty-three miles in 40 min. 3.3-5 sec., one of the front wheel tires went off with a bang, and so the trial had to be abandoned. The tire—a new one—was completely worn through, and yet the single rear driving tire showed absolutely no signs of wear. We may add that Mr. H. H. Griffin held the watch.

THE FILLET CARBURETTOR.

HEREWITH we give a general view of a new carburettor of French design which has just been put on the English market by Mr. A. Godin, of 182, Gray's Inn Road, W.C. It is claimed for the new device, which is made in two types—one for use with automobile motors and one for fixed engines—that it works equally well with either petroleum spirit, pure or carburetted alcohol, and ordinary petroleum. The carburettor comprises two constant-level receptacles, one being intended to feed petrol or alcohol, and the other for heavy oil only. The main part of the device consists of a re-heater and the spraying arrangement. The re-heater is made in two parts, one being for heated air and the other for the heating of ordinary petroleum. As usual, a branch pipe from the silencer conveys a portion of the exhaust gases around the carburettor, the quantity being regulated by means of a tap. Cold air is admitted to the re-heater through a series of adjustable holes towards the bottom

of the device. The exhaust gases, after heating a tubular spiral for petroleum, warm the cold air, without, however, mixing with it. The petroleum is thus warm when it meets the warm air at the spraying nozzle. Should there be an excess of warm air, additional cold air can be admitted through adjustable openings towards the top of the carburettor.

THE Committee of the Automobile Club has decided that the speeches made at the anniversary dinner shall be printed and circulated to the county councillors of England and members of the House of Lords and House of Commons. Mr. Paris Singer has offered to bear the cost of printing and circulating the speeches, which is estimated at £50.

MESSRS. CARBONEL AND SONS, of Marseilles, have established an express transport service for goods between Marseilles, Aix, Lambesc and Salon. The vehicles employed are steam motor-wagons of 35 h.p. At a minimum speed of eight kilometres per hour 10 tons can be carried, and a speed of twenty-five kilometres can be attained when empty.

THE Clipper Tire Company announce that Michelin tires to be used in this country ordered at Stand 1, the gallery, at the Automobile Exhibition, Paris, will be delivered properly licensed. The Paris agents for Clipper Michelin tires are the Société Française des Cycles Clement et Gladiator, 33, Quai Michelet, Levallois-Perret, Seine.

CORRESPONDENCE.

MOTOR-BICYCLES FOR 1902.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The advice of your correspondent, Mr. Teschemaker, to those who contemplate motor-bicycling, which, briefly summed up, appears to read "Don't," is, I think, rather harsh judgment. Unless Mr. Teschemaker refers exclusively to Werners with the motor over the front wheel, or to Singers with the motor inside the rear wheel, I consider his remarks about vibration to be very highly coloured. The position which is evidently going to be adopted by nine out of ten manufacturers—i.e., amidships, so reduces vibration, that, given a comfortable saddle and large tires, it may be put down as nearer 10 per cent. than the 100 per cent. claimed by your esteemed correspondent.

Mr. Teschemaker advises "a few pleasant days in town" as being more conducive to longevity and economy than the purchase of a motor-bicycle; but here again I venture to query the correctness of his views. And last, but not least, do I demur from his instructing novices to gauge the power of belt transmission by pulling the rear wheel round and noticing the slip on the small pulley. Herein lies a fallacy; and, to use a hackneyed expression, Mr. Teschemaker has "got hold of the wrong end of the stick," and would do well to ponder a little elementary dynamics, which may be found in any technical handbook under such heading as "belt driving," together with the simple formula for calculating same.—Yours truly,

A. E. S. CRAIG.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Some words in reply to my fellow Devonian, Mr. Benett, my evidence only relating to practical experience—a literary man being a mere trespasser in the domain of motor engineering—I will then leave the discussion to others.

I have made it clear that I found the Werner, both as regards pace and power, highly efficient. Even on hills, I did better with it than with the "Singer," as the auxiliary pedalling counts for so much in the case of the Werner. And my machine, as now righted, is probably better than it was when bought last June. But I recall many troubles before it was so righted, e.g., cylinder had to be replaced owing to unfixed gudgeon pin slipping out; carburettor tank supports pulled through (this is a common trouble, and will be avoided in the new patterns), belt carrier on wheel worked loose, belt pulley shaft showed considerable side-play, and so on. These troubles, as in "Electrical Engineer's" case, involved (twice with me) a complete overhauling of the whole machine, before it proved really serviceable. It is now certainly a "splendid goer," as I have already stated, but to attain this result I have been put to great inconvenience and not a little expense. Ought this to be? Probably the 1902 Werner with the engine on the head (the M.M.C. pattern) will be the ideal *fine-weather* "scorcher's" mount. I have heard it said that the new "Werner" pattern (centre frame motor), though superior in convenience and in freedom from slip, will not equal the other in speed. This may well be true, and, if so, the fast rider will of course prefer the improved 1901 type. But tests have to be made, and I hope later to be able to report more fully.

Now, as to some of Mr. Benett's points. Yes, the Werner lubrication is messy and dirty as compared with the Minerva. You have to dismount, take off a cap, open an oil can and pour in oil by hand; on a machine, say, like the Phoenix, lubrication is effected by mechanical means. Further, the old oil has to be let out by unscrewing a nut; in the Minerva the lubrication can be done or old oil let out while riding at full speed. As regards petrol storage, Mr. Benett asks if the Minerva can beat his 120 miles storage capacity. Yes; in the Phoenix there is 200 miles capacity. And I must say that I do not at all find that this 120 miles capacity realised in my case, as I refill about every sixty miles; but I have to run usually with open throttle valve for half my runs on account of bad hill country, and this, of course, makes a difference.

Re mud and dust. Yes; the 1901 Werner has a great advantage in the engine being clear of the wheels. But I do not rate the mud convenience so highly, as I have abandoned mud-plugging owing to the refusal of my machine to stand up. A superb goer in fine weather, it is dangerous on grease. The Minerva is not and, probably, the new Werner is equally safe.

Re brake. My opinion is only that of all riders and repairers I know. My 1901 Werner companion wholly supports my view. As my wire connection failed three times, and once nearly let me in for a serious accident, I speak feelingly. Both of us took refuge in Bowdens, which are admirable. With the old brake I could not ride safely down the well-known hill, probably familiar to Mr. Bennett, into Totnes; the slipping of the clips and the opening of the wire loops were too frequent. The drum for the brake is broad and good, but what is the good of this if you cannot keep the brake on it?

Re projections, I refer chiefly to the tank-cap, which has on several occasions torn my understandings. But this is a detail, and easily righted. Finally I urge, give us a good silencer. To conclude, I now find that the improvements I have urged in these columns are practically all to be embodied in the two patterns of 1902 machines, including better lubrication and finish. This is really my best answer to Mr. Bennett. As a rider who has, on the whole, immensely enjoyed his motoring, I feel myself greatly in the debt of the clever "Werner" inventors, and I wish to make it quite clear that my criticisms were simply designed to draw attention to defects in a, generally speaking, admirable design. The Werner, probably in either pattern, will always and justly command popularity.—Yours truly, E. D. FAWCETT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should like to add a few remarks to those already made *re* Werner motor-bicycle. The only difficulty I have been unable to get over is the effect of cold weather on the carburettor. I cannot get the oil to vaporise quick enough to cause an explosion. Possibly there may be some fault with the carburettor, but I do not think so, as at times I have had the air hole nearly full open in warm weather. Last week I tried gasoline (Messrs. Carless, Capel, and Leonard), a much lighter oil, and on the top of Dartmoor, with snow in some places, I was able to start right away, but towards evening the air hole had to be gradually closed and finally no explosions would take place except by injecting oil in the cylinder head. It is not through the oil failing to feed into the carburettor, although I have had trouble with that before now, but no matter what quantity of oil there is in the carburettor, only an occasional weak explosion takes place. Gasoline is no doubt a great improvement for cold weather, but not good enough. Even the latter end of the summer, on a cold morning, I always had to pour a kettle of hot water on the oil tank before I could start. If any of your readers have tried this bicycle in cold climates and found different results, I should be glad of suggestions.

I may say I have never even seen any motor-bicycle but my own and never had any personal instruction in management, so there may be something I have not yet understood, although I have had a mechanical and electrical training. It has struck me, failing the use of the exhaust gases to warm up the oil as in the motor trike, a resistance coil at the bottom of the carburettor, connected, when necessary, with the accumulator, might warm up sufficiently, but this would probably be wasteful of battery power. However, notwithstanding the fact that perhaps most people do not care to go thirty miles an hour against a freezing wind, I think the machine should be capable of use under those conditions.

I may say, taking the machine all round, I was more than pleased and surprised at its power back in the summer when I bought it, and I have during the time I have had it taken every hill from Plymouth through Princetown to Moreton Hampstead, and anyone who knows that road will appreciate this. I have tried and failed at Dartmoor Hill on both sides, what the gradient is I do not know, but I managed to get half way up on the Princetown side—the sandy soil is against hill-climbing there. In conclusion, I should like to repeat the advice given to

me by cycle agents and travellers:—Do not have a motor-bicycle unless you understand its working and can take it to pieces and find out the cause of anything going wrong.—Yours truly, LATE ELECTRICAL ENGINEER.

AN IGNITION TESTING DEVICE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having been "hung up" by a fault in the primary circuit of my electric ignition, I devised the arrangement illustrated herewith for its detection, and by its means I was enabled to locate it in a minute or two. A is a boxwood sparking-plug case with two terminals screwed into the lower end and in which is fitted a four-volt lamp. The wires from the lamp were first placed in position and the box nearly filled with plaster of Paris. B is a cobbler's awl; C is a flexible insulated wire about 12 ft. long; D is a flexible insulated wire about 2 ft. long. One end of D is soldered to the piece of the awl near the handle, the other end is connected to A by one of the terminals. One end of C is connected with the other terminal on A.

To locate a fault: (a) Disconnect the wire which leads to earth from the battery; (b) adjust the contact breaker or trembler screw in such a manner that there is good continuous contact; (c) connect the free end of the wire C to the free terminal of the battery; (d) see that the switch is "on" and the "touche" pin in place; (e) hold the lamp in the left hand and the awl in the right, and with point of the awl puncture the insulated wire on the car or touch the free metal at the connections. If the lamp lights, the wire between the point touched and the battery is sound, and *vice versa*.

The advantages of the method are: (1) A light is more easily seen than the needle of a galvanometer. (2) The awl enables one to quickly locate a fault even in a flexible insulated wire such as occasionally occurs in a De Dion trembler—Yours truly, G. WASHINGTON ISAAC.

THE SMART SURREY POLICE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—On Friday last, at the top of Merstham Hill, I was stopped by one of the above force for emitting steam from my International Benz car, but after holding a strong argument for about ten minutes I was informed that I could continue on my journey, which was to the National Cycle Show at the Palace. This is the second time I have been stopped for the same offence. Can any of your readers inform me how I can prevent the steam from showing out of the exhaust pipe after ascending hills, as I find at the present time it is not safe to drive a car in this neighbourhood which shows any steam?—Yours truly,

S. W. FULLER.

QUERIES RE IGNITION.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—All owners of De Dion voitures or cycles will endorse the remarks of your correspondent, "Ten Miles from Anywhere," which appeared in the last issue of your journal; for assuredly every one of them has had trouble with the trembler method of ignition. After considerable experience with all three systems I am of opinion that both the Simms-Bosch and the wipe contact methods are infinitely preferable to the trembler and platinum tipped screw arrangement.

For six months I used regularly in Paris a De Dion tricycle fitted with the Simms-Bosch ignition, and during the whole of that period I had no trouble with the system whatever, except in two minor details, since satisfactorily overcome by the Automatic Magneto Electric Company. The spark, in common with all those produced by rupture, is extremely hot, and fires almost any mixture; while, the tension of the current being low, short circuiting is practically unknown. The system requires careful initial attachment and adjustment, but, given these conditions, it is, in my opinion, an ideal method of ignition.

With regard to the wipe contact system, it may interest your correspondent to learn that I have found the employment of a Bassée et Michel *interrupteur* and coil, fitted with a trembler (Carpentier's for choice), gives most excellent results, and diminishes ignition troubles to almost vanishing point.—Yours faithfully,

ERNEST M. C. INSTONE.

THE SOUTHSEA RUN AND A SUGGESTION.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—What would have been a splendid parade through the streets of London, and other places, of a unique show of over two hundred motor-cars, although a success as far as it went, would have been much more so had it not been for the London fog which prevented many cars from joining, and prevented thousands of people from viewing the procession of those brought to Whitehall under very great difficulties. Therefore, from the point of view of familiarising the public with the sight and actions of self-propelling vehicles, a great opportunity was almost entirely lost, especially as far as our Metropolis was concerned.

Indeed it was a great and pleasant surprise to me to find such comparatively long and good accounts of the run to Southsea in most of the London papers, from which we may safely conclude that had there been sunshine, with thousands of spectators along the route, we should at least have been advanced one year in everything pertaining to motoring. Yes, even a year less of prejudice and a year nearer the abolishing of the speed limit.

Then, sir, is it not practicable—is it not desirable—to have a parade on one or two days during the motor-car show next April? There are many reasons for the favourable consideration of this suggestion, some of which are:—More favourable weather; more motorists, more cars and more people interested in motoring in London. The whole of the trade would support such a parade, and undoubtedly the public and the Press would become more interested.

The A.C.G.B.I. should, of course, be the promoters, as in the Glasgow Trials, and would themselves determine if there should be any tests of reliability or not (certainly not of speed).

I would advocate a quiet run to any town twenty to thirty miles out of London, and back before dark; and no car that started on any account (except from breakdowns) to leave the procession till dismissed in London on the return. Much more could be said, but I hope the above will be enough to set all those interested a-thinking, and the A.C.G.B.I. promptly acting to bring about what no doubt would have a very good effect on the non-motoring world.—Yours truly,

W. J. BARNIKEL.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Being the owner of an English-made car, I was invited to take part in the Southsea run on the 16th inst., to assist in demonstrating that British-built cars are as reliable as those imported from the Continent. That I succeeded in doing this, the following will amply testify.

I journeyed to London on Friday, November 15th, from the West of England (150 miles), conveying three passengers and luggage. Started the next morning at 9.45 for Southsea, making an absolutely non-stop run (except at controls), arriving at Winchester 33rd car, and Cosham 24th, at 4.46, still with three passengers. Left Southsea for home (113 miles) with four passengers, at 10.30 on Monday, arriving same evening, making a total run for the three days of 358 miles. Nothing whatever was done to the car, other than lubricating and replenishing petrol tank, excepting tightening two nuts previous to leaving Southsea.

I think few foreign cars taking part in the run could show better results. It is also splendid testimony of the progress made by our own builders, particularly the Motor Manufacturing Company, Ltd., whose 7 h.p. phaeton, supplied to me last spring, I drove with such good and pleasurable results to myself and passengers. I am only an amateur driver, and have no interest in writing you other than to promote the well-doing of our own manufacturers, and to interest possible purchasers.—Yours faithfully,

E. W. HILL.

IMPROVING A MOTOR-TRICYCLE.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—As I have recently converted my motor-tricycle from an instrument of torture to "a thing of beauty and a joy for"—well, until I get a 40 h.p. car, perhaps the process may be interesting to some of your readers. The tricycle had the usual defects: difficulty of starting with the pedals and the tendency of the front wheel to tip up, and perhaps the whole machine going over backwards. Another difficulty (as far as I am concerned, and a good many other people who have written to me), if I may venture to name it, is "the uncertainty of the De Dion ignition."

I thought that a free motor would get over the first difficulty, and a forward chain drive the second. As the space between the motor axle and tricycle axle was too small to allow of the necessary reduction of gear ratio, I decided to try a Crypto gear on the motor-axle, which served the double purpose of reducing the gear and providing a free motor. After waiting seven or eight weeks for a Crypto gear I had ordered I gave it up as a bad job, and, as I was determined not to go back to the old style, I consulted Messrs. Root and Clarke, of Herne Bay, who were altering the tricycle for me, and, to help me out of the difficulty, they took the differential gear out of an old Singer tandem-tricycle. This, with a little alteration, made a first-class epicyclic gear, and was fitted to a new motor-axle, which was twice as long as the old one.

The motor was made to work forward, an eight-tooth tandem-chain wheel was screwed to the plate which carries the two small pinions, a 22-tooth tandem-chain wheel bolted in place of the big brass wheel, and an ordinary cycle chain completed the gear. The motor is started with a small handle, and when running free drives the outer drum backwards. When this is held by a band brake the gear drives the chain-wheel and starts the tricycle without tipping up the front wheel, no matter how suddenly the gear is put in. As soon as the free motor was fixed up I could experiment with the ignition indoors; but, although I tried everything I could think of, I could not get it to act with the unfailing regularity I so much desired, so I decided to fit the Benz ignition. Mr. Blake changed my coil for one with a trembler, and made me a fibre cam with brass connections to put on in place of the De Dion cam. I used the ordinary De Dion trembler for the make and break, and now I am certain of getting a splendid spark which never fails, and when the mixture is anywhere near right will start with the first pull-over of the handle every time. I have had the brake on the gear connected to the right-hand brake lever on the tricycle.

Now I start the motor indoors, wheel the tricycle out, take my seat, put the brake on, and start like a car. I have the brake lever held on by a catch, and slow up by switching the spark off and on in the usual way by the handle switch. I have taken the tricycle out, and made six or seven calls of a minute or two each with the motor running all the time. I have tried the new

ignition for speed with the motor running full, and on advancing the spark it keeps on increasing in speed up to, I should think, about 2,000 revolutions a minute, when I switch it off for fear of shaking the tricycle to pieces.—Yours faithfully.

CYRIL SCOTT.

A RUN ON A WERNER IN A THICK FOG.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Being a motor cyclist and a constant reader of your paper, I thought you might like to have an account of a short run in the fog on Sunday, November 3rd. I had asked a cousin who has just returned from South Africa to take the seat in my Milford trailer, and sample the pleasure of being pushed, or rather, in his case, being pulled by a pint of paraffin. When my companion turned up in the morning I was afraid that we should not be able to go for our ride, as the petrol that I had ordered several days before never turned up. This was most annoying. However, I determined to start and take my chance of filling up the tank on the road. I found no difficulty in pedalling the machine and trailer along the Bayswater Road, and we had a fine free wheel run down Notting Hill to Uxbridge Road Station. The heavy Werner, with its addenda, seemed to get up a great pace down the hill, and I heard somebody remark as we dashed by that it was a very silent motor, probably electric! In the Goldhawk Road we procured a can of Pratt's motor spirit, with which we filled our tank and ran nicely and at a good pace to Maidenhead. We put up at The Bear and had a good hot lunch, which was much appreciated after our chilling in the cold, wet fog. The landlord, who was an old Lancer, had a long yarn with us about the war, so the time passed quickly, and we decided to return instead of going to Reading. The return journey was decidedly exciting as the fog became much thicker, and it was impossible to see a yard or two ahead. A large motor-car was following in our wake, *teufel-tufing* all the way. So it was a case of being between the devil and the deep sea. We managed to keep the lead until nearing Hounslow, where we slowed up as our engine was evidently getting tired. After this we came along at a more moderate pace and overtook the car, which had stopped to light up. We pulled up alongside of them to light our acetylene lamp and adjust the trembler when they very kindly offered us assistance, which, luckily, we were not in need of. From here I found it extremely difficult to follow the tram lines even with the aid of a powerful lamp. The huge electric cars looked weird as they passed in the fog like ships in the night. We overtook those going our way, so there was no danger of being run down. At Uxbridge Road Station we had to get off and walk up the hill, as it was impossible to see a yard in front of us. The road was filled with buses and other vehicles wandering about trying to find their way by means of lanterns and torches. Curiously enough when we passed Notting Hill Gate Station it became much lighter, and it was fairly clear all the way to Dorset Square, which we reached in time for a cup of late afternoon tea. As everybody knows, motor-cycles are peculiarly sensitive to atmospheric changes, and I do not think it would be possible to have had worse conditions.

With regard to the Werner, I must say, after a thorough trial of over a thousand miles, that it is a splendid little machine, and I doubt if any of the 1902 productions of the same power will equal the records of this year's front driver. Many people object to the position of the engine, to which, to my mind, the success of this motor-bicycle is probably due. I have never ridden any machine that steers better, its natural tendency is to run straight. The high position of the engine keeps it clean and cool. The improvements that would naturally suggest themselves to any practical rider would be the now Hub two-speed gear, a powerful back pedalling rim brake, a valve lifter, and a slightly more powerful engine for a heavy man or record breaking. My advice for those going in for this sport is, do not throw your money away on any freaks or weak machines with a motor stuck on. They may look very nice on the show bench, but will soon rattle to pieces on the road.—Yours truly,

J. WARREN DAVIS, M.R.C.S.Eng., etc.

A DAY AT CHERTSEY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—A pressing invitation from the powers that be led to my spending a long though by no means a happy day at the Court House at Chertsey last week. The law, it is said, is a *hass*! but that is surely no reason why a body of half-a-dozen worthy English gentlemen, called upon to administer justice, should apparently sacrifice their common sense to lend colour to this oft repeated statement. The first case submitted for impartial judgment was a charge of furious driving—motor, of course—on the Anniversary Saturday. The victim, a well-known and respected gentleman, denied the charge, and then that valiant champion of the oppressed automobilist, Mr. Staplee Firth, proceeded to do battle for him in gallant style. But in the inspector he met a doughty opponent, and soon the air grew thick; "lie," "confounded lie," and other expressions in vigorous English penetrated the murky atmosphere as the battle raged. Mr. Firth impetuous and indignant, the inspector smiling and dogged. "An infamous trap, degrading to the police," was how Mr. Firth characterised the inspector's little plans for catching the automobilist. The method adopted is, of course, familiar to your readers from reports of previous similar cases. Twenty-five miles an hour said the inspector, ten miles an hour said the English gentleman; decision, a fine of forty shillings plus costs.

In the next case the victim was of kindred order and again the strife waged merrily. Here the defendant was admitted to be a gentleman of some standing in the county; on his oath he said he was not exceeding twelve miles an hour, and that he was paying special attention to the speed, having been warned of the pitfalls that awaited him. His engineer confirmed his statements, but alas, the truth was not in him, for again the urbane inspector triumphed; fine, 30s. and costs.

The case that followed presented a little variety, inasmuch as it was a double-barrelled charge, viz., that the wicked man had driven two vehicles at the lightning speed of over six miles per hour. The courteous inspector here left the realms of fanciful twenties and twenty-fives per hour, and grovelled in a paltry twelve. The first part of the charge, "that a tricycle and trailer constituted two vehicles," was decided by the court against the defendant, but fortune and Mr. Firth's clever pleading saved him on the charge of exceeding six miles an hour, and the lucky man was acquitted. There remained two more motor cases to be heard, both at the instance of the ubiquitous inspector, one being that of another tricycle and trailer, and the other a charge of exceeding four miles per hour with a steam locomotive, this charge being based on the fact that the car, a "steamer," was emitting a cloud of steam. The driver of the tricycle and trailer was held to have exceeded the pace of six miles an hour, and had to pay a fine of 20s. The case of the "steamer," however, had not terminated when I left.

Mr. Staplee Firth had a long and arduous day, and fought his cases well. For the inspector, too, I must say a good word: he's a clever man, but out of place. With a few like him in South Africa the war would, I am convinced, finish in a twinkling; for with tape and watch he'd trap the Boers on his favourite quarter-mile.—Yours truly, A VICTIM.

MR. F. R. HATCHER writes: "Petrol for motor-bicycles. Referring to a letter signed 'Lock Nut,' any quantity of petrol (Carless' or Pratt's), from a quart upwards, can be obtained at the Saracen's Head Hotel, Dunstable, and I hope at every other hotel throughout the country, where the proprietors are alive to the fact that motors bring them business."

MESSRS. TIMSON, BULLOCK, AND BARBER, of Montagu Street, Kettering, are now keeping a stock of motor accessories, and are able to carry out repairs to all types of motor vehicles.

UNDER the name "British Tyre Restorer and Repairer," Mr. H. R. A. Philp, of Pailton, Rugby, has introduced a preparation which can be painted on the sides of the tires on motor-cycles and which it is claimed not only prevents cracking, but will often enable an old and cracked tire to be put to a fresh period of service.

THE STRAKER STEAM LORRY.

THE accompanying illustrations show the military steam lorry and trailer designed and constructed by the Straker Steam Vehicle Company, Limited, 9, Bush Lane, London, E.C., to the special requirements of the War Office. The vehicle is 18 ft. 6 in. long by 7 ft. in extreme width. The wheel base is 10 ft. 5 in., and the wheel gauge, from centre to centre of driving tires,

being 200 lbs. per sq. in. It is constructed to the requirements of the Manchester Steam Users Association, is rivetless, affords special access for disconnecting and cleaning, and is provided with a superheater. The engine is of special compound horizontal reversing type, having cylinders 4 in. and 7 in. by 7 in. stroke, the normal speed being 400 revolutions per minute. The valve gear is of the company's design, permitting of linking up. The power developed at 400 revolutions per minute is about 25 i.h.p. The power is transmitted from the engine to the countershaft, at

FIG. 1.—SIDE ELEVATION OF STRAKER STEAM WAGON.

FIG. 2.—SIDE ELEVATION OF STRAKER TRAILER.

FIG. 3.—FRONT ELEVATION OF STRAKER STEAM WAGON.

5 ft. 10½ in. The leading wheels are 2 ft. 9 in. in diameter by 5 in. in width, and the back wheels are 4 ft. 6 in. in diameter with 9 in. tires, the latter having "stropes" secured to same. The leading axle is mounted on a central pivot under the boiler, and takes the weight of that portion of the vehicle through anti-friction bearings, thus obtaining a three-point support, which relieves the frame from any undue transverse strain, and secures great ease in steering. The body of the vehicle is constructed of well-seasoned timber, and framed up with removable stanchions and sides 2 ft. in height. The superficial area is 48 sq. ft. The boiler is of the Straker Company's water-tube type, and contains 70 sq. ft. of heating surface and 2.2 of grate area, the working pressure

two useful ratios, giving speeds at from two to eight miles per hour. The countershaft also carries a sprocket pinion driving direct to back axle through the medium of a specially constructed chain capable of withstanding a working strain of twenty tons. The back axle is provided with device for locking the differential gear; it rotates in hard gun-metal bearings and, through the medium of axle-boxes, is secured to steel laminated springs bearing on the channel frame. Powerful brakes are provided, while there is accommodation for sufficient fuel for a day's requirements. A four-wheeled trailer is connected to the back of the vehicle, the platform area being 45 square feet. The lorry and trailer are intended for a load of 5 tons.

THE "BELLE" PETROL CAR.

REFERENCE has already been made in these columns to the new petroleum-spirit car which Mr. E. J. Coles, of Upper Holloway, is putting on the market. On Saturday last we had a brief run on the new vehicle, of which we are now able to publish an illustration and a brief description. The engine is carried at an angle of about 45 degrees under a bonnet in the fore part of a channel steel frame, with the explosion chamber forward and at the highest level. The normal speed is 800 revolutions per minute, at which the motor develops 6 h.p. The cylinder, which is water jacketed, is cast in one piece, while the valves are so arranged that by unscrewing two nuts they can be quickly removed; another advantage being that no packing is needed. A surface carburettor is employed to furnish the explosive mixture, while electrical ignition is, of course, adopted. Coming now to the transmission, a single belt, working on fast and loose pulleys, connects the engine with the countershaft. The latter carries a train of spur wheels, any one of which can be made to mesh with corresponding pinions on an intermediary shaft, from which the power is conveyed to the rear road wheels by the usual duplicate set of chains and chain wheels. The variable gear,

BIRD'S-EYE VIEW OF "BELLE" CAR.

which is enclosed in an oil-containing case, is adapted to give three speeds ahead and one reverse. A single lever controls the forward speeds, while a pedal actuates the reverse motion. Inclined wheel steering is fitted, while the road wheels are of the artillery type shod with pneumatic or solid rubber tires at the desire of the customer. The belt-striking gear is operated by a pedal, as also are the band brakes on the hubs of the rear wheels and the band brake on the countershaft. Special attention has been paid to the question of brakes. Those on the rear wheel hubs are of large size, while that on the countershaft is water-cooled; in addition to these, hand-operated brakes acting direct on the rear wheel tires are also provided. A novel feature of the car is the combined radiator and water tank. The latter is located in the fore part of the frame, and is in two portions, connected together by a series of what, at first glance, appear to be thin plates, but which, on close inspection, prove to be flattened tubes. The car we tried the other day was an unfinished *tonneau*, with solid tires. It appeared to run very quietly and took the hills that came in our way at a good pace. The frame carrying the engine and all the gearing, any type of carriage body can be fitted, although we understand that the *tonneau* and phaeton styles will be adopted as standards. Complete, the car weighs about 8½ cwt., and on average roads can attain a speed of 25 miles per hour.

FLOTSAM AND JETSAM.

By "FLANEUR."

IF only it could be realised, the proposal which has emanated from Vienna as to the itinerary to be followed by the tourists' section of the Paris-Vienna race of 1902 would be ideal; it is to be feared, however, that the scheme is quite impracticable. The suggested route is from Paris to Geneva, by way of Dijon, thence up the Rhone Valley road to Sion, Brieg and Gletsch; over the Furka Pass to Andermatt; over the Oberalp Pass to Disentis, and on to Tiefenkasten by Ilanz and Thusis; over the Julier Pass to Silvaplana, St. Moritz, and Pontresina; over the Bernina Pass to Tirano; over the Stelvio Pass to Prad, and thence eastward through Meran, Botzen, Toblach, Klagenfurth, and Graz to Vienna.

THIS route would whip the cream off Alpine scenery so far as it is visible from main roads. But there are serious obstacles. The most vital is the fact that it is a hundred to one against the Swiss Government permitting motor-cars on the Furka, Oberalp, Julier, and Bernina Passes, or in the Engadine. The only passes on which automobiles are at present allowed are the St. Gothard and the Simplon. As the Paris-Vienna race would probably take place in the height of the Swiss tourist season, it is unlikely in the extreme that the Swiss authorities would allow the diligence traffic to be affected by the passing of large numbers of cars, for the horses are certain to be frightened, and serious accidents might ensue. This difficulty apart, however, the suitability of the route to automobilists themselves is not without objection. The Furka Pass has been in very poor condition this year, and may be worse next summer. The road, too, from Disentis to Thusis is altogether too narrow, too dusty in dry weather, and too muddy in wet, for the passage of motor-cars, racing or non racing. I have been over this route twice—this summer and two years ago—and can speak with emphasis. Of late, too, the Engadine road has lost its former high quality, and in parts is narrow as well.

FROM my experience of French, Swiss, Italian, and Austrian roads, coupled with a consideration of the routes which are declared "taboo" by the Swiss authorities, I should be inclined to suggest the following as the most practicable routes from Paris:—(1) Dijon, Geneva, Basle, Zurich, Schaffhausen, Constance, Innsbruck, Botzen, Toblach, etc., to Vienna; (2) Geneva, Brieg, over the Simplon Pass to Domo d'Ossola, along Lake Maggiore to Arona, then to Milan, Lecco, along Lake Como to Colico, thence to Sondrio, Tresenda, and Tirano, and over the Stelvio Pass, as per the original route. The second journey would be longer than the first, but more picturesque. Neither, however, would be as striking as the Viennese proposition, and as I have been over the greater portion of all three routes I can speak impartially; but that the first proposal will ever be carried out I take leave to doubt very strongly.

WHILE very far from desirous of questioning the good intentions of the *Daily Mail* in advocating the standardisation of the small car, the writer of the argument in favour of a uniform specification of "weight, horse-power, and measurements" appears, at all events, as hopelessly at sea. A maker builds his car according to his individual judgment, and if one believes in wooden wheels and another in tangent spokes of wire, who is to decide which type shall be the standard, and what is to prevent the minority from acting up to its beliefs, even if a majority agree to regard one type as standard? If one maker, moreover, is willing to give an 8 h.p. car at the same price as that of another maker's 5 h.p., with other factors equal, why should the public be debarred from the opportunity of acquiring the more powerful car?

THEN, again, the public itself has to be considered, even if the trade conspired with complete unanimity. Supposing makers all agreed to fit artillery wheels; there would be those who

would demand the wire pattern, and *vice versa*. The trade might further agree to fit phaeton bodies only to small-priced cars; must those who wanted *tonneaus* be compelled to buy a more expensive vehicle? In the matter of weight, again; if ten hundredweight were an accepted standard, is a maker to be prevented from stating his opinion that eleven represents the minimum weight that is safe, or another maker from declaring his opinion that he could make a car at nine as strong as any standard type? It is entirely impossible to get the manufacturers to agree to such narrow limitations as the *Daily Mail* suggests; and what is still more important, if the trade itself agreed, the public would demand originality and variety at once, as well as that ancient right of selection which is familiarly expressed in the apothegm that "He that pays the piper shall call the tune."

"THE Most Sensational Motor Ride" is the title of an

of the Capitol at Washington on a safety bicycle. But this statement, if made, may have been a bit of *réclame* to lend interest to his latest feat. At the same time, I know Kilpatrick to be a man of immense pluck, having made his acquaintance two or three years ago, when he came to ask my advice on a project he was then maturing.

THERE is a perfect epidemic, by the way, of illustrated references to motor-cars in the various current publications. The same number of the *Strand* has a story, eminently silly, under the title of "Lord Beden's Motor," and it contains various illustrations of a race between an impossible car, which is supposed to be real, and another which is admittedly spectral. In one picture the cars are seen descending a hill with a gradient of one in two! The familiar artistic error is also perpetrated of making a car go round a corner with its inside wheels off the ground instead of the outer, if any left the ground at all. In the Christmas number

THE WINNER OF THE RECENT ITALIAN MATCH, M. COLTELLETTI, ON HIS 24 H.P. PANHARD.
(*La France Automobile*.)

article in the *Strand Magazine* of the current month, by Winston Spencer, wherein is described a rush down a specially-prepared "chute" on a "Mobile" car by Charles Kilpatrick. He is described as first ascending under high steam pressure, turning at the top, and then descending with a straight run. The chute is stated to be only six inches wider than the car, but the photographs accompanying the article show the fact to be otherwise. Somehow the feat, though daring, does not appear so difficult as is sought to be proved, assuming that the boards are free from projections of any kind. Everyone knows that a car never runs in such a bee line as when running free down a smooth hill, and the only factor that seems difficult is the form of steering with which the car is provided, namely, the old and easily swayed tiller, set parallel to the direction of the machine. The only testimony that appeals to me is that of Kilpatrick himself, who is reported to have said that riding down this chute is a severer tax upon his nerves than his famous feat of descending the steps

of *Punch* is a hunting sketch, with the following explanation appended:—"It was most unfortunate. The first time Mr. and Mrs. Spool used their new motor-car to drive to the meet, something went wrong, and the wretched thing bolted for fifty or sixty miles before it could be pulled up." Is not this excruciatingly funny? How pleased the artist must have felt when he evolved this "joke." But had he been making harmless sport out of an ordinary huntsman he would have depicted some humorous incident that was not absolutely impossible, and would not have represented, say, a horse spinning round on its tail, or balancing itself on one foot, or tying itself in a knot. Yet none of these is more absurd than the supposition that a motor-car can "bolt." The essence of legitimate caricature is exaggeration, coupled with the element of immediate "recognisability," if one may coin the word. In the same way a comic reference to a motor-car, however exaggerated, should not be fatuously impossible if it is to possess any quality of humour at all.

MOTORING UNDER DIFFICULTIES.

TO see a motor-car, like a thing of life, running smoothly over a level road carrying its occupants swiftly from one fair landscape to another excites the envy and admiration of the pedestrian. But, as Burns says—

"Pleasures are like poppies spread,
You seize the flower, its bloom is shed."

In our variable climate the pleasures and troubles of motoring are never very far apart. This I discovered on my cost during a recent journey between Glasgow and Coventry. I was ordered to bring a large motor-car which had been on view in the Glasgow Exhibition back to the works at Coventry.

Leaving the "second city of the Empire" on a beautiful Saturday morning I passed through Edinburgh at noon, and put up for the night at the border town of Berwick. Sunday morning was foggy, but as the sun rose in the heavens the fog disappeared and, there being no farmers' carts about, I put on top speed and rattled gaily along through Alnwick and Morpeth. On this bit of hard road with a bracing wind from the German Ocean in my face, I experienced all the exhilaration of a morning's canter on a good horse.

I arrived at Newcastle at midday, and was surprised at the wonderful difference between its Sunday and week-day aspects. It was quite clean and comfortable looking, and, seeing it then, it was easy to understand why it had been named "the cannie town." Leaving it after lunch, I was soon within sight of Durham, but the fog had fallen on the old cathedral towers and was slowly blotting out the landscape. I had to light up long before the regulation time as the fog wrapped everything in its clammy embrace. I had intended to reach York that night, but was glad to put up at Darlington. Had I been a gentleman of leisure on my own car I would have remained there till the weather and the roads improved, but, being only a travelling motor-car salesman, I was bound to continue my journey, and so in a drizzling wet morning I left Darlington and made my way before nightfall to Bradford. There I found a telegram to proceed at once to Blackpool and await orders. The car was in such a shocking state with mud that I stayed in Bradford over night. With the help of the hotel hostler next morning I got the chains off, which were like bars of iron, and then with the aid of a hose we "discovered" the wheels. When all was ready I was loth to leave a comfortable hostelry and face the weather.

"An sic a day to tak' the road in
As ne'er poor sinner was abroad in."

But there was no help for it, and so, encased in waterproofs like a North Sea pilot, I wended my way at half speed through dirty mining villages to Todmorden—between which place and Blackburn I met the *piece de resistance* of the journey. The rain was so heavy that every few minutes I had to stand up to shake the water out of my lap. Locomotion was of the slowest and, to add to my dismay, I saw a long steep hill before me which must be negotiated. There was no detour, and so, like Buller at Colenso, I made a frontal attack and tried to rush it. Its three-inch coating of black mud was, however, as fatal to my progress as the Boers' barbed wire was to Buller, and I stuck fast. For half an hour I waited anxiously for reinforcements, but not a soul was to be seen. There I was, stuck at the foot of this Hill Difficulty on a 25-cwt. motor-car with the rain pelting in my face.

The Scotch proverb "Put a stout heart to a steep brae" came to mind, and acting on it I got out and made a reconnaissance. The wheels, chains, gearing, and lower part of the body were simply one mass of mud. I scraped the chains a bit clean, and put some oil on them. I then put the motor into gear, jumped down, and pushed behind to give it a start—then jumped up to steer it. In this way I progressed some forty or fifty yards, when the vehicle again came to a standstill. This process I repeated some score of times, and at last I gained the top utterly exhausted. Passing on through Blackburn and Preston I came to a toll-bar, where I had sixpence to pay. My doe-skin gloves refused to come off, having positively stuck to my fingers, and

the toll-keeper cut one off with a knife, so that I might get into my pocket to pay him.

Long after nightfall there might have been seen crawling into the tripper-deserted town of Blackpool a weird-looking motor-car begirt with mud from keel to sky-scraper and with a woe-begone skipper at the wheel.

WILLIAM GLASS.

HERE AND THERE.

WESTON MOTORS have made a contribution of £3 3s. to the funds of the Motor Union.

THE Thornycroft Steam Wagon Company are building a steam dust wagon for the Acton Urban District Council.

WE had a trial run on the new Speed-King 8 h.p. light car the other day, and were much impressed by its sweet running and hill-climbing powers. We hope to refer to Messrs. Dennis' latest production at length in an early issue.

THAT the Benz cars are maintaining their popularity is evidenced by the fact that for the last financial year a dividend of 25 per cent. has been declared by Messrs. Hewetsons, Limited, the British agents for these vehicles.

THE new motor fire tender of the borough of Eccles, recently illustrated in our columns, turned out to a fire one day last week for the first time. The horse tender was also ordered out, but the motor was first to arrive at the fire, which proved a trivial affair.

THE Locomobile Company of America have been awarded the medal (first prize), in the steam voiturette class at the recent hill-climbing competition at Gaillon, France. Another medal and a diploma for Locomobiles was also received for the same event.

IT has been suggested that there may be some members of the Automobile Club who do not intend to spend Christmas in London, and who would like to join other members in a run to the South Coast, to stay over Christmas at an hotel at one of the southern watering places. Members who wish to take part in such a tour are requested to communicate with the Secretary.

THE Fleuss Patent Automatic Boiler-Feed and Motor-Car Syndicate, Limited, has been registered with a capital of £12,000 to adopt an agreement with H. A. Fleuss and W. J. Watts, and to carry on the business of manufacturers of and dealers in steam boiler-feed apparatus, builders of steam engines, motors, motor-cars, etc. The registered office is at 15, Bury Street, St. Mary Axe, E.C.

MR. PARKER THOMAS, who is about to sever his connection with the Aberdare Valley Motor Company, with which he has for some time past been associated, is now engaged in the formation of the South Wales Motor Company, Limited, which will shortly open extensive premises in Cardiff, where a good selection of cars and accessories will be stocked, and repairs undertaken.

AT a meeting of the Lincolnshire Automobile Club on the 23rd ult. a lecture was given by Dr. E. Cragg, of Billingborough, on "Automobilism from a practical point of view." Dr. Cragg dealt with the subject in a most interesting and practical manner, and at the conclusion of the lecture a discussion followed, in which a large number of members and others took part. The lecture and discussion dealt with many points of interest to automobilists, and it is intended to arrange similar lectures during the winter. The general annual meeting of the Club will be held on Friday, January 10th.

THE Committee of the A.C.G.B.I. have decided to recommend to the Administrative Committee that, providing the funds of the Club will allow of it, a donation of £5 5s. should be given to the benevolent funds of the borough and county police forces in recognition of the extra trouble and prolonged hours of service which were involved on the police by the Anniversary Run. The Committee recommend that the donations should be made to the benevolent funds of the police forces of the Borough of Winchester, the Borough of Portsmouth, the Metropolitan Police, and the Counties of Middlesex and Hampshire.

THE other day we visited the depot of the City and Suburban Electric Carriage Company, at Denman Street, Piccadilly, W., and were pleasantly surprised at the long list of names shown us of users of electrical vehicles in the West End, a list which, by the way, is steadily extending. To facilitate the use of electrical vehicles the company have made arrangements to maintain and charge the batteries as often as desired at a fixed annual sum.

THE accompanying illustration shows the "Millennium" motor jack, which has just been put on the market by Messrs. Lake and Elliott, of Braintree, Essex. The jack, which will lift a weight of 10 cwt., is worked in a similar manner to a ratchet brace, a raising or lowering motion being imparted to the screw by turning the milled ratchet head. The handle is pivoted, and can be worked at any angle found convenient, while when not in use the tool occupies but little space. The lift of the jack is from 10 in. to 18 in. It should prove a useful addition to the motorist's tool chest.

MR. G. BRAULIK, of 217 and 218, Upper Thames Street, is issuing a new catalogue and price list of instruments, all of which are directly or indirectly connected with electricity as applied to the motor-car. Pocket volt and ampere-meters for alternating and continuous currents, or both, occupy a prominent position. A new direct reading ohm-meter, small but reliable, should be found useful when the charging of batteries or accumulators is in progress.

OWING to the demand for the E.I.C. specialities, the Electric Ignition Company, of Birmingham, have been obliged to take a new factory giving them greater area for development. The company are about to commence to manufacture their sparking plug with three lengths of reaches into the cylinder, viz., $\frac{5}{8}$ in., to suit those engines where the exhaust valve is likely to foul the sparking plug; $\frac{3}{4}$ in. where the exhaust valve allows a trifle more room; and $\frac{7}{8}$ in. where still further room is allowed.

THE Twentieth Century Motor Company, Limited, has been registered, with a capital of £1,000, to acquire as a going concern from A. M. Cawthorne the business carried on by him in his own name or in the name of the Twentieth Century Motor Company, and, generally, to carry on in all or any of their respective branches the businesses of builders of, repairers of, and dealers in motor-cars, cycles, and accessories. The registered office is at 33, King Street, Cheapside, E.C.

WHAT is claimed to be a greatly improved type of storage battery intended primarily for use with electric automobiles has, states *Lightning*, just been introduced by the Albion Battery Company, of 2, Wynyard Street, Clerkenwell. Mr. Carl Oppermann, the well-known maker of electric cars, is the inventor, and the battery is the outcome of five years' experiments. The inventor claims that with a battery weighing only nine cwt. 100 miles of average road can be readily negotiated with only one charge. A further advantage claimed is that the battery can be fully charged in about two and a-half hours, and discharged at even a more rapid rate without any injurious effects to the cells.

THE first house dinner of the winter season of the Automobile Club will take place at Whitehall Court on Wednesday, the 11th inst., at 7.30 p.m. It is hoped that after the house dinner a paper will be read by Mr. Ernest J. Hutton, J.P. The paper is intended for insertion in the Badminton Library book on "Motoring." The title is to be "Ignition in Petroleum Spirit Engines; Systems; Possible Failures: How to Discover and Remedy Them." The paper is to be as free as possible from technical language, and is to be suitable for beginners. It is

hoped that experienced motorists will attend to add to the value of the paper by relating their experiences.

As already mentioned in these columns, the Committee of the Automobile Club is offering a prize of £5 for the best design for an embossed and colour-enamelled metal plaque to be attached to the fronts of hotels and to the establishments of repairers appointed by the Club. The plaque is to be in the shape of a square, having sides of 20 in. each, set upon one of its points, thus \diamond . Any device or design considered suitable may be employed. The initials "A.C.G.B.I.," or the words "Automobile Club of Great Britain and Ireland," or a combination of words and initials, such as "Automobile Club of G.B. and I.," must be introduced. The design must be such as to strike the eye from a distance, and such that it would be immediately recognised among other signs or advertisements. The designs submitted must be on stiff cardboard of the full size of the plaque. The name and address of the designer must be written on the back of the cardboard. The design should be addressed to the Secretary of the Automobile Club, 4, Whitehall Court, London, S.W., and should be in his hands not later than Saturday, the 14th inst. The decision as to which is the best design will rest entirely with the Club Committee, who cannot undertake to return designs, but designers may call for them any day after January 1st, 1902.

MESSRS. T. COULTHARD AND CO., LTD., of Preston, may claim to be an historic firm, their existence dating from the eventful year of 1815. From that date to the present the name of Coulthard has been continually associated with engineering enterprise. For over twenty years the brains of the celebrated house have studied the complex question of steam motor-vehicles with the result that Messrs. Coulthard's steam lorries and wagons are found on highways and byeways throughout the world. It was not, however, till the memorable year of 1896 that the first Coulthard steam cart took the road. The illustrated catalogue now being issued is, besides being a work of art, an interesting souvenir of five years' progress in motor-vehicles for commercial purposes. From the No. 1 Coulthard steam cart of 1896, depicted and fully described, each page takes us one stage further on the march towards perfection. Wagons and trailers are naturally the most frequently depicted. Amongst the former a 4-ton vehicle "snapped" in the act of carrying a 4-ton load up a gradient of 1 in 9 should shatter the faith of the most hardened believer in the superiority of horse flesh for heavy road traffic. Buses in use at home and abroad, groups of vehicles despatched to foreign parts, and plans and elevations of machinery, combine to fill an interesting and instructive work.

THE present system of fastening the drive pulley to the

spokes of the rear wheel of motor-bicycles with washers and small screws has the tendency of making the nipples bell-mouthed. This is claimed to be obviated entirely in the method devised by Mr. W. Starley, of Coventry. In the new arrangement, illustrated herewith, four pieces of wire bent at right angles and screwed at each end pass through eyes on the drive pulley and are tightened by nuts. On the felloe of the driving wheel four plates are screwed or riveted with a projecting piece bent at right angles, parallel with the spokes. In the centre of each of these four plates is a small knob resembling a door handle riveted to them. Where the four wires are bent in the centre they lie in the groove of these knobs and the drive is taken from them. To remove the drive pulley from the wheel all that has to be done is to loosen the eight small nuts about a couple of turns, when the wires can be lifted off the knobs. The arrangement is claimed to give a direct drive from the pulley to the rear wheel without the shearing strain on the spokes.

MOTOR-CYCLES FOR 1902.

(Continued from page 713.)

Still another new motor-bicycle is that made by Messrs. Timson, Bullock, and Barber, of Montagu Street, Kettering (Fig. 1). The motor is of the firm's own manufacture; it is of the Dion type, developing $1\frac{1}{2}$ h.p. actual. It is fitted with large inlet and exhaust valves and efficient silencer. The cylinder is $2\frac{1}{2}$ in. in diameter by $2\frac{1}{2}$ in. stroke. The trembler is on the coil (Van Raden's), and will work, if necessary, at a speed of 3,000 revolutions per minute. The position of the motor in the frame allows the cranks to rotate without touching the motor, thus enabling extra long bearings and a long belt

FIG. 1.—THE TIMSON MOTOR-BICYCLE.

drive to be employed. The wheel base is 4 in. longer than that of an ordinary cycle; this, the firm claims, effectually stops side slip and all vibration. The frame is built especially strong, all joints being reinforced; the front forks are taper gauge with triple head. The back hub is of the New Departure tandem type, which allows the machine to be wheeled backwards—a great advantage in a motor-cycle. The carburettor is of the surface type, fitted with splash plate, and carries sufficient petrol for a run of eighty miles. The case below the petrol tank contains the coil and space for a supply of lubricating oil. The various handles for controlling the motor are conveniently situated on either side of the top tube of the frame. Messrs. Timson and Company inform us that they have thoroughly tested the machine for the last four months, during which it has carried a fourteen-stone rider up hills without pedalling.

Two types of motor-bicycles are being made by Messrs. Humber, Limited, Coventry, for the 1902 season. The Beeston Humber motor machine is of the Minerva type, but it contains a number of special improvements and fittings. In the first place, it is fitted with a spring fork, while, secondly, control is all effected from the handle-bar by twisting the grips. On the left side the advance sparking and exhaust valves are operated by Bowden wire, and on the other side the air adjustment is similarly operated, the throttle being the only motion not controlled from the handle-bar. A front rim brake and a back-peddalling brake are fitted. The Coventry Humber motor-bicycle is of the Minerva type, but without the special features in the way of spring fork and control. Messrs. Humber are also making a chain-driven machine of an interesting type, in which a $1\frac{1}{2}$ h.p. motor is built into the lower cross tube of the frame. Through a clutch the motor pinion drives by a chain on to a countershaft which surrounds the bottom bracket, and then by another chain to the back wheel. A free-wheel clutch is fitted to the chain drive of the engine and another to the pedal chain drive. An automatic compression tap is fitted, which acts during only half the stroke, so that the machine is always ready to start when required. Only very short lengths of the wiring are exposed, and the circuit is broken by merely lifting the brake-lever.

Another firm making two types of motor-bicycles is the Progress Cycle Company, Limited, of Coventry, in both of which bicycle frames of special construction are employed. In one the bottom tube is formed at its lower or bracket end somewhat after the shape of a letter U, with the motor placed in the recess thus formed, and in a vertical position. The motor is of the Forman air-cooled type of $1\frac{1}{2}$ h.p., with the ordinary electric ignition. A spray carburettor is fitted. The petrol tank, which has a capacity sufficient for forty miles, is slung from the top tube beneath the saddle, and forward of this is another case, which contains the battery and coil and a supply of lubricating oil. A belt drive is used on this machine, the belt being a special V section, to suit the grooves cut in the pulleys. The higher priced machine has the motor—a 2 h.p. Simms, with magneto-electric ignition—placed vertically a little behind the steering socket. The frame to which the motor is attached is of special design. The wheel-base is considerably longer than that of the majority of machine

The down tube—from head to bottom bracket—follows the circle of the wheel for a portion of its length, and then curves away to the bottom bracket. At a distance of about one-third of the length of the top tube a vertical tube connects this with the down tube. Between this and the head the motor is fixed, and in the rear of the vertical tube the petrol tank is carried. Power is transmitted to the back wheel by a belt, a jockey pulley running on ball bearings being fitted to take up any slack of the belt. Two brakes are fitted to the machines—a front rim brake, and a back-peddalling brake in the rear hub.

The Ormonde Motor Company, of Wells Street, W., have brought out a new motor-bicycle in which the engine is arranged behind the main down tube in front of the rear wheel. A spray carburettor is employed, and a lubricator for the crank chamber is fitted which can be operated from the saddle. Driving is by belt to the rear wheel, and the wheel base is several inches longer than the pedal-propelled safety. The machine is controlled principally by two levers on the top tube. The tanks are arranged in the usual position under the top tube. The motor, which is of the Kelecom type, the sole agency for which in this country has been acquired by the Ormonde Company, has a cylinder 64 mm. diameter, and at a speed of 1,750 revolutions per minute develops $1\frac{1}{2}$ h.p. The cylinder, instead of being bolted on to the crank-chamber, screws into it. The piston is provided with three piston rings instead of two, as generally used on small motors. The guide for the exhaust stem is bushed, so that it may be easily and inexpensively replaced when worn. The valves are of large diameter and strongly made, to avoid all possibility of fracture through heat. The machine is fitted with Clincher motor-bicycle tires. The Alldays and Onions Pneumatic Engineering Company, Limited, Small Heath, Birmingham, are making two types of motor-bicycles, one with the engine (of $1\frac{1}{2}$ h.p.) carried near the head, on the lower cross tube of the frame, and driving the rear wheel by a belt, and one on the lines of the Minerva. Mr. W. R. Thomas, of Thornbury Road, Brixton, is introducing a new motor-bicycle known as the Brion, a feature being the adaptability of the motor for attachment to the frame of the machine in different positions.

One of the most novel motor-bicycles which is being brought forward for the 1902 season is the Holden (Fig. 2), made by the Motor Traction Company, of 27, Walnut Tree Walk, S.E. As will be seen the machine bears a general resemblance to the "Bantam" front-driving safety bicycle. The motor is of 3 h.p. and comprises four cylinders arranged in two longitudinal pairs horizontally between the wheels. The two piston rods, each carrying two pistons, and the cross heads between each pair drive connecting rods coupled to parallel cranks attached to the rear 16 in. wheel. The speed of the motor being only five hundred per minute, no reducing gear is required. The ignition is electric. A single coil serves to provide high tension current for all four ignition plugs. A two-to-one shaft runs parallel to the motor, and, besides working the exhaust valves, in turn carries a brush, which makes contact with four contact points, and so completes the circuit through each plug, as required. The valves are so timed that the cylinders give an explosion at every revolution of the wheel. The cylinders are water cooled, and natural circulation is depended upon. The throttle is worked by a lever below the left handle, and the electrical circuit is completed and broken by a switch close to the right handle.

FIG. 2.—THE HOLDEN MOTOR-BICYCLE.

A single lever operates all four exhaust valves through Bowden mechanism. A Bowden brake is fitted to the front wheel. Convenient footplates are fitted for the rider, and the position as a whole is very comfortable. The four cylinders all exhaust into one box of large dimensions, so that the noise is reduced to a minimum. The front tire is 2 in. in diameter, and the back $3\frac{1}{2}$ in. The wheelbase is 48 in., though, owing to the smallness of the back wheel and the fact that the front is 24 in., the total length over all is practically the same as that of an ordinary safety. The front wheel is geared up by Crypto gearing, and pedals were fitted to the machine we examined, although w

understand that the use of these will not be continued. The lubrication is performed mechanically, and ceases when the engine stops. The central tank is for water, the forward one for petrol and the carburettor, and the rear one for lubricating oil. The machine will, it is stated, start itself without pedalling, even in the middle of a steep hill, and it would drive on the level even if three cylinders out of four were out of order.

The Shaw motor bicycle, made by Messrs. Shaw and Son, Crawley, has the motor fixed vertically in the rear frame, drawing the rear wheel either by belt or chain as desired. Two sizes are being made, with $2\frac{1}{2}$ h.p. and $2\frac{3}{4}$ h.p. respectively. A large petrol tank is fitted, its capacity being sufficient for a run of 120 miles. The James Cycle Company, Ltd., Birmingham, have been devoting attention to motor-bicycles for some time. As, however, they will not have their own motor ready until late next season, they are prepared to fit either the "Minerva" or "Derby." The Centaur Cycle Company, Ltd., Coventry, are making a motor-bicycle on the Minerva system. A rim brake on front wheel and Bowden brake to the back wheel are provided. The machines will be fitted with a new spring fork. In this, the fork sides run right up from the front axle to the root of the handle-bar, where they are hinged on a cross pin. At the points where they pass through the fork crown, rubber buffers or linings are provided, so that the fork is allowed a certain amount of back and forward movement. Under the name "Morriscoche," Mr. Frank Morris, of King's Lynn, is making a motor-bicycle ($1\frac{1}{2}$ h.p.). It is on the lines of the "Moto-Sacoché" which has already been described in these columns.

A number of improvements have been effected in the motor-cycles of the Singer Cycle Company, Ltd., Coventry, and several new styles introduced.—The 1902 "Singer" motor-bicycle, for ladies and gentleman, now possesses a 28 in. front wheel, lengthened wheel base, lubrication from saddle by pump, and cock attached to lubricating tank, spring seat-pillar, and a very powerful back wheel rim brake. The toothed wheel gearing is now entirely enclosed in a dustproof case, which thoroughly protects it from dirt. The air supply, which requires adjustment two or three times in the course of a day, is now controlled by a small lever on the top tube. As to the three-wheeled machines, these are made in both ladies' and gentlemen's types. A new machine is the Tri-voiturette, which, as its name implies, is a machine of the tricycle order with seating capacity for two passengers. The motor, which is of $2\frac{1}{2}$ h.p., is contained within the front wheel, as is usual with the Singer tricycles. The main framework of the machine is of the usual pattern with the exception of top tube, which has been curved downwards, so as to allow an easy mount and dismount. From the rear of the back axle a rectangular frame projects horizontally. This carries a platform which is hung on carriage springs. On the platform is a comfortably upholstered seat, which pivots at the rear right corner. In front of the platform is a splash-board, which protects the rear rider from the wind and any mud which may be thrown up. Access to the rear seat is gained by swinging it back on the pivot, and when the passenger is mounted it is pulled forward and catches by an automatic spring. There is a band brake on the back axle which is applied by a pedal conveniently placed on the left side of the down tube. The back seat is reversible, so that the passenger may face either backward or forward, or the machine may be had with a suitable box or basket for tradesman's use. Another type suitable for speed or touring is one which has the frame extended behind the rear axle so as to provide a seat for another rider who has a pedalling gear driving direct on to the back axle. Both front and back-pedalling gears have independent free-wheels, so that either, or both, riders may pedal at will. This type is also interchangeable with the "Tri-voiturette."

Two different types of motor-tricycles fitted with $2\frac{1}{2}$ h.p. De Dion or Automoto air-cooled engine are being made by Messrs. W. King and Co., of Sidney Street, Cambridge. In one design the head of the motor projects right through the head of the bicycle. The steering-socket and the part of the same enclosed thereby are absent, and a separate ball bearing is formed at the end of each backbone. The fork sides are continued up to the top of the head, and bow out laterally, thus providing the necessary space for the cylinder, which is secured to both tubes of the frame, and also to the two steering bearings. A stay is introduced between the top and bottom tubes between the crank case, to which the motor is also secured. A surface carburettor and petrol tank, holding $1\frac{1}{2}$ gallon, fill up the remainder of the main panel of the frame. The power is transmitted from a pulley on the crankshaft to a double pulley carried forward of the bottom bracket, and thence to the back wheel, belts being employed for both drives. In the second design, the motor is arranged vertically behind the main down tube, and in this case drives through a single band on to a pulley on the back wheel. The pulley is secured to the rim by radial brackets and the tank practically fills the open part of the diamond of the frame.

Many improvements have been made in the 1902 Excelsior motor-bicycle by Messrs. Bayliss, Thomas, and Co., Ltd., Coventry. The power of the engine has been increased to $1\frac{1}{2}$ h.p. on the brake. This has been attained without increasing the width of the crank chamber, and adding but few ounces to the weight. An arrangement is being fitted, by which the engine can be automatically lubricated without dismounting from the saddle. The carburettor has been increased in size, thereby giving greater capacity for petrol, but, at the same time, not being in the way of the rider's knees. The contact-breaker has been improved, and also the sparking plug, in the latter doing away with the porcelain covering. The

inlet and exhaust valve, compression tap, and interruption block have been altered, and made more satisfactory. An "Excelsior" motor-bicycle for ladies' use is also being introduced by this company. The engine and transmission are fenced in by removable protectors. The motor is carried below the bottom front tube, and the carburettor is placed behind the head between the double curved front frame tubes. In addition to motor-tricycles and quadricycles, Messrs. Brown Bros., Limited, of Great Eastern Street, E.C., are devoting considerable attention to motor-bicycles. It will be remembered that the "Brown" bicycle has the motor ($1\frac{1}{2}$ h.p.) arranged in the angle of the frame above the bottom bracket, being clipped both to the down tube and the lower cross tube. Transmission is by a twisted belt to the rear wheel, and a very simple form of surface carburettor is fitted. The firm are now using a specially-designed frame by the B.S.A. Company for their motor-bicycles. A connection for advancing the ignition also serves, when reversed, for lifting the exhaust valve. Sufficient petrol can be carried in the carburettor to feed the motor for about 50 miles. The ignition is electrical, the current being supplied by accumulators, which are attached either to the seat tube or back stays. The sparking coil is attached by bands to the seat pillar tubes, in a position so as to be out of all obstruction. The weight of the machine complete is 75 lbs.

The 1902 type Werner Motocyclette, which is being introduced by Werner Motors, Limited, 28, Brook Street, Bond Street, London, W., is essentially different in many ways from any other type on the market, and embodies several patents and a registered design. The frame is specially designed, and of ample strength. The bottom tube is forked and bolted to the top of the crank casing, and the front of the angle of the back triangle of the frame is bolted to another point on the casing. A tubular stay runs below the tanks parallel to the top tube. The $1\frac{1}{2}$ h.p. engine is placed low down, and just halfway between the two wheels, in an absolutely vertical position, thus ensuring perfect and regular lubrication. The engine being close to the ground, the centre of gravity is very low, and consequently the steering is steady, and the

FIG. 3.—THE 1902 WERNER MOTOR BICYCLE.

danger from side-slip is claimed to be practically non-existent. The driving is done by means of a belt from a pulley on the engine shaft to a steel rim firmly bolted to the back wheel rim. This distance between the belt pulleys has been carefully considered, and the motor has been fixed in a position which allows a long belt to be used. The bicycle can be pedalled when required for starting or up an unusually steep hill by the ordinary chain and free-wheel system. An entirely new pattern pulverising carburettor is fitted in conjunction with the motor, which is said to be very effective and economical. The petrol tank holds sufficient for 100 miles, and an extra reservoir can be fitted if desired. A very powerful rim brake is fitted to act on the front wheel, and a band brake acting on the back wheel can be supplied when ordered. The 26-in. wheels are shod with 2-in. Dunlop special motor-bicycle tires with thickened edges, with or without non-slipping treads, or 650 mm. by 50 mm. Clipper Michelin tires.

The Kitto motor-bicycle can now be had from Mr. W. H. Kitto, Hartington Road, Chiswick, S.W., with either a frame of American or English construction. The motor ($1\frac{1}{2}$ a.h.p.) is arranged high up on the lower cross tube of the frame, and is supported on a bedplate set on the tube. The oil and spirit tanks are supported from the top tube, while the batteries are carried behind the saddle. The power is transmitted to the rear wheel by a belt. An adjustable jockey pulley is fitted. The left handle twists for the making and breaking of the electric circuit, but otherwise the handle-bar is free from levers and similar fittings the braking action being provided for in the Morrow free wheel and back pedalling brake contained in the rear hub. In place of the usual carburettor a special form of vaporiser in which the air and gas are mixed automatically is employed. The tank supply is three quarts of petrol, which is said to be sufficient for seventy-five miles when the rider becomes experienced. An automatic arrangement for the lubrication of the crank chamber is provided.

(To be continued.)

THE DAIMLER MOTOR COMPANY.

The fifth annual general meeting of the Daimler Motor Company, Limited, was held at the Holborn Restaurant last week, under the presidency of Sir Edward G. Jenkinson, K.C.B., Chairman of the Company. The Chairman said: I wish to-day to explain to you, as shortly and as clearly as I can, the present position of affairs, and to give you the views of the board as to future policy and prospects. We have now appointed as works manager a man who came to us with a very high character, and who has had a thorough scientific training, both in America and in Germany, as an engineer and in the organisation and working of shops. Although only appointed in the beginning of November, the good results of his management are already apparent. I am glad to say that, notwithstanding the bad management in the past and all the difficulties which the company has had to contend with, the business goes on steadily improving. The present board does not desire to take too much credit to itself for the improvement this last year. It took charge of the business too late in the year for it to do much to increase sales, and the full results of its labours cannot yet be seen. The present board claims that it has not only maintained the progress which was going on, but it has during the last few months initiated a new and sound policy, from which a larger business and greater progress may be expected in the future. A few figures will show the progress that has been made since the year 1898. Taking the sales first, they have been: In 1897-8, £47,239; 1898-99 (fifteen months), £62,813; 1899-1900, £63,738; 1900-1901, £73,596. Secondly, cash receipts: 1898-99 (fifteen months), £51,580; 1899-1900, £67,316; 1900-1901, £80,615. Thirdly, the gross profit on manufacture: 1898-99 (fifteen months), £15,290; 1899-1900, £14,920; 1900-1901, £20,628. And, fourthly, the profit and loss: 1897-98, £1,424 loss; 1898-99 (fifteen months), £1,045 profit; 1899-1900, £4,430 profit; 1900-1901, £6,742 profit. Orders on hand in the manufactory on September 30th, 1901, numbered seventy, representing a value of £31,335. These figures are so far satisfactory, in that they show we have a good and expanding business, if we take advantage of our opportunities, build our cars of types up-to-date, and have good management. The two features that are unsatisfactory in our accounts for the year are the increase in our liabilities and the large accumulation of stock. A large stock was accumulated in 1900, which could not be utilised in the spring of 1901, and which could only gradually be worked up into cars for sale. When this board took charge it was too late to build cars for sale during the season of 1901. All that we could do was to complete orders already on hand and to take new orders. By degrees this accumulated stock will be worked up into cars and profitably sold, and the amount will be reduced to proper dimensions. There is nothing in the accounts to make us despondent about the future. We have strong rivals and competitors, however, and there can be no doubt that as the demand for motor-cars increases competition will become keener, and prices will be reduced. We must be prepared to meet this new condition of things, and, above all, we must not be too proud to learn, or too self-satisfied to acknowledge that the English are not the only people who can manufacture good cars. French manufacturers have stolen a march upon us, and this year the sale of French cars has increased immensely in England. Yet I will not allow for a moment that we cannot manufacture cars as good, or that our workmanship is in any way inferior to French workmanship. On the contrary, I believe that our engines, frames, gears, etc., are of better material and workmanship than those of the French. But what we have to do is to study the public taste more, to exercise more economy in manufacture, and to have cars for sale when customers are ready to buy. First thing is to get even with the French, and then, if we can, to surpass them. Now it is evident, if I have made myself clear, that if we are to succeed we must adopt a policy suitable to the state of things I have described, and must have no deviation from it. In the opinion of the present board, our policy must be based on four essential conditions. First, good works management; second, good commercial management; third, the manufacture in considerable numbers of two, or, at most, three, standard types of cars, which should be ready for sale in the early spring and summer; fourth, sufficient working capital. The three first conditions are practically governed by the fourth. Without a sufficient working capital we cannot carry out the third condition, and, unless we have cars for sale in sufficient numbers, we cannot afford to pay adequate remuneration to our managers. We have already, as I have told you, appointed a good works manager. We have in view the appointment of a managing director, and we have decided upon certain types of cars, which, we hope, will be ready for sale in the spring of 1902; but if we are to work with economy and to have cars ready in sufficient numbers, we must have more working capital without delay. Hitherto, in my opinion, the cost of manufacture has been out of proportion to the output, and I am convinced that at a reduced cost a much larger output can be obtained. I have strong hopes that under the management of Mr. Percy Martin, our new works manager, this result will be attained. We have considered most carefully how the money can best be raised to provide us with the working capital we require. We have decided to make an issue of 5 per cent. mortgage debentures, repayable at 105, and the shareholders will have the first chance to take them up on the underwriting terms. The money provided from this source will enable us to carry on energetically the policy which I have advocated, and we feel confident that your business will go on increasing, and that before long you may expect

large profits. For some time past negotiations have been going on with the board of the Motor Manufacturing Company for an amalgamation of the two companies. It was arranged that the Motor Manufacturing Company should be absorbed by this company, and that their shareholders should receive from us one ordinary share for every three ordinary shares held by them; but when we came to go into details we failed to come to a satisfactory arrangement. This is to be regretted, because we believe that an amalgamation on fair terms would be to the advantage of the companies. Perhaps negotiations may be reopened, and the board may have, at some future date, proposals to lay before you. It was our genuine desire to bring about the amalgamation of the two companies, but we had, of course, to safeguard the interests of our shareholders, and also to see that any arrangements which might be made, especially financial ones, would not be of a nature to hazard the success of the business of the amalgamated companies in the future. I have now to move the adoption of the report and accounts.

Mr. J. H. Mace seconded the motion. Mr. E. H. Bayley said he had one or two questions regarding the accounts which he wished the chairman to answer. He desired to know, first, who valued the stock of cars and stores. The works manager, of course, was the proper person to do this, and in previous years the words "as valued by the works manager" appeared against the item; but these were now omitted.—The Chairman said the valuation was made exactly as in former years by the works manager, the figures also being gone into by the works committee of the board. Mr. E. H. Bayley: And increased, I presume. The Chairman: No; not increased. The words referred to by Mr. Bayley were struck out by arrangement with the auditors.

Mr. E. H. Bayley said it was satisfactory to know that the figures were correct. He wished to know why there had been an increase of £620 in the directors' remuneration, and also who the director was to whom £398 was paid for special services? Since he (the speaker) left the board in April last, two very serious things had happened. One was that there had been a drop in the price of shares of 6s., and, what was still more serious, the fall which had taken place in the credit of the company.

Mr. H. J. Toor asked what proportion of the stock was up-to-date, and could be turned into finished cars that would command a ready sale during the coming year. He also wished to know the reason for such a large expenditure as £1,660 under the head of legal and professional charges.

Mr. Holt asked on what terms it was proposed to raise the new debentures—what commission or underwriting fee it was proposed to pay.

The Chairman said, that regarding the question of the directors' fees they were debited in accordance with the provisions of the articles of association. The amount in the profit and loss account was really divided into two parts, one being credited to the old board for six months of the year, and the other part to the new board. The former board had still three months' fees due to them, and the present directors had the whole six months' fees due to them, the latter not having drawn a single penny for remuneration, and he believed he was right in saying it was the intention of the directors not to draw anything until the company had sufficient working capital to carry on the business in the way they wanted to carry it on. The director to whom remuneration had been paid for special services was Captain Longridge, who, at the request of his colleagues, went to Coventry to take charge of the business, and stayed there for some months while the board were looking out for a works manager. His services were of great value to the company, and the remuneration was exceedingly reasonable. Regarding the stock, it was to a very large extent stock which they could utilise, at the valuation placed upon it, in the manufacture of cars which could be sold at a profit. The directors, together with the new works manager, inspected it very carefully, and came to that conclusion. Of the total amount of law charges—£1,660—over £1,408 was incurred during the past administration, being due largely to lawsuits which he considered should never have been entered upon. As to the terms upon which the new debentures would be issued, he could not go further than he had done in his statement, because negotiations were still in progress, and much depended upon the valuation which was going on at the works.

The motion for the adoption of the report and accounts was then put and carried unanimously.

Captain C. C. Longridge, in moving the re-election of Sir Edward Jenkinson as a director, referred to the large amount of time and labour that gentleman devoted to the business of the company. Sir Edward was not only chairman of the company, but also of two of its committees, which occupied an enormous amount of his time. Mr. Mace seconded the motion, which was unanimously agreed to. Captain Longridge was also re-elected to the board. Mr. Avery proposed a hearty vote of thanks to, and confidence in, the chairman and his colleagues. The motion was carried, and the chairman, in acknowledging the compliment, said the proof of the pudding was in the eating, and he thought they would have to wait and see whether or not this praise was deserved. Another year would tell.

LOCOMOBILE STEAM CARS IN FRANCE.

As the impression generally exists that Locomobile steam cars are not permitted to be used in France, Mr. Letts, of the Locomobile Company, asks us to mention that they have had the carriage accepted by the authorities for a long time, but it has been impossible until now to do very much business in France owing to their having to make several

alterations on the carriage before they could get it passed by the authorities.

Several clients have written, asking what changes have to be made to enable them to take their Locomobile into France, as after using their vehicle in England during the summer they desire to take it with them while wintering abroad. Their Paris agent has consequently furnished the following information:—

In order to comply with the French regulations the following changes are necessary:—16 boiler tubes fixed so that they can be removed, if necessary, in order to examine the interior of the boiler; additional water column; additional safety valve; additional hub brakes on the rear wheels; French gauges reading in atmospheres, with a red arrow to show the point at which the valve should blow off, and also what air pressure is considered safe.

The import duty on automobiles is 60 fr., per hundred kilos., a kilo. being roughly 2 2-10 lbs., so assuming that the car complete would weigh about 825 lbs., this would amount to 380 kilos., which would cost about 228 fr., or, say, between £9 and £10. This duty would, of course, be refunded when the carriage was taken out of France. The best thing would be for the customer to ship his carriage direct to L. Barriere and Co., 22, Rue St. Sabin, Paris, through shipping agents, who would attend to the duties for him. The principal charge in making changes would be for brakes, which would be a matter of about eight guineas. The other changes would be principally labour, and should not amount to more than £4. It would not be necessary to make any change on bringing the car back to England, and then it would always be ready to take to France any time its owner might desire.

A NON-STOPPING CASE.

At the Stafford Borough Police Court, George Cooper Hewitt, Lord Shrewsbury's motor-car driver, was summoned for not stopping when requested, contrary to the provision of the Light Locomotives on Highways Order, 1896. It appeared that on Friday morning Dr. Maison was being driven in a close carriage along the Lammascote Road when the defendant was coming in the opposite direction, driving a motor-car. The horse became restive, and the driver put up his hand for defendant to stop, but he did not do so. Defendant alleged that he did not see the driver's hand up. He admitted, however, seeing Dr. Maison hold up his hand, but it was then too late for him to stop. A fine of £5 and costs was imposed.

TWO FATALITIES.

An inquest was held at Westminster on the body of Frederick P. Haslam, corn factor. Evidence was given to the effect that the deceased was driving with his wife in Hyde Park, when the pony, frightened by the noise of a motor-car, reared and threw the deceased into the road. He was pitched on his head and died within an hour. Nothing more was seen of the motor car, but, according to a policeman, there was no suggestion that it was being driven at an improper pace. A verdict of accidental death was returned.

At St. Albans an inquest was held concerning the death of Harry Austin, aged seventy-nine, who was knocked down and killed by a motor-car at Redbourn on Friday last week. The evidence showed that the deceased, an agricultural labourer, was returning from work when he suddenly left the path, with the result that the motor-car driven by Mr. J. S. Critchley ran into him and so seriously injured his head that he died shortly after removal to the hospital. The various witnesses called stated that Mr. Critchley and Mr. Tacchis, who was also in the car, did all they possibly could for the deceased, and independent testimony established the fact that the car was not being driven at more than ten miles an hour, and it was completely under control. A verdict of accidental death was returned, and the driver of the car was exonerated from blame.

THE CAMPAIGN.

As will be seen from another column, Mr. Paris Singer has acted most liberally in the interests of the automobile movement by giving £50 to defray the cost of printing and dispatching to the County Councils of England and Wales, and to members of both Houses of Parliament verbatim reports of the speeches made by the Rt. Hon. Henry Chaplin, M.P., and Lord Onslow at the anniversary dinner of the Automobile Club. The campaign which the Club commenced a year ago by the publication of its blue book to County Councillors, is far from ended. The Club will not rest content until it has obtained a revision by Parliament of the existing law and regulations affecting motor vehicles.

The provisions of the new Act are receiving most careful consideration on the part of members of the Special Legislation Committee, and Mr. Roger Wallace, K.C., the Chairman of the Club, with the Secretary, recently had an informal conference with Mr. Walter Long, President of the Local Government Board, on the matter.

It will be seen from another column that it is desired to obtain for the purposes of this campaign accurate and incontestable information as to the space within which motor vehicles may be stopped when travelling at various speeds. Manufacturers and agents and private members may, by entering their vehicles for this trial, render great assistance to the Club in

pursuance of the campaign. Manufacturers and gentlemen who are willing to enter vehicles for the trial are invited to communicate with the Club Secretary without delay, as it is probable that the trial will take place, weather permitting, before or shortly after Christmas.

It is hoped that affiliated clubs in districts where there are electric tramways will assist the Club by obtaining incontestable evidence taken in the presence of Justices of the Peace as to the speed at which tramcars are driven in cities. The evidence should be taken partly within the boundaries and partly in the suburbs of a city, and the time of day at which, and the name of the street in which such records are taken should be stated.

The results of the Club's campaign are beginning to be seen. The County Council Association have resolved that the statutory limit of the speed of motor-vehicles should be removed. The Association recommend at the same time the numbering of motor-vehicles and increasing the penalties attaching to infringement of the law. Presuming that the specific limit of speed be removed, numbering and heavier penalties would be welcomed by many motorists as methods for checking the selfish and inconsiderate driving by a very small minority of automobilists which has undoubtedly been the cause, to some extent, of the opposition to the movement.—*Automobile Club Notes and Notices.*

THE STORAGE OF PETROL.

At the Kingston County Bench, last week, Messrs. George Nunn and Sons, of High Street and Portsmouth Road, Thames Ditton, were summoned for keeping petroleum spirit upon their premises without being licenced to do so by the Esher and Dittons Urban District Council. Mr. H. A. Houghton, an inspector under the Explosives Act, deposed to visiting the premises on October 22nd, and to finding stored there quantities of petrol, a spirit used for the propulsion of motor-cars. He described the premises as unsuitable for the storage of such an inflammable spirit. In answer to Mr. Campbell, witness said he tested the spirit himself by throwing a quantity on a slab of stone and setting a light to it. The flame rose about 3 ft. He was aware also that the defendants kept a motor-tricycle for private use, and that they were entitled to keep quantities of the spirit, but only in proper places. In answer to the Bench witness said as early as April the defendants applied to the District Council for a licence, but it was refused, as the premises were not suitable, and he advised the defendants what to do in the matter. A suitable place subsequently was erected in Portsmouth Road, and a committee of the District Council had recommended a licence should be granted for this place, but it was not granted yet. Mr. Campbell, for the defence, contended that the defendants having a motor-tricycle, were entitled to store sufficient petrol for their private use, which was all they did, and he further urged that the test of the spirit as carried out by the Inspector did not satisfy the requirements of the Petroleum Act of 1871. The Bench convicted, and imposed a fine of 9s. 6d. and 10s. 6d. costs in each case. Mr. Campbell asked the Bench to state a case for the High Court on the question of the test, but the Bench declined.

AN UNSUCCESSFUL APPEAL.

WILLIAM HEPBURN, Aberdeen, was on July 15th last convicted and fined 40s. for having driven a light locomotive in Aberdeen at a greater speed than ten miles an hour, contrary to the Light Locomotives on Highways (Scotland) Regulations, 1896, made by the Secretary for Scotland in pursuance of the powers given him by Section 6 of the Light Locomotives on Highways (Scotland) Act, 1896. At a diet for the trial of the case on July 11th, the appellant's agent averred that the prosecution was not competent without proof that the rules and regulations libelled had been laid before both Houses of Parliament in accordance with the provision of Section 6, which sets forth "that every regulation purporting to be made in pursuance of this section shall be forthwith laid before both Houses of Parliament." No evidence was adduced by the appellant in support of his objection, nor was any evidence adduced by the respondent that the section had in this respect been complied with, and Sheriff substitute Robertson held that it was immaterial for the purposes of the prosecution whether in point of fact they had or had not been so laid. The question of law for the court was whether, in view of an averment by the appellant that the regulations had not been laid before both Houses of Parliament in accordance with Section 6, the prosecution was competent without proof that the regulations had been laid before Parliament. Their lordships dismissed the appeal on the ground that the Sheriff was right in holding that it was unnecessary for the Procurator to prove that the regulations had been laid before both Houses of Parliament, and that it was immaterial whether they had or not, as they were merely to be laid before Parliament for information and not for confirmation. The Crown was allowed seven guineas of expenses.

DE DION-BOUTON v. MANNING AND SON.

In the Chancery Division the plaintiffs sought an injunction to restrain Messrs. Manning and Son, Limited, dealers in automobiles, from representing motor-cars sold by them to be the same as cars sold by the plaintiffs; from representing, by circulars, advertisements, or otherwise, that they are agents in this country of Messrs. De Dion and Bouton, or

are entitled to sell motor-cars manufactured by them; and from carrying on their business in a manner calculated to lead the public to believe that they are representatives of De Dion and Bouton. After hearing counsel—Mr. A. J. Walter for the plaintiffs, and Mr. Buckmaster for the defendants—his lordship made an order by consent, perpetually restraining the defendants from using the names. The defendants agreed to pay a sum for damages and costs.

SAINT AUTO'S LITANIES.

THE *Auto-Velo* furnishes the following extracts from a poem, "written between two punctures," by one of its fervent disciples of automobilism:—
Deliver us, Saint Auto:

Withal, at every juncture,
Deliver us from puncture.

Preserve us from ignition
That acts in fair condition
Until a storm o'ertakes us,
Then, suddenly, forsakes us,
Short-circuited, no city
In sight—the saints take pity!
From water-pump and sliding
We would, in thee confiding,
Implore protection duly,
And render thanks most truly.

But O, at every juncture,
Deliver us from puncture.

FURIOUS DRIVING CASES.

At Brentwood, last week, Mr. A. L. Bucknall, of Wikhurst Manor, Sevenoaks, was fined £3 and 7s. costs, for furiously driving a motor-car on November 8th. A police-constable stated that Mr. Bucknall covered the six miles from Romford to Brentwood in seventeen minutes.

At Steyning, Mr. Frank H. Butler pleaded not guilty to a summons alleging that he drove a motor-car at a greater speed than was reasonable and proper, having regard to the traffic, at Southwick, on November 17th. Police-constable Thomas Bristow said, on the afternoon of Sunday, November 17th, he saw defendant driving a car very furiously along Adur Terrace into Albion Street, Southwick. He held up his hand to the defendant and told him he was travelling a great deal too fast, and to the danger of the public. Defendant said he was not going at an excessive speed at the time spoken of. Fined 10s. and costs £1 12s. 6d.

At Stockport, Benjamin Marsden, engineer, of Heaton Chapel, was charged with furiously driving a motor-car. The evidence showed that he drove at a speed equal to seventeen miles an hour. A fine of 20s. and costs was imposed.

At the same Court, Charles Cooke was fined 10s. and costs for furiously driving a motor-bicycle at Cheadle. The defendant was seen to ride at a terrific rate through High Street, Cheadle.

At Chertsey, last week, Mr. Henry Pearce, of Hampstead, was summoned for driving a motor-car at a greater speed than twelve miles an hour at Windlesham, on November 16th. Mr. Staplee Firth defended. Inspector Marks said that he timed the car and found that it covered a quarter of a mile in 35.25 secs. During the cross-examination of the witness, one of the magistrates described a question put by Mr. Firth as absurd. Mr. Firth: Your remarks are very embarrassing. A man is innocent until he is proved guilty. You are trying to reverse the thing, it appears to me. Further cross-examination elicited the fact that it was the anniversary run of the Automobile Club on the day in question. In giving evidence on his own behalf, the defendant said his car was geared to ten miles an hour. Other witnesses were called for the defence, and the Bench imposed a fine of 40s. and costs.

At the Rotherham West Riding Court a Frenchman named Felix Naulet, of Ollerton, was summoned that he, being the driver of a motor-car, gave no warning as required, and also that he ran it at an excess of speed at Wickersley on September 4th. Mr. F. J. Mason prosecuted. He said the defendant was engineer to Lord Savile, and on the day in question was proceeding from Ollerton to Sheffield. As he approached Wickersley he passed a trap at a very great speed. He did not sound his gong or bell, or give any indication of his approach. The car was in shape like an omnibus, and it caused the horse to shy into the side of the road. The rate of speed was over twelve miles an hour. Later, Police-constable Walker timed the car from a certain point near the Mason's Arms, Wickersley, to another point further down the road, and he calculated the pace at twenty-two miles an hour. It might be said the constable could not properly gauge the speed, but there would still be a wide margin for inaccuracy. The motor-car passed two horses attached to a dray near the Stag Inn, and caused them to swerve to one side of the road, and it was then being driven in the same reckless way. Defendant was seen at Sandbeck by Police-constable Walker, and at first denied that he had ever been out with the motor-car that day, but in the presence of Lord Savile

he admitted that he had. Defendant pleaded ignorance of the law, and expressed regret if he had transgressed. He had been a driver in England six months. The Bench imposed a fine of £10.

Reported above are 6 prosecutions for furious driving, for which fines amounting to a total of £17 without costs were inflicted.

THE manufacture of light metal pulleys suitable for use on belt-driven motor-tricycles has been taken up by Mr. J. T. James, of Loveday Street, Birmingham.

"ALL ABOUT THE MINERVA MOTOR FOR BICYCLES" is the title of a useful little booklet which has been issued by Mr. D. Citroen, of 45, Holborn Viaduct, E.C.

MR. A. C. INSTONE has resigned his appointment with the Daimler Company, in order to take up the post of general manager to the Auto-Carriage Company, Limited, sole agents in England for the Bardon car.

A MOTORIST, whilst endeavouring to steer between a tramcar and an omnibus, at Kennington Gate, one day last week, came into collision with a coal wagon, the result being that he was thrown into the road and somewhat seriously injured.

WE learn that Messrs. De Dion-Bouton and Co. are taking up the question of motors for balloons. They have been making motors of 25 h.p. for this purpose, but they are now making a new motor developing 40 h.p., which will weigh only 400 lbs. This motor has four cylinders in line, with a single aluminium crank chamber.

THE December meeting of the Nottingham and District Automobile Club will take place at the Blackboy Hotel, Nottingham, on Friday, the 13th inst., when the guest of the evening will be Mr. C. Johnson, secretary of the parent organisation. There will be an informal club dinner at 7.30. The annual dinner will be held on Friday, January 10th.

TO CORRESPONDENTS.

All communications intended for insertion in this Journal or relating to Editorial matters should be addressed to THE EDITORIAL DEPARTMENT, MOTOR-CAR JOURNAL, 39 and 40, Shoe Lane, London, E.C., and must be written on one side of the paper only. Letters must in all cases be accompanied by the name and address of the writer, as no notice will be taken of anonymous communications.

The Editors cannot undertake to return MSS. or drawings, although every effort will be made to do so in the case of rejected communications. Where such are regarded as of value, correspondents are requested to retain copies.

The Editors do not hold themselves responsible for the opinions expressed by their correspondents, or for statements and facts which do not appear in the editorial columns.

The Editors and publishers beg also to state that they will accept no responsibility for unsolicited contributions, even if used, unless payment for same is directly specified in forwarding, and the terms arranged before publication.

To insure insertion communications and contributions must be in the Editor's hands by Tuesday forenoon of the week in which the same are intended to appear. Disappointment may be caused by non-compliance with this rule, and to avoid this earlier receipt, if possible, is necessary.

THE Motor-Car Journal.

VOL. III.]

LONDON, SATURDAY, DECEMBER 14, 1901.

[No. 145.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE second annual dinner of the Yorkshire Automobile Club was held at Leeds on Friday evening, the 6th inst. The vice-president, Dr. Farrow, was in the chair, and amongst those present were Mr. Alexander Bosville, High Sheriff of Yorkshire; Mr. Cheswright, or the A.C.G.B.I. (who was the founder of the Yorkshire Club), and many other gentlemen. In proposing the customary loyal toast the Chairman spoke of the admirable example set by the King as an automobilist. The toast of "The Yorkshire Automobile Club and Automobilmism" was proposed by Mr. Higgins, who said that he happened to live within twenty yards of the Great North Road, and during the past eighteen months he could scarcely fail to have noticed a considerable accession to the ranks of automobilists. The Chairman, in responding, said he hoped the Club would succeed rather more than it had done up to the present. He thought that it ought to have a wider utility than that of merely personal intercourse. The Automobile Club of Great Britain and Ireland was doing a good work, and Yorkshire ought not to be backward in doing its share. The Chairman went on to say that automobilists had not, perhaps, suffered in Yorkshire so much as in other parts of the country from the over-officiousness of the police. The Yorkshire policeman, like the Yorkshire native, had some sense about him, and if he saw a motor-car travelling a little above the statutory limit, so long as the automobilist was not endangering any of the inhabitants of the county, he judiciously looked the other way. From those remarks, he must not be understood to appear as an advocate of high speeds on the road. Many suggestions had been made by County Councils and other bodies as to what should be done to limit the danger of the automobile. One of the suggestions was that each car should have affixed to it a distinctive number prominently displayed in large type. Personally, he was quite willing to agree to that suggestion if it were extended to include all vehicles. The toast was also acknowledged by Mr. A. W. Dougill, the Hon. Secretary, who mentioned that the membership of the Club had increased to fifty.

A Topical Dinner.

THE menu of the dinner must have produced a somewhat alarming effect on the few non-motoring guests. "Starting Handle," with which it commenced, though alarmingly suggestive of indigestion, proved nothing worse than soup, of which there were two varieties. "First Speed" carried the dinner into the fish stage, and "Advance Sparking" produced entrées. By the time "Top Speed" was attained "roast and boiled" was well to the fore. "Exhilaration" was found in roast turkey and salad. The "Slow Down" process was performed on motor-car pudding and other sweets. A "Stop" was made at dessert; after which came "Lubrication."

Mr. Dewar, M.P., and Motor-Cars.

COACHING men who love to "tool" a four-in-hand are taking to the "steering wheel" as naturally as possible. Mr. T. R. Dewar, M.P., who has driven mule teams in South Africa, oxen in India, ponies in New Zealand, and fours-in-hand in the Park, informs his friends that they need not be surprised if he goes in for motoring. While admitting the delights of ordinary coaching for distances of twenty miles or so he declares that there is nothing like the automobile for sensation and sport. In fact, he believes that in another six years' time there will be at least twenty motor-cars in London for every road coach.

Motoring and Sport.

MOTORING is a sport which can be indulged in all day without upsetting one for pleasures in the evening. Colonel Thornycroft, in relating some of his horse-driving experiences in the *Road*, tells how he once drove a four-pony team sixty-three miles in a day, and had a game of billiards in the evening, but his hand shook and there was little excellence in his play. Motorists, however, who have had good experience of the pastime, are able to indulge in such sports without inconvenience.

Motor-Cars Wanted in Belfast.

ACCORDING to many of the leading members of the Town Council of Belfast the tramway system in that important Irish centre is a disgrace. Several of them are wishful of seeing motor-cars introduced for the public service not only to convey passengers rapidly, but also as an incentive to the local tramway authorities. A recent request for a licence for a motor-bus was refused by the Police Committee, but at the last meeting of the Council a full explanation was given, it having been reported that the vehicle in question was not so modern as some that have been successfully worked elsewhere. Councillors Johnston and Davis and Alderman McCormick testified to the friendliness of the Police Committee to the new form of omnibus, and pointed out what an advantage the adoption of an adequate motor-car service would be. We hope that the motor-car industry will be well developed in Belfast, where commerce flourishes more than anywhere else in Ireland, and where a public service system of motor-buses should be profitable.

Beautifying London.

WHILE the development of the new thoroughfare from Holborn to the Strand and other great Metropolitan schemes are in progress the automobile industry is doing its part in the reform of London streets. Architecturally a great advance is in course of achievement, but unless the cleanliness of the streets is secured the real beautification of the Metropolis will be impossible. In substituting something that will not pollute the thoroughfares with refuse—as do horses—and that will demand smooth surfaces in the roadway, motorists are rendering easier the task of the street cleaning committees of the City and the various Borough Councils. This will be a substantial gain, and

its value is dawning upon many surveyors and local authorities. A few minutes' walk along Holborn—from the motor firms on the Viaduct to those in Shaftesbury Avenue—affords an interesting anticipation of the streets of the future. Of course the horses largely predominate, but motor-cars are becoming an appreciable quantity in the traffic of that part of London.

An Exciting Ascent.

LAST week's ascent of the Aero Club from the Crystal Palace was the first undertaken without professional assistance. The Hon. C. S. Rolls and Mr. F. C. Pollock were the passengers, and from first to last the ascent was marked by incidents of an exciting nature. A strong and gusty wind

Photo by

[Argent Archer.]

rendered the start difficult. During the process of taking in ballast the score of assistants who held the guide ropes were at one time or another continually off their feet. During the scuffle with the elements a valuable aneroid barometer fell to the ground and was destroyed. Mr. Rolls, however, had a pocket instrument, with which altitudes were taken. After some reluctance on the part of the balloon several successful photographs were taken, one of which we reproduce. Finally ropes were let go and the two adventurous aeronauts were rapidly carried to the south-east. A shift of the wind bore the balloon to the north, and, to avoid the alternative of being carried over the North Sea, a rapid descent was made on the banks of the Thames near Gravesend.

Roads

THE Roads Improvement Association has addressed an important memorandum to the President of the Local Government Board. The chief plea put forward is for a central authority which would supervise the work of local authorities in maintaining the roads of the country. It is shown that the present system is extravagant, the control of our highways being divided among no less than 1,879 different authorities, whereas the work could be carried out more cheaply and efficiently by less than one-tenth of that number. The Association has determined to put its proposals into a Bill to be introduced to Parliament next Session, and if the Government is unable to adopt it a Royal Commission on the subject will be demanded.

The Failure of Alcohol.

It is truly remarkable, despite the many attempts to popularise alcohol as a motive power, and the many strong points which have been recorded in its favour, that so little success has attended the movement. Every motorist would welcome a fluid which promised to be cheaper, safer, and as effective as petrol, and these claims have been advanced for alcohol. Moreover, the latter is an artificial substance easily manufactured in almost every clime, whilst our petrol supplies are drawn from a few natural sources and are so limited that a "corner" could be worked in it without much difficulty.

Scope for Inventors.

THIS condition of things is not desirable. A growing industry like automobilism should not be wholly dependent on what may be described as a rare product. A new and cheap fuel with all the good qualities of petrol would advance motoring considerably. Alcohol, though so far an apparent failure, has many points of recommendation for inventors. It can be cheaply manufactured in our own country from many forms of agricultural produce. If the British farmer found a demand for such stuff he would take a kindlier interest in automobilism. Alcohol distilleries would spring up all over the country, and considerable employment be given in growing, collecting, preparing, and extracting spirit from the various field stuffs, etc., adapted for that purpose.

Alternatives.

THE complete applicability of alcohol to motoring may be chimerical, and consequently all our fond dreams of new home industries created by motoring may have to be abandoned. But, failing alcohol, perhaps some clever chemist may devise some other hydro-carbon which will be cheap, easy to produce, and powerful in use. Should such not be forthcoming immediately, we may hope at least for more attention being given to the heavy oils. A few firms have enterprisingly studied the matter, and with no inconsiderable success. We trust that progress in this direction will go much further. The ideal has not yet been reached. When the motorist can command a cheap, universally distributed, compact, and safe fuel, many of the woes which befall us at present will have disappeared.

More Check to Police Aggression.

THE police of Cheshire, Knutsford Division, have made an attempt to copy the tactics of the Surrey police, and, notwithstanding the public utterances of Lord Onslow, in which he denounced the tactics of policemen hiding behind hedges in order to trap honourable citizens, they prepared a well-laid plot to catch automobilists near Knutsford, and succeeded in stopping Mr. Nicholas Kilvert, a well-known Manchester gentleman, when he was driving his car from his residence at Brooklands to Chester. The fact that the summons had been issued against Mr. Kilvert raised a great deal of interest, and as it was the first case of its kind, he and his friends determined to put a stop

to the police oppression, if possible. The case came before the court at the petty sessions at Knutsford last week, when Mr. Kilvert was defended by Mr. Stapleco Firth. The sergeant of the police in charge of the case gave evidence in a very confident manner, and stated that the defendant travelled 110 yards, which had been measured by him with tape and a mark put at each end, in 15 seconds. He produced a stop watch in order to give a show of materiality to his evidence. He was subjected to a long and searching cross-examination, and ultimately he began to show signs of wavering from the confident position he had taken up at first. After several points had been severely shaken in his evidence he was attacked upon the exact instant when the car passed the two points mentioned by him, and as to his ability at the time of seeing the car pass such points. Before the cross-examination was finished, the Bench, who had listened carefully to the case, stopped it, and stated that they were perfectly satisfied, from the admissions made in cross-examination, that the sergeant's evidence was unreliable and the case was dismissed.

A Motor-'Bus Adventure.

THERE are so few motor-omnibuses in London that when one overturns it is a matter for comment. The other evening one of the automobile-'buses plying between Fulham and Piccadilly was entering Moore Park Road, Fulham, when a horsed 'bus coming in the other direction caused it to turn sharply—too sharply, as a matter of fact, for it fell over on to its side and the equilibrium of the eight passengers was disturbed. Two or three ladies fainted, and the 'bus became inflamed, while messengers went in all directions for the fire-brigade. Three fire engines quickly arrived; the ladies revived, and the flames were subdued. Eventually it was found that only one passenger complained of serious injuries. The point that we want to emphasise is that the incident was in no way due to any inherent vice in the automobile. Evidently the horse-drawn 'bus should be considered as equally to blame so far as the cause of the accident was concerned. In avoiding meeting that vehicle the motor-'bus overturned itself—evidence of the possession of the spirit of self-sacrifice.

The Club to the Rescue.

BUT for the timely intervention of the A.C.G.B.I., an event would in all probability have occurred on the Brighton road last Saturday which could not have failed to shatter the hopes of automobilism for many a year to come. A statement to the effect that two well-known automobilists had arranged a speed-contest to Brighton and back on that day had gone the round of the Press. Mr. Johnson, the Club Secretary, communicated with the proposed participants, pointing out the strong position which the Club intended to take in such matters, with the result that the race was abandoned.

A "Big Event" in France.

REIGATE is easily eclipsed by an event which has recently taken place at that most charming of Parisian suburbs, Neuilly. In one day 217 motor-car owners and drivers appeared to answer summonses for exceeding the legal speed, refusing to stop when ordered, and other similar offences. Fines of varying amounts and, in some few cases, short terms of imprisonment, were inflicted. Our Parisian brother motorists did not take the matter so calmly as does the persecuted Britisher. A regular riot ensued, the voice of justice was drowned in shouts of derision and howls of protest, and only the timely arrival of a strong force of police saved the Court from destruction.

Counting the Cost.

ADVOCATES of a special track for motor-cars may be interested in knowing what such a road would cost. Mr. George Lowthian, a civil engineer, has recently published some figures on the subject. He calculates that a road 80 feet wide, paved with 4 inch granite cubes laid on pitching with a covering

of concrete sufficient to prevent settlement of the paving setts into holes or ruts, would cost £52,976 per mile. The estimate for a macadamised road, laid on stone pitching and well grouted and rolled with a steam roller, is £27,027 per mile. Somewhat startling figures even on a macadamised basis of calculation; but the motorist does not require a track 80 feet wide. One quarter of that width of a good roadway, reserved for him on any of the main thoroughfares to and from our great cities, would help considerably to solve the overcrowding problem.

MR. T. B. PERCY BRINGS HOME HIS CANOE.

Locomotion in London.

AT the National Liberal Club on Tuesday, Mr. J. Williams Benn, L.C.C., expressed, as he put it, some aspirations of an optimistic citizen, the subject of his lantern lecture being "Locomotion in London." The chairman was Sir Alexander Binnie (until lately engineer to the London County Council), who, speaking of the value of tramway subways, incidentally pointed out that they would be suitable receptacles for water mains, which now leaked so copiously out of sight. Contemplating the possibility of animal traction being totally superseded by mechanical traction, he indicated, as one consequent advantage to London, that the roads would remain far longer in good repair. What damaged them so speedily now, said Sir Alexander, was not the wheels of vehicles (which, indeed, tended to consolidate the surfaces), but the horses' hoofs. He looked forward to the time when the streets would be freed from the road-breaking horse and its insanitary concomitants.

Another Conversion.

AT the invitation of a friend, Mr. Wm. Glass, of Sydenham, took his Panhard over to the "ancient and loyal city" of Oxford a week ago, and had the good fortune to meet the Mayor (Alderman Gray) and the senior Alderman (Mr. Jason Saunders). Having heard that the Oxford Bench regarded automobilists with, shall we say a bedimmed eye, it occurred to Mr. Glass that the opportunity should not be missed, and after some inducement, he obtained Alderman Saunders, his daughter, and the Mayoress of Oxford as passengers on his car for a 20 mile spin. As luck would have it, the car was not running particularly well on this occasion, still the full legal limit was

averaged with, perhaps, a little makeweight. Alderman Saunders after thanking Mr. Glass for a most enjoyable ride, informed him that he saw no reason why a speed much above the legal limit should not be permitted on an open country road. He gave it as his opinion that some motorists drove too fast in traffic and round corners and seemed to have the idea that the road belonged to them. After the ride he jokingly allowed that most of his objections to motor-cars had been rubbed off. The Mayoress expressed her feelings thus:—"I've longed to have a ride on a car and can now say I've never enjoyed anything so much in my life." Alderman Saunders is of all men a friend of the horse, and his remarks on this, his first motor ride, are weighty. Mr. Glass hopes that automobilists will take reasonable care in driving through the streets of Oxford, so that should difficulties arise they may find in the Oxford Bench a body of gentlemen who will take a reasonable view of the case.

THE WAR OFFICE TRIALS—THE THORNYCROFT ROUGH-ROAD VEHICLE.

The Exhibition: A Suggestion.

THAT the general public takes considerable interest in the Automobile Club's annual show at the Agricultural Hall is apparent to all who have attended that display. Evidence of this fact reaches us every week in the correspondence which we receive on every variety of subject connected with the exhibition, ranging from inquiries as to the date of its opening, to invitations to discuss the mechanism of some particular car shown at the 1901 exhibition. This week we had an interesting letter—which we reproduce in another column—making a suggestion with reference to allowing the engines and machinery to be seen in motion. From some points of view the idea is a good one, but we fancy the noise and odour that would be associated with the experiment of running five or six hundred motors in an enclosed space would deter rather than induce the public to buy. The yard attached to the Hall is always open for this purpose, but to adopt the idea in the Hall itself is not practicable.

Motor-Car Service at Scarborough.

In connection with this point, the experiment now being made at Scarborough will be regarded with interest. A company, promoted in the spring by Messrs. Walker and Hutton, has inaugurated a motor-car service, and one car running in October and November earned £80. Within the past few days a second motor-omnibus has been put on the streets, and the third is practically ready. Then the town will have a service of motor-buses between the Grand Hotel and South Cliff, a car starting from each terminus every twenty minutes. The other vehicle will be used for trips to Scalby, etc., and special excursions into the country. The fare for the full journey in town will be 3d., with penny and two-penny stages. Evidently the motor-car will

be one of the attractions of the 1902 season at this popular northern resort. We shall be glad to hear of other seaside towns that are to be similarly favoured.

Ignition Troubles.

ON Wednesday evening, after the first of the Winter Session House Dinners, at the Automobile Club, an interesting and instructive paper on "Ignition in Petroleum Spirit Engines; Systems, Possible Failures: How to Discover and Remedy Them," was read by Mr. Ernest J. Hutton, J.P. The paper, which dealt exhaustively with the matter, was the first of a series destined to appear in a forthcoming Badminton Library book on Motoring. Quite as interesting, and perhaps more instructive to the novice, was the discussion and interchange of experiences which followed. More than one experienced *chauffeur* told a good story of early struggles with ignition, and enjoyed the laugh against himself as much as any of his hearers.

The Absurdity of the "Law."

THE *Liverpool Daily Post* is one of those great provincial dailies that has always opened its columns for "both sides of the question," and Mr. Archibald Ford has just had a long article therein dealing with the agitation now going on against automobilism in a way that should prove conclusive to Liverpoolians. Mr. Ford gives as an instance of the severity with which the law is administered as regards motorists, the case of a driver who in a short drive of twenty miles was summoned in three separate localities and mulcted to the extent of forty pounds in fines.

THERE once was a county called Surrey,
Which loved passing motors to worry.
But since business declined
Surrey's sorry to find
It was she was in too great a hurry.

At a meeting of Dumfriesshire County Council, recently, Major Irving, of Burnfoot, made an appeal to the public in the county to assist the police in pulling up drivers of motor-cars who disregard the Council's regulations. He mentioned a case in the county where a driver disregarded the request of a gentleman driving a pony and trap to stop his car, with the result that the trap was ruined and the pony injured.

MR. VANDERBILT, the American millionaire, whilst driving his automobile at Deauville last summer, came into collision with a dogcart driven by M. Esbrau. The latter brought an action against Mr. Vanderbilt, and claimed 3,000 francs damages. The Seventh Chamber has given its judgment in the case, and only awarded M. Esbrau 1,000 francs damages, holding that both parties were to blame, the speed at which they were driving in each case being excessive.

A VEHICLE, the first of its kind, has lately been supplied to Hall's Safe Company, of New York, by the Vehicle Equipment Company, of Brooklyn. It is built on a very substantial steel bed, will carry ten tons, and is equipped with three 6 h.p. electric motors, two of which are used for traction and one for hoisting. To give some idea of the practical value of the vehicle, it may be stated that it recently hoisted a safe weighing four tons seven stories in six minutes, which operation would otherwise have taken several men half a day to perform.

MESSRS. ROBERT VAUZELLE AND CO., of 21, Rue de Picpus, Paris, have introduced a new liquid battery for ignition purposes, the strong point of which is that the positive elements are removable. The "positive element" is in cylindrical form and fits into the usual oblong case. The battery claims to obviate the risk of long halts even in the event of short-circuiting, which is immediately overcome by changing the positive element. Spilling of liquid is rendered impossible, no matter how violent a shock may be sustained. Other items of note which figure in Messrs. Vauzelle's catalogue are water cooled heads and ignition plugs at popular prices.

The Paris Motor-Car Exhibition.

LE GRAND PALAIS, PARIS—THE LOCALE OF THE EXHIBITION.

HE would indeed have been put down as an unreliable enthusiast, not to use any stronger term, who in 1898 had made bold to predict that in three years the annual exhibition would be held in the Grand Palais which would require to open up its vast crypt in order to be large enough to accommodate the exhibitors. Yet such is the case, and even then every available yard is occupied, and it becomes self-evident that next year a much larger building will have to be found. As I passed the Grand Palais on Monday night towards midnight, going up the Champs Elysées to my hotel, it was brilliantly illuminated within, and the echoes of constant and energetic hammering told of the stalls which were being hurried on for the opening, and on Tuesday morning I was pleasantly surprised to see nearly all the stands completed and the exhibits in place, and little remaining to be done save to rearrange the position of the cars on their platforms. It was hardly the time to go round bothering people for details and novelties, but I was able to get the salient features of the show.

Before, however, going into details of differentials and change-speed gears, I will describe briefly, for the benefit of those readers of the *Journal* who do not know the building, and who did not visit last year's show, the position and general appearance of the structure. The Grand Palais is an immense stone building highly ornamental in design, and with many beautiful sculptures and coloured tile friezes around it, and a roof of glass. It is situated at the corner of the Champs Elysées and the new bridge (Pont Nicolas II.), which was built at the time of the 1900 Exhibition, and this bridge and palace, together with the Petit Palais opposite, form the only trace which will remain to posterity to mark the place of the great 1900 Exhibition. Inside the Grand Palais, apart from the stands crowded with motors of every description, two things strike the eye, namely, the great airship made by M. Tatin for M. Henri Deutsch and the bronze statue of Vercingetorex by Bartholdi. M. Deutsch's airship is cleverly suspended from the roof, and consists of a huge cigar-shaped envelope with a triangular wooden keel suspended from it, and a propeller projecting at one end. The statue of Vercingetorex, who is mounted on a war horse and trampling his foes underfoot, is intended to be placed definitely at Clermont-Ferrand, which is the scene of his exploits. It is too large to be taken by train, and a De Dion-Bouton steam wagon has been requisitioned to carry it to its destination. It appears in the exhibition on

its automobile ready to make the journey as soon as the doors of the Salon close.

At ten o'clock on Tuesday the exhibition was opened, and by two o'clock, when M. Loubet, the President of the Republic, arrived, escorted by M. Millerand (the Minister of Commerce), General Florentin (the military governor of Paris) and M. Lepine (the chief of the police), the building was so crowded that it was almost impossible to move.

Amongst the seven hundred and odd exhibits I noticed Panhard and Levassor's stand, which includes the first and only car yet turned out by this firm with the new Centaure motor and carburettor. The Centaure motor has the *culasse* or valve box and the cylinder cast in one piece, so that there is no cylinder head joint to make. The exhaust valve is placed directly under the inlet valve, and the speed of the engine is regulated by means of a governor which actuates a tap in the carburettor, and allows more or less gas to pass into the cylinder. In addition to the foot accelerator there is a hand regulator enabling the speed of the engine to be diminished at will, so that in future the characteristic "vrum-vrum" of the Panhard will denote the old type, and the new will have a steady "ron-ron" like its English cousin. The new design is being made at present in 10-h.p. and 15 h.p. cars, each with four cylinders, and weighing almost the same, that is to say between 12 and 14 cwt. for the *chassis* without body. The speed changes and reverse are all on one lever, so that the differential has only one angle pinion instead of two. The reverse motion is obtained by two pinions being inserted between the spur-wheels of the change-gear. M. René de Knyff is the owner of this first car of the new type, and he kindly handed me over to his cousin, who gave me the technical details. Lightness and economy are the claims made for the new type, and it is with this that Panhard and Levassor mean to compete for next year's racing supremacy, their endeavours being directed to get as high a horse-power as possible into the weight limit of one ton. A little later I had the good fortune to meet one of the Mors brothers at the stand of this well-known firm, and he kindly gave me some details of their new four-cylinder 8 h.p. and 15 h.p. types, which have four speeds and reverse controlled by one lever, and a combined exhaust governor and inlet speed moderator. The 15 h.p. engine gives 18 h.p. on the brake, and is 87 millimètres in cylinder diameter, with a stroke of 128 millimètres. The 8 h.p. *chassis* will weigh only 10 cwt., and the 15 h.p. not quite 14 cwt. A feature of great interest on

this stand is the 60 h.p. motor for M. Deutsch's balloon; it weighs only 11 lb. per h.p., has four cylinders of 130 mm. by 190 mm., and runs at a speed of 800 revolutions.

Peugeot's exhibit shows a complete transformation, and is represented by four different models, viz., a single-cylinder of 5 h.p., with two forward speeds and reverse, weighing $6\frac{1}{2}$ cwt.; a single cylinder, with $6\frac{1}{2}$ h.p. motor, three speeds and reverse, weighing 8 cwt.; a two-cylinder 8 h.p. car, with three speeds and reverse, weighing 13 cwt. (Fig. 1); and a four-cylinder 10 h.p. car, with four speeds and reverse, weighing nearly 17 cwt. All the above weights are with bodies. In all these cars the engine is in front. The two larger types have chains and the two smaller types have universal joints.

De Dion and Bouton exhibit a *chassis* of their 1902 type of *voiturette*, with a single-cylinder motor, the cylinder being 90 millimètres in diameter by 100 millimètres stroke. There are two forward speeds and one reverse, all controlled from the one handle. The steering gear is inclined and the frame is made entirely of tubes. The curved hollow back axle is maintained as in the old type, but the motor is, of course, placed in front.

will, of course, fill with water, as it is in communication with the supply pipe. Thus a quart or more of water will be stored up under the piston, and if the pressure rises higher and opens the blow-off valve, the compressed air will expand and fill the boiler again. It is a kind of automatic accumulator and does away entirely with the hand pump. M. Serpollet has brought out a new type of 12 h.p. car which weighs no more than the 6 h.p., and he now makes his boiler tubes of nickel steel, which entirely prevents all oxidation.

AUTOMAN.

(To be continued.)

IN giving evidence against the driver of a motor-car at Chertsey, recently, the police officer who prosecuted said he took the time after a constable at the top of the slope had saluted the motorists, to throw them off their guard.

THE use of calcium chloride is suggested to prevent the circulation water in petrol cars from freezing in frosty weather. Five pounds of the chloride should be used to every gallon of water the tank will hold, and can be dissolved in the water before

Fig. 1.—THE 8 H.P. 2-CYLINDER PEUGEOT TONNEAU CAR (1902 MODEL).

[La France Automobile.]

M. Serpollet gave me a long explanation of the improvements he has brought out. They deserve a special mention, and consist in an invention which entirely does away with the hand-pump. Those readers of the *Journal* who are conversant with the Gardner-Serpollet steam-car will remember that occasionally and not infrequently the driver has to work a hand-lever backwards and forwards in order to pump water into the boiler. The reason is that when the pressure in the boiler reaches a certain height a safety-valve opens, and out goes water and steam. M. Serpollet has found an ingenious manner of getting over this difficulty. He fixes on the water-supply pipe, and in direct connection with the boiler, a cylinder closed at one end, and with a free piston in it. Above the piston the cylinder is filled with air at a pressure of, say, 300 lbs. to the square inch. When the pressure in the boiler rises beyond this height the free piston, of course, rises in the cylinder and compresses the air above it. Suppose, then, that the steam pressure rises to, say, 600 lbs., then the free piston will travel half-way up the cylinder, and compress the air to an equal pressure of 600 lbs., and the lower part of the cylinder below the piston

is poured into the tank. The evaporation of water does not affect the calcium chloride, and when refilling the tank pure water is used.

THE motor-car is rapidly becoming a familiar sight in Glamorganshire. During the summer visitors to Southerndown were frequently aroused from their contemplation of the beauties of nature by the "toot-toot" of the automobile, and now Margam Park echoes with the familiar sound, proceeding this time from the motor-car owned by Mr. Andrew Fletcher, which is an object of much interest to the rural population.

THINGS have changed considerably for the motorist during the past six years, as Mr. J. H. Knight, of Farnham, remarked in a lecture delivered at Alton recently. Mr. Knight gave some very instructive and practical information concerning motor-cars and automobiles, and in conclusion suggested that the would-be motor-car owners should purchase British-built cars in preference to those of foreign manufacture, for there was often a difficulty in procuring spare parts from abroad to replace any that broke down.

CONTINENTAL NOTES.

BY "AUTOMAN."

A CHARACTERISTIC banquet took place at the Hotel Continental, Paris, last Saturday week, when M. Buchet, to celebrate the victory which his motor has achieved, invited his staff to meet him. It was not a dinner given to the upper ten, redounding with the names of titled people; but it was much more practical, and included such record holders as Truffaut and Rigal, and many other humble contributors to the success of automobilism. M. Santos-Dumont was to have been there, but he was unfortunately prevented, and sent a letter and telegram speaking in most eulogistic terms of M. Buchet and his motor; and the evening passed off in a most successful manner.

FRANCE sets a good example to the world of automobilism as far as exhibitions are concerned. There there is perfect unanimity, no squabbling, and, supported and encouraged by everyone, the show has an immense advantage and adds facilities to the trade which cannot be minimised in importance. Belgium, on the other hand, which is the "happy hunting ground" of the exhibition promoter, is in a sad plight. There are to be two exhibitions in Brussels, run by factions of the trade who are opposing each other, and the result is bound to be a loss to both exhibitions. In Antwerp the same thing is going to happen, and how manufacturers can be so short-sighted as not to come to an agreement and hold one single exhibition I am at a loss to comprehend.

TALKING of the Paris Show, it must be very important, for it is even bringing back Fournier from America, and it is rumoured he will be accompanied by Messrs. Vanderbilt and Foxhall Keene.

"LA LOCOMOTION," a new automobile journal, edited by M. Gaston Sencier, proposes to organise a race in which the idea would be to carry important documents concerning the national safety, to various parts of France, the demonstration to be an object lesson for times of peace or times of war. It is proposed to ask the Government and the Minister of War to give their assistance to it.

THE Nice races are not to be sanctioned by the Government. It is just possible that the mile race and the hill-climbing test from Nice to La Turbie will be allowed, but that is all. It is a great blow to the automobile world, as great preparations were being made by some of the famous makers.

THE first important step with regard to the necessary Governmental authority for the Paris-Vienna race has scored a success for automobilism, for at the Government House in Vienna, the Count Kielmannsegg, the Governor of Southern Austria, presiding, the Austrian Automobile Club made application, and after some discussion, in which the Government expressed themselves, in principle, against road racing, consent was given on account of the important International questions at stake, and in view of the fact that it would bring an enormous number of foreigners into Austria. At the same time news comes that there is already an Austrian motor-car which weighs less than the 1,000 kilos. limit, and which is said to be able to attain very great speeds.

WHILE on the question of this great International race, I would like to emphasise the opinion which I have so often expressed in these columns, with regard to the important advance and improvements in construction of motor-cars, which has been the direct result of road racing, and urge English manufacturers and enthusiasts to examine carefully the events of the past few years so that they may be led to see the importance of finding a way to get our English manufacturers to compete in next year's race.

THE Panhard type, both the 7 h.p. and the 12 h.p., are good examples of the progress made, due to experience gained in

races. The success of the little Darracq in the race field has caused shoals of similar cars to be put on the market. The Germans, in order to compete, have brought out the Mercedes, with its excellent radiator and with the many improvements in the engine, and now that the weight limit has become official, both Mors and Panhard are making immense efforts to reduce the loss between the engine and the road wheels, and all for the purpose of road racing, but with the ultimate result of improving the type. Unfortunately, England does nothing but copy what improvements have been made by others, and this simply because she does not compete in road racing. The day that it is made worth while for British manufacturers to compete abroad, then improvements will come from England, and we shall cease to be a copyist of our neighbours. I feel sure that if the inducement of a large money prize were put forward by some wealthy enthusiast there is still time for English makers to come into the racing field.

RIGAL, riding on Saturday at Achères, broke the world's mile and kilometre records, covering the mile in 53.35 sec. and the kilometre in 33 sec. Rigal, on his tricycle, with a two-cylinder, 12 h.p. Buchet motor, began by trying to better Fournier's record for the mile with a flying start—51.45 sec.—established in America. He failed in this attempt, though achieving by far the best time over the distance ever accomplished on a motor-tricycle—namely, 53.35 sec. A portion of the macadam was in a bad condition owing to rain. Afterwards, Rigal made another attempt, and established a new record for the kilometre, covering this distance in 33 sec., or at the rate of 67½ miles an hour. Over the same course, Collins, on a Boyer light car, made a record, covering the kilometre in 39.45 sec, or at the rate of 92 kilometres per hour. Truffaut, the same day, beat the mile record for light vehicles, doing the mile in 1 min. 7 sec.

WHEN did the coil tremble?—When the firing commenced.

TO the end of October last one hundred and sixty motor-cycles, valued at £3,316, had this year been exported from Belgium. During the same period 42 machines, valued at £1,150, were imported into Belgium.

FOR the last half century Welshpool and Llanfair have been brought in touch with each other by two well-known daily coaches. This week a motor-wagonette has appeared and does the journey twice daily, the single run taking about three quarters of an hour.

AMONG the members of the medical profession who have lately adopted motor vehicles are Dr. Carney, of Stratford, Essex, and Dr. Allison, of Liverpool. Their choice has fallen on Messrs. Shippey Bros.' "Milwaukee" steam cars, Dr. Allison's vehicle being fitted with Clarkson's arrangement for using ordinary petroleum as fuel.

MR. HUGH OWEN, of the Automobile Transport Company, 72, Comeragh Road, London, W., informs us that they are now prepared to book orders for Twentieth Century cars, with engines of 9, 12, 16, or 24 h.p., for delivery early in the new year.

A PARTY of members of the Touring Club of France, while automobiling in the forest of Saint Germain, picked up an old man who had succumbed to cold and hunger. He was restored to consciousness and taken by automobile to a restaurant at Maisons-Laffitte, where he was dismissed with a good meal and a small sum of money.

ONE thing that no one seems to have noticed about the motor-car is that its pace can be reduced much more quickly and easily than that of a vehicle driven by horse-power. The motor can be pulled up in a couple of seconds by merely a turn of the chauffeur's wrist; and this is a mild form of "pulling the horse up on its haunches," together with the horrid jerk on the poor animal's mouth. The motor has come to stay, and the dear horses will in a very few years be released from the slavery of the crowded streets. We may as well accept it and make the best of it in the attitude of the philosophic mind with regard to the inevitable.—*Truth*.

THE CALVERT SPRAY CARBURETTOR.

MR. G. CALVERT, of Woodville Road, Mildmay Road, London, N., who is devoting much attention to the construction of small motors for motor-cycles, has just introduced a new spray-type carburettor, a section through which is shown in the accompanying illustration. The carburettor consists of the main casting A, cover plate B, regulator plate C, plunger plate G, mixing cone I, and exhaust jacket D. The action is as follows:—The ball valve J, controlling the supply of the spirit, is normally kept firmly in place by a small spring. Upon air being drawn in through the inlets L L, it strikes upon the plunger plate G, which is fixed to the rod M, and, through M, depresses J, allowing a small quantity of spirit to enter the mixing cone I, where it is mixed with the air, and drawn through the holes H H and the pipe E to the explosion chamber. The cover plate C is made to turn on the pin in the centre B, so that it can open or cover the holes L L at will. A pin N is driven in to a hole in M, so that it just touches the top of the outer tube on C. A spiral is cut on the top of this tube, so that as the air inlets are closed by moving C, the spiral allows M to drop more, thus varying the mixture of spirit and air in inverse proportions. M G is prevented from turning by fixing a

small pin on inside of B, and allowing it to work freely through a hole in G. The exhaust cone D is tapped through the centre, and screwed on to K to make a faced joint with A, and forms a small annular chamber, through which a portion of the exhaust gases is made to pass to warm the spirit and assist carburation in cold weather. The carburettor is made in sizes for engines up to 2½ h.p., the main feature, as above described, being that the amount of spirit allowed to pass is controlled automatically by the regulation of the air inlet.

MESSRS. EALES AND COMPANY, Queen Street, Coventry, have taken up the manufacture of belt driving rims for motor bicycles.

WE learn that Mr. A. E. Major, has taken larger premises at 60 and 62, Oxford Street, Reading, where he has extensive workshops with lift, charging station, wash-down department with hose, etc. Repairs to all types of cars can be undertaken.

THE "Wheel World," Paris Street, Exeter, are catering for motorists in the West of England; they lay themselves open for repairs of all descriptions by experienced men. A supply of petrol is kept on hand, while facilities are available for the charging of ignition batteries.

FLOTSAM AND JETSAM.

BY "FLANEUR."

AT one time it really seemed as though the vigorous efforts of the Automobile Club to convert the County Councils by the best of all means, namely, practical demonstrations, were destined to go unrewarded, so much aggression and persecution being manifest not long after the Sheen House gatherings themselves had taken place. The reward has come, however, in the drastic resolutions of the Executive Council of the County Councils Association. It only now remains for the Association to endorse the decision of its Council, to the effect that it is desirable that the statutory speed limit should be abolished, and little more will then be heard in the way of opposition from municipal bodies of appreciable importance, though no doubt individual malcontents will still exist.

WHAT one would like to know, however, is the identity of the actual parties who covertly wage warfare against automobilism through the agency of the police. Take Surrey as an example. Some people believe that the County Council eggs on the police in this matter of wholesale persecution. Others think that it is the magistrates—undoubtedly a very archaic body of individuals for the most part—who inspire the police to aggression. There are others who regard Chief Constable Sant as the archetype of persecution, while yet others believe that individual policemen, the village jacks-in-office, are the principal offenders. Lastly, it is conjectured that persons interested in the breeding of horses incite the police to misdirected action, either directly or by utilising county councillors or magistrates as a convenient channel.

Now, whatever be the causes of the rampant police persecution in Surrey generally, it certainly does seem specially desirable to know the why and the wherefore of the disgraceful aggressiveness displayed on the occasion of the Southsea Tour. The affair is done with, and it is now feasible to look at all the facts dispassionately. They are indeed extraordinary. The chief constables of the respective counties through which the cars were to pass were duly apprised of the approaching event. So far as Surrey was concerned, Captain Sant replied that he would do everything in his power to facilitate the progress of the cars while within his jurisdiction. And what happened? As the driver of one of the participating cars, I can only say that I saw more "policemanism" during the brief period that we were in Surrey than throughout the whole of the remainder of the route.

WHY that display of force at Bagshot? Why the deliberate traps, the "dirty trick" of signalling by means of an apparently courteous salute, and on a tour, moreover, which was in the nature of a public demonstration, with drivers slowing down their cars within the strict limits prescribed by the organisers of the run? And, above all, why were two mounted patrols, recognised as members of the Surrey force, placed at opposite ends of the straight stretch over Hartford Bridge Flats, which are in Hampshire? The whole business is discreditable, and one is bound to enquire how Captain Sant can reconcile this depletion of the villages of their police protection, for the sake of harassing harmless tourists elsewhere, with his promise to facilitate the passing of the cars. Either a breach of faith was perpetrated, or the policemen who were aggressive were acting on their own initiative, and in that case it would be desirable to know whether they have been reprimanded by their superior officer, or whether the Chief Constable is at the mercy of his own men.

Is there no friend of automobilism on the Surrey County Council who will raise the whole question of police administration in the county? Why should Surrey be so unsafe for the driver of even a slow car when the adjoining counties of Middlesex and Hampshire are not intolerant? Policemanism in Surrey is a by-word over the whole country. Cyclists have been persecuted for two decades in that county to a degree quite unknown in other parts of the kingdom. There is something radically wrong somewhere, and some system, or some individuals,

must be at fault. The question is, how is the responsibility to be located?

THERE is another matter which clearly shows how the detestable spirit of persecution prevails in Surrey to an extent unknown elsewhere. It is the only county in which motor-cyclists are fined for drawing trailers at a greater speed than six miles an hour. There has been one other prosecution of the kind, in the West of England if I recollect aright, but the magistrates took the common sense view that light passenger trailers were never contemplated by the Act. How could they be, when they were not even invented? Yet the Surrey police, in the Chertsey district, at all events, go on summoning luckless motor-cyclists for this terrible offence, and the Chertsey bench impose heavy fines on persons who are doing no manner of harm whatever. As a matter of fact it would be much more sensible to fine a man for *not* exceeding a pace of six miles an hour. Anything which never travels above that speed is a public nuisance, and causes congestion at every yard of its journey if passing through a town.

It is pleasant reading, by the way, to find that the Automobile Club is now definitely pledged to the attempt to have the existing law and regulations revised where motor-vehicles are concerned. The Club has done well to bide its time and let sensible people see for themselves that motor-cars are inoffensive vehicles, and that automobilists as a body are not to be classed with criminals. But patience has pretty well attained its limit by now, and automobilists all the country over should back up the club and strain every nerve to secure the sweeping away of that senseless blot on the statute book, the twelve miles an hour limit. Even in 1896 it was ridiculous, and Parliament itself allowed fourteen, but weakly signed away its rights to the unprogressive Local Government Board, who reduced the limit to twelve before ever the cars had been tried. And if ridiculous at that period, when the permissible maximum almost equalled the capacity of the cars if unfettered, what is it now, when every car that is fit to use is capable of much higher speed?

CAN nothing be done to stimulate those automobilists who leave others to carry on the work of propagandism, and make no efforts themselves even on their own behalf, much less for the sake of their brother *chauffeurs*? One can understand why there should be many owners of motor-vehicles who do not join the Automobile Club, because the subscription includes the use of a club-house as well as membership of a protective association, or *société d'encouragement*. But those who do not need, or have no opportunity of using the club house, might, and ought to, ally themselves to the Motor Union for the sake of the common good. Yet there was quite a large percentage of cars entered for the Southsea run opposite the names of which, on the published list, there was no prefix indicating membership of either the Union or the Club. And what of the non-participants in the tour? The total membership of the Automobile Club and the Motor Union combined cannot represent anything like the number of automobilists in this country, and, considering the things we have yet to fight for, the fact is much to be regretted.

THE *Sketch* Christmas number has a very foolish page of illustrations, in which a motor-car is seen to be blown to atoms as an amorous swain is on the point of proposing to his Araminta. Could not the artist, instead of seeking to perpetuate this very stale idea as to the exploding tendencies of motor-cars, have seized on something humorous which a motor-car, with a little exaggeration thrown in, might be expected to do at certain times? It is pleasant to turn from this to a full-page drawing in the Christmas number of the *Sphere*, where an up-to-date phantasy is presented of Father Christmas in an automobile, very passably drawn, and containing the usual merry crew of clown, pantaloon, harlequin and columbine, with a policeman in full chase.

MR. JOHN MARSTON, of Wolverhampton, records, in the *Road*, an incident where a motor-car raced the telegraph.

CORRESPONDENCE.

THE AUTOMOBILE CLUB'S NEW PREMISES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In common with not a few of my fellow members of the Automobile Club, I feel that the committee would have an easier task in finding a scheme for a new club house, which would be feasible and acceptable to the general body of members, if they did not endeavour to embody in their proposals three functions which would be in conflict with each other, and two of which would undoubtedly be in violation of the very constitution of the club. They seek first, and very properly, to continue the invaluable policy of protecting the rights of automobilists and fostering what is destined to become a great national industry while carrying on the vigorous propaganda which has hitherto distinguished the club's career.

Secondly, they aim at establishing an ambitious and costly high class social club, and lastly they propose to attach to the club, as in the Regent Street scheme, an extensive *garage* or storehouse, the rental of which alone is understood to be £1,000 a year, and which, if it is to escape financial failure, must be not merely a temporary storehouse for cars belonging to members using the club house, but must embrace all the ramifications of the sale and exchange of members' cars, dealing in petrol, lubricants, accessories, repairs, and what not, thus constituting a commercial venture utterly foreign to the aims and scope of a club.

It is undoubtedly true that the club, owing mainly if not entirely to its usefulness, and not to its social advantages, has attracted and is more and more attracting members of the highest social status, but it also numbers, especially amongst its earlier members, gentlemen who were pioneers or commercially interested in automobilism, but who are not of the same social standard as the more recent members. It is notorious that the great bulk of the socially superior members never make use of the club as a social club, having already their own clubs, thus showing that they have joined not for any social advantages, but in recognition and support of the club's useful propaganda.

It is manifest that the increased subscription which a first-class social club would necessitate would tend to eliminate the less prominent membership, but it is very doubtful whether such a club, apart from propaganda, would appeal to gentlemen of high standing, whilst the process of elimination would engender the same bad blood as has recently been seen in the case of the French club. Finally, for the club to conduct a large *garage* on commercial lines would be to initiate an unfair and injurious competition with those legitimate traders for whom the club has hitherto fought a good fight without any suspicion of monetary gain to itself.

The wisest course will be to continue the club on its present lines, without increasing the subscriptions of existing members; to move the club house to more commodious but not pretentious or very costly premises, with free storage accommodation for members using the club, thus enabling the surplus funds of the club, which will quickly double and treble, to be devoted to safeguarding the rights and privileges of automobilists generally, and helping to build up a national industry of the greatest importance. And as for a large commercial *garage*, we may be sure that London will require in the near future not one, but a dozen such storehouses, and let it not be forgotten that members having their business or residence in the City, Kensington, Westminster, Hampstead, or Bayswater would find little use for a *garage* attached to a club in Regent Street.

No, let the club leave such a commercial venture to capitalists, who may be trusted at the right moment to see the great financial possibilities of *garages* conducted on sound commercial lines, and who will not be slow to recognise the advantage of securing for their *garages*, wherever situated, the patronage and co-operation of the club in return for privileges given exclusively to its members, who will thus secure not only the advantage of the storehouse attached to the club, but also of whichever of the district *garages* is likely to be of greatest convenience to them.—Yours truly,

A MEMBER.

MOTOR-BICYCLES FOR 1902.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Kindly allow me to complete that amusing but somewhat misleading story of the Locomobile, the milk-can, and the Werner, as told by Mr. Teschemaker in your issue of November 30 last, I happened to be within six yards of the spot whence emanated an explosion which rang through the Agricultural Hall. I am glad to say that the lightly spoken of aeronautical trip of Mr. Tessier did not hurt him much. As he rounded the sharp curve at the end of the arena at a high speed, the Clincher tire on his machine blew off, hence his fall and the explosion of the inner tube. The damage to silencer and combustion-chamber, etc., was due to Mr. Tessier's knee coming in violent contact with them as he came off his machine. I must further beg Mr. Teschemaker's pardon if I flatly contradict some of his other statements. One is of last December, and I must remind him that it is the second time he has misquoted me. It is late to correct him, but I did not consider it sufficiently important at the time. He says in a letter in the *Journal*: "Mr. Bennett now tells us he does not know in respect of what it (the Werner) beat the tricycles." I will merely quote my own words to which he referred (*vide Motor-Car Journal*, December 15th, 1900): "If the Werner machine beat tricycles at the exhibition official trials at Vincennes this year, it was for many reasons, for speed was but one of the many points under consideration."

I must next demolish the story of Werner 1901's death. I will quote M. Eugène Werner's own words to me last July. "I am going to design another model with the motor in the frame. This will be the popular design, for I make it for those people who persistently clamour for a low centre of gravity, regardless of the fact that it can be mathematically demonstrated that this is less stable, but I shall still continue to make the present type." As a matter of fact, he has now just laid down one hundred such machines, so Mr. Teschemaker jumps at too hasty a conclusion when he says the makers are not satisfied with their machine, even if Mr. Bennett is. I will not repeat that I am very satisfied, for I have never expected miracles, and I have always been astonished at the results I have obtained. My training as an engineer teaches me to appreciate both the very serious difficulties which have presented themselves and the manner in which they have been overcome by M. Werner. And so it is that Werner 1901, with slight modifications, will reign conjointly with Werner 1902. I, personally, admitting the truer principles of fore-wheel driving and high gravity centre, am inclined to favour 1902, because I can get in a larger silencer and a flat belt.

The old carburettor has nothing wonderful about it; Mr. Teschemaker is the only person I ever heard bestow that adjective on it. It has its advantages and disadvantages, but it certainly is the simplest for a novice to manage, and was designed to that end. I will cry "peccavi" *re* the lubrication of the Werner engine. I did not consider it requisite to distinguish between the presence or absence of the recess in the top of the crank-chamber in comparing it with the De Dion, because the recess is not necessary, as the working of the Werner piston shows, but I challenge Mr. Teschemaker to prove that the Werner lubrication is inefficient, or inferior to De Dion's, when the maker's instructions are correctly followed. No one has ever complained of this, that I ever heard of. Mr. Teschemaker's graphic picture of "much oil, much splash" and "little oil, little splash," etc., is surely so obviously applicable to any splash system of lubrication that it is scarcely necessary, it seems to me. I must also deny that the Werner piston dips into the crank-chamber, because it certainly does not, the fly-wheels fill that and thus render it impossible. I can assure Mr. Teschemaker that the steady trickle of oil on the trembler may exist in some engines, but it certainly doesn't in either of the machines I have had. My present one used to let a little escape by the valve-lifter, but that ceased so soon as I discovered I was keeping the oil-level too high in the crank chamber. I should like him to see how clean it is after a 50 mile run. The average tricycle engine, I have remarked, is smothered in oil, possibly because it is so rarely wiped.

The down-hill coast on a safety at 25 and 50 miles an hour is no parallel case. The tires are a very important item. I will

mention the exclamation of the last novice I put on my bicycle when he had had a mile or so at about 18 per hour: "How much less bumpy this is than my safety; what a difference the tires make." They were 2 in. Dunlops, whilst his were 1½ in. I am not aware that collisions with carts, etc., are a necessary part of the programme, whatever Mr. Teschemaker may think on the subject. In 10,000 miles I have covered I have never met with one. I will frankly admit that 215 mile rides are too long for me personally, but I am not of the tireless ones, and am quite content with an average of 18-20 miles, but everyone to his taste. By far the most disagreeable feature of a ride in this country is the inane, stupid, and futile hostility shown to the automobile by the mass of the people, high and low, uneducated and educated; the latter are the most to blame considering their lights. Inane, stupid, and futile because they are seeking to oppose an irresistible force. I do not care to say all I think on the subject, but it augurs very ill for our future as a nation, this lack of adaptability to changed times.

Please excuse a few more words. Hints to correspondents *re* wear of tires: Don't blow up your front tire more than necessary; let it "*avoir l'obstacle*," as Michelin puts it; less vibration and less bouncing, hence less racing and wear in consequence. Use no more of your engine power than necessary, and get the speed by your advance lever; less noise and less wear again. I find a band at 3s. 6d. will last about 1,000 miles, and the original tire remains intact.—Yours faithfully,

A. L. BENETT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. Teschemaker's letter really is very unfair, and calculated to do a lot of harm to a growing industry. It seems to me that this gentleman is quoting from an experience of one particular cycle, so why he should condemn them as a whole passes my comprehension. As he remarks, nearly everybody contemplating motoring (on cycles) buys a "Werner." Sometimes their experiences are satisfactory, but more often not; the reason is not far to seek. First, the design is altogether wrong. Secondly, the workmanship or finish leaves much to be desired, but if the finish were on a par with a Maxim gun it would not be satisfactory, owing, as I said before, to defective design. I am of course alluding to the old "Werner," not the 1902 model. I cannot agree with your correspondent either upon the course he recommends to intending motor-cyclists, as the vibration upon an ordinary safety and a motor-cycle are not the same. I confess I have ridden some machines which nearly shake the arms out of the sockets, but this was in all cases due to imperfect design, and if the public would refuse such machines they would soon be taken off the market. Then again you "add 25 per cent. for shocks due to collisions with carts, &c." This on the face of it is ridiculous, as who but the greatest muff would ride at all if he could not ride without such accidents. I am at present completing a design for a motor-cycle, not a motor and cycle, for which I claim perfect comfort, steering, control, and freedom from side slip, no vibration at all on the wrists and arms, and no more than on a safety bicycle from the saddle, if as much. I should be very glad indeed to build one for Mr. Teschemaker if I succeed in introducing it upon the market, for which purpose I am at present seeking capital.

Yours truly,

C. H. LAMB.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Having read several interesting letters *re* motor-bicycles, it has occurred to me that my experiences might be helpful to the novice. I have ridden my trusty Werner since September 1900, and have covered about 4,000 miles on it, and I must confess that it appears to be in as good condition now as when I bought it. I notice several of your correspondents are going through the same troubles that I had, and no doubt it is only experience that will enable one to get the best results out of a motor-bike. For instance, wearing out of front tire, and vibration to handles, can both be cured by running with a loose strap, prepared with Colan or castor oil; it must be remembered that in any machinery a new strap is a great trouble. I find the

lubrication perfect; I oil up about every 20 miles, and find that the engine keeps in good working order. I have not found oil flying out and streaming down trembler; in fact I generally oil the cam, or else it squeaks. I have an E.I.C. plug, and have had no ignition trouble since fitting it. I certainly find room for improvement in the band brake, but I must give Werner *frères* their due, and admit that the workmanship of cycle and motor leaves very little to be desired as far as mine is concerned. No doubt the front position of the motor accounts for it keeping so cool when making long journeys, and I cannot help thinking that Werners are putting the engine down low this year, for fashion's sake only, and against their better judgment. I think if some of your correspondents had spent their time in studying the motor and its requirements, instead of flying into print with evidently only a day or two's experience, it would have been better for them. As regards side slips, I was riding with a Minerva recently, and found the rider contemplated giving it up for a Werner, as he found from practice that the Werner did not slip so much.—Yours faithfully, SIDNEY SILVERTHORNE.

MOTOR-CARS FOR THE TROPICS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If it be as stated in your issue of the 16th ult., viz., that a petrol-fired car cannot be used in a temperature of 90deg. in the shade, it would seem that motoring is a pleasure to be denied the unfortunate whose lot it is to live in the tropics. Perhaps the paragraph refers only to steam cars fired by petrol, or does the same objection apply to the more commonly used petroleum-spirit cars? I have seen no contradiction of it from any makers of the latter style of car, which would lead one to suppose that the facts are as stated in your paragraph. Thus it would appear that all cars are "barred" for tropical use except steam cars fitted with the Clarkson burner, and possibly the new Carlton motor, which, according to the advertisements, runs as well on kerosene oil as on petroleum spirit.

The point raised is, I think, one that would be of interest to men who, like myself, live in temperatures of 80 to 90 in the shade, and who may be meditating the purchase of a car other than an electric one. I have inquired of one or two firms what the flash point of petrol really is, but have had no reply. Perhaps you could enlighten me on the point. I apologise for troubling you on what may be a very elementary point in motoring. But other novices than myself may be at sea in the matter, and it would be as well for the "trade" to clear it up satisfactorily.—Yours truly, P. FOWLIE.

A QUERY RE STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to "Naval Engineer," I may inform him that a steam-car condenser cannot get hot in the sense that a marine condenser does, for the simple reason that the circulating water can never fail, its place being taken by the current of cold air made by the car itself.

A steam-car condenser is simply an ordinary marine condenser with the casing removed and the steam passing through the tubes. Of course, the cooling surface is much in excess of that which would be used in a marine engine of equal power, but as the condenser is not called upon to produce a vacuum, the tubes are made very light and thin. Naturally the condenser is not so effective in hot weather, but then the slight escape of steam is invisible, and so does not matter.—Yours truly, CONDENSER.

MOTORS AT THE EXHIBITION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I be allowed to ask through the medium of your valuable journal whether at your next Show at the Agricultural Hall it is or may be arranged for the engines and machinery to be seen in motion, working on stationary platforms or stands without the car bodies? It would, I think, give a better opportunity for the public to form an opinion upon the different systems adopted, and upon the simplicity or complexity of the

mechanism, its apparent strength, durability, and ease or other wise of manipulation, much better than drives round the arena.

I should also like to ask as to when it is likely that some of the zeal and energy now given to the attainment of high speeds, to use which is prohibited by law—will be devoted to the production of a slower but comfortable and shapely common-sense covered carriage—not a weird-looking horseless brougham—suitable for taking a family home from the opera on rough nights; for, surely, this should be a special mission and strong recommendation to mechanical carriages in saving both men and horses late at night.—Yours truly, AGOG.

THE SMART SURREY POLICE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Mr. L. W. Fuller is not the only victim to the "Smart Surrey Police." I know several, and have been stopped myself for steam escaping from the tank, through defective pump. It taxed the combined intelligence of the six constables in ambush over the hedge, and required an appeal to the inspector (who did not appear to have been recruited from the gamekeeper class), and his decision that it was not a steam driven car, and that the escape was from a temporary cause, before we were allowed to go on. It is not, however, the fault of the police: they are a fairly decent body of men, but their instructions, issued by a bigoted clique, who hold the reins of power, and the special attendance fees in motor cases make them very keen on motorists. My opinion, formed at Reigate Court, was that the sooner the old feudal system of allowing a man, whose qualification for the post was his banking account, to dispense justice was altered, the better for this sleepy old country. I had to listen recently to two cases at Reigate, both supported by witnesses called by the *R.S.P.C.A.* The first was a disgusting case of cruelty by a youth of fifteen on a donkey, he was awarded six strokes with the birch; the second, a hulking labourer was charged with cruelty to a puppy of four months old; the worthy magistrate's question as to whether it was killed was not answered, but the man was fined 5s. for his cruelty. Lunch next, then motor cases, those who pleaded guilty to exceeding twelve miles per hour down the half-mile hill of clear, deserted road view, £1 and costs; all those who dared to dispute the evidence of the constables, and (like Mr. Peall) swore they did not believe their speed was over twelve miles, £2 or £3 and costs. Motorists are not safe from persecution in the county of Surrey, between the Star at Horley and Crawley Station.—Yours truly, F. W. G.

MR. W. O. DEWEY writes:—"With regard to your correspondent's query *re* ignition troubles, I would recommend him to try the Narbonne ignition, which I am sure would entirely get rid of his sparking troubles."

MR. F. W. BISHOP writes:—"It may be interesting to the readers of your valuable *Journal* to learn my experience of the Wellington sparking plug. I have used one of these continually for over two years. I have travelled about 3,500 miles, and in September last I rode 700 miles in eight days, and have only used this one plug."

THE Mayor of Nice has been expressly informed that the Government has decided to refuse permission for the motor-car racing tournament which was to have taken place in April.

A CAPTAIN, two junior officers, thirty-four non-commissioned officers, and several men left Berlin lately for Cannstatt to take over nine motor-cars purchased by the German Government for army purposes. The cars will be driven from Cannstatt via Heilbronn to the barracks in Berlin, to test their speed and capacity for the transport of ammunition and provisions.

AN automobile school is about to be started in Paris. A course of simple and practical instruction in the constitution and the "tricks and manners" of the automobile is to be placed within the reach of all young men wishing to choose the business of *mécanicien* as a career. The *Presse* announces that entries for a free course of instruction in automobilism may be registered at the Ecole Communale of the Rue Saint-Ferdinand, and that the classes are held every evening.

THE WAR OFFICE MOTOR LORRY TRIALS.

IN our last issue we described the Foden and Straker steam vehicles taking part in the War Office trials at Aldershot. We now give a few particulars of the three other competing vehicles—the Milnes and the two Thornycrofts.

The 5-ton war lorry entered by Messrs. George F. Milnes and Co., Limited, is 21ft. long by 6ft. 6in. wide; the wheel-base is 12ft. 9in.; floor space 13ft. 6in. by 6ft. The frame is constructed of U channel steel and will bear a total dead load up to 6 tons. The motor is a four-cylinder hydro-carbon engine, the diameter of piston being 90 millimetres and the stroke 120 millimetres. It is built on the Daimler principle throughout, with Daimler float-feed governor, and patent water-cooler of the marine condenser type. The number of revolutions per minute is 750, and the brake h.p. is 25. The water circulation is maintained by a gear-driven rotary pump. The oil is fed by pressure from a portion of the exhaust, ignition being by the Simms-Bosch magneto-electric system. The transmission is by a single friction cone on the Daimler principle. The power is transmitted from the main longitudinal shaft through the differential gear on the Cannstatt system by means of two pinions engaging two internal gear wheels fixed to the back road wheels. The speed-changing gear is on the Cannstatt system,

the standard military draw hook. The boiler is arranged so that the fire bars can be easily replaced by the liquid fuel burners, which are either of the spraying or vapourising type, according to the nature of the oil which may be available. A condenser is provided, but is arranged so that it can be short-circuited or removed without interfering with other parts of the machinery. The boiler is fed by a pump driven directly from the engine, or by an auxiliary pump or injector. An exhaust feed heater is also provided; the differential gear can be locked in the usual manner.

As early as eight o'clock on Thursday morning last week the lorries engaging in the trials had drawn up at the Royal Engineer depot, Aldershot. The members of the Mechanical Transport Committee were with one or two exceptions present, and appeared well satisfied with the prospects of the initial trial. In nearly each case the vehicles conveyed only the driver, brakesman on trailer, and the observing officer and his assistant, but an exception or two had been made of officers and others who had obtained a special permit from Captain Lloyd. The trial was started by the order being given to get up steam. The Thornycroft oil fuel wagon occupied twenty-five minutes, the Thornycroft coke fuel wagon thirty-five minutes, the Straker coke fuel wagon forty-five minutes, and the Foden lorry with coal fuel about an hour. The Milnes wagon having a combustion engine, of course did not require to raise steam. The vehicles were then started on their course at intervals of five

THE STRAKER STEAM LORRY AND TRAILER.

four speeds being provided. With this gear, the first and second, and third and fourth speeds are each controlled by one lever, by which means, as the two couples of speeds are independent of each other when changing, neither couple affects the other set of gear wheels. The Cannstatt principle for changing speeds also automatically disengages the friction cone when either speed lever is actuated. The reverse speed is obtained by dropping into gear a special cog wheel, giving a speed of four miles per hour. Two circumferential brakes, worked by worm gear from the driver's seat by hand, act on the hind wheels. There is also a double-acting brake-clutch on the first speed shaft, and a sprag on the back axle.

Vehicle No. 6, entered by the Thornycroft Steam Wagon Company, Ltd., is of the company's standard type, capable of carrying three tons and drawing a further two tons on a trailing vehicle. Vehicle No. 7, by the same company, is illustrated in another part of the present issue; it is specially adapted for use on rough roads and uneven ground, the steering axle being capable of an unusually large angle of tilt; and the driving and steering wheels, being of large diameter, the boiler and engine are situated directly over the driving axle, the carrying platform being provided at the fore part of the vehicle. This arrangement gives the wagon great power to get out of holes in soft ground, etc., and enables it to exert its full power as a tractor when it is not itself laden. The boiler and engine are of the same pattern as the standard wagon; it is fitted with three speeds, a winding drum, and one hundred yards of steel wire rope. A spring draw gear is provided, fitted with

minutes in the following order:—Foden, Milnes, Straker, Thornycroft No. 6, and Thornycroft No. 7; the first named being despatched at 8.30. The direction lay through Aldershot on to Hale and Odiham, through Blackwater, Camberley, Bagshot, Frimley, and back to Aldershot *via* Farnborough, a total distance of thirty miles. The first to arrive home was the Foden lorry, which was followed by the two Thornycroft wagons. The Straker wagon, which had been delayed on the road, arrived an hour and twenty-five minutes after the Foden lorry. The Milnes lorry came in about twenty-five minutes later. Between the first three cars there was but a few minutes difference in the time in which the run was accomplished, but the officials have, at the end, to report upon stoppages on the road, to which each individual machine was subjected. The exact times of the completion of the run are, therefore, not to be relied upon as vital. Of the remaining two machines, each of which covered the distance, allowance has to be made for accidents not inherent to their construction, but casualties such as might be expected at any time. Heated bearings owing to the failure of a lubricator caused a slight delay to the Straker vehicle; and the breaking of the coupling-rods between the Milnes lorry and its trailer, created still further delay on the part of this entry, as the load of two tons on the trailer had to be transferred to the main vehicle. Even this machine brought its full load into the depot within seven hours. About half a dozen motor-cars accompanied the lorries, conveying members of the Mechanical Transport Committee, members of the competing firms, and a number of interested motorists.

On Friday, the 6th inst., the five vehicles were despatched over the same thirty-mile course as on the previous day, but in the opposite direction. The Milnes wagon made a bad start, again breaking the connecting rod of the trailer when only one hundred yards had been traversed, and having, in consequence, to carry the whole of the five tons dead load on the wagon. Bad luck pursued the car throughout the day, and it reached home a long time behind the others. The Foden lorry was again most successful, completing the distance first, in 4½ hours, improving on Thursday's time by about an hour, due to the use of Welsh coal instead of coke. The Thornycroft coke-fired wagon also did well, but broke a small water-feed pipe and suffered a slight delay, its time being 5 hr. 21 min. The Straker steam wagon did better than on the previous day, but the high-pressure connecting-rod again got over-heated, so that 5 hr. 53 min. were taken up by the trip. A defect in the oil burners of the Thornycroft petroleum-fired steam wagon was the cause of a serious delay, the car arriving about an hour after the Straker.

Saturday last was taken up by an inspection of the vehicles by the Committee. On Monday the trials were continued in stormy weather. The five different types competing were subjected to a severe test over the thirty-two miles of road mapped out, the distance having to be covered in a little over six hours. The wagons were despatched between 8 and 9 a.m., the route being *via* Hale, Crondall, Ho, Warnborough, Alton, Farnham, and Aldershot. The Foden wagon was again first in, for the third time in succession, covering the distance quite easily. The Thornycroft coke fired wagon, No. 6, was second, and the Straker wagon a long way behind. The Milnes wagon was about forty minutes behind the Straker, and last came the Thornycroft experimental rear-driven wagon. This was constructed to burn petroleum, but on Monday fire bars were used and coal fuel tried, but the draught was not sufficient to take it along at any good average speed.

(To be continued.)

THE PANHARD AND LEVASSOR NEW "CENTAURE" MOTOR.

MESSRS. PANHARD AND LEVASSOR have lately adopted an improved form of petrol motor, which they have named the "Centaure." The improvements are mainly connected with the governor controlling the admission of explosive mixture, with the arrangement of mounting the valve

FIG. 1.—SECTION OF CENTAURE MOTOR.

chambers and the method of controlling the exhaust valves. Fig. 2 gives a front view of the four-cylinder 16 h.p. motor, Fig. 1 a transverse section through the axis of one of the cylinders, and Fig. 3 a partial plan. The regulating of the motor is effected

through the admission of the gaseous mixture, either by means of a cock with a single valve or through the control of the admission valves. The two admission valves of one group of two cylinders are arranged in boxes, *a*, upon which presses a crosspiece, *b*, through its extremities. This piece is secured to the explosion chamber, *c*, by a nut, *d*, and a bolt, *e*, so that the dismounting may be effected solely through the unscrewing of the nut. The arrangement of each suction valve is such that the part can be replaced by another, including an electro-magnet, into which a current is sent by the regulator. The magnetic suction valve dispenses with any other regulation of the admission of the gaseous mixture. The substitution of this new valve for the ordinary one can be effected without any modification of the explosion chamber. The plugs, *x*, of the exhaust valve boxes are held in a similar manner by crosspieces and nuts, *z*. The control of the exhaust

FIGS. 2 AND 3.—ELEVATION AND PLAN OF CENTAURE MOTOR.

valves is obtained through a cam-shaft, *f*, entirely enclosed in the casing, and acting upon simple rods, *g*, which lift the valves at every revolution of the shaft. Each of these rods is guided by a double fork, *h*, embracing the cam-shaft *f*. The cam-shaft is completely enclosed in a casing, *i*, open only to the crank-chamber of the motor. It is lubricated by the oil continually thrown by the connecting rod-heads, *b*. Provision is made so that the cam-shaft can be readily adjusted or dismantled. Fig. 1 represents a motor in which the ignition is effected through an incandescent tube; but it is pointed out that this motor has been especially studied from the point of view of electrical ignition. The cylinders are connected in pairs and provided with a water-jacket, *m*, at the upper part. The pistons are of cast-iron with cast-iron segments. The centrifugal governor, *n*, mounted upon the cam-shaft, acts directly upon the admission valve. It is capable also of electrically controlling the admission valves. In this case it displaces a simple key, which comes into contact with one, two, three, or four flexible strips of metal.

AN American contemporary states that the Prescott Automobile Manufacturing Company, of New York, has secured an order for 100 steam vehicles for shipment to London.

THROUGH SCOTLAND ON A DELAHAYE CAR.

ON Friday morning, September 13th, I left Nottingham with my mechanic on my new 6 h.p. Delahaye *tonneau* car for a tour in Scotland. The first stop we made was at Doncaster for lunch. A few miles out of Doncaster we had the misfortune to break an induction valve spring, which, at the same time, damaged the ignition plug. This put right, we made splendid time through Selby to York, where we stayed an hour for tea, and then went *via* Thirsk to Stockton-on-Tees (134 miles), where we stayed the night. Next morning we discovered a puncture, which, unfortunately, delayed us till eleven o'clock, when we started *via* Durham to Newcastle, where we stopped an hour for lunch, and then went on through Morpeth and Alnwick to Berwick (100 miles), where we passed the night. Sunday morning we had a splendid run through very pretty country, with the sea on our right, to Edinburgh (60 miles), having called for lunch at Dunbar. We stayed in Edinburgh till Tuesday afternoon, where, in the meantime, a friend—the Rev. W. A. Boyd—joined us, and we went *via* Linlithgow and Falkirk to Stirling. Next

AT THE FOOT OF BEN LEDI, OUTSIDE CALLANDER.

morning, much to our annoyance, we found another puncture; after repairing same, we ran on *via* Donne and Callander to the Trossachs Hotel. Here we stayed a couple of days, and then came back to Callander. Starting next morning for Oban *via* Lochearnhead, we had a long climb—about three miles—up Glenogle and on to Crianlarich and Tyndrum, thence over that well-known stretch of fearful road to Dalmally, then alongside Loch Awe, through the Pass of Brander, Taynilt and Connel Ferry, where our exhaust valve spring gave way, reaching Oban in time for dinner. We stayed in Oban a couple of days, and in the meantime, I went over to Connel to tell the man in charge of the ferry that I wished to take a motor-car across. He, however, refused to take it, so there was no alternative but to take the car on the Fort William boat as far as Onich, opposite Balachulish. We reached Onich about three in the afternoon, and started *via* Fort William, Spean Bridge (where we stopped an hour for tea), and alongside Loch Laggan to Newtonmore, reached at 8.30 (56 miles). There we struck the old Highland coaching road from Inverness to Perth, and next morning commenced a twenty mile climb through bleak

Highland country, *via* Dalwhinnie to Dalnaspival. A glorious run down followed, through Blair Athol, Pitlochry, the Pass of Killierankie, and Dunkeld, to Perth (70 miles), where we put up for the night.

Starting next morning, *via* Auchterader, Dunblane (where we broke another exhaust spring), and Bridge of Allan, we reached Stirling, and after lunch continued through uninteresting country to Lanark (60 miles). Next morning was hopelessly wet, and we did not take the road till 4 p.m. The weather continued wet, and we were glad to bring the short day's run to an end at Abington. It was still raining when we left for Carlisle next morning; reached late on account of trouble with valves and electric ignition. After a late lunch at Carlisle we pushed on to Penrith, where we brought our seventy-mile day's run to an end. With the thought of Shap Fell before us, we made an early start next morning. The Fell, however, presented no insurmountable difficulties, and the summit once attained, we ran down hill all the way to Kendal and lunch. On again through Kirby Lonsdale, Skipton, and Settle (where another exhaust spring broke), to Bradford (92 miles). Next morning opened with a four-mile climb out of Bradford, followed by a good run through Wakefield to Doncaster, where we had lunch, and then went home, *via* Worksop and Mansfield, arriving in good time for dinner (74 miles).

The total distance we covered was 875 miles in seventeen days, out of which we were resting six and a half. Considering that my car is fitted with only a 6 h.p. single-cylinder motor and the rough, hilly country we had to contend with in some parts, I think that it did the work marvellously well. Of course, I did not start with the idea of getting over the ground as quickly as possible, but to enjoy myself; and I did enjoy the tour immensely. I would just like to add that when leaving home I did not anticipate getting much further north than Edinburgh; but I was fortunate in picking up a copy of the Con-tour Road Book, which I found most useful with regard to gradients, and shall never go touring again without it, as by studying it one knows exactly what one has to expect in the way of hills, as well as distance. We were troubled a good deal up in Scotland with the horses, but in the majority of cases, in my opinion, it was those in charge of them, not the car, which frightened the horses. Long before our car approached we could see the drivers pulling at their horses, and hear their excited shouts as they belaboured them with the whip. What nervous animal would stand such treatment? One more point of interest I may mention: our total consumption of petrol on the tour was thirty-seven gallons.

C. HARDY.

THE petition for the winding-up of the Automobile Manufacturing Company, Limited, is down for hearing at the Royal Courts of Justice, on Wednesday, December 18th.

MR. ALBERT E. OAKLEY, of Kimberley Gardens, Green Lanes, London, N., has ample accommodation for storing and repairing motor-cars and cycles, conveniently situated on a main road.

THE members of the English Motor Club will hold a run to Dunstable to-day (Saturday). On the following day there will be an extension of the run, according to the state of the weather and roads.

GAMAGE'S, of Holborn, E.C., are nothing if not up-to-date; they are at present showing in their Christmas windows "Santa Claus" on an up-to-date motor-bicycle, covered with snow, frost, and presents, riding down a snowy lane which runs through the centre of their window.

WHILE a motor-car was proceeding through Ealing one day last week the machine was observed by pedestrians to be behaving in a very strange manner. When abreast of Culmington Road an explosion took place. The vehicle quickly caught fire and was completely destroyed, and the Ealing Fire Brigade had to be summoned to subdue the flames. The occupant of the car was uninjured. The vehicle was insured against fire and explosion with the State Fire Office, of 13, Abchurch Lane, E.C., who inform us that the explosion was the effect and not the cause of the fire.

HERE AND THERE.

A SERVICE of motor-cars is now running seven days a week between Folkestone, Hythe, and Shorncliffe, over fifty journeys being made daily. So successful has been the venture that other cars have been ordered.

THE King left Marlborough House on Saturday last for Sandringham, accompanied by a select party of week-end guests. Wolferton was reached at 6.25, and the King proceeded to Sandringham in his motor-car, his guests following in closed carriages.

AT the last meeting of the Erdington District Council, an application was received from the Birmingham Motor Passenger Company for a licence to ply for hire in the district with motor-cars. After some discussion the matter was referred to the Finance Committee.

A MOTOR-CAR in which were three gentlemen met with a mishap last week by an encounter with a flock of ponies near Bury St. Edmunds. In attempting to clear the animals the car collided with one of them and capsized, fortunately without injury to the occupants, or serious damage to the vehicle, though the pony was injured to such an extent that it was found necessary to shoot it.

THE public examination of William Grant, coachbuilder, of Aberdeen, disclosed liabilities amounting to £833, and assets £803. A claim of £800 was included in the assets against the Northern Carriage and Motor Company, Limited, and J. D. Mitchell, the price of the stock said to have been sold by bankrupt to the company.

THE illustration on this page depicts the 1902 Dosa-Dos model of the Locomobile steam car. The horse power of the car is 6½. There are a good number of new features on the carriage, including larger piping. It is a heavier carriage right through than the standard type now so well known, and has fuel carrying capacity for a run of 100 miles. The first example of the new type only arrived last week and was immediately purchased by a gentleman who is taking it out with him to India.

FOR some time past difficulty has been experienced by motor-bicycle builders in obtaining a suitable chain stay bridge sufficiently wide to allow of the direct driving of the belt. To overcome this difficulty the Empire Motor Company, of Janes Street, Oxford Street, W., have brought out a new bridge, which is so constructed as to allow free direct play of the belt, without the use of an additional jockey pulley. It is made to suit the standard B.S.A. tubes and stays, and is also strengthened by a special shoulder on the driving side.

HEAVY motor-cars bid fair to take a strong hold on the carrying trade of the country, and keen men of business are

keeping a careful watch on the possibilities of cheapening and improving their methods of transport by means of the automobile. An example of enterprise in this direction by Alderman H. M. Baker, of Dover, Government contractor, was made very prominent last week. Usually to take a load of one and a-half tons to Dover Castle means employing a pair of big strong horses. On Monday last week, however, instead of two horses struggling with a light load, an automobile carrying over two tons ascended Castle Hill with ease. The lorry employed by Mr. Baker was an 8 h.p. Milnes. The vehicle used was brought from Whitstable to Mr. H. M. Baker's stores at Canterbury, and from Canterbury to Dover, with only the consumption of two gallons of petrol.

MESSRS. R. M. WRIGHT and Co., of Mint Street, Lincoln, the well-known motor-car agents and dealers, have taken the large hall known as Gadsby's Auction Mart and are having it fitted as a well appointed motor depot and works. The premises extend back from Newland, the main road to York, Gainsborough, Retford, etc., to the present workshop in Water Lane; the intervening premises have also been secured so that they will all be

connected up, and there will be a straight run through from the new premises to the works and garage at the back, with outlet into Water Lane. There will be a showroom space of 3,000 sq. feet, each of the two floors being of the same size. The workshops and garage with inspection pits will be 25 feet wide by 58 feet in length. A special feature of the business has been cars for business or pleasure, and the hiring-out business, which already is on a large scale, is to be materially developed. A full stock of petrol,

grease, lubricants, and spare and renewal parts will be kept, while all classes of repair work can be undertaken.

AT a meeting of the Hammersmith Borough Council last week it was stated that owners of motor-cars had frequently called at the Council's electricity works to obtain a supply of electricity for their accumulators. The electrical engineer suggested that, considering the large number of motor-cars now in use, and the very small number of charging stations available, it would be a great convenience to the users of the cars, and a source of profit to the Council, if electricity were supplied at the electricity works for charging such accumulators. The cost of the necessary machinery would not exceed £200, including the motor generator for changing the alternating into continuous current. The latter would not only give a low pressure supply to accumulators for petrol cars, but also the higher pressure for the larger batteries carried by electric motor-cars. The subject was discussed at some length, and ultimately the Council decided to establish an accumulator station at the electricity works at an estimated outlay of £200; that petrol car batteries should be charged at the rate of 8d. per unit, and electric cars at the rate of 3d. per unit.

THE LOCOMOBILE 6½ H.P. DOSA-DOS.

MOTOR-CYCLES FOR 1902.

(Concluded from page 733.)

A MOTOR-BICYCLE which has been in use for some time in France, where it is made, but which is new to the English market, is the Petrocyclette (Fig. 1). It is being introduced by Mr. T. R. Marriott, of St. Albans. The motor is arranged vertically in the angle of the frame above the bottom bracket, the flywheel being outside the crank case. The engine shaft carries a sprocket wheel and a large leather-lined friction clutch, so that the motor can be thrown in and out of gear as required. The driving is by chain gearing to the rear wheel hub, the ordinary pedal chain drive being fitted on the other side of the machine. The clutch is thrown in and out of engagement by means of a small lever set upon the top tube, and connected to the clutch by a steel wire, which is wound round a small drum on the lever spindle. The novelty in the motor, which is $1\frac{1}{2}$ h.p., is the method of air cooling. The cylinder has an air jacket composed of an outer cylinder of copper, with ribs, and, in addition to this, a tube is wound spirally around the cylinder proper, between the latter and the outer one. A funnel is fixed near the top, projecting in the direction in which the bicycle is travelling, so that a draught created by the forward drive is forced into the jacket, and issues from

FIG. 1.—THE "PETROCYCLETTE."

another aperture at the bottom. It is claimed that this system of air-cooling cylinders is much more efficient than when flanges are cast upon the cylinder. The carburettor is of the pulverizer type, in which the petrol is drawn up by suction and mixed with the air as it enters the cylinder. The petrol reservoir and lubricating oil tank are carried beneath the top tube of the frame. The former has a capacity of one gallon and the latter of about three-quarters of a pint.

The Phoenix motor-bicycle of Mr. J. van Hooydonk, 736, Holloway Road, N., has already been illustrated and described in our columns. A feature of the machine is that the motor is provided with a device whereby lubrication may be effected without dismounting. An additional petrol tank is fitted, enabling the rider to cover very long distances, the petrol being forced from the spare tank by air pressure when required. A single lever serves to break the current, and by a further movement to lift the exhaust valve. A new departure by this firm is the production of a lady's motor-bicycle with Minerva motor, and a motor tandem bicycle. The latter is of the lady back description, all the motor work being arranged in front under the control of the forward rider. On this machine, as on the lady's machine, a guard is fitted over the belt to protect the skirts of the rider, and the tandem is fitted with a two-speed hub, making altogether a very complete machine. La Société des Cycles Clement and Gladiator, of 14, Regent Street, S.W., are introducing the new Clement motor-bicycle into this country; it is fitted with a 1 h.p. motor, carried on the lower cross tube of the frame, and driving the rear wheel by a strap. A machine of this type has just completed a record run from Paris to Rome in 4 days 23 hours, crossing the Alps en route. The route. The weight, complete, of the machine is only 60 lbs.

One of the most novel motor-bicycles that has come under our notice recently is the "Martini," made by Mr. William Hardy, of 55, Greenwich Road, S.E. The small petrol motor, to which a neat form of exhaust-valve lifter and spray carburettor are fitted, is supported on the lower cross tube of the frame, but, instead of a belt, chains are used to transmit the power to the rear wheel. The motor drives direct by a chain from the pinion to large chain sprocket on the back wheel, but there is a free-wheel clutch fitted to the latter, so that the bicycle never drives the motor. For pedalling, there is the ordinary chain and free-wheel, and to connect the pedals with the motor is another chain on the opposite side of the bracket to the pedal chain; it drives a small pinion on the outside of the motor pinion also with a clutch. By the arrangement adopted it is said to be possible to "coast" down hills, with the engine and all driving chains at rest, saving petrol and wear and tear to all working parts. In the event of a back-fire or mis-fire the machine is not brought to a standstill, the bicycle simply overrunning the engine. We shall be interested to learn how the "Martini" arrangement works out in practice. The Riley motor-bicycle, of the Riley Cycle

Company, Ltd., Coventry, has a specially designed frame, so arranged as to provide a rigid bed for the motor ($1\frac{1}{2}$ h.p.), which is carried in a vertical position in front of the bottom bracket. The drive is conveyed to the rear wheel by a belt, while to reduce vibration, the Sadler anti-vibrating saddle support is used.

One of the first, if not the first, lady's bicycle to be put on the market was made by Mr. Dan Albone, of Biggleswade, and now he is one of the first to place a lady's motor-bicycle upon the market. The machine, like the "Ivel" motor-bicycle for gentlemen, has a Minerva motor fitted between the bottom bracket and the front wheel, while the frame is dropped to accommodate the skirts of the rider. The carburettor is fitted behind the upper part of the main down tube, and the battery and coil are supported by the saddle stays above the mud-guard. The regulating levers are arranged upon the tube rising to the top of the head. The belt is carefully guarded, so as not to catch in the lady's dress. The East London Rubber Company, Limited, of Great Eastern Street, E.C., who have lately established a motor department, are introducing a new motor-bicycle made by the Fabrique Nationale d'Armes, of Herstal, Belgium, in which a number of novel features are introduced. The motor which is of $1\frac{1}{2}$ h.p., and has an external fly-wheel, is fitted vertically inside the frame, and drives the rear wheel by a belt. Instead of the usual metal rim for the belt, a wooden pulley is fixed to the rear wheel. A small float feed carburettor supplies the mixture for the engine.

The Werner type of motor-bicycle, in which the front wheel is belt-driven by a motor attached to the steering post in front of the head, finds favour with the Raleigh Cycle Company, Limited, of Nottingham, who are employing the Werner $1\frac{1}{2}$ h.p. engine on their machines. A feature of the machine is the lubricating arrangement, a lubricating cup being fitted which will hold sufficient oil for 100 miles. Below this there is a hollow cock which in itself holds one charge. As this is turned over the contents are discharged into the cylinder, and when the cock is returned to its former position the lubricator fills it in readiness for the next charge. The front wheel is carried in an eccentric fork end, so that the driving belt can be easily adjusted to any reasonable extent without resorting to cutting a piece out, and running the risk of removing too much. The control of the motor is entirely effected from the handle-bar, the throttle, valve lifter, and air adjustment, all being done without removing the hands. A back-wheel rim brake is applied by Bowden wire from inverted handle grip, and the ignition is controlled from the left handle grip as usual. Sufficient lubricating oil for 100 miles and enough petrol for 150 miles are carried. The arrangement of the tank, which fills up nearly the whole of the forward panel of the diamond frame, has been carefully designed. In the forepart is the carburettor, in which is an indicating float, so that the height of the petrol can be easily maintained, and even running can result. The petrol is contained in the upper part of the tank, and the lower part is neatly arranged to contain the coil and accumulator. Three spare compartments are provided to contain lubricating oil, a reserve supply of petrol sufficient for fifteen miles, and a small funnel. The arrangement reduces the length of the ignition wires so that the chances of short circuiting are greatly minimised.

Another American motor-bicycle which appears to be meeting with success is the "Mitchell," handled in this country by Messrs. Davis, Allen, and Co., of 5, Singer Street, E.C. The motor, which has an air-cooled cylinder 3 in. diameter by 3 in. stroke, develops $1\frac{1}{2}$ actual h.p.; it is arranged above the upper part of the bottom tube, with the head of the motor forward. Driving is by a belt to an aluminium pulley secured to

FIG. 2.—THE "MITCHELL" MOTOR-BICYCLE.

the back of the rim by six radial brackets, a jockey pulley mounted on the down tube taking up any slack of the belt. The oil and petrol tanks are suspended from the top tube of the frame, and the lubricating oil is led to the junction of the cylinder and crank case. No carburettor in the ordinary sense of the word is employed, the petrol being run into a mixing tap, which is provided with an air valve. The machine is fitted with "Goodyear" detachable pneumatic tires, which have thickened edges lying in the rim with hollow sides and straight inner flanges.

Still another motor-bicycle of American manufacture—the Merkel—is being introduced into this country. From the importers—the Universal Trading Company, Limited, 55, Dale End, Birmingham—we

learn that a 1½ h.p. motor is supported on the lower cross tube of the frame, and drives the rear wheel by a belt working on a jockey pulley. A new machine, somewhat on the lines of the 1901 Werner, has been put on the market by the Imperial Cycle and Motor Company, Upper Trinity Street, Birmingham, the 1½ h.p. motor being supported in front of the head. The mixture, however, is led from the carburettor through a flexible rubber tube to the combustion chamber instead of through the head of the machine. A float feed carburettor is employed in conjunction with a tank holding 1½ gallon of petrol. A spring connection is provided for uniting the wires of the ignition to the terminals. The timing lever for the ignition is arranged on the handle-bar. The gas, mixing, ignition, and compression tap levers are all placed so as to avoid confusion. The carburettor is a self-feed float, and is automatic in action. The cycle frame itself has been specially made, and fitted with strong front forks, ball head, and wheels; it is also provided with a free wheel, front wheel brake, back-peddalling rim brake, and two inch tires. We also understand that the Imperial Company are constructing motor-tandem bicycles on similar lines.

Motor-bicycles are also being made on the lines of the Minerva and Brown machines by Messrs. H. F. Copland and Co., Stanstead Road, Forest Hill, S.E., Mr. J. F. Bentley, 45, New Bridge Street, E.C., the Lancaster Engineering Company, Loveday Street, Birmingham, the Referee Cycle Company, 66, Turnmill Street, E.C., the New Coventry Eagle Cycle Company, Limited, Lincoln Street, Coventry, Messrs. F. H. Parkyn, Limited, Olympic Cycle Works, Wolverhampton, the Wearwell Cycle Company, Limited, Wolverhampton, Messrs. J. C. Wilson and Co., Battersea Rise, S.W., Messrs. Bradbury and Company, Limited, Oldham, Messrs. W. R. Heighton, Limited, Peterborough, the Canada Cycle and Motor Company, Limited, 57, Holborn Viaduct, E.C., the Eclipse Manufacturing Company, Limited, Oldham, Messrs. Harrington Lucas, Limited, 88, Cheapside, Birmingham, Messrs. Bransom, Kent and Co., Limited, 332, Goswell Road, E.C., Messrs. A. W. Gamage and Co., Holborn, E.C., Mr. J. F. Janes, Sydenham Cycle Works, Sydenham, S.E., the Triumph Cycle Company, Limited, Coventry, Messrs. Mills and Fulford, Coventry, and Messrs. John Barratt, Limited, Wolverhampton. Mr. A. Breeze, of 75, Albermarbury, E.C., and Mr. J. L. Thomas, of Barnet, are both building Minerva type machines, in which an attempt has been made to reduce vibration by the use of spring forks. Among the several firms making special sets of cycle fittings suitable for use in connection with the building up of motor-bicycles, are the Birmingham Small Arms Company, Limited, the Chater Lea Manufacturing Company, Limited, Messrs. Perry and Co., Limited, the Cycle Components Company, Limited, and the Eadie Manufacturing Company, Limited.

The London Autocar Company are introducing a new small air-cooled motor of 1.5-8 h.p. complete with a spray carburettor specially adapted for driving bicycles. It is of French construction and is known as the "Brutus." A new motor for use on bicycles has also been introduced by Messrs. H. W. Van Raden and Co., of Coventry.

A CHESHIRE MOTORISTS' STORY.

We that live here in Cheshire,
Have been severely tried
By magistrates' high pressure,
And by police belied.
It matters not if riding
On bicycle or car,
You would see bobby hiding
Before you had gone far.
Last week they had a stopper
Besides that new stop watch;
That clever sergeant copper
Had got about his match.
The terrible te-ragedy
Was quickly turned to mirth
When Sergeant B——, the bobby,
Was quizzed by Staplee Firth.

C. G. C.

SPACE AT THE MOTOR-CAR EXHIBITION.

In the High Court of Justice, on Monday, before Mr. Justice Kekewich, the case of Farman (trading as Farman's Automobile Agency) v. Cordingley and Company, was heard. This was an action for an injunction to restrain the defendants from letting a certain space at the Motor-car Exhibition to be held at the Agricultural Hall in April, 1902, in alleged violation of an agreement entered into between the defendants and the plaintiff in May last, and for damages for breach of agreement. In January, 1901, the plaintiff applied to Mr. Cordingley for a space in the Agricultural Hall for the Motor-car Exhibition of 1901, and signed a printed form of application, whereby he agreed to enter his name as an exhibitor, "subject to the approval of the Allotments Committee of the Automobile Club of Great Britain." The plaintiff exhibited at that exhibition, which was held early in May last, and either on the last day of the exhibition or at some later date in May—the exact date was in dispute—he applied to Mr. Cordingley for a space in the hall for the exhibition to be held in 1902. According to the

plaintiff's case, a certain space was allotted to him at the ordinary rate—there was no dispute as to the price—and nothing was said about any conditions as to the approval of the Automobile Club or otherwise. Mr. Cordingley, on the contrary, stated that the prospectus of the exhibition of 1902 was shown to the plaintiff at the date of his application, which prospectus contained a printed form of application similar to that used in the previous years; and, further, that he expressly told the plaintiff that the space was let to him subject to the approval of the Club. It appeared that the plaintiff was intending to exhibit at some other exhibition of motor-cars, and that the Committee of the Automobile Club were unwilling to give their approval to any exhibitors unless they undertook not to exhibit elsewhere. This policy was in accordance with certain resolutions recently passed at a representative meeting of the motor-car trade held on the premises of the Automobile Club to the effect that it was detrimental to the interests of the trade that several exhibitions of motor-cars should be held in this country at the same time. Some correspondence took place between the plaintiff and the defendant Cordingley, and upon the plaintiff declining to give an understanding not to exhibit at any other exhibition Mr. Cordingley recommended him to withdraw his application, inasmuch as it required the approval of the Automobile Club, and that approval would not be obtained. The plaintiff, in reply, denied that his application was subject to any such condition, and he commenced this action. At the trial there was a direct conflict of evidence as to the date of the interview at which the space was allotted to the plaintiff, and as to what took place at that interview. Mr. Renshaw, K.C., and Mr. Eustace Smith were for the plaintiff; and Mr. T. Terrell, K.C., and Mr. Leigh Clare for the defendants.

Mr. Justice Kekewich said that the question as to the terms of the agreement between the parties was a question of fact. The evidence as to that was of a most unsatisfactory character, but having regard to the fact that the plaintiff had been a constant exhibitor at these exhibitions and to the terms of the agreement which the plaintiff had entered into with reference to the exhibition of 1901, his Lordship came to the conclusion that the plaintiff agreed to take the stand allotted to him for the exhibition of 1902, subject to the approval of the Allotments Committee of the Automobile Club. It was for the plaintiff to show that that approval had been given, and he had not attempted to show it. But then it was said that the plaintiff was entitled to succeed because the defendant Cordingley, having let this space to the plaintiff, was bound to do his best to obtain the approval of the Committee, and he had not done so, and "Day v. Singleton" (1899, 2 Ch., 320) was cited in support of that proposition. But in his Lordship's opinion that case was distinguishable from the present, because in this case Cordingley was simply the agent of the Committee for allotting the ground; he had nothing whatever to do with obtaining the approval of the Committee. These exhibitions were admittedly held under the direction of the Automobile Club, and it was for the Club to say who was to be admitted as an exhibitor. The plaintiff's case therefore failed on both points, and there would be judgment for the defendants, with costs.—*The Times*.

A NON-STOP CASE DISMISSED.

At Kingston, Mr. Arthur Morris, of 31, Piccadilly, London, was summoned by Mr. George Bird, for being in charge of a light locomotive in Hook Road, and not stopping it when requested to do so. Mr. Bird said he was riding a horse, attended by a groom, when he met the defendant and another gentleman in a motor-car. As the animal shied at motor-cars, he held up his hand for the defendant to stop. He did not do so, however, with the result that the horse shied to the side and nearly threw him into a ditch. A policeman having stopped the defendant, witness told him he had nearly broken his neck, whereupon he simply laughed in his face. Defendant alleged that he did not see the horses until within a few yards of them, there being a large wagon in front, and that he had no time to pull the motor-car up. He lessened speed, however, at once. Mr. William Morris, defendant's brother, having given evidence to the same effect, the chairman said, as there was a conflict of evidence, defendant would be given the benefit of it, and the summons would be dismissed.

THE MERCERS' COMPANY v. THE BRITISH AUTOMOBILE COMPANY.

In the Chancery Division of the High Court of Justice, before Mr. Justice Kekewich, Mr. Warrington, K.C., said that in the matter of the Mercers' Company v. The British Automobile Commercial Syndicate there were two actions brought for the purpose of restraining the defendants from causing a nuisance by noise and in other ways by the manner in which they conducted their works. One of the actions had been settled, and he asked that the other action should stand over until next sitting, as the parties were still negotiating in the hope of arriving at a settlement. Mr. Justice Kekewich assented.

ACTION FOR DAMAGES ABANDONED.

In the Dublin Nisi Prius Court No. 2, before Mr. Justice Kenny and a city special jury, the case of Harvey and another v. Fortescue was heard. This was an action in which Mathew Harvey and Mary Harvey

his wife, of Ballinlaughan, county Louth, sought damages from Mathew C. E. Fortescue for personal injuries to the plaintiffs, and for damage to their car and harness, caused by the alleged negligent driving by the defendant of a motor-car. The defendant denied he did the acts complained of, and pleaded the accident was inevitable, and contributory negligence on behalf of the plaintiffs.

Serjeant Dodd, in opening the case for the plaintiffs, said the accident arose from reckless driving of a motor-car by the defendant, who was a Major in the Louth Militia. The event occurred on Sunday, July 28th, when plaintiffs were driving home on a side car and met Major Fortescue, who was driving a motor-car, accompanied by his wife. The motor was coming at a great rate of speed in the direction of the Major's house. The plaintiff pulled the horse as close as possible to the ditch on the left. The road at the point was eighteen feet wide, and the mare becoming frightened wheeled round, and had turned almost completely when the motor came up behind and struck the back of the car, smashing it. A doctor was called in, and was in constant attendance on Mrs. Harvey until October, and she had since been suffering from extreme pain, apprehension, and fright, her condition being all the more serious as her child was near being born. Plaintiffs admitted having attended a race meeting two days after the accident. After some witnesses had been called on both sides, Serjeant Dodd said he had conferred with his client and the Solicitor-General, and he did not propose to go further with the case. The parties were willing to turn back to back, the defendant paying the jury, and they would, therefore, be spared from examining the lady in Court.

PETROL STORAGE LICENCES.

At the South-West London Police Court, George E. Pearce, a cycle dealer, of 4, Belle Vue Road, Wandsworth Common, was summoned, at the instance of the London County Council, for keeping petroleum spirit for sale on his premises contrary to the statute. Mr. J. Godfrey supported the summons. One of the Council's inspectors was passing the defendant's shop on September 21st, when he noticed a large iron plate bearing the words, "Pratt's Motor-car Spirit," fixed outside the premises. He walked inside and found five tins, each containing two gallons of the spirit. The defendant said he simply used the spirit for his own motor-cars; he had never sold any. Mr. Godfrey argued that the presence of the advertisement showed that the spirit was for sale. The defendant observed that he only displayed the advertisement as a favour to the firm from whom he purchased the spirit. So far from selling the oil he had refused on one occasion to sell a small quantity to a customer. Mr. Garrett thought there was no justification to warrant a conviction, and he dismissed the summons.

SEQUEL TO A FURIOUS DRIVING CONVICTION.

At the Spittlegate Police Court, Mr. C. E. W. Lucas, solicitor, of Nottingham, said the Bench would remember that on the 19th October last, Mr. Samuel Harvey, of Nottingham, was fined £5 and costs in that court for driving a motor-car, on the Great North Road, at a greater speed than he was entitled to do, in the parish of Long Bennington, on October 3rd. He was instructed by Mr. Harvey to make an application to remove that conviction into the Court of King's Bench for the purpose of being quashed. In order to do that he had to serve Major Longstaffe and Colonel Parker, two of the convicting magistrates, with due notice. He had a further application to make in the case. At the hearing Police-constable W. Bean swore that he was standing at the ninth milestone on October 3rd, and saw Mr. Harvey coming in a motor-car from the direction of Newark towards Grantham. He timed him for half a mile, and this he found he covered in fifty seconds. In cross-examination Bean said he knew it was half a mile, because he saw Mr. Harvey coming past the bridge, and he measured the distance with a cyclometer that week. Knowing the road he (Mr. Lucas) found that anyone standing at the ninth milestone could not see the bridge which the constable alleged he saw Mr. Harvey pass. Under those circumstances Police-constable Bean must have told an untruth when he said that, for there was a bend in the road which prevented anyone seeing more than 723 yards. He asked for a summons against Bean, so that the matter could be threshed out in that court. Consideration of the application was adjourned.

FURIOUS DRIVING CASES.

At West Bromwich Police Court, Henry Neath, residing at Fox Yard, Tipton, was charged with being drunk when in charge of a motor-car on the 2nd. Defendant's motor-car came into violent collision with a tram engine. The motor-car was badly damaged, as also was Neath. Mr. J. S. Sharpe, who defended, said defendant was perfectly sober at the time, and was crossing the road, when the steering gear became locked, and the car came to a standstill right in front of the tram-engine, which collided with the car. The Bench considered the case proved, and fined defendant £1 17s., including costs.

At Knutsford, Mr. Nicholas Kilvert, of Brooklands and Manchester, was summoned for driving his motor-car at a greater speed than twelve miles an hour. The information was supported by Sergeant Bladen and a constable. The evidence of the prosecution was that Mr. Kilvert had driven over a measured distance of 110 yards on the Chester road, Plumley, in 15 sec., or at the rate of fifteen miles per hour. The sergeant stated that he took the time with a stop watch, which he produced in court. The cross-examination by Mr. Staplee Firth brought about an utter collapse of the case for the prosecution, and the Bench dismissed it.

At Worthing, Herbert Austin, of Birmingham, was summoned for furiously driving a motor-car at Broadwater on November 17th. Mr. A. B. Dixon appeared for the defendant, Police-constable Payne stated that defendant covered a quarter of a mile along the east side of Broadwater Green in thirty-eight seconds, or at the rate of twenty-three miles an hour. Addressing the Bench for the defence Mr. Dixon pointed out that this particular road was unusually wide and straight, and that consequently the offence was not so serious as it would have been in a narrow and crowded thoroughfare. The magistrates imposed a fine of £5 and £1 10s. costs.

At the Northampton Borough Sessions, Cecil Edge, 14, Regent Street, London, was summoned for driving a motor-car along Bridge Street at a greater speed than was reasonable, on October 1st. Defendant did not appear. The Chief Constable said he had great difficulty in serving the summons, and as defendant had promised to appear that morning, and the Chief Constable had several witnesses in Court, he asked for a warrant to be issued for his apprehension. The warrant was issued.

PARISIAN thieves are now abstracting the platinum tubes from the interior of motor-cars. Hundreds of thefts of this kind have been committed during the past few weeks. One night recently £60 worth of platinum tubes were stolen from a large dépôt close to the Arc de Triomphe.

ONE of the special features of the bazaar to be held at the Queen's Hall, London, on the 18th, 19th, and 20th inst., in aid of the funds of the Sisters of the People, will be the opportunity given to visitors of enjoying a motor-car drive, as the Motor Manufacturing Company, Limited, have promised to place a carriage at the disposal of the committee for this purpose.

WHILE the Duke and Duchess of Beaufort, who had been spending the week-end at Bowood with the Marquis and Marchioness of Lansdowne, were returning to Badminton in their motor-car, the driver endeavoured to turn a curve too sharply near the village of Dorry Hill and brought the vehicle to grief. Fortunately the car did not capsize and none of its occupants was injured. The vehicle was, however, damaged, and the journey was continued in another conveyance.

THE Newbury County Council has passed a resolution that in consequence of the accidents and dangers caused by motor-cars, a Committee be appointed with a view of reporting their decision to the Local Government Board and Members of Parliament. An amendment to memorialise the Local Government Board and County Council to provide for registration and better regulation was also carried, one of the Councillors remarking that registration would be inadequate, as a police officer would not be able to read the number of a car going at an excessive speed.

THE Motor-Car Journal.

VOL. III.]

LONDON, SATURDAY, DECEMBER 21, 1901.

[No. 146.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

THE December meeting of the Nottingham and District Automobile Club was held last week, at the headquarters, the guest of the evening being Mr. C. Johnson, Secretary of the A.C.G.B.I. The chair was taken by Mr. E. W. Wells (vice-president), in the unavoidable absence of the president, Mr. R. Millington Knowles, J.P. After an informal club dinner, Mr.

Claude Johnson delivered an address on matters of general interest to automobilists. He sketched out the work done by the Automobile Club with a view to altering the present unsatisfactory state of the law in respect to the limit of speed, and stated the measures which were being taken with a view to introducing a Bill into Parliament which might meet the views of automobilists, and at the same time be acceptable to other users of the road. In conclusion Mr. Johnson expressed the great honour he felt at receiving the invitation from the Nottingham Club, which he regarded as one of the most successful of the affiliated organisations. A cordial vote of thanks accorded to the visitor terminated the proceedings.

Prosperity in France.

IN estimating the wealth of France at the present time, the new motor-car industry looms large, and must be regarded as one of the great factors in the national prosperity. The advent of the cycle was useful in stimulating a desire for the exploration of the country, and this has found full vent in the development of the motor-car. Not only has the new machine proved lucrative to the actual manufacturers, but it has fostered and developed many other industries ranging in variety from the wheelwright and tire-maker to the cafés and inns throughout the country. This is a fact familiar enough to motorists; we recur to it now to enforce the idea that the progress of the motor-car in this country will restore the prosperity of many a wayside village.

"Reminiscences."

THE Right Hon. Sir J. H. A. Macdonald, K.C.B., Lord Justice Clerk of Scotland, has kindly consented to read a paper at the Automobile Club, on Wednesday, the 13th February, after the House Dinner of that date. The subject of the paper will be "Reminiscences." The paper is to be written for subsequent publication in the Badminton Library book on "Motor Driving." It is desired that this chapter should contain a selection of the most interesting experiences in connection with the early days of the revival of automobilism, such as delays on the road which occurred on account of the inexperience of drivers or the imperfections of the early machines. The Secretary of the A.C.G.B.I. would be glad if gentlemen who have experienced or have in mind amusing incidents of the character above-mentioned would kindly send to him at the

Club, 4, Whitehall Court, London, S.W., a short account of such incidents for submission to the Lord Justice Clerk.

A Mystery.

AT any time of the day during the past week English motorists could be seen at the stand of Messrs. De Dion Bouton at the Paris *Salon* endeavouring to fathom a mystery. The latest idea of the De Dion firm is to build a 12 h.p. single-cylinder engine. To compensate for the lack of balance in a motor of such power, it is connected to a second dummy cylinder—that is to say, one without valves or sparking plug, and only a rising and falling piston synchronised with the piston in the cylinder proper. The motion of the piston in the second or dummy cylinder is utilised to operate a forced lubrication system also. Only one engine of this type is shown, and its future looks by no means hopeful, for much reticence is shown about it by the representatives of the firm itself.

"A Hunting We Will Go."

So thinks many an ardent automobilist, who sees in his car a means of attending a distant meet unattainable by ordinary means. "Not on your motor-cars," says the Warwickshire Hunt, a fine old crusted non-progressive institution. Why not it is difficult to understand, unless the prohibition is based upon the same principle as that which strove to diverge the railway line from the limits of the Hunt. The motorist does not hunt on his car, but uses it as a means of going to and from the meet, having sent his horse or horses in advance; therefore damage to agricultural interests cannot be urged. The flimsy excuse that the motor eats neither hay nor corn from the land which it crosses will not hold water, for the same applies equally to the railway train which conveys many a keen sportsman from crowded city to distant meet. Each in its way tends to increase the members of the Hunt and adds to its too frequently much impoverished exchequer. The covert-side should prove an excellent venue for the establishment of a proper understanding between car and horse, and not the scene of bickering between conservative huntsman and more go-ahead but equally sportsmanlike motorist.

Brer Fox and the Motor-car.

QUITE a novel feature has been added to the "sport of Kings" by an up-to-date German fox who saved his brush by an ingenious ruse. Hard pressed by the hounds he tore down the main street of Wilmersdorf, a suburb of Berlin, leaped on the platform of an electric motor-bus as it passed at full speed, and in an instant was under one of the seats—to the terror of the women passengers. In a few minutes the car was stopped, and the conductor soon fished Reynard out with a pair of iron tongs. The ruse, however, had served its purpose. The hounds, puzzled at the loss of scent, had taken another direction, and the fox, being let loose, got clear away. We commend the idea to the Warwickshire Hunt, who might add considerably to the length and excitement of a run by giving weary Reynard a lift on one of the motor-cars so much in evidence at their meets.

More Aerial Experiments.

THIS week's aerial rendezvous shifted from the Crystal Palace to the more classic Welsh Harp. On Tuesday Mr. Frank W. Cooper, an undergraduate of Clare College, Cambridge, made an ascent in a small balloon of 8,000 feet capacity, with the object of ascertaining the supporting capacity of the air at different altitudes. The balloon was not provided with a car, and Mr. Cooper seated himself on a ring at the extremity of a parachute, which was suspended by means of a contrivance, under his control. When liberated the balloon shot quickly up to 1,000 feet in less than half a minute. The aeronaut, who swung violently to and fro, seemed to the spectators below to be in difficulties, and after detaching himself he had a dead fall of 300 feet before the canvas inflated and the parachute began to descend more gradually. On reaching the ground, the daring young aeronaut was none the worse for his adventure, but described the sensation of the first part of his fall as decidedly uncomfortable. The scientific results of the descent we are at present unable to state, but we understand that Mr. Cooper intends to continue his experiments.

Motor-Cars at Elections.

AT the Renfrewshire County Council election the other week good service was done for the successful candidate by a friend's motor-car, the ladies specially favouring the new mode of driving to the poll. A correspondent informs us that even farmers left their wheat-sowing to get a drive on a motor-

car. The accompanying illustration shows the successful candidate, Mr. Denholm, and Major Campbell, his agent, on the car.

Wanted a Definition.

WHEN will common sense be embodied in the law? For a long time, as motor-cars were not specifically mentioned in any statute, they were described as traction engines—and the industry suffered the slow torture involved by the presence of the man with the red flag. Now toll-keepers and other survivors of the Dark Ages are allowed by strictly regarding the letter of the law to do some strange things. Bicycles and motor bicycles are liable to the foolish definitions of bridge-keepers, and even Mr. Justice Wright, who has had a case before him, has not added much to the solution of the problem. A bridge company with power to levy tolls decided that a bicycle was a "carriage on springs." Such folly was appealed against and Justice Wright has given the definition that a bicycle is not

"a vehicle drawn by horses or other beasts of draught"—a very luminous judgment indeed. It does not say what a bicycle is, but it does at least imply that the riders of such "vehicles"—and there will be a large number of motor-bicycles in use next season—are not liable for toll on the same scale as circus vans, harvest carts, and coal lorries. For which all such riders should be thankful.

Another Admonition.

A VERY sensible article on the speed of motor-cars appeared in the *Bristol Echo* the other day, in which it was recognised that the speed limit is absurd; but it was also maintained that motorists would, by proper observance of the existing law, do much to help their cause and secure the ultimate abolition of the vexatious restriction. That is what has been urged by representative motorists for many months, and we are glad to see that great provincial daily papers are ceasing their abuse of the automobilist, and urging him to carry out the advice of the Automobile Club. This is certainly the wiser course to take—and one that motorists should always follow.

A Plea for Exeter.

SOME of the residents of the old city of Exeter have modern ideas, and against the proposal to disturb the roadways of the main thoroughfares for the provision of tramcars comes the suggestion that a public motor-car service should be formed. In a very sensible series of notes the *Devon Gazette* points out the position of the ratepayers if they now spend £100,000 on tramways, and if, in a few years, motor-car services were developed by private enterprise. By setting their passengers down at their doors and taking them to their destination by the shortest possible route, the motor-car would quickly establish its popularity and its profitableness. Then where would be the ratepayers' expenditure? But if the municipality would secure a few motor-cars for public service a useful experiment could be made, cross routes could be maintained, which would be impossible with the tramway system, and the convenience of the citizens would be more efficiently served.

Motor-Vehicles for Heavy Traffic.

MR. E. SHRAPNELL SMITH has a good letter in the *Liverpool Daily Post* on motor-wagons for the cheap and effective transit of heavy goods. He believes that animal power will survive where delays are frequent, and for short distances in towns where the roads are level or moderately graded, while motors will be adopted for particular districts, where they will be capable of rendering efficient and economical service in competition both with horse haulage and the railway. In the cartage work between Manchester and the outlying towns thousands of tons per week are being carried by motor-wagons at a considerable saving, when compared with railway charges. Mr. Smith makes a reassuring point for the railway companies, when he shows that while the latter will lose some of their short distance traffic, they will gain by the feeding powers of motor-vehicles in country districts, for facilities to get produce to market must foster internal trade.

Motor-Cars in the American Postal Service.

IN the annual report for the year ended June 30th last just issued by the Postmaster-General of the United States, it is remarked: "The first contract for the carriage of mails by automobiles was entered into during the last fiscal year for service between the post office at Buffalo and the station in the Pan-American Exposition grounds, a distance of 4½ miles. This distance was covered in thirty-five minutes, and there were seven trips daily. The service rendered proved satisfactory, and a similar service will be started in Minneapolis on January 1st next.

At Scarborough.

WE hope that the Town Council of Scarborough will give the new motor-car service which is being established there the fullest opportunity of demonstrating its usefulness. At the last meeting of the Council, when the matter was discussed, there seemed a tendency on the part of many members to try and force the cars to avoid one of the best routes, viz., that over the Valley Bridge. Now, if the service is to have fair play, it should be allowed along the routes best suited to the public convenience. It is folly to require public motor-cars to avoid certain roads if private motor-cars are allowed to travel on such thoroughfares. There should be absolute impartiality between horse and motor drawn vehicles, and now that Scarborough has a chance of further popularity by the encouragement of a motor-car service we hope that no personal prejudice will be allowed to thwart the success of the scheme.

Weston-super-Mare.

A Weston-super-Mare correspondent draws our attention to the delights of his town, and wonders why motorists do not go that way in large numbers. Certainly the road from London is very good, and the mileage, *via* Bath and Bristol, is 140. The only note of warning to be offered is that at "Long Ashton" (four miles from Bristol) motorists should go steadily. The Grand Atlantic Hotel has every accommodation for motors and motorists, and Mr. Burnell will be found able to look after any necessary repairs. Petrol can easily be obtained, and accumulators charged in the town. The number of resident motorists is growing, the latest addition to their ranks being Mr. J. J. Bastow, who is not only a Somerset County Councillor, but also a J.P. He has ordered a 8 h.p. Daimler car.

Motor-Cars in the Eastern Counties.

In some of the papers published in the Eastern Counties—now that they have got over their original prejudice against rapidity of movement on the public highways—we see pleas raised for the inauguration of motor-car services for the use of the farmers and market gardeners. The great railway companies use their strength to exact the utmost for the transit of home-grown agricultural produce; while favourable terms are allowed that from the Continent. At present, the lumbering market wagons with the heavy horses and sleepy drivers are the only competitors to the railway companies. But the adoption of a reasonable scheme of motor conveyance from some of the market gardens in South-east Essex to Covent Garden, Spitalfields, and other London markets would bring the railways to a reasonable frame of mind and materially assist the English producer.

A Long Run in the Fog.

MESSRS. W. W. MORRIS and F. M. Evans, of Pontypridd, made a memorable motor-car journey from that place to London in the recent fog. Leaving home at noon on a Monday all went well till Chepstow was reached at 4.30. Continuing *via* Aylburton they were enveloped in a dense fog, but felt and inquired their way to Newnham, where they put up for the night (fifty-six miles out). Starting early next morning they reached Gloucester, still befogged, and there found a net-work of tram-lines added to their difficulties. Birdlip Hill was reached under the same unfavourable conditions, and taken with due caution. On to Cirencester glorious sunshine prevailed. After an incident with a hay-motor in the fog, Wantage was reached, where the night was passed. On Wednesday morning a cold run was made to Wallingford, but at Slough the fog fiend was more in evidence than ever, and Hounslow was reached with great difficulty. Here the friendly arc lamp of an electric tram acted as did the pillar of fire to wandering Israel, and under its beneficial beams the motorists reached Hammersmith, and finally groped their way to Kensington, completing their journey to the City next morning.

More Records.

THE struggle after records in France still continues. On Tuesday, on the road between Paris and Rouen, near Gaillon, Gabriel, on a Darracq car, made several successful attempts, covering the kilometre with flying start in 39 1-5sec., or at the rate of over ninety-one kilometres an hour. The flying mile was covered in 1min. 3sec., while the mile from standing start was done in 1min. 13 1-5sec., as against his own old record of 1min. 19 1-5sec. On Wednesday M. Jenatzy was to make an attempt at creating a new record with his combination petrol-electric car at Achères.

Lassoing Motorists.

VARIOUS and even humorous are some of the serious suggestions made by American authorities for the suppression of the "motor-scorcher." Previously we have referred to proposals for placing obstacles on the roads and administering electric shocks; now, Mayor Patten, of Evanston—a suburb of Chicago—comes into prominence with the declaration that he will "send the policemen out in detachments of two, equipped

MR. S. T. DAVIS, JUN., ON HIS 8 H.P. RACING LOCOMOBILE.

with ropes, with orders to bring obstinate riders to their senses with a jerk." This means that to the ordinary accomplishments of the keepers of law and order must be added an expert knowledge and practice of the principles of lassoing. Perhaps some of our own rural authorities would like to introduce a similar innovation, importing a few cowboys from Texas for the purpose of catching motorists. It would certainly indicate greater manliness than is involved in the English expedient of hiding behind hedges.

MOTOR tractors for heavy work are about to be introduced on a large scale into Russia, under Government auspices. For some time past experiments have been conducted by the Minister of Ways and Communications in the use of motor-cars for purposes of haulage over unpaved tracks loosely laid with timber-work instead of rails, and having satisfied himself that a 3½ h.p. machine could move a couple of tons on such a track at a speed of twelve versts an hour, he is making preparations to introduce the system on a large scale in those immense regions still only thinly or not at all provided with railways. Machines of about 7 h.p. will be used, and they are expected to haul loads of four tons at about ten versts an hour.

FLOTSAM AND JETSAM.

By "FLANEUR."

AUTOMOBILISM must be a very good thing for the southern railways and the cross-Channel steamers! Though I have often been in Paris in December, I have never before seen so many Englishmen in the gay city at this time of year as during the last few days. The Automobile Club party of Friday last was formidable enough, with its sixty entrants but there were those who had gone before and there were many who came after; and one was liable to meet an Englishman at every turn when perambulating the Grand Palais. With but little effort one could imagine one's self at the Agricultural Hall. And while one could not but regret that it should still be necessary to evince so much interest in the products of another nation, as an automobilist one could reasonably rejoice that the movement was so vigorously "booming."

To my thinking there is nothing so admirable about the Paris show as the enthusiasm of the Belgian King. He was there on Friday, he was there on Saturday, and, *mirabile dictu*, he was there again on Sunday, in all that seething throng of the proletariat, which was so dense, indeed, that the police abandoned all attempts to force a passage for the royal *chauffeur*. The King is even stated to have matured a project for the building of a special road, from end to end of Belgium, to be reserved exclusively for automobilists and cyclists. There is little doubt but that he will carry out his plan, for it is to King Leopold that the numerous side paths for cyclists which abound in Belgium owe their existence.

A GOOD story may be told, by the way, of the King's second visit to the Salon, on which occasion a member of the Automobile Club party had an amusing *rencontre* with His Majesty. The Englishman in question was inspecting a certain stand when he found himself being pushed about somewhat roughly, and realised that he was face to face with the advance guard of King Leopold's party. So great was the press, however, that the Englishman could neither move forwards nor backwards, and to escape from the predicament he jumped upon the stand. Immediately afterwards the King came by, and stopped at the very spot where the Englishman was standing, and, to the latter's horror, began to question him in French, of which the impromptu attendant did not know a solitary word.

LOOKING a second time at his man, however, the King either remembered his face—for, curiously enough, they had once met on the road in Belgium—or at any rate recognised the fact that he was not of Gallic origin, and ejaculated in good English, "Why, you are not a Frenchman?" "No, your Royal Highness," was the reply. "Then how came you to be on this stand?" the King further queried. "*To get out of Your Majesty's way*," was the naive rejoinder. At this the King and his two companions laughed most heartily, holding their sides and almost bending double, so great was their amusement. Though not an actual eye-witness of this diverting incident, I was told the circumstances shortly afterwards by the person most intimately concerned, namely, the Englishman himself.

NOT long ago I ventured to animadvert on the ridiculous way in which the Serpollet legend was still being retailed in the Press in connection with King Edward VII. From a chance remark which greeted my ears in the Grand Palais, it is evident that the legend dies hard. As I was walking along I heard English being somewhat loudly spoken, and found that it proceeded from one of two gentlemen approaching in my direction, who was laying down the law to his companion with considerable gusto. "Ah, here," he said, "is the Serpollet stand. The Serpollet cars are driven by steam, and the King of England has got one; but real *chauffeurs*, you know, simply pooh-pooh the whole thing," etc., etc. By this time I had passed; but the incident showed unmistakably enough that the fiction of the King

owning a steam-car is still believed, even in quarters professing to be well informed. It was only the other day, moreover, that one of the Paris journals, in discussing the probabilities of there being a meeting of royal *chauffeurs* on the Riviera this winter, said that probably the King of England would come on his Serpollet!

ANOTHER curious matter is recalled by the mention of the Serpollet car. In a telegraphic account of the opening day at the Salon, in the *Daily Express*, it was stated that the Serpollet had been much improved this year owing to the fact that the boiler was now manufactured of "nickel or steel tubes." Nickel steel one knows, and steel one knows, but nickel as an alternative is something distinctly new. Inasmuch, however, as the Paris edition of the *New York Herald*, which was published on the morning of the first day of the Salon, contained exactly the same error in an advance description of the exhibits, the great discovery of boiler tubing made of nickel would appear to have been telegraphed to the *Express* the same day on the slender authority of the *Herald's réclame*.

It seems an extraordinary anachronism on the part of the Master of the Warwickshire Hunt, the Hon. Greville Verney, and of Lord North, to issue, on behalf of the committee, an intimation to the members that automobiles are not desired at the meets in future. As the hunt includes several automobilists, it has become the practice of the latter to send on their horses in advance and to follow later *en automobile*, a natural and harmless proceeding of which, it appears, certain of the more conservative members have complained; hence the committee's notice. But, now that is issued, it may be asked, *Cui bono?* The objectors have merely interfered with other people's ideas of pleasure without increasing their own. The automobilist who hunts has a perfect right to travel to the meet by any means he chooses, and it savours of a dog-in-the-manger policy to object to his driving up in a car. The opportunity, moreover, for accustoming horses to motor-vehicles would, one would have thought, have been welcomed rather than otherwise.

EFFORTS are being made to promote a syndicate in West Hartlepool for the purpose of providing a service of motor-cars between that town and outlying villages, including Greatham and Wolviston.

THE Works Committee of the Willesden and District Council, having considered the engineer's report as to cost, recommended the Council not to entertain the proposal to purchase a motor-quadracycle for the sanitary inspector. The recommendation was adopted.

WE hear that still another new motor-car dépôt is about to be opened in Long Acre, W.C., so long the home of the coach-builders. This time it is the Wolseley Tool and Motor-Car Company of Birmingham which will be represented, the agency having been taken by Mr. C. Browne.

A BLACKBURN correspondent informs us that a company is being formed privately, with a capital of £20,000, to take up the carriage of merchandise by motor-wagon between Liverpool and Blackburn. The directors include influential commercial men of Liverpool, Wigan, and Blackburn. The proposal is to compete with the railway in the carriage of goods for which 10s. per ton and upwards is now charged. Cotton, of which some thousands of tons annually are taken to Blackburn from Liverpool, falls under this tariff.

IT is reported that the Swiss Government has decided to replace all the horse-drawn post chaises and mail coaches by motor cars. The speed at which horses could ascend the steep hills was not satisfactory, and the animals often underwent great suffering and cruel treatment. A 12 h.p. motor-omnibus, travelling from Neufchatel to Chaumont, a distance of five miles, with an ascent of over 2,200 feet, or 18 per cent., covers the distance in one hour with ease, where a coach with four horses required two-and-a-half hours at the best.

The Paris Motor-Car Exhibition.

(Continued from page 742.)

THE STATUE OF VERCINGETORIX ON A 30 H.P. DE DION STEAM WAGON AT THE SALON.

LAST week I was just able to give the readers of the *Journal* a general description of the great Paris show and a few of the most salient features in time for publication. There is, however, so much to describe which is of genuine interest that I have not yet myself been able to note it all, and so great has been the attendance that it has been difficult to get near the interesting exhibits except in the mornings. By 3 p.m. on Sunday last the large hall was closely packed, and outside the turnstiles thousands of people, marshalled by the *sergeants de ville*, were waiting their turn for admittance. The attendance must have reached nearly 40,000. Among the spectators I came across a great many Englishmen, and the exhibitors say that they are the largest buyers.

Turgan Foy is the only firm in the show to exhibit a combination of steam wagons and omnibuses, petrol cars and steam launches. The heavy steam vehicles are of course the most interesting and are deserving of special mention. There is a wagon weighing four tons and capable of carrying a load of five tons, an omnibus (Fig. 2) to carry eighteen passengers, and a tractor capable of carrying a load of four tons, and at the same time drag trailing wagons containing six tons. During the French army manoeuvres this year this tractor was the means of successfully transporting nine tons, consisting of a train of five artillery wagons, which made a total length of thirty yards. All the vehicles above described have two compound engines, one on each side. In order to do away with the need of a differential gear, the power is transmitted by two chains, one to each engine. The steam is generated in the Turgan

boiler, coal or coke being used as fuel. The omnibus will travel $12\frac{1}{2}$ miles an hour and the wagon $7\frac{1}{2}$, and the firm gives a guarantee that they will climb any incline up to 12 per cent.

Whilst on the subject of heavy traction, I may mention the wagon (Fig. 1) of the Société Nancienne, at the head of which firm is M. De Pontou d'Amécourt, whose car ran through the Paris-Berlin race with four passengers. The wagon in question obtained the gold medal in the alcohol competition, which took place under the auspices of the Ministry of Agriculture a month ago. It has been designed by M. Brillié, who also received a gold medal on the same occasion. The motor is vertical, with two cylinders and four pistons working in opposite directions. The diameter of the cylinders is 92 millimetres, and the total stroke of the two opposing pistons 170 millimetres. The engine is placed in front under the driver's feet. In the public competition above referred to this wagon carried the heaviest load (3 1.3 tons), and used the smallest amount of alcohol. Its weight is $2\frac{1}{2}$ tons, and the horse-power of its motor 10. M. De Pontou d'Amécourt informed me that he has a project on the *tapis* to run one of these wagons, fitted up for twenty passengers, in the tourist section of the Paris-Vienna race. It will certainly be a unique experience to travel from Paris to Vienna, across the Alps, in a motor-wagon.

A most original and interesting invention is the automatic change speed gear brought out by M. Mégy, already noted in the mechanical world for inventions in relation to elevators and friction clutches. M. Mégy's object is evidently to reduce the driving of a motor-car to its simplest expression, and certainly,

if his car will run satisfactorily and give the results he claims for it, he will very quickly command a large sale. To begin with—and this is but a detail—the inclined steering pillar is cleverly hinged in the centre, and has a spring catch so arranged that it can instantly be moved into a vertical position to allow the driver to easily mount up to or descend from the car. Supposing, now,

automobile if the pull is carried on far enough it also puts on two brakes; and, further, a touch on a spring and another pull reverses the car. It is not very easy without drawings to describe how this is achieved by M. Mégy. In the first place, the motor, which has a separate governor independent of the movements necessary for the starting and stopping of the car, is always in gear with a

FIG. 1.—LA SOCIÉTÉ NANCIENNE'S ALCOHOL LORRY—SECTIONAL ELEVATION.

the driver to be in his seat and the motor turning, and everything ready for a start, a spring on the steering wheel is pressed and the steering pillar depressed or pushed forward, and the car starts off automatically, always on the first speed. As soon, however, as the engine, slowed up by the car starting, regains its normal speed, the second speed slips in automatically, and the third and fourth similarly as the speed of the engine

pinion on the first-speed shaft, but this pinion is free to revolve and drives the first-speed shaft only when an expanding friction band places it in contact with a dished disc keyed to this shaft. On the first-speed shaft are four other pinions always in mesh with corresponding pinions on the second-speed shaft and giving the four different ratios corresponding with the four speeds. Each of these four pinions is free on the first-speed shaft and

FIG. 2.—THE TURGAN-FOY STEAM OMNIBUS.

increases, without any movement on the part of the driver. Should the latter, however, desire to slacken his speed for any reason, the pulling of the steering wheel towards him is all that is necessary, and just as a driver of a hippomobile pulls the reins more and more to slow down and stop, so the pulling of the steering wheel slows down and stops the Mégy motor-car, with this difference, that in the case of the

has its dished disc to connect it by friction to this shaft. On a prolongation of the first-speed shaft a sixth pinion, working a loose pinion, which again turns a fixed pinion on the second-speed shaft, with a friction disc this time on the second-speed shaft, constitutes the reverse motion, which, for simplicity's sake, I will not deal with in this article. The first-speed shaft is hollow, and contains a sliding bar, which, as it advances, actuates

the friction gear in each of the four discs successively. On the motor is a second governor, which presses forward the sliding bar in the interior of the first-speed shaft as the engine increases in speed or draws it back as the engine slows down. It will be seen, therefore, by following carefully the above description, that the first movement of the steering wheel sets the first-speed shaft in motion, and then, as the speed of the motor increases, the sliding bar is pressed forward until, if the conditions are favourable—as, for example, on a level road—the fourth speed is reached. Should, however, a hill be encountered, directly the motor begins to slow down back slides the bar automatically till the third speed comes in, and so on. Whatever may be the success awaiting this invention in the future, it is certainly one of the most remarkable and ingenious in the whole show.

On Georges Richard's stand there is an elegant state coupé (Fig. 3) made for Mouley Abd El Aziz, the Sultan of Morocco. It is beautifully finished in dark green with moirée silk lining. Inside the coupé are seats for the driver and one passenger side by side, and all the levers, etc., are inside. At the back is a footboard for a flunkey. As regards the mechanism of the vehicle, it is the same as the Richard belt and gear-driven voiturette.

FIG. 3.—THE SULTAN OF MOROCCO'S RICHARD CAR.

Messrs. De Dion Bouton et Cie are not only makers of petrol motor-vehicles, but they are also one of the largest, if not actually the largest, makers of steam vehicles for heavy traffic in France. They have now added to their departments one for the manufacture of electric vehicles. The cars are equipped with a special form of accumulator which has been the subject of experiment for some time, and are claimed to be an advance on previous traction batteries. At the Salon they are exhibiting a double phaeton, and a *vis-a-vis*, of which more anon.

In my reference last week to Panhard and Levassor's stand I omitted to speak of the new manner in which the gear box is attached. Instead of fixing it to the frame by four rigid bolts, it is pivoted on the differential shaft and fixed to the frame in front only, in order to save it from the jerks and shocks to which the frame is liable. Rochet-Schneiders have two new types—a 6 h.p. two cylinder and a 12 h.p. four cylinder, the cylinders being 100 millimetres and the diameter and the stroke 120 millimetres. On both cars a radiator like the Mercedes has been adopted.

AUTOMAN.

To the current number of the *Engineering Magazine* Herr Paul Daimler contributes an interesting illustrated article on "The Development of the Petroleum Automobile."

THE Auto Machinery Company, of Read Street, Coventry, are issuing a revised price list and catalogue of their particular speciality, roller bearings. The bearings consist of rollers, outer bush, and sleeve (on shaft) of best steel, hardened, tempered, and accurately ground; cage ends of gun steel or gun metal and distance rods of steel, made by modern machinery, ensuring accuracy and highest possible results.

CORRESPONDENCE.

Owing to the Christmas Holidays, the next issue of "The Motor-Car Journal" will be published on Tuesday morning, the 24th inst.

MOTOR-BICYCLES FOR 1902.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have followed with great interest the experiences related by your various correspondents on the above subject. In adding my contribution to the list, I think I may lay claim to a wider field of experience than any of your other friends, inasmuch as before I rode my motor-bike I built it. When I started on it there were no data available as to what power would be necessary, and in the endeavour to cut the weight down as low as possible I naturally made the motor too small, and had to discard it for a larger one. My present engine has a greater cylinder capacity than any bicycle now on the market, and weighs 31 lbs. Extreme attention has been paid to the balancing of the moving parts, and the result is a practically vibrationless machine.

The motor is mounted in the present Werner position, and drives the front wheel by means of a flat leather belt $\frac{3}{4}$ in. wide. This position, I hold, is absolutely the best for the motor to be placed in, as not only is the maximum cooling effect obtained, but any width of belting can be employed without fouling the rider's legs, and also all levers can be arranged on the motor itself, leaving the handle-bar absolutely free, which adds much to the appearance of a machine. By the way, I should advise anyone investing in a motor-bicycle to specify a flat belt drive, as the round band joined up with a bit of wire must be more or less a toy. If a flat belt and Harris's patent fasteners are used, the belt can be shortened by any desired amount in a few minutes.

With regard to tires, I am riding a pair of $1\frac{1}{2}$ in. light roadster Palmers, and after some 3,000 miles travelling, including a tour round the south of England, they show practically no signs of wear. I had considerable trouble at first, however, with the front wheel rim which used to get badly hammered, but after I had fitted a "Jointless triplet," rim, found considerable improvement. Two-inch tires, I expect, would give still better results, but I hesitate about getting them, for I might possibly introduce with them the side-slip evil, which I have, up to the present, been free from. Perhaps some of your other correspondents will give their opinions on this point.

In answer to "Locknut," permit me to say that on my recent holiday tour I had no difficulty in obtaining petrol in either gallon or half-gallon quantities, except at Ludlow, where they would not sell less than two gallons. It is rather more expensive in these small quantities, and on my next tour I intend to carry about two gallons with me.—Your faithfully, W. MC. W.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—"Late Electrical Engineer" complains of a difficulty in getting his mixture strong enough in cold weather. I have been troubled in the same way, but discovered last week that the stem of my handle-bar which enters the steering head was not closed at the bottom. On stopping it with a cork, the machine started off at once on first trial, and I enjoyed an hour's run. The thermometer stood at 45 deg. Fahr., and the air ring was only quarter closed. Obviously I shall have to make another opening in the uptake pipe in warm weather.—Yours truly,

T. FREDERICK HUNT.

P.S.—I should have said my machine is the Werner (1900).

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—It was so obvious that the method I suggested of testing the belt grip of motor-bicycles was only intended to be a rough and ready one, and not scientific, that I do not think Mr. Craig need have wasted paper and ink about the matter. As a matter of fact, in suggesting the application of the tensile force (necessary to make the belt slip) from the circumference of the large pulley, I did an injustice to my own argument—not to the system of belt-transmission. I think my point still stands, despite Mr. Craig's efforts to upset it, namely, that a bicycle motor will not usefully develop more power than its belt can transmit.

Mr. Craig has misconceived my attitude towards motor-cycling. Those who are fortunate enough to get hold of a reliable machine, and who will use it in moderation and on good roads, will get much enjoyment out of it. I fear, however, that many of the present machines do not quite come up to my own standard of reliability. Perhaps I am not so easily satisfied as some of your correspondents, who have to call in the assistance of a kettle of boiling water to start their carburettors and yet seem to think they have got hold of a good thing. Personally, I have gone in for a Holder, which has yet to prove itself.—
Yours truly, W. E. TESCHEMAKER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Would not a flat crossed leather belt, one inch in diameter, be a practical method of transmission in the standard Werner bicycle? This could be more securely fastened than the V-shaped and round belts, and give the maximum amount of grip. It would take up rather more room than the usual pattern, but this would not matter much in the case of the standard Werner, as there is plenty of room in the front position of engine, and there are no riders' legs to consider. The circumference of pulleys would, of course, be flat or slightly convex and flanged, and the engine would have to be reversed. I don't know whether this reversing of engine would increase the vibration much.

It would be interesting to know if any readers of the *Journal* have ever tried this method. It succeeds very well with the small Benz car.—Yours faithfully, ROBT. H. ARMSTRONG.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—We see with great satisfaction and pride that our humble names and our little machine do so much to fill the columns of the *Journal*, which you publish with such talent and taste. Permit us also to contribute to your columns and for the first and last time break our silence. Five years ago we produced our first machine, which we baptised "Motocyclette." We received rather a cold reception from the world of automobilism, and everyone predicted its very short existence. We had the rashness to think the contrary, and without any help, without "seeking capital," we risked all the fortune we possessed to improve our motor-bicycle. We worked hard, we went through all sorts of difficulties, and suffered the injustice and scepticism of the whole world alone. The years passed and finally success came. We have sold more than four thousand machines, and won prizes in all big races; amongst others, Paris-Berlin, Paris-Bordeaux, Paris-Roubaix and the Tour of Holland. We received a gold medal at Exhibition of 1900, for having accomplished, without the slightest repairing, 600 miles round the lake of Daumesnil, under the constant control of a special technical commission. Finally Mr. Egerton crossed England and Scotland on one of our machines. But, apart from all these prizes and results, we are conscientiously proud of having been the means of considerably advancing automobilism. Hundreds of big firms, both in Europe and America, actually follow us. If the little Werner had not existed, it is more than probable there would not have been any motor-bicycles. We write this in no boasting spirit, but we wish to point out the fact that we were the first inventors of a light motor-bicycle, and that all others are our followers. Now we want to know who of these followers has got in front of us, and which motor-bicycle has proved itself superior to ours? Very often in the columns of the *Journal* the name of a Belgian motor is mentioned. We would like to know the name of a single official race (not of a thousand miles, such as we have run in, but simply of a hundred miles) in which this machine succeeded in winning a prize. What we do know is that in all big official races—as Paris-Bordeaux, Paris-Berlin, Tour of Holland—at the start there have been a dozen different types of machines, and at the end only Werners. May be there are some official races of which accounts are not published; if so, we should be glad to hear of them.

We have read with great pleasure courteous criticisms of Messrs. Benett, Warren, Konett, Fawcett, and others, and we have noted with attention their remarks. We like the criticism,

we like the argument, and we know better than anybody the proverb:—

"C'est celui qui ne fait jamais
Rien qui ne le trompe pas."

But we feel quite unable to answer anything to such a letter as M. Teschemaker's. There is no argument, no rational criticism, nothing but the evident wish to speak unjustly of something and do somebody harm. We can only answer such a letter by another French quotation, which is our motto:

"Bien faire—et laisser dire."

We may add, in spite of M. Teschemaker's advice not to buy motor-bicycles, we obtained an immense success at the recent English Show and also at the Salon in Paris. Practically all our output for 1902 is sold in advance. Being possessors of all records of speed and reliability, it seems we possess now a record of popularity.—Yours faithfully,

MICHEL AND EUGENE WERNER.

Paris.

THE SMART SURREY POLICE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent "Flaneur" voices the desirability of our knowing who are the actual persons who covertly wage war on automobilism through the action of the police. All of us must agree with him. I believe I can indicate one person who is responsible for the vindictive treatment of motor men in one certain district, and no doubt a black list of our enemies can easily be formed by co-operation. I, for one, would be delighted for such a list to be formed, and for these persons to be made to sweat when the time—our time—comes. If I am myself called vindictive for this, I reply that gratuitous harm is done to us, most of us innocent, progressive-minded, well-wishing people, by our persecutors; and I desire to point out that for the most part our persecutors are narrow, unprogressive, and unjust-minded people who are in reality enemies of society, and that it is to our interest as a nation that such people should be pushed under and deprived of influence. We motorists are getting all the persecution we will take; and the knowledge by all of us as to who in each district are our enemies would give us collectively a tremendous weapon.—Yours truly, ODI.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If your correspondent, Mr. S. W. Fuller, will drill a hole in the side of his exhaust box and turn his steam pipe through this, so that the steam discharges into the silencer, he will get over his difficulty. I tried this first in 1897 and have always found it to answer. The steam becomes super-heated, and issues from the silencer in the form of an invisible gas.—
Yours truly, A. J. ALDRED.

MOTOR-CARS FOR THE TROPICS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter of "P. Fowle" in your issue of 14th inst., and the statements I have recently seen as to flash point of petrol and its unsuitability for use in the tropics, possibly my experiences may be of interest to your readers. I have been conversant with gas engines from 1876; naphtha, gasoline (or petrol) from 1889, English, American, and German, and have driven motor-cars abroad in the tropics since 1896, and in England, France, etc., from 1900. I speak from every day practical experience in tropical weather as high as 116 degrees Fahr. in the shade. There is no trouble or difficulty whatever in carburation, or in overheating of cylinders. My Benz car or De Dion tricycle were in daily use, and I never experienced trouble from use of petrol in any form. I also used, from 1882 up to 1900, gasoline largely in stationary and launch engines, and this mixed with petrol works well. Also gasoline and benzoline mixed in equal proportions works well. In fact, since I have been in Europe it seems to me that carburation is here far more fickle. My 9½ h.p. Decauville never refuses to start, hot or cold, but my "Progress" car, driven by De Dion engine, like all De Dion engines, was very tricky. I am a mechanical

and electrical engineer, and consequently very dissatisfied (as any electrician must be) with the De Dion ignition. Mechanically and electrically it is wrong, and novices will always have trouble until it is altered. What is wanted is, instead of trembler, a good rubbing contact (as Bassé and Michel), a trembling coil, E.I.C. plug, and good flexible, highly-insulated wire. Result, no more trouble.—Yours faithfully, F. H. H.

PILOT BURNERS FOR LOCOMOBILES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I seem to remember having seen a letter some time ago in your paper, but cannot now find it, as to a way of fitting a pilot burner, independent of the main burner and automatic cut-off arrangement, so that on arriving at a place where one intends stopping two or three hours, this pilot burner could be left alight, and which, though it would not blow out, would not increase the steam pressure or let it run down very low. At present I find myself hurrying back to the car, and probably finding the steam pressure gone and the awful torch necessary. If any of your readers have tried such a device, would they say how it is arranged.—Yours truly, Loco.

A QUERY RE STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to "Naval Engineer's" query of November 30th, re exhaust steam showing from Serpollet cars, I may say that these vehicles will run as far as the supply of oil and water will take them on a fairly level road without showing steam, but on ascending a steep hill they use a lot of steam, and sometimes there is more than the condensers can cope with. On attaining the level again, however, it will be all right. If travelling in a gale, sometimes the wind will cause the lamp to burn badly, and fail to heat the tubes of the boiler sufficient to lash the water into steam, then it will occasionally throw off wet steam, but very little. Taking the Serpollet all round, it is an excellent car as it is practically noiseless and has scarcely any vibration. Its speed is as good as any one could wish for, and there is no danger of explosion.—Yours truly, CHAUFFEUR.

TURNING CORNERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in your issue of December 7th that "Flaneur," referring to the article in the *Strand*, states that the illustration of the motor-car rounding a corner on the outer wheels with the inner wheels off the ground is wrong, and that a car would turn on its inner wheels. Surely your statement is incorrect, for why does one, when rounding a corner on a bicycle, lean inwards? Surely it is to counteract the tendency to continue in a straight line? Again, on a track of any sort, or even a railway, the corners are banked so as to tilt the machines towards the corner, which acts like the leaning inward on a bicycle if the tendency is to fall inwards (towards the corner), which is only a continuation of going round on the inner wheels; surely, banking as made now would tend still more to overturn the machines. I saw my theory borne out last holidays by witnessing a runaway dogcart overturn outwards whilst turning a corner. I hope I have made myself clear to you, and I should like to know whether I am right.—Yours truly, H. TALLENTS.

QUERIES RE IGNITION.

TO THE EDITOR OF *The Motor-Car Journal*.

I notice in the *Motor-Car Journal* of November 30th, a letter from "Ten Miles from Anywhere" under the above heading. I do not, of course, know whether your correspondent's troubles are chronic or only recently developed, as he gives no particulars, but there is one cause of electrical troubles which I have found is more prevalent in De Dion voiturettes than in any other make of car. It is a simple matter, seldom noticed and very easily remedied, but makes a wonderful difference in the running of a car. In the course of my business as a motor repairer, but more often when having been sent for on consultations, I have found many cases where this has been the sole trouble.

If any owner of a De Dion voiturette who has an apparently mysterious series of troubles, generally missing fire or sometimes stopping altogether, arising from what seems to be plug sooting, and who has tried smaller quantities of lubricating oil, better quality of ditto, new plugs, etc., all with apparently temporary good results, only to find the trouble again arising within perhaps a mile or less, will take off the induction coil (I am referring to the long, round De Dion pattern), he will find that the brass band on the end of the coil furthest away from the plug wire terminal is fastened by means of a screw, about half an inch long, to the internal economy of the coil, and that this said screw has worked loose. It will be found that the tightening of this screw will entirely do away with his troubles. After tightening, to prevent the trouble occurring again, it is well to solder the head of the screw to the brass band; this will prevent it unscrewing from the vibration of the vehicle. There are also some smaller screws in both bands, but these are of little consequence.

It will be well also for those whose cars are not of this type, but in which the De Dion motor is used, to make the same examination, as I have also found many of these to be affected in the same way. In some cases also of two-cylinder motors where the De Dion coils are used, I have found one of the cylinders not doing its work in a proper manner from the same cause. This defect, though so easily found and remedied, has caused, within my own personal experience, several owners of cars to be so disgusted with the sport of motoring as to be inclined to throw both the car and the sport over entirely, and no doubt there are many more outside my experience who have felt the same and have been inclined to give up what is otherwise a very reliable and handy little car in favour of some other vehicle or form of locomotion.—Yours faithfully,

C. H. GUEST, M.I.M.E.

"A WOULD-BE PURCHASER" writes:—"I should be much obliged if any of your numerous readers could give me their experiences with petroleum oil cars. What is the cost of running per mile compared with petrol cars? Which is the most popular make? etc."

MR. A. L. BENETT writes:—"Would you allow me to correct the letter you printed in the last issue of the *Journal*. By a printer's error I am made to say, "I will *not* repeat that I am very satisfied" (with the Werner machine). It should be "I will *now* repeat," etc. This alters the sentence considerably. Another and less important printer's error is "*voire l'obstacle*," in place of "*boire l'obstacle*," as it should be."

WHY did the carburettor (carber-hit-her)?—Because the engine mis-fired.

DURING the month of October, automobiles and parts thereof to the value of £11,250, were exported from the United States, bringing the total value of such exports for the first ten months of 1901 up to £52,507.

THE German Emperor has founded a prize, consisting of a handsome vase, for the best spirit-driven motor-car suitable for agricultural purposes. The conditions for the competition will be decided next February.

MESSRS. JOHN ROTHWELL AND SONS, Knowsley Road, St. Helens, Lancashire, have been appointed district agents for Messrs. Carless, Capel and Leonard, and motorists can now there obtain petrol of the well-known brand.

BEACONSFIELD, Bucks, which is on the main road between London and Oxford, has hitherto been without a motor-car repairing establishment. The long felt want has at last been supplied by Mr. Jose Jackson, who has opened extensive premises where repairs are undertaken, and petrol, oils, and accessories can be obtained.

A MOTOR bicycle, in which a $1\frac{1}{2}$ h.p. De Dion motor is carried below the main cross tube, has just been put on the market by Mr. J. N. Birch, of the Motor Works, Nuneaton. The power is conveyed to a pulley on the rear wheel by means of a belt. The frame of the machine is of strong construction, the front forks being duplicated.

THE "HOLBORN" MOTOR TIRE.

THE accompanying illustration shows a section of the new motor tire which has lately been put on the market by the Holborn Tyre Company, of 35, Bream's Buildings, Fetter Lane, London, E.C. As will be seen from the section, the form of the tire is quite different to all preconceived ideas of motor pneumatic tires, and is based upon the fact that the conditions under which automobile tires run are different from those which exist in the case of cycles. In the latter case the total load is light, and, therefore, the tire has to be thin at the sides in proportion to the tread, which latter must be thickened to resist punctures. With the motor-car it is otherwise. The tread of the tire may, according to the Holborn Company, be comparatively thin, because punctures are rare. It is the bending of the fabric at the sides which causes the trouble, owing to the disintegration of the strands. The Holborn tire is secured to the rim by fly nuts and bolts, the latter pulling down into position an inner rim made in four sections,

and at the base the sides are thick, tapering towards the tread so far as the fabric is concerned. On the other hand, the rubber is thicker on the tread and thinner at the sides. The result of this is that the movement of the fabric is spread over a larger area, and does not take place exactly at the rim, as in the case of thin-sided tires subjected to the weight of a car. A number of claims are made for the new tire, notably the narrow tread, the reduced liability to puncture, and the ease of detachability. The tire is made in a variety of sizes ranging from 26in. by 2½in. for light voiturettes to 28in. by 4in. for heavy cars.

WE are informed that Mr. J. W. Simpson, of 9, Broad Street, Margate, is now in a position to undertake repairs to motor-cars. Mr. Simpson also stocks petrol, oils, greases, etc.

MESSRS. WILLIAM LEA, of the Motor Car Depot of Liverpool, inform us that they supplied the Milwaukee steam-car fitted with Clarkson's appliances, referred to in a recent issue as purchased by Dr. Allison.

WE learn that the agency for Great Britain for the Auto-Incandescent system of ignition for petrol motors has been acquired by the Brush Engineering Company, Ltd. (automobile department), Donington House, Norfolk Street, Strand, W.C.

WESTMORLAND COUNTY COUNCIL has been considering the advisability of placing caution boards at dangerous junctions, corners, or other places on the main roads of the county, requiring drivers of all vehicles to drive slowly. Sub-committees have been appointed to inspect and report upon various places where, in their opinion, such boards should be fixed.

CONTINENTAL NOTES.

BY "AUTOMAN."

THE sea was really very unkind to the large party of automobilists who took advantage of the Club's cheap ticket, on Friday last week, to cross the Channel and attend the Paris Automobile Show. It was bad enough to have read the announcement in the *Daily Mail* that the crossing would be "dangerous," and I believe the fair partner of at least one prominent member of the Club let her lord and master face the danger alone. When, however, the party reached Folkestone the appearance of the jetty was sufficient to make the boldest sailor shudder. I quite believe that all we wanted was somebody to start back for us all to have cut and run when we saw the angry billows dashing through the iron-barred openings in the pier. But no one had the pluck to turn back, so we all trooped on board, and pretended to look pleased. But, oh! what dreadful plight we were soon in, and what a disgrace to automobilism to see the drawn yellow faces when we reached Boulogne! The groans of one of my friends and colleagues would have moved a heart of stone, and more than one prominent dealer in motor-cars looked like a ghost in an astrachan collar. On deck, too, the sight was one never to be forgotten, many well-known faces in the automobile world being discovered between sou'-westers and waterproofs borrowed from the sailors. However, if the crossing was bitter, it was also short, and soon the Paris train held us nearly all. I say advisedly nearly all, for several of the party lingered too long over the delights of the "buffet" at Boulogne quay station, and had to charter carriages to catch up the train at Boulogne town station, where it always makes a short stop.

THE train from Boulogne to Paris is a "corridor," and one can therefore move about and see one's friends en route. The circulation was incessant, and this brings me to the point I had in view when I began to tell the readers of the *Journal* about the trip to Paris. In a compartment, not a hundred miles from the one in which I found myself, a discussion was going on over my poor unworthy body. It seems—not to be indiscreet—that a certain prominent manufacturer, Mr. Austen of the Wolseley Company (not to name him), takes umbrage at some of my remarks in these columns last week with regard to my charges against the English manufacturers of copying French cars instead of striking out for themselves and creating improvements. Said Mr. Austen, "We were the first to advocate equal wheels and many other improvements, and we claim that our transmission loses less in friction between the engine and the road wheels than any French car. We do not try to take our power round corners, we take it right to where it is wanted in a straight line, and I am going to write to 'Automan' and tell him what I think of his remarks."

I WOULD welcome any correspondence or criticism from Mr. Austen on this subject, because I think it would lead to a good result, and wake up the trade. But Mr. Austen must remember, however, that an exception proves the rule, and I was inveighing against the trade as a whole and not against individual manufacturers. I am quite prepared to admit that his car is an exception of which he may be justly proud, but I would go a step further and humbly suggest to the consideration of Mr. Austen that if he is correct in his opinion—and I am not going to doubt it—that the loss in transmission in the Wolseley car is less than in the Panhard and Mors types, then his firm can just as easily win the Gordon-Bennett and Paris-Berlin races as I can write my Continental Notes. The very wise limit of weight makes successful racing a question of loss in transmission pure and simple, and if the Wolseley can pull off these events, their makers would have not only the English trade—I hear they have got a good slice of that already—but the world's trade in their hands, and bring the orders to our shores that flow at present into the hands of Panhard, Mors, Renault, and other Continental firms.

WHILST on the subject of racing, I want to endeavour to kill what is really becoming a popular error, and a theory that has no foundation in fact. It is said that racing produces only cars that are made just strong enough to stand a race, to hold together, so to speak, and then to be liable to fall to pieces very shortly after. Nothing could be farther from the truth or more ridiculous. A car that is to go from Paris to Berlin at an average speed of forty odd miles an hour must essentially be strong, and if it will stand that it will stand anything. Charron's winning car of last year, Fournier's of this year, the Renaults, and a host of others I could name, are a living testimony of this fact, and yet the same old story is dished up year after year and the wiseacres shake their heads and trot it out whenever road-racing is mentioned.

THE German Ministry of Finance has decided that touring motor-cars crossing the German frontier shall be free from customs duty, as also the petrol which they are carrying for their own use. In future a trip into Germany will consequently become much simpler, and this wise removal of all annoying and useless restrictions will take a large influx of tourists into that country. It is to be hoped that other foreign nations will follow this liberal policy.

LAST week I finished my Continental Notes with the short account of Rigal's world's record of the flying kilometer in 33 secs. He is now figuring in Barnum and Bailey's show, which is at present on a visit to Paris, and is located in the Galleries de Machines of the Exhibition of 1900. A straight track right across the arena has been laid for him, and, all the lights being lowered, he dashes through the arena at between sixty and seventy miles per hour with the limelight following him. Rigal has a three months' engagement at £200 per month.

AN account of a new and wonderful invention is going the round of the French press—a motor without any exhaust. It purports to be (I give the story for what it is worth) the outcome of a new chemical process by means of which the oxygen required for the explosion in a petrol or spirit motor is provided without the assistance of the atmosphere, and by which the carbonic acid gas produced by the explosion is also absorbed. It is said that exhaustive and successful trials have been made by naval engineers. The importance of such a discovery would be very great, and such a motor would be suitable for many applications where at present its exhaust is a difficulty. On submarine boats, notably, it is impossible to use petrol on account of the waste gases which would vitiate the air.

THE day before the opening of the Paris Automobile Show the general meeting of the A.C.F. was held, and it was finally decided to incorporate the Yacht Club with the A.C.F. and take in its 300 members. Two reasons have led to this step being taken. The first was to put a little life into the Club, for, notwithstanding the fine situation and the magnificent accommodation provided by the building in the Place de la Concorde, it was really the most dead-and-alive place in Paris. With the entrance of the Yacht Club will come gambling, and without gambling no Paris club gets any attendance; so it is believed that animation will follow the gambling, and, in addition, a substantial profit to the Club from the commission always charged for the benefit of the house—this is the second reason; for the Committee foresee the time when the influx of new members will cease, and then it will be difficult to make both ends meet and continue the campaign of encouragement to the trade which was the object of the initiation of the A.C.F.

THE King of the Belgians attended the concert at the French Automobile Club, and has paid several visits to the exhibition at the Grand Palais.

MESSRS. G. F. HEATH AND CO., 83, Great Colmore Street, and 123, Holloway Head, Birmingham, have been appointed sole agents for new type Werner motor-bicycles in Birmingham. Messrs. Heath will keep a full stock of all Werner parts and accessories.

THE WAR OFFICE MOTOR-LORRY TRIALS.

THE trial of the military self-propelled lorries at Aldershot was continued on the 10th inst. The route to be covered extended to 31 miles 7 furlongs, and this was completed by the Foden wagon in 5 hr. 21 min., the Thornycroft standard wagon being 18 min. behind it. The Straker was a long way to the rear, and came in a few minutes ahead of the Milnes. All the lorries experienced great difficulties on account of the soft and muddy roads. The Thornycroft new-type vehicle did not go out. The principal feature of the trial on the 11th inst. was the bursting of the steam pipe on the Straker vehicle, and the competition is practically now between the Foden and the standard Thornycroft. On Thursday, the 12th inst., tests were made as to which lorry could cover the required distance (thirty-two miles) with the least fuel. The Foden was an easy winner by over 200 lbs. of coal.

The run, on Friday, the 13th inst., which was of special interest owing to the heavy gradients included in the route, was more favoured in the matter of weather, the roads, however,

THE FODEN WAGON BREASTING A STEEP HILL.
(Photo by Mr. H. G. Burford.)

being somewhat greasy after the heavy rains of the previous day. The first and worst hill to be climbed was that over the Hog's Back from Wanborough to Puttenham, a grade of 1 in 8 up, and 1 in 7½ down, with a fairly good surface. Arriving there somewhat too late, we met the Foden lorry going at a good pace to Compton, having been third in the climb, a minute behind the ordinary Thornycroft, and one and a-half behind the Straker. The Milnes, however, though slower on the climb, was ahead at Compton, and gained several minutes there, through not needing to stop for water. Taking a short cut, we met the Milnes again, without a trailer, at Godalming, which it reached at 10.49, followed twelve minutes later by the Foden. Several cars, with Messrs. Claude Crompton, J. H. Knight, H. G. Burford, and others interested, arrived about the same time, and following in pursuit we overtook the Milnes beyond Milford, packing a cylinder joint that had blown owing to a passenger taking the helm and permitting a back fire. This was soon done, and two miles further on the three-mile ascent of Hindhead had to be negotiated. The Milnes arrived first at the bottom, but after taking up our station at the steepest grade near the top, 1 in 11½, we waited some time for the first arrival, which proved to be the Foden, taking the hill in good style. The Milnes, which seemed to be "missing" somewhat, was rather delayed, but soon

arrived and tackled the steep pitch at a fair speed. A quarter of an hour or so elapsed before the Thornycroft turned up, and she had to pause for steam on the grade, but started comfortably on 1 in 11 after less than half a minute. Rumours of the Straker being delayed at Godalming arrived, but returning that way we met her four miles behind, going strong, being, apparently faster on some of the hills than her competitors, and we were unable to get particulars of the cause of her delay. Later inquiry showed that the Foden arrived home first with over half-an-hour to spare. Much local interest has been shown in the big tractors, the more so since horse haulage is expensive in the neighbourhood, and it may be hoped that they will give a stimulus to the adoption of heavy motor-vehicles generally by brewers, contractors, etc., in these parts, as we have had several requests for information on the subject from such. The following shows the relative merits of the two first types in Friday's work:—

	Time.	Fuel.	Water.
	H. M.	lbs.	Gallons.
Foden	5 27	402	284
Thornycroft ...	6 4	588	401

The most remarkable incident of the last of the series of trials undertaken on Saturday last, was the narrow escape one of the vehicles had from plunging over a bridge into a river. The route mapped out for the trial was thirty-four miles long, and led over the River Till by an old bridge. The approach was by a sharp rising road with two quick curves in it, the bridge running almost at right angles to the last curve. The first three successfully negotiated the spot, but the fourth, Thornycroft's rear-driven wagon was not so fortunate, the upward curve being taken too wide, with the result that one of the fore wheels collided with the bridge side, threw it down and dropped over, the engine being stopped in time to prevent it from plunging down below. With the aid of strong planks and jacks the fallen part was raised and got back into the roadway, and as an examination showed that no serious injury had been sustained, the journey was continued. The day's work resulted in another victory for the Foden wagon, which started second but finished half-an hour ahead of the next best competitor, the Thornycroft standard wagon, the following being the comparison:—

	Time.	Water.	Fuel.
	H. M.	Gallons.	lbs.
Foden	5 17	256	402
Thornycroft ...	6 1	393	667

This week the competing vehicles have been subjected to speed trials, manœuvring tests, rough country trials, hill-climbing and brake tests in the neighbourhood of Aldershot.

"FROM start to finish," says *M.A.P.*, "a depressing gloom has surrounded 1901. Motoring by day and playing Bridge at night are the only pleasures left."

WE are informed that the Caledonian Motor-Car and Cycle Company, of 265, Union Street, Aberdeen, have again been appointed sole agents for the sale of Peugeot motor-cars in Scotland for the season 1902.

AN automobile agency and repairing depot has been opened at Street Farm Works, Moulsham, Chelmsford, by Mr. H. Greiner, who has been till quite recently an employé of the Daimler Company at Cannstatt.

C. H. GUEST, LIMITED, has been registered with a capital of £2,000 to take over the business of an electrical and mechanical engineer, car builder and cycle manufacturer, carried on by C. H. Guest at Draycott Mills, Draycott, Derby. The first directors are M. J. Astle and C. H. Guest.

THE Steam Motor Construction and Maintenance Company, Ltd., has been registered with a capital of £5,000 to adopt an agreement with W. Ingram-Lyon, and to carry on the business of manufacturers, hirers, and vendors of, and agents for, motor-cycles, motor and other carriages, etc. The registered office is at 25-29, Coleman-street, E.C.

DIEPPE TO ROUEN AND BACK.

THE other Saturday, when the morning dawned, weather conditions did not seem to point to the carrying out of our pre-arranged programme; however, as the day advanced these materially improved, and by 2 p.m. it had become quite a genial autumnal day, with a pleasant south-east wind blowing.

So we turned out of its *garage* the trusty "Diana," boarded her (four of us in the party), and headed down the Rue Général Chanzy for Arques la Bataille. Fifteen minutes found us at this historical spot, famous as the scene of the great battle fought between Henri IV. and the Duc de Mayenne, in which the latter suffered a disastrous defeat; the charming old château still stands picturesquely placed on the summit of the hill to awaken memories of the past. Leaving Arques behind us we sped on through Martigny to Torcy; from this point, a distance of eighteen kilometres, we had on our left the majestic Forêt d'Eau. Magnificent in its autumnal glory, the sight was one that must ever remain in our memories, as it is not often that we have such a glorious one afforded us. We bowled along at a comfortable 25 kilometres an hour through St. Hellier and Pellincombe, till we drew up at the Hôtel de la Poste at St. Saens, where we refreshed both "Diana" and ourselves, having, as usual, found an obliging host. Like all the French villages the same peaceful calm reigned supreme, and, beyond awakening a curious inquisitiveness on the part of the villagers in the mechanism of the "Diana," nothing of interest occurred. It was just 5 p.m. when we left St. Saens, our next point being St. Martin, and then Rocquement. The light was just waning when we turned into the main road, and the ride can be better imagined than described, as we had 15 kilometres of a run between avenues of trees rich in the golden foliage so peculiar to the Normandy elm. All went well till we were within 10 kilometres of Rouen, where we found they had had some very heavy rains. As a result it was difficult travelling, and as we approached the entrance to the town we experienced a lot of trouble from side-slip. However, we landed safely at the top of the Rue Jeanne d'Arc, and it was but the matter of a few seconds to find ourselves at the Hôtel de la Poste (an hotel largely patronised by automobilists). Here we secured our rooms, and after enjoying the pleasure of a well-served dinner, had a stroll through the town in the moonlight, which gave a most picturesque effect to the graceful spires of the several churches and towers which abound here.

It may be of interest to motorists to know that the designation *chauffeur* first originated in Rouen, but it was then applied to a different class of men to those at present thus named. At the end of the eighteenth century a band of brigands infested Rouen and Vicurly, and it was their practice to submit their victims to torture by burning the soles of their feet to make them divulge the hiding place of their treasures; they were known as *chauffeurs*.

The next day, after spending some time in sight-seeing, we brought round "Diana" to the hotel, wished our genial hostess good-bye, and made our way along the Rue de la Bourse to the route du Bon Secours. Without any exaggeration whatever the view we had whilst ascending this hill was simply enchanting. I cannot attempt to describe the beauty and the immenseness of the panorama; I may be wrong, but I should say it has not its equal—had we seen nothing else that day we should have been amply repaid. We regretted that time pressed and we had no alternative but to speed on if we wished to reach our destination by nightfall. The church of Bon Secours should be visited, as it is certainly one of the sights of Rouen, and a walk should be taken on to the hill near by to get the view of the surrounding country, which presents a most interesting spectacle on a fine day. We were pushed for time, so we put on *grande vitesse* and headed for Bosc, some 9 kilometres on the route. Passing through this village, our next point was Fleury-sur-Audecle; it was nearly 1 p.m. when we made this

village, and here we really were in some magnificent forest scenery. Passing on to Lyons la Forêt, 5 kilomètres from Fleury, we were in the heart of the forest, and what a sight! How we appreciated the advantages of a motor-car—for it is quite certain that by no other means of locomotion could we have passed through such delightful scenery in such a short space of time. For 15 kilomètres we passed along the roads which abutted the Forêt Nationale de Lyon, the kaleidoscopic tints on the trees exceeding in beauty those of the Forêt d'Eauv.

When we joined the National route, we were just 13 kilomètres from Gournay-en-Bray. It was close upon 2 p.m., and the keen, crisp air had sharpened our appetite, so we urged on our car and twenty-five minutes saw us safely before the Hôtel du Nord, Gournay. There we found an excellent lunch, to which we did ample justice. After lunch we oiled up and watered "Diana," and at 4 p.m. set out to knock off the seventy-five kilomètres still to be covered, and this along the excellent National roads. It was just 4.30 p.m. when we ran into Forges-les-Eaux (the Harrogate of Normandy). We did not stay here but kept on for Neuchatel-en-Bray, which we reached at 5.15 p.m., having covered the 35 kilomètres in the hour and a quarter.

A little halt was necessary here to light up, also to oil and water, so we drew into the yard of the Hôtel du Chariot d'Or, where we found ample convenience for motorists. There we had our "five o'clock," as our Gaelic neighbours call it. It was now 6 p.m., and dark, so that our final spin home had to be made under less favourable conditions than the earlier part of the run. However, we found it distinctly exhilarating; and it was just chiming 7.15 p.m. when we pulled up at the house in Dieppe, having again covered the 35 kilomètres in the hour and a quarter. People rave against motor-cars; surely it must be ignorance, otherwise they would not. Had it not been for our trusty "Diana" we could never have beheld all the delightful scenery which we did, for in the day and a half we covered quite 230 kilomètres, and this, be it known, without the slightest hitch in the machinery. Everything went perfectly, and at the finish of our journey we felt infinitely better in health than we did at the start.

"SYGOGNE."

HERE AND THERE.

AN attempt is being made in Chester to form a company to promote a motor-car service for the ancient city, and much local interest is naturally being taken in the scheme.

THE Hon. C. S. Rolls was to have made a balloon ascent in Paris on Sunday last, but, owing to the inclement weather, the idea had to be abandoned.

THE President of the Board of Trade has consented to receive a deputation from the Roads Improvement Association in reference to light railways on public roads.

ON another page we reproduce a photograph of Mr. S. T. Davis, jun., Treasurer of the Locomobile Company of America, on his 8 h.p. racing Locomobile. At the recent race meeting on the Ocean Pathway, Brooklyn, Mr. Davies established a new record for steam cars, covering a mile with a flying start in 1 min. 15 sec.

THE Robin Cycle and Motor Works, 755, Wandsworth Road, S.W., have recently been greatly extended, and ample space is now available for the storage and cleaning of a number of cars. When we called a few days ago a variety of repair work to Benz, Daimler, and De Dion vehicles was in hand. A good stock of oils, greases, and spare parts is also kept.

MR. J. F. SCOTT, of Edinburgh, is introducing an improved gear sleeve for Daimler and Panhard type cars, the feature being that the third speed ring is made detachable so that it can be replaced in the same manner as the fourth speed. The third and fourth speed gears abut together on the new sleeve, are bolted to a flange, and also secured by means of a feather.

MESSRS. RICKARD AND CO., of Brentford, have opened extensive new workshops, and are prepared to undertake work

of all kinds, both for motor-cars and launches. They are also supplying engines for motor-bicycles fitted with their new carburettor and ignition gear. It is claimed for the new carburettor that it will not overflow, however rough the road may be.

WE are authorised to state that the Hon. John Scott Montagu, M.P., more than a month ago resigned his seat on the Board of the De Dion-Bouton Company. Mr. Montagu's resignation was caused by the decision of the De Dion Company to act in opposition to the policy decided on by the trade and adopted by the Automobile Club—viz., that there shall only be one exhibition within twenty miles of Charing Cross per annum, and that the Exhibition of 1902 should be the Automobile Club's Exhibition at the Agricultural Hall.

A STRIKING example of the interest now taken in the proper maintenance of roads is afforded by a placard recently issued by order of the Hertfordshire County Council. It takes the form of a caution, drawing attention to the damage done to main roads by the transference of mud, soil, and clay to them from adjoining land by the wheels of carts, and it threatens with prosecution offenders who omit to clean the harmful matter from their wheels before bringing them on the roads out of fields. The offence has for years been ignored, but it is a welcome sign of the activity of road surveyors that they should be zealous to maintain their good roads unimpaired by careless methods of carting.

MESSRS. W. R. THOMAS AND CO., of 12, Thornbury Road, Brixton, S.W., are introducing a new motor-bicycle, which they have named the "Brion." The motor has a cylinder $2\frac{1}{2}$ in. diameter by 3 in. stroke, and is claimed to develop $1\frac{1}{2}$ actual h.p. The ignition is of course electrical, while the carburettor is of the Longuemare spray type. The engine is supported below the lower cross tube of the frame, and drives the rear wheel by means of a strap. The petrol tank has a capacity sufficient for a run of 125 miles, while sufficient lubricating oil can be carried for 200 miles. The road wheels are 26 in. diameter, and are shod with Dunlop 2 in. pneumatic tires. Not the least important feature of the Brion motor-bicycle is the relatively low price at which it is being put on the market.

THE annual meeting of the shareholders of the Star Cycle Company was held at Wolverhampton last week. Mr. C. E. Shaw, M.P., who presided, said the unsatisfactory side of the balance-sheet had reference to the motor-car department, and the sum of £2,530 had been written off. From the very first the motor-car industry had been somewhat in the nature of a speculation. It would be unwise in consequence of a temporary loss to relinquish their hold upon the industry. The question resolved itself into one of confidence in the directors, and as 75 per cent. of the total sales of motor-cars was made in London, he considered a depot ought to be opened there. As this, however, would involve an expenditure of £1,000, they hesitated to move until they knew whether or not the shareholders were behind them. The report was adopted, and eventually the directors were empowered to open a depot in London.

THE Quarterly 100-Miles Trial of the Automobile Club will be held on Tuesday, January 14th, 1902. The course will be from London to Oxford and back, via Uxbridge, Beaconsfield, and High Wycombe. The speeds of the vehicles will be taken on Dashwood Hill on the outward journey, and on Aston Hill on the return journey. The gradients of these hills are 1 in 16 and 1 in 21 respectively. The purpose of the trial is that cars entering shall make a non-stop run of 100 miles. If a stop is made the cause of the stop is recorded, as also are the number of passengers carried and the consumption of petroleum spirit. Manufacturers and agents wishing to enter vehicles for this trial are requested to communicate with the Secretary, Automobile Club, 4, Whitehall Court, London, S.W., from whom full particulars and entry forms may be obtained. The entrance fee is three guineas plus one guinea, the latter being the fee for registration under the Competition Rules of the Club. The last day for receiving entries is Saturday, January 11th, 1902.

IGNITION IN PETROLEUM-SPIRIT ENGINES.

AS, briefly mentioned in our last issue, the time chosen for the reading of the first of a series of papers destined to appear in a Badminton Library book on "Motoring" was Wednesday, the 11th inst., after the first of the Winter session House-dinners at the Automobile Club. "Ignition in Petroleum-Spirit Engines; Systems, Possible Failures: How to Discover and Remedy Them," was the complex title of the first paper, read by a most able exponent, Mr. Ernest J. Hutton, J.P. The paper, which was made still more instructive by the many diagrams displayed, was of an exhaustive nature, dealing with every known method of ignition, and setting forth the advantages and disadvantages claimed by each. If every chapter of the Badminton book is as full of useful information as that contained in Mr. Hutton's opening paper, the way of the future automobilist will be made easy. The discussion and interchange of ideas which followed the conclusion of the paper were equally prolific of tips which should prove invaluable to the inexperienced brought to a sudden stop and searching for both cause and remedy.

Mr. Campbell Swinton recommended carrying a small dynamo, worked by the engine, as a means of keeping batteries charged, as preferable to charging accumulators before starting. Doctor Boverton Redwood expressed the opinion that the nature and power of the spark generated should be the subject of further investigation. In supporting this theory he cited a somewhat curious experience. On the occasion of a petroleum ship taking fire at sea, he had, with others, investigated the cause. The opinion prevailed that a spark,

struck from the iron of which the ship was largely constructed by a nail in a boot, was the cause. Experiments, however, proved that no such spark would ignite petroleum or the vapour rising from it. Amongst simple, but easily remedied, causes of failure of ignition, a case was quoted of the battery having slipped, with the result that it rested against the aluminium side of the car, thereby short-circuiting the current. Restored to its proper position ignition was continued. Mr. Staplee Firth recalled an early experience with a car which would not go. After a long search for the cause of failure a yard of wire was found hanging over the side. When re-attached to the battery terminal, from which it had worked loose, the car continued its journey. Instances were cited of the failure of the Simms-Bosch electro-magnetic ignition, due to overheating and splitting of the mica packing. As a remedy it was stated that vulcanised rubber washers had been found as effective as mica for packing and impervious to heat.

Another curious cause of failure, in the case of a wipe spark, was traced to a brush having worked loose through vibration and fallen away from the commutator, a mishap easily overlooked and easily remedied. Soot or dirt on platinum points was considered the most frequent cause of failure, and the simplest remedy cleaning with sand paper. The distance between points and consequential length or fatness of spark was a matter

of consideration. Weight of opinion gave that distance as varying from 1-64 to 1-32 of an inch, the lesser distance being about equal to and measurable by the thickness of the finger nail; the greater by that of the thumb.

THE "HEWETSON" MOTOR-BICYCLE.

CALLING in at Messrs. Hewetson's, Limited, extensive depot in Tottenham Court Road, W., the other day, we had an opportunity of inspecting the new motor-bicycle which the company have just put on the market. The machine, of which we give an illustration herewith, is of Austrian design, and, as will be seen, has a frame of special construction, the ordinary lower main tube being replaced by a horizontal tube and another one curved so as to be parallel with the front wheel. The frame, which has a vertical stiffening tube just behind the motor, is of strong construction throughout, the fork crown being of unusually liberal dimensions. Coming now to the engine, this is of the vertical air-cooled type, and is stated to develop $1\frac{3}{4}$ h.p. No dry batteries or accumulators are used in connection with the electric ignition, the spark being provided by an improved form of the Bosch magneto-electric machine, which will be seen in an inverted position below the crank chamber of the motor. The combined surface carburettor and

petrol tank, which has a capacity of about a gallon, is located in the back panel of the main frame, leaving plenty of room for an additional petrol tank, tool bag, etc. No compression cock is provided, its place being taken by an exhaust-valve lifter, which is controlled by a lever like a brake lever from below the left portion of the handle bar, the same lever also actuating the tap by means of which the quality of the

explosive mixture is regulated. The quantity of gas allowed to pass to the explosive chamber is controlled by the small handle seen on the top bar of the frame, just behind the engine. The power of the latter is conveyed by a long, flat belt to a light pulley on the back hub. This pulley is practically a small wire-spoked wheel in itself, and is not attached to the rear road wheel through the spokes or rim, but is connected direct to a special hub. An adjustable jockey pulley is fitted to the main down tube of the frame. The usual pedals and chain gearing, with free-wheel clutch, are fitted to start the engine. Two-inch pneumatic tires are provided to the road wheels, while there is a powerful band brake fitted to the front wheel hub. Altogether the new machine appears to be of sound construction. We understand that it is a good hill-climber, and that on fair roads it can attain a speed of thirty miles per hour.

THE balloon ascent which the Aero Club had arranged to take place from the Crystal Palace last week, to enable the Hon. C. S. Rolls, Professor Hutchinson, of Cambridge, and M. Gaudron to make scientific experiments, had to be postponed owing to climatic conditions, and is now fixed for Friday, December 20. It is proposed to collect germs, which will be cultivated and microscopically examined by Dr. Hutchinson at Cambridge.

MOTOR-CAR v. CHAR-A-BANC.

A COLLISION between a char-a-banc and a motor-car at Monkspath was the basis of an action for damages brought by a baker named Charles Newbold, 87, Church Lane, Aston, against Harvey du Cros, jun., well known in cycle and motor circles in Birmingham. Newbold's oven had fallen in, and he relinquished baking temporarily in favour of driving. On June 22nd he was taking a party of ladies to Henley-in-Arden, when the defendant's motor-car struck his fore off-wheel and knocked the spokes out. The plaintiff alleged that in consequence he was unable to use the vehicle for some time, and lost a good deal of money which he otherwise would have earned. Messrs. Hugo Young, K.C., and S. S. Dorsett appeared for the plaintiff, and Mr. Vachell for the defendant. The plaintiff and his witnesses said that they did not know of the proximity of the motor until the collision occurred, and Mr. Vachell cross-examined with a view to showing that the cause of this was the noise that was proceeding from those in the char-a-banc. It was denied that they were singing. One young lady said that they were talking amongst themselves. Mr. Vachell: Thirteen young ladies talking amongst themselves, and you say there was no noise? (Laughter.) Another witness was not inclined to admit that they had reached so high a pitch of enjoyment that they paid no attention to anything else in the road. She was not particularly jolly. Mr. Young: You had no men with you? (Laughter.) Mr. Du Cros, who said he had driven motor-cars about 60,000 miles in five years, attributed the accident to the unsteadiness of the plaintiff. The latter, he stated, pulled his horses in upon the motor after the front wheels of the latter had passed. Mr. Du Cros also declared that he sounded his horn continuously whilst coming up behind the char-a-banc. Defendant denied that he had had eighteen collisions whilst motor driving. He had had only one other case, and in this also he was run into. The motor he was driving cost £560, and was damaged to the extent of £38. The Judge charged the jury with characteristic brevity. Which of the views put forward did they accept? The jury declared for that of the plaintiff. Damages amounting to £35 had been agreed upon by the parties.

A DRUNKEN MOTORIST.

GEORGE HEADMAN, of New Kent Road, was charged at North London with being drunk whilst in charge of a motor-car at Lansdowne Road, and Edmund H. Newley, machinist, of Spencer Road, was summoned for attempting to rescue Headman from custody. Police-constable 52 NR, said in consequence of information received, he proceeded to Lansdowne Road in company with Police-constable 479. There he saw Headman sitting in the car, and as there had been a collision, witness asked him to get out. He refused several times, but when he did, witness saw he was very drunk, and took him into custody. Newley then seized his companion by the arm, and attempted to take him from the custody of the constable. Police-constable 479 N corroborated.—A young man named Sands said he was driving a pony-trap, when defendant ran into him and damaged the horse and vehicle. Headman alleged that Sands was on his wrong side and ran across his (Headman's) way. He contended he was so upset at the accident, he was excited, but was not drunk. Newley also said he was only excited. The Bench were satisfied Headman was drunk, and fined him 20s. and costs, but considered Newley had only acted foolishly, and discharged him with a caution.

SEQUEL TO AN ACCIDENT.

At the Hereford County Court, before Deputy Judge Amphlett, Messrs. Thomason and DuBuisson brought an action against Mr. G. Llewellyn Davies, solicitor, Greenwich, to recover the sum of £2 2s. for a visit to the Callow, near Hereford, and professional attendance upon three persons. The case for the plaintiffs was that the defendant called at their surgery on a motor-car and said he would be glad if one of them would proceed at once to the Old Tunpike at the Callow and attend to some persons who was injured. The plaintiffs did as requested and found three persons badly injured, one having a broken leg. Nothing was mentioned about payment at the time. Plaintiffs had written several letters asking for payment, but had received no reply. The Deputy Judge stated that if a man called at a doctor's and ordered him to go out he was liable unless his liability was displaced, and gave judgment for the plaintiffs.

A COLLISION CASE.

In the Bristol County Court, William M. Appleton, trading as the Bristol Motor Company, brought an action against the Bristol Tramways and Carriage Company, Ltd., to recover the sum of £50 for damages to a motor-car, alleged to have been sustained through the negligent driving by a servant of the defendant company of an electric tramcar at Ashton Gate on the 14th September. Mr. Weatherly, instructed by Messrs. Tanner and Clarke, appeared for the plaintiff, and the defendant company were represented by Mr. Vachell, instructed by Messrs. Stanley, Wansbrough, and Doggett. A number of witnesses were examined on behalf of

the plaintiff's case, which was that the tramcar in question overtook the motor-car as it was passing another motor and ran into it, causing the damages complained of. For the defence, Mr. Vachell submitted that there was absolutely no evidence of negligence on the part of the driver of the tramcar, and that there was an error of judgment on the part of the driver of the motor-car. His Honour said that in his opinion the accident was brought about solely and entirely from the negligence of the driver of the motor-car in not looking round to see if the tramcar was coming before trying to get round the other motor. The driver of the tramcar could not have had the smallest knowledge that the driver of the motor was going to do what he did, viz., turn out on the metals, and it was not suggested that the tramcar was going at excessive speed. Judgment would be for the defendant.

AUTOCAR SUPPLIES (LIMITED).

A compulsory winding-up order having been made against this company, the usual meetings of creditors and shareholders were held last week at the Board of Trade offices, Carey Street, W.C., Mr. A. S. Culley Assistant Official Receiver, presiding. The chairman reported that the company was incorporated on August 21, 1900, with a nominal capital of £20,000 divided into 10,000 six per cent. preference and 10,000 ordinary shares of £1 each. It was formed to acquire the business of a motor agent previously carried on by Mr. A. C. Selbach. The promoters of the company were Mr. Selbach and Mr. S. Makovski, who on June 25, 1900, entered into an agreement which provided that the company should be formed to acquire Mr. Selbach's business at the price of £10,000 in fully-paid ordinary shares in the company. In order to provide working capital Mr. Makovski applied and paid for 2,500 preference shares. It appeared that Mr. Makovski received 5,000 of the vendor's shares as a bonus for subscribing for the preference shares. The contract for the sale of the business to the company was entered into on August 24, 1900. Mr. Selbach stated that he had carried on business as a motor agent for about seven years prior to the formation of the company, and during the last three or four he had traded in England. At the time of the transfer to the company he held only two agency agreements with motor and cycle makers. One of the agreements was excluded from the sale, and in respect to the other he stipulated that for three years he should be paid the profits received under it by the company. The company did not take over any tangible property, and no accounts showing the results of the previous trading were produced. Certain premises were leased for 14 years, and a sum of £1,000 was expended in making them suitable for the company's purposes. Owing to the landlord's objection to grant a lease to the company, Mr. Selbach became the lessee, and upon the winding-up order being made he claimed the beneficial interest in the lease. The Court had decided that such interest belonged to the company, subject to Mr. Selbach's right to an indemnity, the form of which had not yet been settled. The business had been carried on at a loss throughout. A statement of affairs had been filed showing liabilities £1,307 6s. 4d. and assets £1,874 6s. 7d., the deficiency as regarded shareholders being returned at £11,932 19s. 9d. At both meetings the Official Receiver and Mr. G. H. Chantrey, chartered accountant, were nominated for the post of liquidator, and the Chairman stated that the matter would be reported to the Court, with whom the appointment rested.

ACTION TO RECOVER COMMISSION.

BEFORE Mr. Justice Bruce in the King's Bench Division, Messrs. Kesterton and Company, Limited, brought an action against Messrs. Marshall and Co., of Belsize Works, Manchester, to recover commission under an agreement. Under the deed defendants were allowed the use of plaintiffs' premises in Long Acre, London, as their London depot. Plaintiffs were to pay 5 per cent. commission on the business done in motor-cars to the defendants, and an extra 2 per cent. upon all the business done by plaintiffs on behalf of the defendants. The premises were used from October 30th, 1899, to February 20th, 1900, and plaintiffs asked for an account and for the commission due to them. Defendants admitted the rates of percentage allowed, and paid £64 odd into court in full satisfaction of the plaintiffs' claim. After hearing the evidence, his lordship held that the percentage was to relate to all business; the agreement as sent to the plaintiffs must be acted upon, and plaintiffs must supply defendants with an account of all business done in motor-cars under the contract. Judgment accordingly.

AN APPEAL REFUSED.

In the King's Bench Division, Mr. Stevenson moved for a rule nisi calling upon the Justices of the Peace of Kesteven, Lincolnshire, to show cause why there should not be removed into this court, with a view to its being quashed, a conviction for driving a motor-car at a greater rate of speed than that allowed by the regulations of the Local Government Board. The conviction set out that the defendant Harvey, for whom he appeared, being in charge of a light locomotive, otherwise a motor-car, on the Great North Road, drove or caused it to be driven at a rate greater than twelve miles an hour, contrary to the regulations of the Local Government Board, made under the Locomotives on Highways Act, 1896. The Act itself provided that no light locomotive should travel along a

public highway at a greater speed than 14 miles an hour, or at any less speed which might be prescribed under the Regulations of the Local Government Board. The objection taken on behalf of Harvey, who said he was only travelling at the rate of seven miles an hour, was that the Regulation of the Local Government Board was not put in evidence or proved in any way. The Court refused to grant a rule.

AN MOTOR BALLAD.

If I had an automobile,
A rubbery, rollicking thing,
All shellac, japanning, and steel,
With plenty of ginger and spring,
I'd "Hello!" to Edward, the King,
So happy and airy I'd feel,
And sail like a bird on the wing,
If I had an automobile.
If I had an automobile,
With a bell that goes ting-a-ling-ling,
Though it cost me of trouble a deal
And proved a most ruinous thing,
In public its praises I'd sing,
Making sport of the horse and the wheel,
For expenses not caring a ding,
If I had an automobile.
If I had an automobile,
The newest and stylistest thing,
My rivals with envy would reel
And writhe under jealousy's sting,
With my little old ting-a-ling-ling,
Like a winner all summer I'd feel,
And I'd laugh at the horse shows, b' jing,
If I had an automobile.

—St. Louis Post Dispatch.

IN THE BANKRUPTCY COURT.

Re B. B. Bocket Pugh, of 6, Castle Crescent, and carrying on business at York Road, Caversham Road, Reading, motor-car proprietor. The summary of the debtor's statement of affairs shows liabilities £284 6s. 6d., and assets nil. The Official Receiver remarks:—"The debtor states that he has no business, but has been employed as a motor-car manager for his mother, having no fixed salary, but only board and lodging. He has been previously employed in the South African Police at a pay of 8s. per day. He states that he has no assets whatever. The cause of insolvency is stated to be 'living beyond my means before I went to South Africa.' Since he returned from Africa he had been engaged in managing for his mother one of the motor-cars which run between Reading and Caversham. The car cost £525, less 15 per cent. discount, and in a good week the takings would amount to £20." The debtor was questioned at considerable length by the Official Receiver respecting that car and two others which were kept at the depot in York Road, and ran on the Reading and Caversham route. Debtor declared that the first-mentioned car belonged to his mother, and the others to his brother and a Mrs. Strode respectively. He had no financial interest in either of the cars. The debtor was ordered to appear at the next Court, the Official Receiver intimating that in the meantime inquiries would be made respecting the ownership of the various motor-cars.

FURIOUS DRIVING CASES.

At Brighton, Roland Browne, of Bramham Gardens, Earl's Court, S.W., was summoned for furiously driving a motor-car on Marine Parade on the 30th ult. Police-constable Sidney Mullins said he saw defendant driving a motor-car along Marine Parade on the day named at the rate of about eighteen miles an hour. At the bottom of Chesham Place witness held up his hand, but defendant continued the same pace until he reached Clarendon Terrace, where witness spoke to him. Defendant then denied that he was going very fast, and said he could pull up in eight yards. George Stoner, 31, College Gardens, fly proprietor, said he was standing at the bottom of Seymour Place and noticed the car coming along very fast—eighteen to twenty miles an hour. Defendant seemed to have proper control over the machine, but witness thought the pace was rather dangerous. Defendant denied that he was going fast. The car was travelling at not more than nine miles an hour. He met his wife at the Railway Station at 3.20, and placed her in a cab, and arrived at Clarendon Terrace a few minutes before the cab. He always drove very steady, and could pull up in eight feet and not eight yards as stated by the constable, as he had two very powerful brakes. The Chief Constable said he had had one or two complaints about the driving of motor-cars at the spot named, and he asked for the infliction of a substantial penalty. Fined £5 and costs, or a month's imprisonment.

At Stone Police Court, Arthur Merrick, a motor expert, of 3, Fairfax Street, Coventry, was fined £5 and costs on two charges of driving his car at a dangerous speed. The officer who proved the case said the car was

being driven at twelve miles an hour, while a witness described the pace as thirty miles an hour.

At Dumfries, before Sheriff Campion, William Holland, motor-car driver, Ballochmyle House, Mauchline, was charged with a contravention of the regulations made by the Secretary of State under the Light Locomotives Act, by driving a motor-car on the public road between Sanquhar and Kirkconnel on 14th November last at a greater speed than twelve miles an hour. He pleaded not guilty, but was convicted on evidence. His agent stated that he had been dismissed in consequence of the annoyance caused at Ballochmyle by this charge, and was now out of employment. For that reason a similar charge made against him in Ayrshire had not been proceeded with. The Sheriff in the circumstances limited the fine to £1.

At Glasgow, John Murray was found guilty of recklessly driving a motor-car in Cambridge Street on 30th ult., whereby a man named Wm. Thomson was run down and injured. Murray stated that the motor-car was his father's, and the accident was entirely due to Thomson, who seemed to be filling a pipe that was in his hand. A fine of £1 1s., with the option of 14 days' imprisonment.

A MOVEMENT is on foot in St. Petersburg to form a Russian Automobile Club.

At a meeting of the Sub-Streets Committee of the Darlington Corporation, last week, the question of motor-cars for street watering, etc., was brought up. Nothing definite, however, was done, except to call for a return from eight or nine towns where such vehicles have been in operation for some time, to see how they worked.

WE have received the first number of a new German fortnightly entitled *Das Schnauferl*. Most of our readers will have heard of the German comic paper *Fliegende Blätter*. We can best describe the new paper by stating that it is on similar lines, but dealing with automobile subjects only. The journal is published by Herr Gustav Braunbeck, of Mannheim.

THE Chambre Syndicale de l'Automobile have decided to hold an international exhibition of mechanical locomotion, under the patronage of the Automobile Club of Belgium, from March 8th to March 17th, 1902, in the Grand Hall of the Palais du Cinquantenaire, at Brussels. The members of the divers committees and sub-committees of the A.C.B. have agreed to form a committee of organisation to take up the direction of the trials, which will take place on the special track reserved in the hall for this purpose.

THE Dorman Engineering Company, of Northampton, are the makers of a new motor, known as the "Whirlwind," primarily intended for launches, but adaptable to cars, agricultural machinery, saws, pumps, hoists, etc. The pamphlet issued by the company gives complete specification and illustrations of a standard engine. The double cylinders supplied are 4½ in. by 5½ in.; the carburettor is of the Longuemare type, though any other pattern can be fitted. Ignition is electric, the current being supplied by 2 volt 25 ampère hour accumulators.

THE Motor-Car Journal.

VOL. III.]

LONDON, SATURDAY, DECEMBER 28, 1901.

[No. 147.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

IN order to obtain incontestable evidence of the distance within which motor-vehicles travelling at various speeds may be stopped, the Automobile Club proposes to hold a Special Brake Trial on Saturday, the 11th January next. The records to be obtained at this trial are specially required in connection with the proposed amendment of the automobile laws. It is hoped, therefore, that manufacturers and private owners, in view of the importance of the issue, will enter vehicles for this trial. The speeds of vehicles will be taken and recorded on a run of probably one mile with a flying start, and the distances within which they can be stopped at the end of the mile will be measured and recorded. Manufacturers and owners who are willing to enter vehicles for this trial are requested to communicate without delay with the Secretary, Automobile Club, 4, Whitehall Court, London, S.W. The Club Committee reserve to themselves the right to refuse entries.

The War Office Motor-Lorry Trials.

THE trials of the various types of self-propelled lorries competing for the War Department prizes at Aldershot were completed last week. The tests on Tuesday were so severe that only one of the five competitors reached the depot again without a mishap; three of the wagons being placed hors-de-combat during the morning; and a fourth having to be extricated from a bog. The trials consisted of sending the wagons across country, the rough ground on and about the Long Valley being selected as the course. One of the first tests of the day, to try their steering apparatus, was to see which lorry could turn in the smallest circle. This was best accomplished by the Thornycroft rear-driven steam wagon, which turned completely round in an eleven yards circle. The wagons were then started off across country, up and down hills and across streams, the Foden leading, and for about a mile all did extremely well. At length the Foden approached a spot where a deep ditch with almost straight banks, the full depth and steepness of which were concealed by long grass, ran across the track. When the wagon reached the spot, the front wheels dropped bodily into the water, badly damaging the fore carriage. It was really more awkward than the Committee anticipated, and the other vehicles were stopped from attempting to cross. They were, however, required to cross a stretch of four hundred yards of hard and soft bog, which the drivers attempted to negotiate by fixing on to their wheels "fish plates." The Thornycroft standard wagon managed to negotiate and traverse this stretch of heavy ground, dragging its trailer and load of five tons after it, but the Thornycroft rear-driven wagon after getting half way through sank very deeply, and had eventually to be dragged out by a traction engine. The Milnes motor-wagon was in trouble before reaching the bog, so

did not attempt it, and the Straker lorry had got but a little way across it when a steam-pipe burst. A repair was, however, effected and the run completed.

The Awards.

THE Committee has made its report to the War Department. The first prize of £250 and the second of £150 have been put together and divided between Messrs. Thornycroft and Foden, and the third prize of £100 goes to the Straker Company. The Milnes oil-driven motor-lorry, although not a prize winner, has been purchased by the War Office for further experiments, owing to the cheapness of its fuel and the facility with which oil can be obtained.

Above the Clouds.

THERE is one advantage at least which the aeronaut has over his fellows who have their living and being on earth. He can rise superior to weather. No matter what the conditions prevailing on earth below he can force his way through the clouds and sail to the realms of everlasting sunshine. Such was the experience of a party of aeronauts who, on Thursday last week, ascended from Paris during a heavy snow storm. The party consisted of the Count de la Vaulx, the Hon. C. S. Rolls, Mr. Frank Butler, and Miss Vera Butler, who found accommodation in a balloon belonging to the Aero Club de France. After three hours above the clouds and under a blue sky they descended in the forest of Limours, to find the earth thickly carpeted with snow.

An Electric Motor-Car at Bolton.

CONSIDERABLE interest has been taken in Bolton in the electric motor-car recently obtained by Mr. W. B. Hulton, J.P., from the City and Suburban Electric Carriage Company. Mr. Hulton has been induced to adopt an automobile owing to the extension of slippery setts and electric tram-cars in the town. These render it unwise, in his opinion, to use high-class horses, and so an elegant electrical equipage is now daily to be seen in Bolton. It will run 50 miles on one charge, at a maximum speed of twelve miles an hour, and is taking the heavy gradients in the vicinity of the town with ease. Mr. Hulton has had a motor and gas engine laid down in the coach-house at Hulton Park, from which the necessary recharging will be done.

In Johannesburg.

JOHANNESBURG is already beginning to make up for the time lost during the war, and the motor-car is being utilised in the delivery of newspapers along the reef. A local correspondent declares that there are signs of a general automobile boom at Johannesburg in the near future. Already several motor-cars are owned by the leading merchants, and when the stress of the military occupation is removed there should be a good demand in that district.

Dust in Streets.

SOME few months ago Mr. J. B. Massey, the street-cleaning superintendent of Burnley, read a paper on "Dust" before others similarly employed, and it was generally conceded that the horse was one of the greatest offenders so far as the dust of our streets is concerned. Dr. Reynolds, the Commissioner of Health of the city of Chicago, now declares that, so long as the horse works for his living in the streets of that city, he will be a menace to the public health of its inhabitants. Hence the movement for the adoption of the automobile is now being actively promoted by the medical profession of the United States.

MISS ELLIOTT PAGE ON A LOCOMOBILE DOS-A-DOS.

The Economy of Motor-Cars.

NOT only for sanitary reasons, but on the score of economy, the doctors should be among the friends of the new industry. Mr. A. E. Major, of Reading, has drawn up a statement showing the relative cost of horses and motor-cars. This is based on a doctor's estimate, and several of the medical men of Reading are agreed that the expenses of the horse have been very lightly stated. Mr. Major gives the cost of a motor-car with its rugs at about the same as two horses with two sets of harness, an open trap, rugs, and stable requisites. The weekly running expenses are set down at £1 6s. for coachman and £1 9s. for forage, straw, etc., making a total of £2 15s., where horses are employed. In the case of the car the weekly outlay is set down at 16s., composed of 12s. for a lad and 4s. for the petrol required for an aggregate of a hundred miles; 15 per cent. is reckoned as the depreciation in a motor-car. Perhaps these figures will induce others to give their experience in our columns.

Efficiency Wanted.

THE attitude of politicians to motor-cars is interesting and may be considered without treading the thorny path of politics. Mr. A. J. Balfour is an expert in motor-car matters and a devotee of accelerated motion—provided, of course, it does not go beyond the legal limit. Sir H. Campbell-Bannerman does not like motor-cars and prefers the horse, thus proving himself a conservative—with a small C. Now Lord Rosebery has spoken and he has declared for Efficiency. We had only just

finished reading his Chesterfield speech when we saw a letter from Mr. Frank Constable, of Brighton, in which he said, "It is the desire for efficiency which is the origin of the demand now producing the supply to this country of the productions of Panhard and Levassor of from 7 to 12 h.p." We do not want such rapid speeds as would frighten Sir H. Campbell-Bannerman, and—perhaps—satisfy the leader on the other side of the House, but we do want that efficiency for which one who does not follow either of these gentlemen so constantly pleads.

Motor-Cars in Perak.

IT has been a matter for surprise to us, remarks the *Perak Times*, that arrangements have never been made for the formation of a company to establish motor-car services in Perak. "Services of cars connecting Kampar, Gopeng and Ipoh; Ipoh, Papan Menglembu and Lahat, to mention only two instances, would, we are of opinion, pay handsomely, while, pending the completion of the Taipeng-Padang Rengas section of the railway, motor-cars running between those two places should return an excellent dividend. We trust that someone having command of the necessary capital may be found to initiate a motor service in Perak."

Toleration as to Types.

SOME months ago we expostulated with one of the electrical papers for its unfair remarks on the petrol motor-car; now *Lightning* goes out of its way to disparage cars other than electric as "the plaything of the man who has time on his hands." We quite agree with our contemporary in trying to keep electric cars to the front; hence the prominence we have given to any new developments in that direction. But we emphatically protest against an attempt to discourage the makers of other kinds of cars. We want to see all kinds of cars upon the road, for it is only by experiment and experience that the best type of vehicle will be ultimately obtained. The middle class man may, as *Lightning* says, be waiting for the electric automobile, but he is using the petrol or the steam car in the meantime. It is, however, absurd to say that petrol and steam cars are mere playthings for the wealthy, seeing that the delivery vans now in use are all propelled by one or other of these systems, and that doctors and business men generally have been so well satisfied with the results.

Furious Walking.

IT is well within the range of possibility that "furious walking" will at no distant date monopolise the attention of rural police, just as "furious driving" of automobiles does to-day. Inventive man has long turned his attention to providing some means by which the pedestrian can attain a speed which might vie with that of a certain giant of nursery classics. Many contrivances, mostly of the roller skate order, have from time to time claimed a passing notice, though none have so far found favour, excepting in the eyes of their enthusiastic inventors. Two Swiss engineers have come to the front with the latest of such devices, which bids fair to eclipse all others. The "automobile boot" is credited with a speed of 160 feet per second, or a fraction over 109 miles an hour. It is described as resembling a patten, by no means heavy, comfortable in use, and a really elegant substitute for an ordinary boot as far as appearance goes.

At Manchester.

THERE are two or three motor firms located within easy distance of each other at Deansgate, Manchester, where automobiles are steadily acquiring a familiarity with the public. In the show room of Messrs. Robinson and Price we recently saw some motor-bicycles—early assurance of the confidence they feel in this development of the industry—and also some Locomobiles, while a Royal Enfield 6 h.p. car formed the central attraction in the window of Newton's Motor and Cycle Works near by.

The Horse Danger.

Now that motorists are becoming so numerous on the road, we think it time to enter a plea for the better regulation of horse-drawn vehicles. At present, anyone appears to be regarded as competent to drive a horse and cart, with the result that accidents are frequent. As it is becoming recognised that the horse is a creature of uncertain temper, we do not see why certificates of competency should not be issued to drivers who have satisfied someone appointed by the local authority that they are sufficiently skilful to manage a horse of ordinary habits. The idea may seem strange, but when we remember how many accidents have been caused by shying horses which have got beyond the control of incompetent drivers we are justified in the demand.

Hidden Merit.

THE advantages of motors for business purposes have been somewhat tardy in penetrating the commercial mind, though already recognised to some extent; but a new merit is suggested by the cases of van thefts, of which several have been reported lately. These, it may be pointed out, though the well-deserved penalty for leaving vehicles unattended, would have been practically impossible if the vans had been automobiles. Few attempts have been made to purloin motor-cars, and of these few, not one, we believe, has met with success; while the risk would be entirely avoided by suitable means of interrupting ignition, or otherwise locking the mechanism, even in the case of experts alike in crime and automobilism arising among us, a state of things which, in spite of the confusion between the two in the average magisterial intellect (?), has, we may be thankful to say, not yet come to pass.

Paint and Powder.

It is a somewhat regrettable fact that the average motorist is not so particular about the appearance of his vehicle as is the average carriage-owner, thereby causing the enemy to blaspheme. He has, however, several excuses on his side for deficiency in the matter of paint and varnish, one at least being that however spick and span his car may be at starting his journeys are seldom short enough or oversufficiently clean roads for such a decorative state to persist to their conclusion. Another point, also, which deserves some notice, is the want of durability of varnish or paint under the conditions prevailing with a motor-vehicle, which, though sometimes due to lack of the laborious and prolonged care given to the production of a surface on good coach-work, seems to be more justly attributed to the deteriorating effect of road dust at high speeds. The effect of the "sand-blast" on such hard materials as glass and porcelain is familiar, and there can be little doubt that to a similar action is due the want of durability of motor-carriage paint-work. The principal effect will usually be noticed on the paint at the back of the car, where the inrush of dust-laden air is most violent; and it is difficult to see how any painted surface can be made to resist it. Still, a good automobile is quite as worthy of attention to its outward appearance as any other carriage, and neglect of it produces an unfavourable impression on the uninformed public.

Home Made Motor-law.

As a result, it is alleged, of one or two successful raids by "moting" burglars, the Mayor of Gannat, France, recently issued a decree respecting the speed of motor-cars in that township; the decree ruled that their normal speed must not exceed that of a walking horse and in the commune, that of a trotting horse. The local Jack-in-office, however, received a smart reminder from the Minister of the Interior that his place was to administer the law, not to make it, and the speed law remains the same at Gannat as elsewhere in France.

A Useful Attachment.

A SMALL accessory that has its merits, though novelty is not one of them, appears at the Paris Exhibition, in an adjustable mirror attachable near the driver's seat to give a rearward view therefrom. The habit of looking backward claims its regular meed of victims with automobiles, as in bicycle races, and such a device is often useful in traffic, more especially if there is a hood or similar obstruction behind the driver. Such an arrangement adapted to cycle handle-bars has been on sale for many years, and is frequently used on motor-cars. The mirror should be convex, to give a good field of view, in which case it need not be large. Apropos of this subject, it might be added that the compulsory use of such an arrangement on the popular covered van, by which so many accidents are caused owing to the inability of the driver to see behind him, would be of great advantage to ordinary traffic.

A GROUP OF CARS IN THE SOUTHEAST RUN.
Mr. Whiteway's "Slowcoach"—the winner of Mr. Edmund's prize—in the foreground.

"Made in London."

THE *Sun* has tried to make a mild sensation by giving all the glory of special headlines to an article setting forth how motoring garments are made on the Continent, and then labelled as "Made in London" for the English market. By this means underselling is declared to be going on in the trade to the injury of British makers. "Ladies and gentlemen," says our contemporary, "are measured for garments and the tailor overhauls his stock, and if he has nothing to fit in the required style he makes a few alterations." This is a direct attack on reputable London firms which we cannot credit, and in endeavouring to make out some sort of a case the writer of such rubbish has gone a bit too far. Measured goods are measured goods, and the alteration of style in the way described is easier done on paper than on waterproof material.

Show at Liverpool.

DURING the first week in February St. George's Hall, Liverpool, will be the scene of an interesting show which, it is hoped, will be opened by the Earl of Derby, the President of the Liverpool Self-Propelled Traffic Association. We gladly recognise the loyalty of the Liverpool Cycle and Motor Show, Limited, under the auspices of the local centre of the Automobile Club, in carrying out the spirit of the resolutions passed by the trade at the Automobile Club meeting last June. This should go a long way towards the success of the venture, which, in addition to the Exhibition, will include competitions for the vehicles on view, and also for vehicles owned by amateurs. The trials will be for a distance of not less than fifty miles, and the classification is (1)

motor carriages; (2) motor-bicycles and quadricycles; and (3) motor-bicycles. Professor Hale-Shaw, F.R.S., will be the judge, and those who comply with the Automobile Club's definition of an amateur may enter on payment of ten shillings. A silver medal will be offered in each class. Several members of the Liverpool Self-Propelled Traffic Association are entering, and probably there will be a large attendance from the North of England.

Success In Public Services.

MR. H. P. G. BRACKENBRIDGE, the manager of the Edinburgh Autocar Company, has been giving a representative of the *Devon Gazette* some of his views with regard to public motor-car services. He believes that, for success, the gradients of the district should be easy. Through routes and low fares, the latter not exceeding one penny a mile, are also essential; but Mr. Brackenbridge is opposed to going further for that amount. One of the drawbacks to the Edinburgh service is that they run a mile and a quarter for one penny. If they only ran the mile it would make a great difference in their receipts. Recently a new car—the Kingsburgh—costing £500, and carrying fourteen or sixteen passengers, has been adopted, and it is hoped that the up-keep will be considerably less than with the cars hitherto employed.

A Suggestion Worth Trying.

IN annual practice the life of the cars which have been used at Edinburgh has been two years—a result not of defective engines, but of the gearing and the frame not being properly stayed. The side strain has been the cause of the gearing soon getting out of alignment. Mr. Brackenbridge is hopeful that a different principle of construction in the Kingsburgh car will obviate that disadvantage. One important point to which the present manager of the company has given attention is the question of tickets. They are a nuisance, and Mr. Brackenbridge seems to favour the plan of charging drivers so much a day for the car—on the same principle as the London cabs are hired. Thus a regular income would be secured, and the interest of the drivers in obtaining passengers assured. The experiment would certainly be worth trying.

An All-Weather Want.

THE motor-car that will be of service in all weathers has yet to be evolved; but progress is being made. The popular tonneau body, while giving comfort on fine days, does not protect the riders from the keen blasts of winter; and those cars that have been fitted with a window in front are not elegant. Probably it will be found that the addition of a canopy fitting on to the existing car will best meet the requirement. Still the matter is worth the consideration of manufacturers, and the introduction of a car that would combine the comforts of a closed-in car for the winter, with the delights of an open brougham in the summer, would be popular.

Trams v. Motor-Cars Again.

A SPECIAL correspondent of the *Glasgow Herald* has asked the question, "Are electric tramways to be superseded by motor-cars?" and then takes a column and a-half of space in which to answer, "No." We do not remember to have heard any leading motorist express the view that motor-cars would wholly supersede tramcars. What is contended is that in many localities and where streets are narrow and winding, the motor-car has obvious advantages over tram-cars. Then, too, the passenger can be set down close to the pavement, whereas those who leave tram-cars have probably to dodge traffic before reaching the safety of the pavement. There is no doubt that motor-car services could efficiently act as feeders to tramway services just as they could to railways. These points in favour

of the automobile are worth consideration, and they indicate helping rather than superseding tramway services. At present that is all we urge.

French Motor-car Drivers.

How to guard against the annoyances and the expense due to the intrigues of unworthy *mécaniciens* is a burning question in France, and no solution of the problem has been found. M. B. de Saunier, the well-known writer, makes the following suggestion: "Do as the Chinese do with their physicians. They pay them a stipulated sum per year or per month so long as their health is good, but when they are sick, the physician must do his work for nothing until the health is restored. Pay the *mécaniciens* a certain sum per month, and dock them heavily for all the time the automobile in their charge is out of order." It will soon be found, he adds, that any automobile of reputable make may be kept in running order at a comparatively small expense.

A New Industry.

SINCE M. Santos Dumont successfully rounded the Eiffel Tower and established the fact that an air-ship can be made as amenable to rudder and propeller as the ship that ploughs the ocean, the balloon trade has received such an impetus that it may now be regarded as an industry. All over the world are adventurous spirits determined to emulate if not surpass the brilliant aerial feat of the young Brazilian. The result is work for many hands in preparing the specially constructed balloons or air-ships, which will in due course battle for the atmospheric championship. To turn to our own country, we recently referred to two orders for flying machines secured by a well-known automobile firm. Messrs. Spencer, we understand, are also busy; besides the balloon ordered by the Aero Club, which is to be on the lines of the *City of York*, in which some members of the Club have already taken a trip heavenward, they have in hand at Holloway no less than three specially-designed air-ships, the inventors of which propose to enter the lists for aerial honours.

Not the Horse This Time.

DURING a recent automobile tour through Central Indiana an old woman on a country road caught sight of the new vehicle, and took refuge in a fence corner, deserting her horse and phaeton. The automobile was stopped and one of its occupants got out and walked toward the horse, which showed signs of following its owner's example. "Never mind the horse," shouted the woman, "come to me. I am worse scared than he is." She refused to come back into the road, but made a detour along the fence until she passed the motor-vehicle, and then resumed possession of her horse. The aged Indian said she had never before seen an automobile and never wanted to see one again. We have heard of that Indian in this country.

THE Mayor of Gannat, who recently attained fame by making special laws for automobilists in his commune, has since been arrested for inciting the inhabitants of the village to stretch ropes across the streets. He was, however, released by order of the Minister of the Interior.

FIFTEEN thousand dollars (£3,000) is the price that Mr. W. C. Green, president of the Green Consolidated Copper Company of Arizona and reputed owner of 2,700,000 acres of United States soil, is said to have paid for one of the Panhard cars recently imported into America by Messrs. Charron and Girardot. The car is stated to be the one used by the latter in the Paris Berlin race. Mr. Green has already made several fast trials in the vehicle. With M. Charron driving, he travelled seventy-six miles over Long Island roads in 1h. 40m., including slackening of speed in passing through towns and settled districts. The flyer was timed one mile in 1m. 3s., with five passengers on board.

The Paris Motor-Car Exhibition.

(Continued from page 761.)

FIG. 1.—GENERAL VIEW OF THE BOLLÉE EXHIBIT. (M. LEON BOLLÉE IS SEEN IN THE CENTRE OF THE PICTURE.)

I HAVE heard a great many people saying that there is little or nothing new in the show, but I think the kind of person who makes this remark wants to make his hearers believe that he knows everything there is to know about motor-cars, or else he only takes a superficial view and sees a great many cars which look and are practically alike, and goes off to the buffet or to listen to the band. For my own part I have been much surprised by the number of new and original exhibits.

M. Leon Bollée, of Le Mans, has been inventing again, and cannot keep to the beaten track, and really what he has produced is most original. He has literally made a motor-car without a

The front wheels run on pins or naves, which form a part of each pillar. The whole arrangement is most original, and I intend to have a run on the car in a few days' time, so that I can give the readers of the *Journal* an idea of how it feels in operation.

The Gillet Forrest 9 h.p. motor has a square instead of a round *culasse*, and it is arranged so as to very efficiently cool the exhaust valve. There is a good device on the car, consisting in a single handle, which turns on or off the water, oil, petrol, and electricity; thus when the car is brought to a standstill, this handle can be

FIG. 2.—DIAGRAMMATIC ELEVATION OF BOLLÉE FORE-CARRIAGE.

frame and without a front axle. This sounds impossible, but M. Bollée has done it, and the car, he states, runs remarkably well. Instead of a frame, a single central tube, Fig. 2, about four inches in diameter, is employed, and the motor crank case and change-speed gear box are hung on this tube. A single chain drives the live axle, containing the differential. The axle supports the back springs, which are attached to two cross tubes brazed to the central tube. In place of a front axle the central tube carries a strong flat spring placed across the car, instead of longitudinally. At each end of this spring is a vertical pillar carrying at its other end a corresponding flat spring, also transversal.

FIG. 3.—DIAGRAMMATIC PLAN OF BOLLÉE CAR.

actuated, and everything is disconnected at once. The handle has an arrangement permitting it to be padlocked in that position, so that no one can interfere with the car in the absence of the owner. Most motorists have experienced the result of forgetfulness in turning on the petrol-tap before starting, and have been puzzled to find their car gradually slowing up before they realised

what was the matter. This one handle prevents such an occurrence.

Perhaps the greatest novelty of the show is the petrol-electric carriage of Champrobert, in which the 8 h.p. vertical motor placed in front drives a dynamo, the current from which passes through a transformer to an electric motor, which drives the back axle: the transformer gives five forward speeds, a stop

FIG. 4.—THE DE DIETRICH LIVE-AXLE TONNEAU.

position, a reverse motion, and two brakes. The dynamo produces the spark for the ignition of the gases, and lights the lamps of the car. The change of speed is accomplished without any jerk, and there are no gear wheels to wear. The car weighs a little over half a ton, and is said to be able to travel up to 28 miles per hour.

De Dietrichs, in their new models, have done away with the universal joints and bevel pinions by which the back wheels of the car were made to revolve, and have replaced them in the larger type by chains, and in the lighter type by a live axle. They still maintain the horizontal engine in front, water cooling without pump and belt driving, but it is an open secret that new models are being prepared to compete in the Paris-Vienna race next year. The 6 h.p. engine in the live-axle car (Fig. 4) comprises two horizontal cylinders 98 mm. diameter, and runs normally at 660 revolutions per minute. A spray type of carburettor is employed. The power is transmitted by a belt from the motor-shaft to a counter shaft arranged just in front of and parallel to the live axle. The variable speed gear and balance gear are all enclosed in a single casing. Three speeds forward and a reverse motion are provided. The radiators are arranged vertically in front of the bonnet, which is of pointed form. The chain-driven De Dietrich (Fig. 5) is fitted with a 12 h.p. two-cylinder horizontal motor, stated to work equally well with petrol or alcohol. Four speeds forward and a reverse are available. The engine transmits its power to the countershaft by a belt. On this shaft, inclosed in a case, are the change-speed gear wheels, any one of which can be made to mesh with its corresponding spur wheel on a parallel shaft, from which the power is transmitted to the rear road wheels by the usual duplicate pair of chains and chain wheels. The De Dietrich cars are well known in France, and the 1902 models seem likely to maintain the firm's reputation.

Dechamps, of Brussels, has formed a French company, which exhibits his cars, and notably a four-cylinder 20 h.p. geared car, in which the cylinders are 100 millimetres in diameter and

the stroke 130 millimetres. The governor acts on the inlet valve. Each of the four cylinders is separate, in order to cool them more completely, and the cylinder heads are in one casting with the cylinders. The base chamber is in three pieces, the top and the bottom pieces being in aluminium, and the centre piece, which carries the bearings, in bronze. An interesting feature of this car is the novel brake on the hind wheels. The hand brake lever is keyed to a shaft which traverses the car, and which has also keyed to it at each side a quadrant rack working an angle pinion, which causes two longitudinal rods to revolve in one direction or the other, as the hand lever is moved forward or back. These longitudinal rods have each a right and left hand screw at the other end working into two nuts, one of each being fixed to each end of the brake band. Between the two movable nuts is a stop which prevents the rod from moving longitudinally. When it is desired to apply the brake, the lever is moved forward, the rod, therefore, is made to revolve by means of the rack and pinion, and the right and left-hand screws draw the two ends of the brake together by means of the nuts affixed to them. The brake is thus applied very gradually, and is most powerful in either direction. It also entirely prevents the deformation of the brake band, which always takes place with a brake band which is held by one end and applied by the other.

The Locomobile Company of America, show steam cars similar in appearance to the type well known in England, but in order to conform to the French regulations band brakes on the wheels have been provided. Double safety valves, double water columns, and several other modifications have also been introduced.

In my last week's contribution on the subject of the show I mentioned "*à titre de curiosité*," a State motor-car for the Sultan of Morocco. I must not, however, pass over the exhibit of the firm of Georges Richard without alluding to the complete transformation in models and designs which this enterprising firm has made in adopting the Panhard and Mors type of car. They have in these new types a 7 h.p. mono-cylindrical, a 10 h.p. two-cylinder, and a 20 h.p. four-cylinder. The 10 h.p. seems to me to be the most interesting; the cylinders are 100 millimetres in diameter, with a stroke of 100 millimetres. The governor acts on the inlet valve, and there are both hand and foot accelerators, in addition to the advance sparking arrangement; the pump is enclosed and driven by a spur wheel, and is on the wing principle.

FIG. 5.—THE DE DIETRICH CHAIN-DRIVEN TONNEAU.

A system of automatic forced lubrication is adopted, in which the pressure of the exhaust gases is utilised. The motor is located under a bonnet in the fore-part of the frame, and transmits its power through a friction clutch to the change speed gear box. Three speeds forward and a reverse motion are provided. The three forward speeds are accomplished by the usual sliding gear, the top speed being direct and without gearing. The

reverse motion is obtained by slipping in a pinion on an eccentric shaft. Messrs. Richard claim to be the inventors of the universally-jointed longitudinal shaft as applied to automobiles, and in their latest cars this system is adopted, there being no chains or belts. Any type of carriage body—phaeton (Fig. 6), tonneau, etc.—can be fitted.

Amongst the accessories a new ignition plug certainly claims

gases on the new metal keeps the coil incandescent, and no further attention is required. Thus, accumulators, coils, magnetos, burners, etc., are all discarded at one fell swoop. M. Wydts assures me that he has had a motor running with one of these plugs, for three months, and if so be the case, a revolution in ignition is likely in the near future, and the motorist will be relieved of another serious obstacle to his enjoyment of the pastime

FIG. 6.—THE GEORGES RICHARD 10 H.P. PHAETON.

the first place. It is called the "Allumeur Electro-Catalytique," and is the invention of M. A. Wydts. A catalytic body, I may perhaps be allowed to explain for the benefit of those readers of the *Journal* who do not happen to have come across this word, is one which has the property of becoming heated and even incandescent when surrounded by hydrogen gas, by means of the condensation on its surface of an infinitesimal quantity of this gas. Spongy platinum is one of those peculiar bodies, but it is also very fragile. M. Wydts has discovered an alloy of osmium, iridium, and ruthenium, which constitutes a metal at once extremely porous, absolutely inoxidisable, and able to withstand 1,700 deg. Centigrade of heat, and which has, at the same time, the property of becoming incandescent in carburetted hydrogen, made more or less with azote, oxygen or carbonic acid. M. Wydts's ignition block (Fig. 8) consists, therefore, of a plug very similar in appearance to the ordinary sparking plug, and can be screwed into place in the usual manner. Inside the plug is a little spiral wire coil of this wonderful metal, one end of which

Amongst the new radiators, Messrs. Grouville and Arquembourg have brought out a cylinder with a fan at one extremity. In the cylinder is a coiled radiator with the usual fins; the air is drawn through the radiator, and the cooling thereby more efficiently achieved.

The Aero Section of the exhibition is more of an historical retrospect than anything else, and from this point of view it contains some most interesting exhibits. First and foremost ranks the "nacelle," or basket, of the balloon Dupuy de Lome. It is a relic of the siege of Paris by the Germans in 1870, and was intended as an attempt to communicate with the outside world. The siege was raised, however, before the balloon could be completed, and work was suspended on it during the Commune. It was not until 1872 that it was finished, and experimented with, when it proved to be a complete failure. The car is boat-shaped, and made of strong basket-work with seats at each side. A shaft runs from bow to stern and projects over the latter, carrying at the extremity a huge propeller fan. The shaft is cranked in such a manner that eight men may be able to work it simul-

FIG. 7.—PLAN OF DE DIETRICH CHAIN-DRIVEN CAR.

FIG. 8.—THE "ALLUMEUR ELECTRO-CATALYTIQUE."

taneously, and it was intended in this manner to propel the balloon; however, at the first trial it was found that the labour of the crew had little or no effect.

AUTOMAN.

is connected to each of two insulated terminals on the outside of the plug. To these terminals are also attached the two wires of a tiny primary battery (1 volt and 0.5 ampères). The following is the *modus operandi*. The switch of the battery circuit being turned on, the coil of this new metal inside the cylinder of the motor becomes incandescent and the motor can be started. The switch is then turned off, and the continual condensation of the

THE Bavarian postal authorities have decided on the introduction of motor-cars for a quick despatch of letters from and to the mail trains. Munich and Nuremberg will first have a regular motor service between the post-offices, letter-boxes, and mail trains, and as soon as a sufficient supply of cars is available other towns will be similarly equipped.

THE POLICE PERSECUTION OF MOTORISTS.

HOW IT CAN BE STOPPED.

THE police persecution of automobilists and cyclists in certain districts has reached the dimensions of a public scandal, but, so far, no practical suggestion has been made as to the means by which it can be stopped. The machinery for effectually putting an end to it, however, lies ready to hand, although it has not been used. Before describing its nature and the way it can be set in motion, it is desirable to make clear who are the authors of the persecution of which complaint is made.

Clearly it is not the individual policeman who is at fault. Left to themselves, the rank and file of the police are disposed to give their protection and assistance to the users of cycles and motor-cars as freely as to other sections of the public. But they are not left to themselves. The superior powers upon whom they are dependent for advancement incite them to enter upon a persecution which, so far as this country is concerned, finds no parallel in recent times. This persecution can be traced to the action of the county and borough justices, many of whom are members of the local committees controlling the police forces.

of its police force have been efficiently maintained. It follows, therefore, that if it can be shown to the Home Secretary that the discipline of any force is inefficient, then, in discharge of the duties imposed upon him by statute, he is required to withhold his certificate. In that event, the whole cost of the police will fall upon the ratepayers in the locality affected, and the result would be to increase the local rates by several pence in the £1. The question, therefore, that arises is this—can it be shown in the case of any police force that their management and discipline are unsatisfactory? Upon this point there is little room for doubt. Consider for a moment the case of certain forces, and see what is the nature of the evidence that can be laid by the Automobile Club and the large cycling clubs before the Home Secretary as to their efficiency.

Reigate is a borough with a separate police force. This force has made itself notorious throughout the country by the way in which it neglects its proper duties for the purpose of persecuting road travellers. Its procedure seems to be as follows. On those occasions when it anticipates the passage through the borough of a considerable number of automobilists and cyclists, a piece of the roadway, 176 yards in length, is measured off. At the commencement of this measured distance, a policeman in plain clothes is stationed. When a rapid travelling cyclist or automobilist arrives near the spot, a whistle is blown and a stop-watch started. Should the traveller cover the 176 yards in a less

FIG. 1.—PLAN OF RENAULT LIGHT CAR (see opposite page).

In the counties the standing joint committees responsible for the management of the county police are composed one-half of justices and one-half of members of the county councils. In the boroughs, a number of J.P.'s are always to be found upon the Watch Committees. It is these justices who are undoubtedly the prime authors of the persecution of automobilists and cyclists.

Experience has shown that an appeal to the intelligence of the "great unpaid" is likely to be without result. As they were in the days of Shakespeare, so they are at the present time and so they will continue until this country has reorganised its judicial system on a more intelligent plan. But although the great body of J.P.'s may be unmoved by appeals to their intelligence, they are not so unmoved by any action which touches their pockets, and all county J.P.'s are large property owners, directly interested in any question affecting the rates.

It is possible under the existing system of local government to reach the pockets of those J.P.'s who are responsible for the mismanagement of the police. At the present time, one half of the cost of the pay and clothing of every police force in Great Britain, with the exception of the City of London police, is paid for out of Imperial taxation. Before the Imperial contribution is handed over to any local authority it has to secure the certificate of the Home Secretary that the numbers and discipline

time than the policeman considers desirable, another signal is given and immediately five or six ambushed officers line up across the road, stop the unfortunate rider, and take his name and address. Arrangements of a similar character have also been adopted in the county of Surrey by the Surrey police.

As a result of these discreditable proceedings there appeared before the Reigate County Bench on one occasion in September forty-nine motorists and cyclists, and on another occasion in October, sixty defendants, viz., forty-seven cyclists and thirteen automobilists. A number of cases were also taken before the Reigate Borough bench. On all occasions the J.P.'s proceeded to cheerfully fine everyone whose identity could be established. The police evidence was accepted as final and conclusive, although there should be no difficulty in proving to the Home Secretary that it was contradictory and worthless to the last degree. If any man was so ill-advised as to attempt to defend himself, the fine was promptly increased. The heaviest fine, one of £5 and costs, was inflicted upon an unfortunate automobilist who ventured to cross-examine his accusers in an attempt to show that the methods adopted to secure his conviction were most unusual, not to say un-English.

It is quite clear from these facts and others within the knowledge of most automobilists and cyclists that the discipline of these forces is bad and their management worse. It cannot for one moment be contended that the management or discipline of a

force is efficient when that force is systematically engaged in creating instead of preventing offences and in persecuting and hindering instead of protecting and helping the people. A body of police managed on these lines becomes an actively malevolent instead of an actively benevolent power.

The vitiating effect of magisterial incitements to persecution upon the ideas of the individual policeman comes out in the following cross-examination, from which it is very clear that hypocritical nonsense about "duty" is preferred by the magistracy to evidence. It is extracted from a local Reigate newspaper.

Defendant : "You were watching for motor-cars and cycles?"

Policeman : "I was doing my duty and I trust I did it."

Defendant : "There were half a dozen policemen just ahead hiding behind a hedge?"

Policeman : "There were five, I don't know where they were."

Defendant : "And immediately you blew your whistle, they came into your sight?"

Policeman : "Yes."

Defendant : "What sort of arrangement do you call that? Did Captain Sant (the Chief Constable) tell you to do that?"

Policeman : "He told us to do our duty."

Defendant : (to a sergeant) "Did Captain Sant tell you to dress in plain clothes and make these arrangements?"

Sergeant : "Captain Sant ordered us to do our duty and we did it."

Under these circumstances, the Home Secretary should be approached by the Automobile Club, the Cyclists' Touring Club and the National Cyclists' Union, and asked to withhold his certificate of efficiency in the case of those police forces whose discipline leaves so much to be desired. Mr. Ritchie is a strong man who would certainly refuse to sign an undeserved certificate of efficiency.

Supposing the Imperial grant on behalf of the police for the county of Surrey or the Borough of Reigate were stopped, an equivalent sum would have to be found by the ratepayers, and this would mean a considerable increase in the local rates. The result would be that the pressure of the ratepayers upon the local authorities would be quite sufficient to put an immediate stop to the persecutions which now make Surrey notorious. Nor would the effects of such a course be confined to that district. The knowledge that the Home Secretary had withheld his certificate in a single case would have a most salutary influence upon the authorities in other districts who feel inclined to adopt similar practices.

It may be asked whether there are precedents for the course proposed. The answer is—plenty. Since the Act which regulates the police grant came into operation in 1856, many local authorities have had the grant withheld on one ground and another. In recent years, however, there has been a decrease in the number of certificates refused. In practice, the Home Secretary has found it sufficient to issue a warning stating that if such and such things are not done then he will have to seriously consider, etc., etc. It is only quite recently that a warning of this character was addressed to one of the most powerful county boroughs in England, and the Home Office, which does not hesitate to censure the council of a big industrial community, would have no hesitation in dealing drastically with an insignificant non-county borough like Reigate, or even an important county like Surrey.

But it would probably be unnecessary for the Home Secretary to actually go so far as to withhold his certificate. Assuming that the clubs referred to above could lay before him convincing proofs of the persecution of cyclists and motorists in certain districts, and the deteriorating effects of this persecution upon the discipline of the police, he would probably cause a circular letter

to be issued to the various police authorities warning them that when the question of giving or withholding the annual certificates of efficiency came up he would take into consideration any charges supported by evidence which tended to show that motorists and cyclists had been made the subjects of special and unjust treatment. Such a circular would probably have the desired effect.

W. REES JEFFREYS.

THE RENAULT LIGHT CAR.

THE Renault voiturette has won many friends in this country since it was introduced a year or so ago. Keeping up with the times, Messrs. Renault Frères, of Billancourt, France, are bringing out a light car for the 1902 season. Our illustrations give a general view of the vehicle, as also a reverse plan—that is to say, a view showing the arrangement of the mechanism as seen from underneath. The frame, which is both longer and lower than the voiturette, is fitted in the forepart with one of the latest De Dion 8 h.p. single-cylinder motors, having a cylinder 100 mm. dia. by 100 mm. stroke. The transmission is very much on the old lines, the power being conveyed through a friction clutch to the gear box, which is connected by a universally-jointed shaft and bevel gearing to the rear live axle. Three speeds forward and a reverse motion are provided, these being controlled by a single lever at the

right of the driver. It may be mentioned that on the top speed the engine drives the car direct without the intermediary of any spur wheels. The engine is water cooled, the circulation being on the thermo-siphon system, no pump being employed. Ample brake power is provided, while the steering is controlled by an inclined hand wheel. The road wheels are all the same size, 24½ in. diameter, and shod with 80 mm. pneumatic tires. It may be added that the Roadway Autocar

FIG. 2.—GENERAL VIEW OF THE RENAULT LIGHT CAR.

Company, Limited, of 43, Berners Street, W., are the sole British agents for the Renault vehicles.

WE hear that Messrs. Darracq contemplate adopting a magneto-electric system of ignition for their motors at an early date.

WE understand that the proposed run of the English Motor Club to Dunstable on Saturday, the 14th inst., was cancelled owing to insufficient support by the members.

THE Motor Manufacturing Company have just supplied a large motor laundry van to the Egham and Staines Laundry Company, Limited, of Staines. The motor is of the company's standard 7 h.p. type, fitted with tube and electric ignition. The van has a carrying capacity of one ton.

WALKING round the Paris Salon we were struck with the fact that almost every exhibitor of motor-cars had at least one chassis on his stand, with the gear box open, so that visitors could not only examine the motor with ease, but also study the transmission mechanism and get a good idea of the workmanship.

"HAVE you been in the Aero section?" is the question that nearly every Englishman, who has visited the Paris Salon, has asked, on meeting a fellow-countryman. The section was not a large one, but it contained a number of most interesting exhibits, some of the models of dirigible balloons being shown in operation.

CORRESPONDENCE.

MOTOR-BICYCLES FOR 1902.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In a recent number of the *Journal*, your correspondent, Mr. T. Frederick Hunt, mentions an improvement he added to his Werner in the shape of a *regulator*. This he states greatly lessens the wear on the driving tire. I am sure he would greatly help many Wernerites by giving them details of construction and method of fixing and using it. Such interchange of useful ideas will undoubtedly be greatly appreciated by readers of the *Journal*.—Yours faithfully,

ELECTRICAL ENGINEER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I ask in your *Journal* if it is not possible for British ingenuity to devise flexible joints to cycle frames? Movable joints would absorb the vibrations of the motor, also resilience of two or three pneumatic tires acting irregularly from the unevenness of the road. Springs seemingly intensify the agitative anguish of body and mind in dislocating jolts.

When riding on horseback, however rough the ground, a good rider's mind and body act in harmony with that of the horse, and produce an effect entirely different to the distressing discord of mind and body one feels when riding a motor-cycle. And why the difference? It is because the horse's joints are adapted to preserve himself and rider from violent concussions going over hard ground.—Yours faithfully, W. A. SADLER.

TURNING CORNERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I call attention to a curious error in a paragraph which appears under the heading "Flotsam and Jetsam," in your issue of December 7th. In referring to an illustration in the *Strand Magazine*, the writer ridicules the fact that the inner and not the outer wheels (of a car rounding a corner) are represented as having left the ground. Surely a moment's thought would have informed the writer that the illustration was perfectly correct, and that a vehicle rounding a corner tends to overturn outwards, not inwards.—Yours faithfully, W. H. CLAY.

THE MOTOR UNION.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was much interested in reading in a recent issue about stimulating automobilists to join the Motor Union. But who outside of actual members know anything about it? Why do not you, or the Union itself, proclaim its existence, address, advantages of membership, and all about it to the hundreds of your readers who know nothing of it? Surely there is a lack of "push" in trying to augment its numbers on the part of its executive. "Flaneur" shows there is need of union, as there is much yet to fight for; but I doubt if that paragraph will be the means of any joining the Motor Union, as it does not enlighten by giving the very necessary information to your readers concerning it—not even its address nor the name of its secretary. So I maintain that the reason of many not joining it who would is because of its obscurity and failure to keep its advantages before all who are interested. Why is this not done? Can anybody be wakened up to do it?—Yours faithfully,

W. J. BARNIKEL.

A HINT RE CHANGING SPEEDS AT NIGHT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Perhaps the following may be of use to motorists who occasionally use their motor-cars at night. I found it rather difficult when changing gears at night to get the change-speed lever right into the required notch, sometimes pulling it past and sometimes not far enough. To remedy this, I fitted a small 4-volt electric lamp under the steering-wheel of my 6 h.p. Darracq to shine on the change-speed lever, and had a small press switch screwed on to the steering-wheel. When changing speed it is only necessary to press down the button and the notches can easily be seen as in daylight. The lamp is connected up through

a well-insulated flexible wire to the ignition battery? Of course, it could easily be made detachable to enable the motor to be examined at night.—Yours truly,

R. WINTER.

SOME IGNITION QUERIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Could any of your readers advise me what to do respecting a Benz car I lately bought from a doctor, who assured me it had not had much wear, although I now believe that it has been worn a good deal, because one of the chains worked off and caused the car to swerve and run into a hedge, upsetting the springs and carriage work. I found the chains were "stretched" and mounted the cogs. I have now got new chains and sprockets. Several times lately when I have gone out three or four miles I have had to push the car home again, as the engine has refused to work. The fault appears to be with the accumulators or the coil. I have read that the accumulators in the course of three or four years wear out. How can I ascertain if mine are worn out? I have had them recharged, but they do not seem to keep the engine going nicely even now. Can they be properly recharged with a V.R. primary battery—the new Leclanche battery—this is what they have been recharged with, and I am uncertain as to its being sufficiently powerful to recharge the four cells?—Yours truly,

PUZZLED.

MOTOR-CARS FOR THE TROPICS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent, Mr. P. Fowle, need not feel any anxiety as to his being able to enjoy the pleasures of a petrol motor-car, even if his lot is cast in a country where the temperature is often 90 degs. in the shade. He could use quite safely in such a climate either a steam-car fired by petrol, or a car of the ordinary kind where petrol is exploded in the cylinder of the motor. It is best, however, in a hot country to use a specially distilled petrol of 700 specific gravity. The boiling point of 700 petrol bears much about the same relation to the ordinary temperature of such a country as India as the boiling point of 680 petrol bears to the ordinary temperature in England. It is, therefore, easier to get satisfactory results in a hot country from 700 petrol than from 680 petrol.

Your correspondent asks what the flash-point of petrol really is. Petrol flashes at the ordinary temperature of the atmosphere, or even at the lowest temperature known in this country, but this does not mean that under any circumstances whatever petrol is capable of flashing spontaneously *without the presence of a flame*. What is known technically as the flash-point of a petroleum product is the temperature at which, when gradually heated in an enclosed cup as prescribed in the Petroleum Acts, it will give off such an amount of inflammable vapour as will ignite when brought into contact with a flame. If a flame is not present, petrol may be heated to any temperature and yet can never ignite. Owing to the inflammable nature of petrol itself, and also of the vapour which it gives off, great care is necessary in handling and storing it, but such precautions to avoid accident as a prudent man would take in this country would be amply sufficient to guard against all risk of accident in such a country as India. On the other hand, owing to the climate of hot countries being often extremely trying to horses, especially in the wet season, there should be in such places a great future for motor-cars, as they would fill a want which has long been felt—Yours faithfully,

FOR CARLESS, CAPEL, AND LEONARD,

WM. J. LEONARD.

FRANCE COPYING ENGLAND.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have just returned from an inspection of the great French Automobile Show which is now taking place in Paris. Although the whole arrangements, both of exhibits, situation and building combined, give a result that I am afraid it will be a long time before we can equal in England, still there were many points that make me feel that England is rapidly catching up the Conti.

nent in the manufacture of automobiles, and in some respects actually ahead. I found no less than three of the big French firms—namely Rochet-Schneider Mors, Panhard exhibiting motors in which were incorporated ideas which, if they did not copy from English motors, they have at any rate introduced into their motors after they had been in use in England for some considerable time. The points which I particularly noticed were first, an almost universal adoption of the choke valve, the credit of introducing which, I think, must be given to the Wolseley Company. The other English improvements which I noticed were incorporated into French engines were: first, on the Rochet Schneider stand, I found the placing of the commutator or contact breaker on the dash board in full view of the driver, with a glass plate for him to see if everything was working perfectly. On the Mors exhibit I found that their most powerful engine was made with an entirely aluminium case and water jacket with steel liners placed inside. On the Panhard stand the valve gear had been placed inside the crank chamber, while electric ignition only is being used on their latest model. Their annoying method of getting at one inlet valve has been replaced by a simple one, and the straight unbroken stems for lifting the exhaust valve have replaced the old spade pieces with their rattle and inaccuracy.

All the improvements that were shown on the three stands mentioned have been previously incorporated in the Napier, and although I myself am not yet a possessor of one, I feel proud to see our position in the industry in such evidently able hands, and who in such a short time have introduced so many improvements that the leading French manufacturers have thought fit to copy or imitate.—Yours truly,

H. A. HECTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the paragraphs by "Automan," in a recent issue, regarding the different foreign vehicles, in which he says, "Unfortunately England does nothing but copy what improvements are made by others," may I, on behalf of the Napier engine, point out that this is not strictly correct? At the present moment I can mention three or four points in the Napier engine that have been embodied in its construction for a long time, which must be well known to many of your readers, and which have been moreover embodied in some of the very latest French engines. First, the principle of making the whole of the engine-body and crank chamber of aluminium and merely putting inside this a cast-iron liner for the piston to work in. This principle has been adopted by Mors in his racing engine, but was in use by Napier prior, so far as I am aware, to its adoption by anybody else.

Then, again, take the firm stand I have made in refusing to fit lamp ignition. The latest pattern Mercedes, Mors and Panhard engines are fitted with electric ignition only, and Napier did this two years ago. The commutator on the dash-board was also introduced on the Napier, and has been copied by the French firms. Arranging inspection of inlet valves so that only one nut has to be removed. This was first introduced into the Napier, and an almost similar arrangement is to-day in use on the latest Charron and Panhard cars.

Every credit must be given to the splendid machines turned out abroad, but at the same time we may as well ourselves recognise, when we do make an improvement, and when this improvement is also recognised by firms abroad, inasmuch as they copy it, it is reasonable to suppose that the idea has something in it. I thoroughly agree with "Automan's" other remarks, and would like to see other firms than the Napier competing abroad. It gives English makers a very small chance when only one or two cars compete in races with a couple of hundred entries. If every good English firm would send a few cars, English work would quickly be recognised as very satisfactory in many ways.—Yours truly,

S. F. EDGE.

MESSRS. HEWETSONS', LIMITED, write:—"With reference to the article on the Hewetson motor-bicycle in your last issue, we note you say the 'combined surface carburettor and petrol tank, etc.' This is not quite correct, as there

is no carburettor, a mixing valve being connected directly with the petrol tank. The whole of the working of the machine is effected by means of a lever beneath the left handle, there being only one other lever used, viz., that for controlling the throttle valve when descending steep inclines. We should further like to point out that, owing to the long wheel base, the equilibrium is perfect, rendering the Hewetson easier to ride than the ordinary bicycle."

THE "CALORADIA" RADIATOR.

THE accompanying illustration gives details of a new form of radiator, for use in connection with the water-cooling arrangements of petroleum-spirit motors, which has lately been put on the market by M. Laeis, of Rue Duris, Paris. The construction of the radiator is so clearly shown by the illustration that but little description is necessary. It may be mentioned that the coil is built up of sections of sheet copper; the hollow fins are 2 in. square, external measurement, while the centre halo

is 3 in. in diameter. The radiator can be made in any size and with any number of bends, the weight per metre run being just over 4 lbs. The maker states that he has well tested the "Caloradia" ere putting it on the market, and claims that it can resist a pressure of 75 lbs. per square inch.

THE Antwerp Automobile Club is organising a Christmas tour into Holland.

THE Wellingborough District Council, after inspection of various methods of utilising motor-cars for street scavenging, have decided to purchase a Simpson and Bibby vehicle at a cost of £600.

Two interesting exhibits on the stand of Messrs. Buchet at the Paris Salon are the motor-tricycle on which M. Rigal has lately created new records, and the strange-looking machine of Truffault, of which we published an illustration recently.

NOTWITHSTANDING the disappearance of the public electric cabs in Paris, a visit to the French capital brings to light the fact that electrical vehicles are being used in very rapidly increasing numbers. One cannot go down any of the well-known thoroughfares of the city without seeing half a-dozen electric broughams or landaulets running along.

AN interesting finish to a day's visit to the Paris Salon is an inspection of the large number of cars that are standing opposite the Grand Palais awaiting their owners. Here every practically known type of motor-cars can be seen, ranging from a powerful Panhard down to a little belt-driven Benz car, of which even in Paris not a few are to be seen running about.

ONE of the exhibitors at the Paris Salon is of an ingenious turn of mind. He is showing a new sparking plug, or a new contact breaker—we forget which. Instead of turning a handle, he has got hold of a second-hand sewing machine, on which he has mounted the contact breaker and plug, and while an interesting crowd is gathered round, Mr. Exhibitor is busy working the treadles for all he is worth.

FLOTSAM AND JETSAM.

BY "FLANEUR."

I N a book-shop on Friday I picked up a volume with the title of "The Sport of Kings." It proved to be in praise of fox-hunting. The Warwickshire Hunt Committee notwithstanding, I should be sorry to say anything against a fine old English sport. All the same, I could not help thinking that the time was not far distant when the sport of kings *par excellence* would be automobilism. Already it is well on its way towards that consummation. The Tsar, the German Emperor, the King of the Belgians, the King of Italy, and, last but not least, our own King, Edward the Seventh, make up a very formidable list; its augmentation is only a matter of months now, and if motor-car driving is not recognised ere long to be pre-eminently a regal sport let me be written down a false prophet.

THAT King Edward has decided to treat himself to a new car is from every point of view a matter of the greatest possible satisfaction. In the first place, it indicates in incontrovertible fashion that his ardour as an automobilist is unabated, and the fact that the new vehicle is to be of double the horse-power of his present cars is further confirmation of his zest for speedy locomotion. In the second place, the power of the car is equally a proof of the fact that the King has no sympathy with the reactionary folks who would do everything in their power, and a good deal more if they could, to throttle automobilism at every opportunity. Further, it is a standing rebuke to those who affect to think that motor-car driving at anything more than equine rates of speed is dangerous to all concerned; naturally, the King knows the value of his life to the State, to his family, and to himself, and would not jeopardise the safety of the royal person, nor, on the other hand, would he imperil that of others, by the employment of an obnoxious form of locomotion. But best of all is the King's determination to encourage the native automobile industry. It is no small feather in the cap of the Daimler Motor Company that they have secured a further order from His Majesty, for it reveals clearly enough his faith in English motor-car building, and his satisfaction with the particular make of car which he has used to such practical effect during the past year.

It will be singular indeed if the royal example does not have a quickening effect upon society, whose members, it may be inferred, are not all as conservative as the Committee of the Warwickshire Hunt or the stewards of those race meetings at which motor-cars are banned. I am sanguine enough to hope that it will not be long before an English automobile show will attain the dimensions and the diversity alike of the Salon now concluding on the other side of the Channel, and, what is more, I am confident that the day will also come when the exhibits will be as strictly national as those in Paris. It is impossible for the present, however, to dismiss the recollections of the French show from one's mind. No words can convey to those who did not cross from England the real brilliance of the spectacle, and its revelation of the strength of the automobile movement in France. Then, again, the class of the visitors, notwithstanding the huge attendances, was distinctly high from day to day, and stand-holders could testify from their order-books that curiosity was not the main motive which influenced large numbers of the well-dressed crowds.

A PORTION of the Salon which many probably failed to explore was the *sous-sol*, or basement, in which a good deal of machinery was at work, the main proportion of which was running on alcohol. It is clear that the French authorities are doing everything they can to encourage the use of alcohol for internal combustion motors, and the alleys leading to the basement were even lined with beetroots and kindred products, as though it were an agricultural show. What the economic value of alcohol may ultimately be shown to be, as compared with petrol, it is unwise to prophesy.

but I am bound to say that the super-sensitive persons who object to the odour of petrol will have much more substantial cause of complaint if alcohol comes to be generally employed. The odour prevalent in the *sous-sol* was undoubtedly acrid, and far more potent than the most heavily charged exhaust from a petrol motor.

So excellently managed was the French show in most respects that it is not ungenerous to offer a little criticism, for which, indeed, there is little cause. But it is much to be desired that the organising committee will condescend to give us a decent catalogue next year; the existing style has been tolerated long enough. Even if a gratis production, it would be unfit to place in the hands of the public; but for a franc one would expect something with some pretensions to being of service. It is no misuse of words to describe the official catalogue as an absolutely farcical production, quite unworthy of any show, much less one of the finest to be held in any country in connection with any industry whatever.

ONE other matter calls for passing comment. One fails to understand the exaggerated prominence given to the steam wagon and the statue of Vercingetorix. In England we should think nothing of hitching the latter behind a traction engine or putting it on a Thornycroft trailer and convey it to its destination without more ado. As a work of art the statue was interesting enough, but that was not the object of its being exhibited, and indeed it was too closely packed in wooden supports to be seen to the fullest advantage. Yet the authorities placed the wagon and its sculptured load in the very centre of the main alley, as though the combination were the *piece de resistance* of the show.

IN referring to the fact that an American *chauffeuse* has lately passed her examination as a motor-car driver, a contemporary erroneously observes that she is the first foreigner of her sex to obtain the driver's licence required by the French Government. That honour, as a matter of fact, can be claimed by Miss Vera Butler, who gained the coveted certificate many months ago, as reference to facsimiles of the documents which were published at the time will show. When officialism casts its eye upon the doings of the aeronaut, no doubt the intrepid Miss Butler will qualify in that capacity also, as she has made several ascents along with her father, both in England and in France.

WHAT did the exhaust box? The inflated tire.

QUITE a number of firms in France are studying the tire question, and not a few tires are to be seen at the Salon, by which the demons puncture and skidding, it is claimed, are conquered. A novel tire, which we hope to illustrate in an early issue, is the Pneu-Ferré. The tread of this tire is covered with small steel plates, which give it a very strange appearance; we, however, hear it favourably spoken of.

A FIRE broke out on Wednesday night last week at 97 and 98, Long Acre, W.C., upon the premises of the British Automobile Commercial Syndicate, Limited. The premises are comprised in a building of five floors, extending 60 feet in one direction and 30 feet in another. An acetylene lamp was accidentally upset on the third floor, and a serious fire followed, which was not checked till the floor and its contents had been severely damaged. A man named Rowland Le Bars was badly burnt in endeavouring to overcome the fire in its early stages.

WESTON MOTORS, 14, Mortimer Street, London, W., inform us that they are about to place on the market a four-seated Weston "Dos-à-Dos" steam car, in response to a demand amongst their customers for a vehicle which will comfortably accommodate four passengers, whilst being a good hill-climber as well as a fast traveller. They claim to have been the first in the United States to design a "Dos-à-Dos," and though shipments of this model to this country have been somewhat delayed, owing to the demand on the other side, they hope to have four-seaters on view early in the New Year.

HERE AND THERE.

WHY was the tire inflated? Because the gear was deferential (differential).

THE import duty on motor-carriages in France is 60f. per 100 kilos., say £1 5s. per cwt.

THE Automobile Club of America is about to establish a Club garage for the use of its members.

IN the January number of the *Badminton Magazine* "The Motor-Car Question" is dealt with by Mr. Alfred C. Harmsworth.

MESSRS. J. PARR AND COMPANY, of Leicester, have just completed a 6 h.p. four-seated *tonneau* to the order of Lord Harrington, of Elvaston Castle.

MR. WILLIAM K. VANDERBILT and Mr. Foxhall Keene, two well-known American *chauffeurs*, have, according to reports, cabled their entries as competitors in the Paris-Vienna race.

TOD SLOAN, the well-known jockey, was among the many visitors to the Paris Show, where, we understand, he placed an order for a 20 h.p. Boyer car.

MR. GEORGE M. HOLLEY, of the Holley Motor Company, Bradford, Pa., made a record on the Stadium track at the Pan-American Exposition recently, riding three miles on a Holley motor-bicycle in 5 min. 7 sec.

DR. E. LEHWESS recently took the editor of the *Outlook*, whose ode to motorists we reproduce in another column, for a spin on a Durkopp car. As a result he has become quite a convert to automobilism and has already ordered a motor vehicle.

MECHANICS in the employ of automobilists in New York City have organised the *Chauffeurs' Club of America*, with headquarters at 1684 Broadway, New York. Drivers wishing to become members must be expert operators of petrol carriages.

WE learn that Mr. J. W. Stocks, of the Ariel Motor Company, has been appointed manager of the De Dion-Bouton Company, Limited, 23, Brook Street, London, W., and that he will take up his new duties on the 1st. prox.

THE Daimler Motor-Car Company, Limited, are building a new motor-car to the order of the King. It will be fitted with a four-cylinder motor of 22 h.p., and will have a special *tonneau* body capable of seating six persons at the back.

WE learn from a correspondent that the interest in motor-bicycles is rapidly growing in Cape Town, and, judging by the progress made during the last few months, 1902 ought to see a boom in this particular class of motor-vehicle in South Africa.

A VERY handsome calendar has reached us from Messrs. Brampton Bros., the well-known chain makers. It is a veritable work of art, the colouring of the female bust, which is the central feature of the calendar, being excellently executed; in fact, the calendar is suited even for a drawing-room.

A HOVE correspondent writes, asking us to mention for the benefit of the driver of a private Panhard car, which passed through that place on Sunday morning last, that the black dog he ran over—or rather caused to be run over—died a few seconds after the accident.

A BRIGHTLINGSEA correspondent reports a curious automobile incident. A gentleman was riding in that town when a large dog charged his car and overturned it. The driver, who was pinned beneath the vehicle, was fortunately unhurt, though the car suffered somewhat severely.

THE Brush Engineering Company, Limited (Automobile Department), of Donington House, Norfolk Street, Strand, have acquired the sole agency for Great Britain for the motor-cars made by the Société des Anciens Ateliers P. Sage, of Paris. At the Paris Show this company is exhibiting a 10 h.p. car, fitted with an Abeille two-cylinder motor.

BAS MEUDON, a suburb of Paris, has for some time past been the scene of operations of a gang of blackmailers who, personating detectives, stopped cyclists, carriages, and automobiles carrying no lights, etc., and demanded money for not prosecuting.

Four years' imprisonment has been awarded to the enterprising members of the gang recently captured.

THE Edinburgh Auto-Car Company, Limited, has issued a circular to the effect that the requisite amount of Preference shares (5,000) not having been subscribed for, an extraordinary general meeting will be held on Friday, the 27th inst., to pass the following resolution: "That this company be wound up voluntarily."

THE Prefect of Police in Paris it is stated recently received a letter stating that the writer—a woman—was tired of life and about to commit suicide. The Prefect immediately despatched an officer to the address in an automobile, who arrived just in time to save her. She was at the moment engaged in fixing a rubber tube on the gas burner in her room, her intention being to put the other end of the tube in her mouth and thus asphyxiate herself.

AT a recent meeting of the Tunbridge Wells Farmers' Club the motor-car and traction engines received a warm benediction. Mr. G. Arnold, of Frant, ably defended the new system against what he called the unreasoning prejudices existing in many quarters, and he said that legislation, so far, was very grandmotherly in imposing vexatious restrictions upon the owners and drivers of motor-cars and traction engines. Especial emphasis was laid by several speakers upon the value of motor conveyances to outlying farms.

MOTORIST TO TRAMP HE HAS JUST KNOCKED DOWN:—"While down there, you might just see if any bolts have come loose!"

[Das Schnauferl.

UNDER the heading of "Action to Recover Commission," there appeared in our issue of last week an account of an action, *Kesterton v. Marshall*, in which by the transposition of the words plaintiff and defendant some inaccuracy occurred. In the first place, it was the defendants and not plaintiffs, as stated, who were to pay 5 per cent. commission on the business done in motor-cars. Further, it was defendants not plaintiffs, as stated, who were ordered by the Court to supply plaintiffs and not defendants with an account of all business done in motor-cars, under the contract referred to.

THE casualty statistics for France during the month of September, published by the *Velo*, show no fatalities due to motor-cars. The horse, as usual, heads the list with 63 deaths and 758 injuries; the railway comes next with 16 fatalities and 79 injuries; the bicycle has 8 deaths to answer for, and 63 injuries; and the motor-car only 44 injuries. Of the deaths 72.40 per cent. are due to the horse, 18.40 per cent. to the railway, and 9.20 per cent. to the cycle. Of the injured the horse claims 80.30 per cent., the railway 8.37 per cent., the cycle 6.67 per cent., and the motor-car 4.66 per cent.

CONTINENTAL NOTES.

BY "AUTOMAN."

SEVERAL Englishmen have asked me this week to define *carrosserie limousine*, and as the mode nowadays seems to be setting in in that direction it may be useful and interesting to the readers of the *Journal* to know exactly what the definition is. A *limousine* body is one which has an open front for the driver's seat and a closed *coupé* behind for the passengers. It is a most rational and comfortable arrangement, and I think it will become as popular on the English side of the Channel as it is on the French side.

JUST before the close of the Paris show every evening there has been a representation by the cinematograph of certain parts of the Paris-Berlin motor-car race, and, curious to relate, in some cases the wheels of the cars are seen to revolve in the wrong direction. A friend of mine spoke to Lumiere, the inventor of the cinematograph, on the subject, and gave me the following explanation. When the spokes of the wheels are travelling exactly at the same speed as the films in the photographic apparatus, every succeeding spoke will take the position on every succeeding film which was occupied by the preceding spoke on the preceding film; therefore, the wheel will appear stationary, *i.e.*, always in the same position, since all the spokes are alike; but should the films travel quicker than the spokes, then every succeeding spoke will not quite have reached the place occupied on the preceding film by the last one, therefore the wheel will appear to revolve backwards.

THE financial success of the great firm of Panhard and Levassor is the talk of automobile circles, and it is really phenomenal. After paying 5 per cent. interest, a dividend of 30 per cent. has been distributed to the shareholders, and in addition the whole of the machinery has been written off. A friend of mine had three hundred shares of £400 each a little more than a year ago, and sold them at little over par. He is now regretting the income of £4,000 and odd that he would have been drawing, for he put the whole of it into another motor-car business and lost it. As far as future prospects are concerned the firm is just as full of orders as ever, and is obliged to turn customers away and tell them to apply to the middlemen.

A SECOND contingent of members of the A.C.G.B.I. arrived in Paris on Friday last week, and I ran into Messrs. Edmunds, Manville, Gorham, and I heard of Colonels Holden and Templar being seen. At the A.C.F. at lunch-time I had the advantage of making the acquaintance of Mr. Martin, who has just taken over the management of the Daimler Motor Company's Works at Coventry, with whom I had some long and interesting discussions on motor matters, whilst walking round the Show examining the various exhibits. It would seem, from what I learnt from Mr. Martin, that at last the Daimler Company is going to wake up, and not be content with copying the ponderous models of ancient history, wherein the poor motor had to carry about with it an "old man of the sea" in the shape of useless lumps of metal, which neither added to the beauty, nor to the comfort, nor to the stability of the car. As far as I could gather—and I warn the readers of the *Journal* that I am quoting my impressions of a conversation (Mr. Martin's may be quite different)—without altering in principle, modifications consistent with sound engineering practice will be gradually incorporated in the new cars, and whilst due attention will be paid to the gathering of improved ideas from the Continent, original improvements will not be wanting. It is only a small step from this point towards producing a car which can compete honourably for the Gordon-Bennett Cup, and redeem the fiasco of last year, and the apathy which seems to surround the prospects for 1902. If I may humbly give the Daimler Company a word of shall I say "encouragement" or "advice," I would point out to them that every dividend-paying concern engaged in the

manufacture of automobiles, I may say almost without exception, owes its position to success in international competitions, which brings in its wake large orders not from private users alone, but principally from the middlemen, who order quite a series of cars. These orders enable the manufacturer to repeat exactly the same article numbers of times over, while all his attention can be devoted to the designs and improvements for the trade of a year later. It is hardly possible in this complicated trade for a firm to make money if they have to make special improvements and alterations for every individual cranky customer. It wastes everybody's time and no "extras" can cover the loss.

IN my last week's "Continental Notes" I referred to a new invention which has the advantage of doing away with the exhaust of explosion motors. Thanks to several short conversations with my friend and colleague, Paul Meyan, of *La France Automobile*, I am able to give the readers of the *Journal* a few further points on what is certainly an important discovery.

THE inventor is Monsieur G. F. Joubert, doctor of science, and formerly professor of chemistry at the Ecole Polytechnique. M. Joubert has been working for some years with the object of producing a complete apparatus whereby the artificial air may be supplied to the lungs of a human being and the carbonic acid gas which is exhaled from the lungs condensed or absorbed. In a word, he has been searching for a "breathing cycle" and he has found it, inasmuch that by means of his apparatus he has experimentally sustained respiration for hours together without the aid of the atmosphere, either for the supply of the oxygen or for the taking away of the waste gases. The patient draws in artificial air from one end of the cycle and sends out the vitiated air at the other without the slightest inconvenience. The oxygen is produced by means of a substance called "oxylithe," which is similar in appearance to the calcium carbide employed in an acetylene lamp, and by a chemical reaction the carbonic acid gas or vitiated air is absorbed. The object of the inventor was to find a substitute for the air pump used by a diver and to free him from the dangers and inconvenience of the air tubes, and it was also thought that it might be of service to firemen going into smoke-filled rooms to save life. The idea of trying its application to explosion motors came later, and the Baron von Zuylen borrowed a motor from the Marquis De Dion and caused it to be experimented with. The motor was one of the well-known 1½ h.p. type, and so successful was the result of the experiments that three other larger motors were tried, with the astonishing result that they not only worked perfectly, but also produced a saving of 30 per cent. in the fuel employed, or rather in the explosive vapour.

EXPERIMENTS on a very large scale are being made, and the importance of this invention cannot be minimised, for its use, for example, in submarines is self-evident. The motor would neither take away the air which is so necessary for the crew nor would it vitiate it with an exhaust.

MESSRS. G. STRAUS AND CO., LIMITED, 211, Upper Thames Street, London, E.C., have been appointed sole agents for Great Britain for the Aachen Stahlwaaren Fabrik. The concern make a speciality of petrol motors and parts for motor-cars; change speed gears, back axles with differential gear, transmission and Cardan connecting rods.

THE General Electric Company, Limited, have, under the name "Ignis," put on the market a new accumulator for ignition purposes. They are made up in little polished wood cases containing four cells, complete with leather strap and terminals. It is claimed that they can be given a very excessive charge or discharge without injury or buckling of the plates, and that they are generally very efficient.

BRAKES.

IT has often been remarked that going uphill and going downhill constitute the most difficult parts of motor-car driving and there is undoubtedly a large amount of truth in this remark. Travelling uphill is certainly difficult to the novice, but travelling downhill presents features of difficulty and sometimes of danger to others than novices. A large number of cars (gear-driven) are fitted with that doubtful combination of the brake withdrawing the clutch, and to the writer this device does not seem altogether satisfactory. There are a large number of drivers who, when they come to a hill, simply go down on the brake and should the particular brake they happen to be using fire or in any other way fail to act, fall back upon the emergency brake. This method of using brakes is brought about by this peculiar combination of a brake releasing the clutch. Surely it is quite easy to release the clutch with one pedal and apply the brake with the other, and then if the hand brake does not release the clutch there are three good brakes on the car. (1) The engine. (2) The foot brake. (3) The hand brake.

Using the engine as a brake is a practice adopted by many, but it must be remembered that this method of braking can only be conveniently used when electrical ignition is adopted. The method is this. When a really steep and dangerous hill is reached, put in the slow speed, start down the hill and shut off the spark. By this method it will be found that nine hills out of ten can be descended without touching a brake. Of course it will be found on hills of extreme steepness that the car will begin to overrun, but then there are both brakes to fall back upon. The writer feels confident that the adoption of this method would add considerably to the life of the brakes and also avert many accidents. Concluding, the writer will say a word or two about travelling uphill. The majority of accidents happen from the result of missing gears, which very often means a run back to destruction. A sprag, it is true, may be used, but a sprag has been known to "skip" before now, especially on very smooth roads and wood paving with tramlines. If a really good back-acting brake is fitted, an accident may be averted; if it is not, by far the safest way of ascending the hill, especially if the hill is in a town or not very well known, is to start with the lowest speed in and go straight up.

R. A. C.

JUDGING from what we saw at the Paris *Salon*, there are likely to be some rubbishy motor-bicycles on the market shortly, and intending motor cyclists will do well to look askance at some of the very cheap machines that are likely to be offered to them. Quite a number are on view at the *Salon* at prices of about £26 complete, but from what we could see from a casual inspection they are very dear at the price.

M. JESUS DURO, a Spanish automobilist, has recently successfully completed a fine run from Madrid to Paris. The journey from Madrid to Saint Jean de Lux was undertaken alone, and occupied three days. Leaving the latter place at 9 a.m. on Friday, November 29th, accompanied by M. Claverie, Bordeaux was reached at 5.20 the same evening. The following day, starting at 7.45 a.m., the two *chauffeurs* arrived at Tours at 9.50 p.m. Starting at 7.20 on Sunday morning Paris was reached at 2 p.m. Considering the unfavourable season, the journey was a remarkable achievement.

WHAT promises to be one of the most interesting features connected with automobile racing has, remarks an American exchange, been quietly worked up among the prominent members of the Rhode Island Automobile Club, ten of whom have placed orders for 20 h.p. Winton vehicles, each of which is to be exactly like the other, and to be specially adapted for high-speed running. The vehicles are to be delivered by March next, and it is the intention of the owners to arrange a series of contests between the carriages. As all the vehicles are theoretically equal, each driver will have an opportunity of showing his skill and ability in driving.

IMPORTS OF MOTOR-CARS, CYCLES, AND PARTS.

BELOW we publish our monthly official list of the imports of motor cars and cycles and parts thereof into the United Kingdom during November, 1901.

IN THE WINDING UP COURT.

In the matter of Pennington Motor Foreign Patents Syndicate (Limited) (in Liquidation).—Notice is Given, that the creditors of the above-named company are required, on or before the 31st day of January, 1902, to send their names and addresses and the particulars of their debts or claims, and the names and addresses of their solicitors (if any), to Mr. Wm. Roger Caldwell Moore, of 142 and 143, Palmerston Buildings, Old Broad Street, London, E.C., the liquidator of the said company, and if so required by notice, in writing, from the said liquidator, are by their solicitors to come in and prove their said debts or claims at such time and place as shall be specified in such notice, or in default thereof they will be excluded from the benefit of any distribution made before such debts are proved.

The Thames Valley Motor-Car Company (Limited).—The creditors of the above-named company are required, on or before the 1st day of February, 1902, to send their names and addresses, and the particulars of their debts or claims, and the names and addresses of their solicitors (if any), to Mr. Desmond Forde, of 75, Aldermanbury, in the City of London, the Liquidator of the said company, and if so required, by notice in writing from the said liquidator, are, by their solicitors or personally, to come in and prove their said debts or claims, at such time and place as shall be specified in such notice; or in default thereof they will be excluded from the benefit of any distribution made before such debts are proved.

ODE TO THE MOTORIST.

WHEN men have nightmares, they dream about you.
I myself have been chased over the tops of pinnacles
By flaming-eyed Panhards and Durkoppes
In my sleep.
Nor is this all,
For if one brings oneself
To read reports of the proceedings of police-courts
One finds that the average citizen
Gets more or less chased by you, sir,
In his waking moments.
The Police I know, my dear sir, seldom speak the truth:
They remember so well the day
When a horseless carriage had to be taken through the street
At the speed of a funeral march,
And with a red flag in front of it,
That the spectacle of an affable motorist
Bowling through a Surrey village
To the tune of six miles an hour
Shocks their imagination,
And they believe for the rest of their natural lives
That the affable motorist aforesaid
Must have been travelling
At the rate of anything from 60 to 600 miles per minute.
Hence, my dear motorist,
It comes to pass that you are afforded so many opportunities
For airing your eloquence and the fatness of your purse
Before the police magistrates.
In my opinion it seems just possible
That the real trouble lies in the fact
That you, my dear sir, do actually
Go through villages at a very low speed,
And that really the best thing you could do
Would be to make a point of going through them
At the highest speed consistent
With the safety of your own person.
For if you did this,
No policeman of my acquaintance would be able to catch you
Hence you would never be fined.
I have been out of sympathy with motor-cars
Right up to the other night.
The other night I had the felicity to take a small trip on one
The motorist would fain have driven me to my house,
Which is half-an-hour's cab drive from Charing Cross
He offered to do the distance in ten minutes
And started stirring up his petroleum,
But I said "No! Let us go to the Marble Arch."
We went through the Mall, to Hyde Park Corner, to South Kensington, to
Paddington,
Into the Edgware Road, and so to the Marble Arch;
Time, at the outside, 15 min.
I am willing to admit
That we went down certain streets quite rapidly,
What time the policemen at odd corners stared stupidly,
And fumbled for their notebooks.
But, as a result of that trip, my dear sir,
I have become an enthusiastic motorist.
I am convinced that speed and wind and the smell of petrolism mixed
Is the only thing which can be considered worth living for.
And if you happen to know anybody
Who would be willing to take
A typewriter and a pair of skates (not much worn)
In exchange for a Durkopp racer,
Kindly communicate with me.

The Outlook

MOTOR-CAR AND DOG-CART.

AN interesting action for damages arising out of the alleged fright of a horse by a motor-car came before Mr. Justice Bigham at the Birmingham Assizes last week. The plaintiff was Helena Gertrude Brockington, and the defendant, Henry Sagar, of Sowerby Bridge. According to the statement of Mr. Shakespeare, who appeared for the plaintiff, Mrs. Brockington, on the 27th June this year, was driving a horse and dog-cart with her husband and a gentleman along the Burton and Lichfield Road, and when between Bear's Hay and Fradley she saw a motor-car approaching from the opposite direction, coming down an incline, at a terrific rate. The horse began to show signs of being frightened, and Mr. Brockington put up his hand for the motor-car driver to stop. Instead of stopping he stooped down, pulled a lever, and dashed past the carriage at a tremendous pace. The result was that the horse swerved, threw over the carriage, and smashed it, and, as one of the witnesses put it, the occupants of the dog-cart were "strewn on the floor," and Mrs. Brockington was injured. Witnesses having been cross-examined, and Mr. Southwood, a jobmaster, having deposed as to damage to horse and trap, Henry Sagar, the defendant, denied that he had been negligent, and that he had been requested to stop. On the other hand, he contended that the plaintiff had not the horse under proper control.

When it jumped across the road in front of his car, she pulled the horse backward into the ditch, and so overturned the trap herself. It was not true that he was going at the rate of twenty-five to thirty miles an hour. The extent of the car's capacity was only twenty miles an hour. Albert and William Ellis, who were fellow-passengers in the car, contended that the motor would not be going more than ten or twelve miles an hour at the time of the accident. His Lordship, who said the case was a simple one and had taken a great deal too much time in hearing, told the jury to let the damages be quite moderate if they found for the plaintiff, and not to take her view of the matter at all. After private consultation the jury found for the plaintiff, and awarded her £30 damages.

FURIOUS DRIVING CASE.

At Edinburgh, Alexander Rose, a motor-car driver, was charged with having on the 23rd November driven a motor-car recklessly and carelessly in Atholl Crescent and West Maitland Street. The evidence of several constables was given for the prosecution. They stated that the accused's car was timed between two points, and covered a distance of 440 yards. The journey was accomplished in one minute, which was at the rate of fifteen miles an hour. Expert witnesses were called for the defence, and Mr. W. M. Lapsley, Mr. Sleigh, of the Rossleigh Motor Company, and Mr. Camague, who were on the car on a subsequent trial trip, gave evidence to show that the car could not run at the rate of fifteen miles an hour. Mr. Lapsley gave it as his opinion that it was impossible for the constables to time the journey with ordinary watches. On the trial trip the car, urged to its highest speed, only reached the maximum speed of 12½ miles an hour on a macadamised road. Mr. Sleigh stated that the car in question was an old one, and was driven by oil, which meant that it could not exceed the speed to which it was geared. All the witnesses agreed that a quarter of a mile was not a sufficient distance in which to test a car. Bailie Waterston reserved judgment.

MAKING OF MOTORING COATS.

In the Islington County Court, Mr. Alfred Dunhill, Euston Road, sought to recover from Mr. H. L. Civval, tailor, £10 10s. in respect of material spoiled in making eight leather coats. Thomas Owen, in the plaintiff's employ, said he gave defendant a sample motor coat to make up. He made a satisfactory coat, so he was forwarded a number of skins to be cut up for making more motor coats. The skins used for the purpose always bore certain blemishes, but instead of working round those blemishes, he cut them up as he would ordinary cloth. The result was that large holes now appeared in the coats. They were badly made altogether, and nothing like the sample made in the first instance. They would not be able to sell one of them. Defendant said he told plaintiff's manager that the skins were not sound, but he was told by them to patch up the holes, which he did. Other defects in the skins he covered up by means of ornamental work. After examining the coats the Judge held that the work had not been properly done, and gave plaintiff a verdict for the amount claimed, with costs. A counter-action was brought by Civval against Dunhill to recover £12 13s. 3d., for goods sold and work done. On this cause, which arose out of the previous action, judgment was given for £6 15s. 3d. in favour of plaintiff.

FOR the special convenience of those motorists using steam as a motive power, Mr. A. L. Dyke, of Limnar Building, St. Louis, has introduced a compact but serviceable portable electric light outfit. The lamp, which is equipped with a small porcelain socket, is screwed at the top behind the water gauge. The push button which starts and extinguishes the light is sunk flush with the surface of the arm of the seat near the throttle lever, and is connected by a small wire with the lamp. Pressure upon the button causes a brilliant light to be reflected from the lamp to the mirror, thereby permitting the driver to see the exact amount of water in the gauge. The battery connected with the lamp is placed under the seat entirely out of the way.

THE Motor-Car Journal.

VOL. III.]

LONDON, SATURDAY, JANUARY 4, 1902.

[No. 148.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

PUBLISHER'S ANNOUNCEMENT.

Commencing with the present issue the rates for trade advertisements in the "Motor-Car Journal" will be increased to the extent of 20 per cent.

Cordingley and Co., Proprietors.

COMMENTS.

IN wishing our readers a Happy and Prosperous New Year we would take the opportunity of thanking the many motoring friends who have favoured us with Christmas cards and similar reminders of the festive season. Apart from the kindly thought which has inspired these greetings through the post, we welcome them as further evidence of the enthusiasm of motorists for their sport and pastime. Automobilists have not been slow to utilise photos of their cars for use on Christmas and New Year's greetings. Thus the popularity of the motor-car has been rendered more and more pronounced.

Royal Patrons.

THE list of Royal automobilists is growing until it will shortly embrace everyone who has any claim to Royal or Imperial title. King Edward, the King of the Belgians, the Queen Dowager of Italy, the King and Queen of Italy, and the German Emperor are all riders and drivers, while among those of noble rank may be mentioned the Dutch Queen's Consort, who uses a car when on his shooting expeditions. Queen Hélène of Italy is a clever driver, and the King and Queen of Württemberg also possess a car. The Dowager Empress of Russia has a motor-carriage similar to that owned by our own Queen and is making good use of it.

English Aeronauts in France.

THE party of English automobilists and aeronauts staying at the Elysée Palace Hotel in Paris have made very good use of their time. It has already been recorded that the Hon. C. S. Rolls, Mr. Frank H. Butler, and Miss Vera Butler ascended with the Comte de la Vaulx, but it is not also known that along with Colonel and Mrs. Templer, Captain and Mrs. Shelby, Mr. J. A. Holder, Mr. R. Bird, Mr. and Mrs. T. B. Browne, and others they had the pleasure of entertaining and subsequently being entertained by M. Santos Dumont, Colonel Renard, head of the Balloon Section of the French army, Comte de la Vaulx, of Russian and Mediterranean fame, and M. Deutsch de la Meurthe. A curious incident in connection with the above-mentioned ascent, by the way, is that the aeronauts passed right over the fort of Mont Valérien, and are probably the only English people who have seen its jealously guarded interior. They observed all the troops, heard the bugles sounded, and noted the disposition of the cannon and other armaments at their leisure. A nice fate would have awaited them had the balloon incontinently descended at that juncture, as they would certainly have been clapped into prison. They were lunching at the time, however, and amused themselves by dropping a chicken bone within the ramparts. Passing over Versailles

they pierced the clouds of fast-falling snow and reached the blue sky above, with the sun shining brightly. For two hours they could not see the earth, and seemed to sit on the clouds. Darkness coming on, however, they descended very gently and threw out guide-ropes, trailing over the forest of the Duchess d'Uzes, where rabbits were seen running about the snow, and a large fox was spotted at the corner of the wood. At last, seeing two men, the aeronauts shouted "*Attrapez la corde*," and the men ran along over the fields to obey the behest, but the wind took the balloon along too fast. The grapnel was then lowered and the valve opened, and the balloon soon sat on the top of a tree and then bounded on to a second like a ball. Presently men and women came out from the village and drew the balloon down into the open, where it was carefully packed up and a cart procured, in which the party journeyed six miles to a railway station and caught a train for Paris, after a most enjoyable ascent with magnificent optical effects.

The French Aero Club.

THE following particulars concerning the French Aero Club will no doubt be found interesting by the founder members of the new English Club which has been formed with kindred objects. The subscription is 50 francs. per annum, and the Club contains 450 members; in fact it is about to move into larger premises, those in use being too small. It publishes an official organ under the name of the *Aerophile*, and has a large place of its own at Suresnes, known as the Park of Aerostation, where the sheds of M. Santos Dumont and M. Henri Deutsch have also been erected. The Club shed from which the balloons are inflated cost no less than £1,200. As regards the ascents, the Club votes £200 per annum towards their cost, and the members who intimate their wish to make an ascent are charged £2 each, the difference in the expenses being paid out of the subvention, including the freight of the balloon back to M. Mallet, who looks after them for the Club. There are four balloons in use, and they are splendidly made by Mallet and Lachambre at a cost of £140 each. So excellent too are the instruments carried that the throwing out of a single teaspoonful of sand is sufficient to show an altered record.

A Motoring M.F.H.

NOTWITHSTANDING the recent outcry against such a practice, the Duke of Beaufort goes to hounds on a motor-car. The Duke has explained to the Hunt supporters that he uses the car not to do away with horses or oats, but solely to save time in getting to meets. For one trysting-place he can leave home three-quarters of an hour later than in a trap, and that is something, he thinks, for a Master who has little time at home during the hunting season.

A Novel Contest.

DURING the last days of the Paris Salon an original contest was held, under the auspices of a big manufacturer of pneumatic tires. The competitors, who were *mecaniciens* employed by makers or private owners of automobiles, were required to remove a tire from a wheel on which it had been previously inflated hard, put it on again, and reinflate it. The winner accomplished these operations with a 92 by 12 centimetre tire in

9min. 23 3-5sec., securing the prize of £10. He is employed by Panhard and Levassor. One of Charron's *mécaniciens* took the second prize (£8), and a Gardner-Serpollet man the third (£6), their times being 9min. 35sec. and 9min. 38sec. The most curious circumstance about the contest was, however, that, according to their statement, the winners took more time for the operation than they usually do in the workshop, or even on the road.

Where do old cars go to?

A CORRESPONDENT mentions that on a recent tour in an out-of-the-way district he came across what must have been one of the earliest Benz cars sold in England. It was a quaint and ramshackle affair, but was owned by a rustic enthusiast—a retired Civil Servant—who was as proud of it as if it were the winner of the latest Paris-Bordeaux race. Having no rivals but a traction engine in its sequestered district, this ancient motor-shay held a monopoly of the honours in automobilism. The sight of it prompts our correspondent to inquire if most of the old cars have fallen into such rustication, or have the majority perished on the scrap-heap? It is highly probable that a fair number are doing veteran work of some kind still, having generally come into the hands of amateur engineers who expend incalculable energy in getting them to work, and making the task of the engine more difficult doubtlessly by the addition of "improvements," invented by the owners. It would be rather interesting to start an inquiry as to where the oldest car in England is, of the petrol type. One day we may come to regard it as a precious relic.

A SNAPSHOT AT SOUTHSEA: MRS. FRISWELL AND MR. FRANK BUTLER IN THE FOREGROUND.

Brakes Again.

THE lamentable accident to the driver of a heavy motor-van at Rockingham Hill, though needing no undue emphasis when the prevalence of horse accidents, especially with heavily-loaded wagons, during the recent frosty weather is considered, may well serve as a reminder to builders that ample brake-power is as indispensable on vans and lorries as on lighter high-speed vehicles, while the fact that they are usually shod with iron tires diminishes the efficiency of tire brakes, especially in wet or frosty weather. It is somewhat surprising that rim brakes have not been more largely used instead of remaining, as appears to be the case, a monopoly of the Wolseley firm, as they have many points of merit, not the least being that they are both powerful and cleanly. When, in the good time coming, it will be legally incumbent (as it ought to be now) on the owners of hay motors to have some means of preventing their getting beyond the driver's control, the rim brake will probably have its innings.

King Frost.

THERE are still, alas, a number—rapidly becoming, as far as influence goes, a minority—of blind reactionaries who refuse to see anything good in the automobile, and, impervious to argument, can only be left to the healing work of time. But if anything will convince the motophobe, a good hard frost, especially if following wet weather, will do it. At such a time the horse-owner, unable to go out without the fear of letting his horses down, can only abuse the local authorities for their feeble attempts to cope with the slippery state of the roads, and in the intervals envy the motorist, who goes on his way without a qualm. For Nature has beneficently decreed that frozen roads, however glassy, are with moderate care safe, and with good pneumatics comfortable, for the latter, while his engine, if the carburettor is duly protected and warmed, never goes so well as when the outside temperature is low. Nevertheless, King Frost demands even from him a certain special attention, not only against the risk of frozen radiators, etc.,—against which sufficient warnings have been published—but in the minor but important matter of frozen lubrication. Drop-lubricators, if—as they frequently are—in a position where they are not kept warm, require special attention to ensure their functioning regularly in very cold weather, owing to the thickening of the oil. And for the same reason, the ordinary oil-can is often a tedious implement to use, and one of the varieties which has an ejector valve which forcibly drives out the oil is a time-saver at this season.

Motor-Ambulances for London.

IN a brief review of the ambulance service of London, Sir Henry Burdett, K.C.B., seems to appear as a friend of the horse as opposed to the electric ambulance. His main objections are on the ground of expense and because he believes in a larger number of hand ambulances being placed about the City. But he would surely not hinder an experiment, and we hope some day to see motor-ambulances provided in all the outlying districts. Of course, there is much to be said for the hand-ambulance when it is stationed but a short distance from the hospital; but the motor-ambulance would certainly be of service in the suburban districts. When the late President of the United States was shot the value of the invention was demonstrated beyond all possibility of dispute.

To those who keep Petrol.

EVERYONE in Bournemouth who is known to members of the Town Council as the owner of a motor-car has received from the Finance Committee a copy of the Home Secretary's order with regard to the storage of petrol, etc. The Town Clerk mentioned that several gentlemen in the town had not reported the fact that they had petrol on their premises, and that the Corporation had power to obtain penalties from those who did not comply with the regulation. Possibly this item of news will be useful in other places as well as Bournemouth.

Motoring Round the Globe.

MANY people find it difficult to go twenty miles without money, but others appear to go right round the world minus a supply of current coin. People have walked round the world picking up their livelihood as they progressed, and now two motorists—from America, of course—have decided to motor round the world, so far as it is possible. From New York they will go by steamer to Ireland, and then enjoy a trip through the United Kingdom. Across France and Italy, thence up the Nile, and into the Holy Land these intrepid motorists will go, returning home by way of China and the Philippines. Then they intend to settle down as divinity students in the University of Chicago!

**Apparently
Not Quite
Fair.**

THE Borough Engineer of Southwark has been making some comparisons as to the cost of horses and motors for municipal dust collection. Taking the average day's work in Southwark as performed by a one-horse van with one collector, he has compared the result with the tests made by the Liverpool Self-Propelled Traffic Association in June last. The latter went up gradients and over a special track, while the Southwark estimate was for an ordinary road. Consequently the comparison is not strictly a fair one; and, further, Mr. A. Harrison (the Borough Engineer referred to) compares his one-horse van with a motor-van having double the capacity, which he charges with treble the help. For in the former case he only accounts for one collector; in the latter he sets down the wages of three, although the load carried is only twice as much as in the first case. With the horse-van the cost works out to 3s. 4½d. per ton; with the motor at 4s. 4½d.

**In Favour of Motor
Dust Vans.**

MR. HARRISON explains that the position of Southwark in this matter is an exceptional one. The borough is of small area, and the depôts and shoots are most economically placed. Hence rapid traction is of comparatively small importance. There are sixty-five miles of streets and no point is more than a mile from one of the shoots. The time spent in travelling is only 1 hour 56 minutes out of a working day of 9½ hours. Hence it must not be inferred that the Borough Engineer is unsympathetic with regard to motor dust collection. He followed the trials of the Liverpool Self-Propelled Traffic Association and was well satisfied that motor traction at the present day is a success, and that in a district not so economically situated as Southwark, and where the motor has to travel a good period of the working day, the results would be quite different to those relating only to Southwark, which are published in the previous paragraph.

Sign-posts.

WHEN will local authorities in this country recognise the prosperity that automobilism promises to restore to the old coaching roads and main highways? Seeing that motoring assists the circulation of money in rural districts they should do something to assist motorists by placing sign-posts along the roads directing drivers. At present this is done in a very perfunctory manner; often the sign-posts are weather-beaten and unreadable. In France these things are managed differently, and the road from Dieppe to Paris is now so completely provided with sign-posts that a foreign motorist landing in Normandy without a map would easily be able to ascertain the way to Paris by simply following the roadside directions. The entire route is divided into numbered sections, and at frequent intervals the driver or cyclist is informed by sign-posts as to the turning, inclines, distances, etc. The Cyclist Touring Club in England proposes to do something of the same kind from Newhaven to London; but it does seem a pity that a work of such public utility should have to be left to private enterprise.

**Miss Butler's
Escape.**

IN her new-found ardour for aeronautics Miss Vera Butler is inclined to vote travelling *en ballon* even safer than *en automobile*! At all events, her aerial excursions have been free of mishap, while the last one, on her little Renault car, was followed, strange to say, by an untoward incident. A day or two after they had ascended with Comte de la Vaulx and Mr. Rolls through a snowstorm, and returned to Paris by train, Mr. and Miss Butler set off for the south of France on the 5 h.p. Renault, Miss Butler steering as usual. On arriving at the *octroi*, however, half way down the hill at Versailles, the car skidded on the ice and snow, and promptly turned turtle. Both Mr. and Miss Butler were pinned underneath, with petrol pouring out, and tools and everything else that was loose falling into the road.

Miss Butler, of course, was pinned down by the steering wheel and could not stir. The *octroi* official pulled the light car over, however, and Mr. and Miss Butler crawled out, only to find, to their surprise, that they had not a wound or even a scratch. They were travelling at moderate speed when the spill occurred, and are quite at a loss to account for the catastrophe, as they had descended the same hill six times last spring in the same car. The spokes of the wheels were all broken, and the wings and lamps smashed. Sending the car by *petite vitesse* to the south of France, Mr. and Miss Butler accepted the kind offer of a passing automobilist, M. Leclere, to drive them back to Paris on his 20 h.p. Panhard, and arrived at their hotel much to the astonishment of those who had not long previously bid them farewell. No doubt the new 8 h.p. Renault, with its longer wheel-base and equal-sized wheels, will prove less liable to a *renversé*.

RIGAL AND HIS 12 H.P. RECORD-BREAKER.
(La Locomotion.)

**Spare Tires on
View.**

APPARENTLY the spirit of vain glory has possessed some American automobilists, and one of our Transatlantic contemporaries deplores the aping of tourists by motorists out for a short spin in some of the suburbs of New York. It appears that many of the motorists always carry spare tires in abundance—and in conspicuous positions on their carriages. This is due to the same sort of inanity which causes men to turn up their trousers in all weathers. No other reason can be given, and not only is it absurd in many instances, but it is said to be carried to such lengths that the public is concluding that the motor vehicle is in danger of needing a new tire at any moment. Carry spare tires by all means—and in many English places they are absolutely necessary—but do not make such a conspicuous show of them as to lead people to the conclusion that they are part of the ordinary equipment for a half hour's journey.

**Care in
Starting.**

Few people have any adequate conception of the number of parts or pieces in an automobile. And yet, despite their number, the management of a car is really simple when the driver studies his engine and takes a pride in his work. Often, however, drivers are unreasonable; and then trouble may be

expected. Some drivers start and stop their machines badly. The sudden jerk when starting a steam vehicle, caused by opening the valve too far, can only have bad results, and must eventually throw some of the finer engine parts out of gear. Sometimes, instead of slowly advancing until the vehicle has got up sufficient power, drivers put the speed lever at once at the second or third speed, and risk not only being thrown out of the vehicle, but also wrecking the motor which they have undertaken to handle. A motor must be treated like a sensitive animal which requires attention, and not like a heap of steel parts which cannot be broken or damaged.

A Great Many Little Things.

BUT to revert to the sentence with which we opened the last paragraph. A visit to an automobile factory gives a good insight into the multiplicity of parts required in a motor-car and the duplication of pieces that is essential to the completed machine. The operation of putting the radiating discs on the piping intended for the water-cooling system is interesting. The discs are stamped out by the thousand. Then they are flared out in the centre to make a bearing surface, and when they have been put in place the workman goes over them with a soldering iron and fastens each one to the pipe. An automobile using only ten feet of water-cooling pipes has about 500 of these discs, so that the completed car is really an accumulation of thousands of small pieces put into their proper order.

Motor-Waggons at Liverpool Docks.

At a meeting of the Mersey Docks and Harbour Board the other day, Mr. Robert Gladstone, the chairman, reviewed the work of the past year. With reference to motor-waggons, he remarked that if these were brought into general use at the docks, instead of horse haulage, an enormous area of shed space would be saved for the handling of goods. It might also be that these motor-waggons might solve a difficulty which had bothered the Board greatly with reference to the getting away of goods by the railways. It was almost certain that motor-waggons would come into use, and prove to be of very great advantage.

Agitation at Torquay.

THE agitation as to trams and motor-buses is extending in the fair county of Devon, and Torquay is now following the lead of the city of Exeter. Evidently strong feelings are being aroused. The Rev. J. H. Wilkinson, one of the local clergy, has fulminated against the "so-called villa residents" who selfishly object to any "means of speedy and inexpensive transit," and declares that "the cycles and perambulators which infest the roads and pavements of Torquay are a more intolerable nuisance than any trams or motor-buses could be." Here is a point that motorists might well urge. If the swiftly-passing motorist is a nuisance, what of the dilatory and lackadaisical perambulator or mailcart that is kept in the country roadway to the annoyance of horse-drawn and motor-propelled vehicles alike.

Motor-Cars and Elections.

MOTOR-CARS have generally been credited with the possession of great electoral virtues, and some M.P.'s owe much of their ability to perambulate their constituencies thoroughly at election times to the aid of friends who were able to lend such vehicles. Therefore, it is news to learn from the *Cardiff Evening Express* that "a Parliamentary candidate for a Welsh constituency lost the bulk of the farmer votes that had hitherto been given to his party for no other reason than that he traversed the farming districts in a motor-car." This reads like an exact revival of the old antipathy to railroads

on the part of those whose business was with proprietors of coaching houses. We are surprised that political antipathy should go so far—especially when it is remembered that Mr. Chaplin, one of the stoutest defenders of agricultural interests in the country, is an automobilist, and Lord Llangattock, a noted breeder of horses, is also a lover of the motor-car. Probably the young man engaged with our contemporary wanted a paragraph or two, and revived an ancient fiction in the attempt.

The late General Montgomery.

WE regret to record the death of Major-General H. P. Montgomery, which took place at Winchester late on Sunday night, at the age of 72. The deceased was one of the pioneers of automobilism, having set up a Daimler car in the summer of 1897, since when he has constantly used it till a week or two ago, when he was taken ill. On the occasion of the first Automobile Club tour some years ago, the deceased took a great interest in the event, "engineering" the motorists into Winchester. So late as the recent anniversary run to Southsea, too, he showed his interest in our movement by undertaking all the arrangements at Winchester.

Propagandist Automobiles.

AUTOMOBILES are about to be used very freely in propagandist efforts in the United States, and political and religious organisations are already making known their requirements for the spring and summer of 1902. In one specification for a lecture-van we notice that the normal load is to be from 1,000 to 1,200 pounds, and the maximum load is to be 1,800 pounds. Carrying its normal load the van must be capable of travelling at an average 8-mile speed and a maximum speed of 12 miles an hour on good roads. It must be possible to ascend an 18 per cent. grade. All control devices must be of simple construction, and must not be in the way of the operator. The front wheels are to be 36 inches diameter and the drivers 42 inches; they are to be of wood, with hickory spokes and felloes, and are to be shod with Munger tires. Roller bearings are required in the wheels. The vehicle body is to rest on four springs to support a load, if necessary, of 2,000 pounds. The machine must be capable of describing a circle, when turning, of a diameter equal to or less than twice the length of the van.

WE understand that the only British vehicle so far entered for the 1902 Gordon-Bennett Cup Race is a 30 h.p. car by the Wolseley Tool and Motor-Car Company, Limited, of Birmingham.

It is proposed that, during the course of the Automobile Club's Exhibition at the Agricultural Hall, which, as is already well known, will be held from the 19th to the 26th April next, one of the days shall be specially reserved for motorists and their friends, the charge for admission being half a crown.

THE Speedwell Motor and Engineering Company, Limited, has been registered with a capital of £10,000, divided into 4,000 6 per cent. cumulative preference, and 6,000 ordinary £1 shares, to acquire and carry on the business of the Speedwell Electrical, Motor-Car and Cycle Company, of Reading. The present issue consists of 3,000 preference and 3,000 ordinary shares. Prospectuses and forms of application may be obtained from the registered office, 134, Broad Street, Reading.

AT the Queen's Hotel, Aberdare, on New Year's Eve, Mr. W. Parker-Thomas was presented by the employees of the Aberdare Valley Motor Company, Limited, with a handsome solid silver cigarette case and match box upon his vacating the position of manager. Mr. A. E. Reynolds, who has been appointed secretary in charge, was in the chair. The presentation was made by Mr. Fred. Evans, one of the oldest public service drivers in the country, who spoke of the great kindness and consideration of Mr. Thomas for those under him. We may mention that Mr. Thomas is opening for himself at Cardiff, but is still retained by the above company as consulting engineer.

MECHANICAL FLIGHT UP-TO-DATE.

(All rights reserved.)

By SIDNEY H. HOLLANDS.

I. HISTORICAL OUTLINE.

RATHER than hark back to the apocryphal but oft-quoted aerial exploits of Dædalus and Son, the present writer prefers to fix the commencement of the era of mechanical flight development at the middle of the thirteenth century. That period certainly appears to be the earliest at which the subject is dealt with at all practically, or even intelligently. To that famed mediæval mechanic, Roger Bacon (of "Brazen Head" celebrity)—often known as "Friar Bacon," in allusion to his monastic experiences—born in 1214, is due then—in all probability—the honour of the earliest conception of artificial flight practically considered.

In his quaint treatise, "Of Admirable Artificial Instruments" (written in Latin)—he says: "That I may the better demonstrate the inferiority and indignity of magical power, to that of Nature and Art, I shall awhile discourse on such admirable operations of Art and Nature, as have not

that none but a practical, as well as a theoretical mechanic could deal with adequately. In practical work Da Vinci designed and constructed (1) winged apparatus for man-flight (*see illustration*); (2) An artificial wing, made with an articulated skeleton-frame (resembling the bat's wing) flexed and relaxed by means of artificial tendons or wires for use with a membranous covering; (3) a screw-propeller for aerial navigation. The contour of this screw thread, equivalent to the modern "blades," was formed of stout iron wire, stiffened with radius stays, and covered with varnished linen. Da Vinci's original drawings of all this apparatus are still preserved in the Ambrosian Library, Milan. It is a fact but little known that Leonardo Da Vinci was absolutely the first to apply the screw as a propeller, and then, curiously enough, to aerial propulsion.

Robert Hooke, the celebrated seventeenth century mechanician, born 1635, applied himself enthusiastically for over two years—1657-9—to the devising and working out of "Thirty Different Methods of Flying." It may be mentioned *en passant* that to Robert Hooke is due the honour of being the true inventor of the well-known centrifugal ball-governor, now in almost universal use in engine-governing. Watt usurped the

the least magic in them; and afterwards assign their causes and frames. And first, of such engines as are purely artificial:—

(3) "It is possible to make engines for flying; a man sitting in the midst whereof, by turning only about an instrument, which moves artificial wings made to beat the air much after the fashion of a bird's flight." Roger Bacon again refers to the subject in his "Sylva Sylvarum" as follows:—"Certainly many birds of good wing, as kites and the like, would bear up a good weight as they fly; and, spreading of feathers thin and close, and in great breadth, will likewise bear up a great weight, being even laid without tilting upon the sides. The further extension of this experiment for flying may be thought upon."

The next aviationist in order of time we have to deal with is no less a personage than Leonardo da Vinci, born 1452, known to the majority of moderns only as a great painter and an eminent "old master." That versatile genius was nevertheless foremost in the ranks of mediæval mechanical engineers. One of Da Vinci's best and most interesting technical literary works, viz., his "Treatise on the Flight of Birds," is one

credit of this valuable invention, and is even now frequently credited with it.

In the years 1678, 1742, and 1784 respectively, the Frenchmen Besnier, the Marquis de Bacquerville, and Gérard, all produced apparatus designed for flight by manual power. (*See illustrations.*)

In 1842 appeared the first attempt at a steam aerial machine—this was Henson's (*see illustrations*)—a large aeroplane model with twin screws. Its steam motor went fairly well, but the machine as a whole did not; it must, however, be conceded that this little machine was a very considerable advance on all precedent. This was followed in 1845 by the steam model of Cossus, depending on vertical ascensional screws, and in 1851 by that of Aubaud, having ascensional screws and aeroplanes. (*See illustrations.*) In 1863, De Ponton D'Amécourt and De la Landelle, respectively, produced model steam aerial machines having superposed ascensional screws; the latter had also aeroplanes and rudders. The steam machine of Daudel, 1864, was a new departure, having rotating wings. In 1867, Le Bris produced an improved form of his 1857 soaring machine. In this

improved machine Le Bris once soared to a height of 200 feet, and sailed a distance of about 600 feet.

Messrs. Butler and Edwards, working jointly in that same year (1867), produced another quite new departure in aerial machines—a dart-like structure, the origin of which is obvious and strangely suggestive of juvenile recreation, propelled by the reaction of a rearward jet of steam. (*See illustration.*)

It was in the year 1868 that Stringfellow produced his improved "Henson," a "three-decker," superposed aeroplane machine with twin-screws, and a steam-motor that is quite historical. This motor gained for Stringfellow the £100 prize offered by the British Aeronautical Society at the Crystal Palace competitive display of light aerial motors in 1868. (*See illustration.*) In common with Henson's machine, this would not raise itself in the air, but its motor was a very satisfactory achievement for that time, being of 1 h.p., and weighing about 14 lbs. with accessories. It is a significant fact that at the present day we have reduced even that weight per horse-power to half.

Thomas Moy, in 1875, produced a comparatively large steam aeroplane machine, designed to carry one passenger, and having twin propelling fan-wheels; its motor was of about $3\frac{1}{2}$ h.p. This machine (*see illustration*), is stated by Moy to have raised itself off the ground. The late F. W. Brearey, B.Sc., introduced his ingenious "wave-action" type of machine in 1879 (*see illustration*); his models were driven by the stored energy of india-rubber strands in torsion, and really flew very prettily, as the

present writer can bear witness. This type of machine was suggested to Brearey by seeing the curious undulatory propulsive action of flat fish in an aquarium.

In 1880, Edison designed an aerial machine, the design of which reflects but small credit on that "inventor" (*see illustration*). In the year 1884 Mr. Lawrence Hargraves, of Sydney, N.S.W., commenced a really sound and rational, as well as a deeply interesting course of experiment. Mr. Hargraves designed and constructed a great number of model aerial machines, these being of several types, all more or less efficient, giving comparative results. These little machines were well thought out in every detail. Recently Mr. Hargraves has produced several large and exceedingly light and efficient motors. For about fifteen years past Mr. Hargraves has contributed a long and valuable series of papers on aerial machines to the Royal Society of N.S.W.

Mr. Octave Chanute, C.E., of Chicago, at about the end of 1889, devoted himself largely to the promotion of Aeronautics, and early in 1894 published in New York his valuable book, "Progress in Flying Machines." Since that time Mr. Chanute has been prosecuting some valuable soaring and kite experiments with some very original and efficient apparatus. This brings us up to comparatively recent times, for at about the beginning of 1890 Mr. Maxim started on his long and instructive course of experiment, with a large "whirling table," etc., to determine the necessary power-ratio, sustaining, and propelling media, etc. The first outcome of these was his original or first type of machine—a model—(*see illustration*),

which he afterwards widely departed from in his final large machine. At about the same time as Mr. Maxim, Professor Langley, of the Smithsonian Institution, Washington—also after a long and judicious course of "whirling-table" experiments—produced his first type of steam aerial machine in 1893, which he finally developed into his celebrated and highly successful steam "Aërodrome," a large model 15 ft. by 14 ft., with a total weight of 30 lbs., and a steam motor developing $1\frac{1}{2}$ h.p. and weighing 7 lbs. (with generator). In November, 1896, this splendid little machine really made three-quarter mile of true free flight, being purposely, and not necessarily, limited to that distance. This undoubted achievement may be said to have started a new era in mechanical flight, being the most convincing performance of free steam flight on record. Professor Langley has also made numerous valuable contributions to the literature of Aeronautics and Aërodynamics.

Towards the end of 1896, Mr. C. H. Lamson, of Portland, Maine, U.S.A., produced some very interesting apparatus, and results, comprising a double "three-decker" aeroplane machine—a double two-decker aërocurve soaring machine, and a superposed kite-like "air-schooner," as Mr. Lamson terms it. The very latest production in true mechanical aerial machines is that of Herr Wilhelm Kress, of Vienna, who is now conducting a course of trials and experiments with the "aviators" to be illustrated later on. Like

Professor Langley, Herr Kress has wisely flown his experimental machine over a piece of water, thus minimising the risks of an abrupt descent.

(To be continued.)

AN illustration on another page of the present issue shows M. Rigal and his racing tricycle on which this intrepid rider has recently created so many records. The machine is fitted with a two-cylinder 12 h.p. Buchet motor.

AN Italian engineer has devised a sparking plug with two insulated terminals, the rods making an angle of about 60 degrees with each other. Centrally over the spark gap is a mica window, which admits of the spark being observed when the motor is in operation.

THERE has recently been seen a steam *dos-a-dos* in operation around the streets of New York, with a complete sand equipment, consisting of sand boxes and feed pipes leading down close to the tire of each rear wheel and terminating 1 or 2 inches from the ground. The feed pipe is spread out at the end, so that it lays a track of sand about one and one-half inches wide. The feed of the sand is controlled by a rod leading from the sand box and connecting with the brake rod in such a position that the instant the brake is put into use the sand feeds down to the ground, preventing any slipping movements of the wheels. The flow of sand may be shut off on good roads by a small check rod running to the seat. When asked about the results it had given, the operator smiled and said, "It is just the thing."—*Automobile Topics*.

SIX DAYS IN SUSSEX.

THE car was Mr. Edge's converted Panhard with Napier engines. The party consisted of my wife, myself, and my engineer—the latter because I no longer enjoy stooping or getting dirty. The idea was rather to see the places than to cover any large quantity of ground, and the runs were therefore short, as follows: To Worthing 31, Hastings 48, Canterbury 45, Rochester 26, Horsham 57, home again 38, altogether 245 miles.

We started from the nearest metalled road on a dull Tuesday about 11.30 a.m., and ran the nine miles into Chichester swimmingly in half an hour, turning there to the left for Arundel. Three or four miles along this road the engines stopped suddenly, a trick they had taken to lately. They soon restarted; the trouble on this and other occasions being due to the two low tension ignition wires lying almost bare of covering upon the exhaust pipe, and short-circuiting now and again when they had a mind to. I had an old cycling recollection of the Chichester to Arundel road as a good one, but found it unexpectedly undulating, though none of the hills amount to much. Entering Arundel, you climb one unexpected precipice, and shortly descend another, which turns out to be the main street of the town, with the castle on the top. We lunched here, but, unfortunately, it was not a day on which visitors were admitted to see the castle. An easy run took us to Worthing by the road through Angmering, which is pretty, but has two level crossings. It is not the main road, has no signposts, and twists a little, and is not, therefore, very easy to find.

We had picked up our engineer at Worthing, and started next morning about ten o'clock through Shoreham along the sea front to Brighton and on to Lewes, which also has a precipitous hill in the middle of it. We lunched at Horsebridge, near Hailsham, a place of no importance, except as indicating the branch to Hastings. The difficulty of going to Hastings this way is to avoid being drawn to Eastbourne, to which all the signposts and all the roads tend. After Horsebridge, the seventeen miles into Hastings was simple and done at a good speed until St. Leonards was reached. The car was put up at Dick Russell's stables at the reasonable charge of 1s., and we were able to obtain petrol there, a public service of cars running from the same stables.

The next morning we started at ten minutes past ten, ran through Old Hastings—which is more interesting than the tourist town—turned up its very narrow High Street, climbed up the very steep hill to Ore—450 feet above sea level—in fine style, and prepared for some easy running. But this was destined to be a day of difficulty and disappointment. The car had refused to take the second speed near the top of the hill, and given it rather a jar, and now a curious rattling was heard in the gear case. This could not be neglected, so we stopped at 10.40. We examined the gear through the hole at the top, and found several nuts loose—these we tightened—and one missing. As the body of the car has to be lifted to take off the top of the gear case, we decided to take off the bottom. To be more strictly accurate, I decided that the engineer should take off the bottom. He got under the car and did take it off, but owing to the thoughtfully inaccessible position of the nuts on the cover, it was a long job. He found the loose nut and bolt, and put it in again, but it now appeared that getting on the cover was a longer job than taking it off. My wife and I climbed a grassy bank, where we basked in the sun, and from the high elevation had a magnificent view of Rye and Dungeness. We found it easy to be philosophical, but the engineer, who was lying on his back in the dusty road, with gear case grease dropping in his eyes and mouth, did not. We could not understand how to replace the spring which pushes the friction cone into place. The engineer went a mile and a half to fetch a blacksmith with a long crowbar to help, and after we had got it up we found we had done it wrong, and that it required no violence and no assistance. We spent five hours at that roadside place, being variously jeered at or commiserated by the passers-by, but we gained experience.

We had an unsatisfying lunch of bread, cheese, and beer at a public-house hard by, and finally got away soon after four o'clock. The car ran all right, but there were other troubles. Winchelsea, a very quaint-looking place, was reached in good time, and we got safely down the hill out of the town. This hill is short but steep, very narrow, and turns round at right angles to disclose a very narrow archway, through which you have to pass. It has two danger-boards, but should be marked "very dangerous," because it is so unexpected, and I was very glad that I had approached it at a walking pace. A fine military road leads to Rye, for which you have to pay a toll both going into and leaving the town. I tried to get to Brenzett Corner, but quite in vain. There were no signposts; no one knew the way, and, unfortunately, I had not the one-inch Ordnance with me, the only map one can trust. As a result, I had four or five miles of a nightmare of a road, loose gravel with deep ruts, in which the car tried to skid, with a canal handy alongside for it to skid into. After two miles we saw a man by the roadside, and my wife said, "He does not look like an ordinary countryman, ask him the way." He was not ordinary; he was a mouthing imbecile, and could only make inarticulate noises. I do not wonder at it, living on that road! At last we came into a village, which turned out to be Appledore, and from here I found my way with difficulty and by devious roads to Ham Street, and so to Ashford. At Ham Street, and for miles each side of it, the roads were infested with sheep. There must have been a fair or something, for half a mile of road at Ham Street was solid with sheep, and some five or six times each side of it we had to pull up to allow one or two flocks to go by. It is to be observed that sheep will not, as a rule, get out of the way of a car till it actually brushes them. They are, however, better than cows, which have a habit of pretending to get out of the way and then unexpectedly turning round and standing still, facing one. The characteristics of other animals are interesting; hens always appear about to be run over, but never actually are. The barking dog, however, is very apt to fail to get out of the way. I believe owing to his calculating the speed of a car from that of horse-drawn carriages. We did actually only run over one dog on the tour, but he, fortunately, was a small one.

At Ashford we had a false alarm, thinking the water-pipe was broken, but it turned out to be only a tap open. We swept the fourteen miles from here into Canterbury in magnificent style, and arrived exactly three hours after leaving the scene of our accident. Considering the nightmare road after Rye, the flocks of sheep, devious byways from Appledore to Ham Street, and so forth, this was not bad time for forty-one miles, and looks almost as if we must have exceeded the legal time somewhere.

(To be continued.)

RUSSELL.

MR. JAMES A. O'GRADY, of Enfield, county Meath, Ireland, is now catering for the wants of motorists by keeping a stock of petrol.

A NOTICEABLE feature of the new cars at the Paris Salon was the very general adoption of new patterns of radiators. The Mercedes type is a very popular one, but it is also noticed that several new forms have been introduced in which the cooling of the water is assisted by means of a fan combined with the radiator.

Two Denver motorists, Mr. W. B. Felker and Mr. A. C. Yont, recently succeeded in climbing Pike's Peak, Colorado, in a Locomobile steam car. The feat has been attempted several times, but this is the first time anyone has reached the summit by motor-car. The two *chauffeurs* started at daybreak from Manitou for the summit. The distance is fourteen miles over the old carriage road, which is little used and out of repair. The grades are not very difficult, but the road is cut by gulleys and obstructed at frequent intervals by boulders and fallen timber. Axes and shovels were brought into use many times during the day to make the road passable, but the summit was finally attained. No accident was met with, and the travellers reached Manitou on their return late the same evening.

THE "SPEED KING" LIGHT CAR.

As briefly mentioned in a recent issue, we lately had an opportunity of testing the new 8 h.p. light car which has been put on the market by Messrs. Dennis Bros., Limited, of Guildford, and of which we are now able to publish illustrations. The frame of the vehicle is of strong tubular construction. In the fore part of this, under a bonnet, is set an 8 h.p. genuine De Dion single-cylinder motor. The water circulation is maintained by means of a Panhard type of pump and radiators. The latter are placed below the frame at the front end, while the water tank, which has a capacity sufficient for a run of 250 miles, is located under the bonnet. The motor

FIG. 1.—DIAGRAMMATIC ELEVATION.

is fitted with a centrifugal governor acting on the exhaust valve, while the carburettor employed is of the De Dion or Longuemare spray type.

Coming now to the transmission mechanism, it may first be mentioned that three speeds forward and a reverse motion are available. The forward speeds are controlled by a single lever, while the reverse is actuated by a pedal. The engine transmits its power through a pedal-operated friction clutch to the change-speed gear, which is of the Panhard type, a noticeable feature being that on the high speed the power of the motor is transmitted direct to the rear axle without the intervention of any spur-wheels. The change-speed gear is enclosed in an oil-containing box, and is connected to the rear live axle by a universally-jointed longitudinal shaft and bevel gearing, no chains or belts being used. A special stay is fitted to the rear axle, keeping the latter rigidly in position and preventing undue wear on the bevel gear used. Particular attention has been devoted to the question of braking

FIG. 2.—PLAN.

power, and to the control of the car in heavy traffic. The clutch pedal is connected with the governor in such a way that when depressed and the engine is disconnected from the transmission mechanism, all tendency for it to "race" is prevented. A second pedal, in addition to being connected with the clutch and governor, actuates a powerful double-acting band-brake on the counter-shaft. To the hubs of each of the rear road wheels a special form of expanding band brake is fitted, the braking surface

being entirely enclosed in, so that it is kept free of mud and dirt. The latter brakes are operated by a hand lever at the side of the car. Like the pedal brakes, the application of the hand brakes disconnects the clutch, and, by means of the governor, slows down the engine.

The lubricator, which is fitted to the dashboard, is provided with a three-way cock, one pipe leading to the change-speed gear case, one to the engine crank chamber, and one to the gear on the rear axle. The steering is controlled by an inclined hand wheel, in which is fitted the current interrupter. The road wheels are of the artillery type, 32in. in diameter, and are shod with Clipper 3in. or 3½in. pneumatic tires. The car, which has a long wheel base, weighs complete about 11 cwt., and can attain a speed of twenty-eight miles per hour. Having an independent frame, any type of carriage body—phaeton, *tonneau*, etc.—can be fitted. The vehicle we recently tested was fitted with a very roomy *tonneau*, glass front and detachable awning. On the high speed little if any noise, except the beat of the engine, was heard, while as to the hill-climbing capabilities of the vehicle, we cannot say more than that the steep hills in the neighbourhood of the Crystal Palace were mounted with ease. We may add that Messrs. Dennis are building a car on similar lines fitted with a 10 h.p. two-cylinder slow-speed engine.

WHEEL BASE LENGTH.

THE attempt to apply horse-drawn vehicle facts to motor-vehicle problems leads many constructors into faulty positions, remarks Mr. Chas. E. Duryea, the well-known American automobile builder. The fact that a horse can pull a heavier load if hitched close thereto is not denied, and is a fact, because the point of attachment is usually lower on the vehicle than the point of draught on the horse. In other words, the horse is so hitched that he partly lifts the vehicle, which lessens the draught, and this lifting effort increases his grip on the ground, which likewise increases his tractive ability. It is even true that mounting a rider on a horse's back will increase his pulling capacity, because it insures firmer foothold. With the motor-vehicle the short wheel base is an objection. If rear driven the tendency is to push the forward wheels under the obstacle instead of over, and the checking of movement due to the front wheels striking obstacles throws the weight forward and increases the difficulty with which the forward wheels rise over the obstacles. With a long wheel base these effects are less, and a greater proportion of the load may be carried on the rear wheels, leaving the front ones free to rise over the obstacles. These same conditions also demand, theoretically, a centre of gravity lower than the rear axle. The proportion of necessary increase of power to decrease the wheel base is hard to state, as the height of centre of gravity has much to do with it, and as the resiliency of the forward tires goes far to lessen the effect.

On the matter of side-skidding opinions differ. A heavy mass once started will continue its movement longer and against greater resistance than a light mass; so it sometimes seems that a vehicle heavily loaded on the rear wheels skids worse than one lightly loaded; but my belief is that heavily loaded rear wheels are not so liable to skid, and that a little care in driving will avoid most complaints from side-skidding. It is quite certain that a heavy load in front increases the liability of the rear wheels to slip, and when once started slipping they skid sideways easily. It is further evident that a short wheel base vehicle will swing around on a shorter arc in case of skidding, and will thus be more liable to upset than a longer vehicle, which describes a longer arc and requires more time to complete the same. This latter fact enables the driver to shift the steering so as to partly correct the skidding effect. All these facts point, considers Mr. Duryea, to the advantage of long wheel base, lightly loaded front wheels, and a quick, positive steering.

EARL RUSSELL has sent us an interesting account of an automobile tour he recently made in Sussex, the first part of which appears on another page of the current issue.

CONTINENTAL NOTES.

By "AUTOMAN."

THE great Paris Automobile Show closed its doors on Christmas Day immediately after the drawing of the winning numbers for the Tombola. I have given the readers of the *Journal* in the three last issues a short description of the novelties of the exhibition. It will not, however, be out of place, and I think it will be interesting for me to sum up the results and the impressions gathered from the show taken as a whole. To assist me in summing up, I shall make use of some statistics collected by the *Velo*. The first point that strikes me, and perhaps the most important, is the gross value of the exhibits, which reached nearly a quarter of a million sterling. This quarter of a million sovereigns is, of course, only the "sample card" of the trade, and, taking one exhibit with another, cannot represent more than a twentieth part of the stock manufactured or in course of manufacture. The stock, then, in France must be, allowing my hypothesis to be correct, at least five millions of pounds, and, if I am correct in estimating that this stock is turned over twice a

of the light cars up to ten or twelve horse-power. The speed of the motor tends, if anything, to diminish in this class of car, and the tubular frame is the most usual. In the heavy cars tube ignition is fast disappearing, being replaced by electric or electromagnetic; the latter form seems to be coming steadily to the front. The wood frame is still generally used, but the strengthening pieces are now fish plates properly and suitably constructed. The great feature in the heavy cars is the reduction in weight. This reduction, which has been going on by leaps and bounds, is not to the detriment of the strength, stability, or comfort of the car, but merely consists in the elimination of useless weight in the metal parts, which do not undergo any severe strains.

SMALL improvements in detail and finish are not wanting, and, lastly, the *tonneau* body is changing, and does not hold the field as securely as it did last year. Its back is being made much higher to keep out the dust and a third seat is being supplied. There are a great many "limousines" and also double phaetons.

IN the remarks and opinions I have made and expressed from time to time in the *Journal*, on the subject of a comparison of

FIG. 3.—GENERAL VIEW OF THE "SPEED-KING" LIGHT CAR. (See page 794.)

year, the respectable figure of ten millions sterling would represent the trade in France.

LAST year there were more heavy cars and voiturettes, but this year the fashion has set in seriously for the "light car," which comes in between the two classes above-named, and which carries off the palm in numbers, as the following figures will show:—Heavy cars, 186; light cars, 230; voiturettes, 48. Motor-bicycles have increased from 29 to 81, whilst motor-tricycles have gone down from 45 to 21, quads following in the same direction. With regard to motive power, petrol and alcohol are far away ahead, five sixths of the total number being propelled by either one or both of these products. Electricity comes next, steam being last.

PRICES have, as a rule, been slightly reduced, but, on the other hand, as the light car is fast superseding the voiturette, the total sum expended by a purchaser is on the whole increased, the purchaser, of course, getting a superior article for his money. The universal or Cardan joint is still in favour for the majority

of the French and English motor-car industry, I have tried to make my object clear from the start, but in order that there may be no possible misunderstanding on this head, I would here repeat that my only object is to bring home to British capitalists and manufacturers, first, the undoubted fact that we are behindhand, and thereby losing a very large trade which is being carried on by our neighbours over the silver streak; and, second, the reason why we are losing this trade and the way in which we can get a big slice of it. In short, doing whatever lies within the power of my pen to bring the trade to our island.

BY the two letters which appeared on this subject in the last issue of the *Journal*, I take it that both Mr. H. A. Hector and Mr. S. F. Edge are in the main of my opinion, but desire quite rightly to call attention to points which give British cars the lead in several respects. Napier has undoubtedly struck out on good lines, and if the same go-ahead spirit animates the firm in the future we may soon be able to see the Napier considerably reduced in weight and able to compete successfully across the Channel. I am very glad to see that Mr. Edge agrees

with me on the head of international competitions, and I hope the New Year will see him taking a leading position in a great continental race, the sequel to which would undoubtedly be large export orders for his firm, and a step towards bringing the motor industry to our shores.

FROM many conversations which I have had on this topic, I find that a good number of automobilists are beginning to see the force of my arguments, and perhaps some of them may be induced to offer a big money prize to the British firm who can produce a car capable of winning the Gordon-Bennett or the Paris-Vienna race. It would be a patriotic action, and would bring, if successful, a really substantial increase to our engineering output and employment to thousands. There is yet time to do this before the 1902 season.

THE Government opposition to the "automobile week" at Nice is raising quite an agitation along the shores of the Mediterranean. In the first place, the Mayor has made special representations to the Ministry, and now every commune through which the racing cars would pass is taking steps with a view to the withdrawal by the Government of the veto. In addition to this quite a political campaign is being organised on the subject, and from what I have heard the races will be held in any case. If the Government remain firm in their present attitude, the races will be held on the other side of the frontier, and the large sums of money which it brings with it will pour into Italian instead of French pockets.

MEANTIME, the negotiations for the Paris-Vienna race are steadily proceeding, and the possible routes are being discussed. Dr. Stern, a member of the Committee of the Austrian Club, and himself the winner of the Semmering hill-climbing competition, proposes two alternative routes. Both leave Paris by way of Troyes, cross the Swiss frontier at Delemont, and touch Basle, but the first route recrosses the Swiss frontier at Sackingen, and again at Schaffhausen, leaving Switzerland for the second and last time at Singer, to enter Bavaria, from whence it proceeds *via* Stockach and Messkirch into Austria, arriving in Vienna *via* Salzburg and Linz. The second route only crosses into Switzerland once, at Delemont, and leaves it to enter into Austria at Constance, whence it gains Vienna through Innsbruck, Saint Johann, Salzburg, and Linz.

IN the meantime, a third route has been proposed, in which only twenty miles of the course lays on Swiss soil, the remainder being entirely French, Italian, and Austrian. It is well known that it will be difficult to obtain the necessary authority in Switzerland, and that, *par contre*, Italy will be only too glad to give consent. It strikes me forcibly, however, that the Swiss will soon find out on which side their bread is buttered, and make an outcry against the shortsighted authorities whose "Dogberryism" will drive so much money across the frontier; for, of course, money follows the whole course of the race, as anyone who witnessed the Paris-Berlin can testify.

THE King of the Belgians went to Paris specially to visit the Automobile Show, and did the round of all the stands. Whilst visiting one of the stands of a contemporary the question of the Belgian road was mentioned, and His Majesty announced that Mr. Van Loo was actually considering the project, in conjunction with the Minister of Public Works, of a broad macadam road to connect the main road from Paris to the Belgian frontier direct with Ostend. It is obviously the object of this proposal to attract French automobilists to spend the summer at Ostend, and, moreover, as King Leopold himself has a villa there, it is easy to see how useful the road will be to him in the event of his wishing to visit Paris for a day or two. Truly the motor-car is becoming quite an important factor in life.

HERE AND THERE.

THE Fife Police Committee have asked the Head Constable to report as to the advisability of purchasing a motor-car for the use of the fire brigade.

USERS of Daimler and Panhard cars are well aware that the third speed is the one upon which the bulk of the wear occurs, and consequently requires renewing much sooner than the other gears on the change-speed gear sleeve. The first and second speeds on the sleeve rarely wear out, whilst for a few shillings the fourth-speed ring may be renewed. Hitherto, however, when

Daimler Gear Sleeve, showing method of fixing Third Speeds.

Loose Third-speed Ring for bolting to flange on Sleeve.

the third speed has worn out, the whole sleeve, costing about £8, has been thrown on the scrap heap. The above illustrations show the method introduced by Mr. Frank Morriss, of King's Lynn, of converting a Daimler gear sleeve to receive loose third-speed gear rings, and the loose third-speed half rings, which can be supplied at any time for fitting in the same way as a fourth speed after the sleeve has once been converted. It will be noticed that the old third-speed ring is turned away into a flange, of standard shape and size, with a protruding face or rim. The two halves of the ring are turned to dead size with a groove, which dovetails into this flange. This Mr. Morriss claims to be the vital part of the arrangement, as when the two half rings are bolted together a ring as perfect and strong as the former solid third-speed gear is obtained. Once the sleeve has been converted, any number of renewal third-speed rings can be supplied in the same way as fourth speeds. We commend the arrangement to the notice of public service companies especially, and to other users of Daimler and Panhard cars.

THE accompanying illustration shows the Phoenix motor-tandem bicycle that has lately been put on the market by Mr. J. Van Hooydonk, of 736, Holloway Road, London, N. So far as regards the motor, this is of the Minerva pattern, similar to that used on the Phoenix motor-bicycle, the cylinder being $2\frac{1}{2}$ in. in diameter by $2\frac{1}{4}$ in. stroke. The power is transmitted by a long belt to the rear wheel, the upper part of

the belt being guarded so that a lady can occupy the rear seat without danger. Another feature of the machine is a combined current breaker and exhaust valve lifter actuated by means of a Bowden wire. Automatic lubrication of the crank chamber is provided, and a sufficient supply of oil is carried for a run of no less than 800 miles. Large petrol tanks are also fitted, these having a capacity for a 200-mile run. The road wheels are 26 in. in diameter, and are fitted with 2 in. pneumatic tires.

THE liquidator of the Aberdeen District Motor Service Company has sold to an English gentleman the five motor-cars which were run by the company.

THE Vacuum Oil Company intimate that they have transferred their offices from Victoria Street to more commodious premises at York House, Norfolk Street, Strand, W.C.

THEIR works in Anchor Street, Chelmsford, have been sold to a firm of motor-car engineers by Messrs. Crompton and Co. The latter firm will carry on their operations in future at their new works in Writtle Street.

REFERRING to the comment in our last issue regarding motor-cars in Manchester, Messrs. Bennett and Carlisle, Ltd., of 239, Deansgate, Manchester, ask us to mention that they are the only representatives in Cottonopolis for the Locomobile steam cars.

THE Sirdar Rubber Company, of Duke Street, London, E.C., have sent us a little booklet showing sections of their solid rubber tires for motor-cars. Included in the list are a number of testi-

steepness of the hill, the driver lost control of the machine, which was overturned. The driver, a man named Ladds, received such injuries that he died whilst being conveyed to Kettering. His assistant escaped without injury.

THE opening lecture of the Winter Session of the Yorkshire Automobile Club is announced for Thursday, the 9th inst. at 8 p.m. Dr. Thresh, of Armley (vice-president), is to be the speaker, and the subject he has chosen to *thresh* out is "The Construction, Faults and Failures of Internal Combustion Engines Applicable to Automobiles." Tickets of admission are obtainable from the Committee. Members are earnestly desired to attend, and their friends are cordially invited.

At a recent meeting of the Tutbury District Council, the question was raised of an appeal to the County Council for notice boards to warn drivers of motor-cars against the danger of passing through Branstone at a high rate of speed, stated to be twenty or thirty miles an hour in some cases. It was decided that a letter be written to the Burton City Council, and also Superintendent Hicklin on the matter.

THE SOCIÉTÉ NANCÉIENNE'S ALCOHOL-MOTOR LORRY (SEE ISSUE DECEMBER 21ST, 1901).

[Le Chauffeur.

monials from users of these tires, expressing their satisfaction with the same.

THE 12 h.p. car exhibited by Messrs. Panhard and Levassor, of 14, Regent Street, S.W., at the Paris Exhibition, has been purchased by the Duke of Sutherland. This carriage, which is of the 1902 pattern, has a single speed change lever and is fitted with a body of an entirely new design, built especially by Messrs. Laboulet and Cie, of Paris.

MESSRS. R. CUNDALL AND SONS, Limited, Engineers, Shipley, Yorks, inform us that in consequence of the success of their stationary oil engines, and after much experimenting, they are about to put a heavy oil car on the market. The engine will be of the slow-speed governed twin-cylinder horizontal type, with electric ignition. At 850 revolutions per minute the engine will develop 7 h.p.

A MOTOR-WAGON owned by Messrs. Wallis, Burton Latimer Mills, Northamptonshire, and used for conveying heavy loads of flour, was being driven down Rockingham Hill on Friday of last week, when, owing to the slippery state of the road and the

GOURDIE, the young man who is charged with killing the boy Cross and injuring several other persons by running them down with a motor-car in High Street, Perth, last November, is to be brought up at the Circuit Court at Perth on the 7th inst. Mr. Arthur Dewar, advocate, Edinburgh, has, it is understood, been retained for the defence. As there are about thirty witnesses for the prosecution, and a large number for the defence, the trial is likely to be a long one.

THE Committee of the Automobile Club announce that a meeting of representatives of manufacturers and sellers of automobile vehicles will be held at the Automobile Club, 4, Whitehall Court, London, S.W., on Wednesday, January 22nd, at three o'clock, to confer with the Committee of the Club concerning:— (1) A trial of automobile vehicles in 1902; (2) a proposed trial of motor vans and delivery carts; (3) the date of the Automobile Exhibition after the exhibition of April, 1902. The Committee ask, in the event of any maker or seller of motor vehicles not receiving an official invitation to this meeting, that this announcement will be accepted as an equivalent.

FLOTSAM AND JETSAM.

By "FLANEUR."

TO a very large extent I can endorse the letter signed "W. J. Barnikel," which was published in the last issue of this journal on the subject of the Motor Union. That that body is accomplishing the feat of "hiding its light under a bushel" with conspicuous success I am not prepared to deny, but I am not prepared to accept Mr. W. J. Barnikel's inference that it is the duty of this journal or of myself as an individual to do the work which legitimately appertains to the Union officials. Nor does it seem fair, moreover, to lay the whole blame upon their shoulders. The original paragraph to which Mr. Barnikel refers was a criticism of the aloofness of the somewhat substantial proportion, among the entrants for the Southsea run, of those who neither belonged to the Automobile Club nor the Motor Union, and his contention is that these abstentions, leaving the Club out of the question, are due to ignorance of the very existence of the latter body. There are "hundreds of your readers," he says, "who know nothing about it."

It is the comprehensiveness of this estimate to which I must take exception. I have the strongest doubts as to whether one in ten of the anniversary tourists in question was unaware of the existence of the Union. The ranks of the automobilists are receiving new recruits at a very rapid rate, it is true, but the majority of those who participated in the anniversary run must have owned cars long enough to have been fully cognisant of the foundation of the Union, and to have read the prospectus of its projected operations, which was published in the automobile journals, and the report of the preliminary meeting.

MOTOR-CARS have not yet become so commonplace that men can purchase them offhand round the corner in as matter-of-fact a manner as though they were buying a portmanteau over a counter; to some extent every existing *chauffeur* knows what is going on in the automobile world, and must be an exceptionally self-confident and an exceptionally lucky individual if he can drive his car, year in and year out, without feeling his dependence at times upon other automobilists. Hence, while it may readily be admitted that there are automobile tiros who as yet know nothing of either Club or Union, the bliss of perfect ignorance could hardly be proclaimed by the Southsea tourists, and I am obliged to maintain the opinion that they forebore from joining the organisations named out of sheer laziness and an ignoble willingness to profit by the labours of others without themselves incurring either trouble or expense.

At the same time, I should be sorry to let slip any opportunity for furthering a good cause, and, if there be any reader of this journal who is really unaware of the existence or functions of the Motor Union, let it be stated herewith that that body was formed a few months ago mainly for two objects. The first was to relieve the Automobile Club, already fully engaged in good work in divers directions, of the labour of taking up legal cases in which automobilists were the plaintiffs or the defendants, a department in which there is much to do while police aggressiveness, magisterial stupidity, and horse-owners' malice are so discreditably rampant. An enumeration of the leading examples of successfully fought actions, or of monetary awards to members in respect of the fines or costs which they had incurred, was circulated to the guests at the annual dinner of the Automobile Club on the 14th of November last; I am not aware as to whether the members of the Motor Union as such received a similar synopsis.

In the second place, the Union was founded to bring within the fold of an organised body all those automobilists who were

unable or unwilling to become members of the Automobile Club. The latter are *ipso facto* members of the Union, and 7s. 6d. per head is paid out of their subscriptions to the Union funds, but members of the Union alone pay a guinea annually.

DISMISSING, however, as a matter of detail that will right itself, the mere question of whether or not the Union has been sufficiently "boomed," there is no room for doubt as to the desirability, nay, duty, of every automobilist to belong to it and assist in furthering its interests. It has always appeared singular to me that the average Englishman should be so terribly reluctant to ally himself with any concern that is formed for the corporate good, and only pay out his shillings or pounds to what will bring him a direct return. To adduce a striking example I may quote the case of the Roads Improvement Association, a body which deserves the support of every user of a motor-car, and equally of every cyclist, horse-owner, or even pedestrian. Yet its membership can probably be counted by hundreds only instead of tens of thousands. Road-users are now confronted with prospective evils in the shape of encroachments in every direction by tramway extensions, only made possible by a nefarious and never contemplated perversion of the Light Railways Act. In fighting these projects alone the Association could usefully spend thousands annually, added to which there is a comprehensive scheme of highway reform to be carried through, without which we shall never obtain scientifically-made and decently-maintained highways.

If properly supported the Association could hammer home the little-known fact that, narrow as some of our roads are, and overhung by buildings which would be costly to remove, our trunk roads were designed to be maintained across their whole width, whereas for scores and scores of miles one sees them bordered with grass. In the anti-railway days coaches used to be driven six abreast along the Brighton Road; the same could be done now without any demolition of bricks and mortar, but simply by removing the grass, and maintaining the entire available surface. There is a practically unlimited field before the Roads Improvement Association, and I would strenuously exhort every reader of these lines to enrol himself as a member, and send an annual subscription—it is little enough—of five shillings to the honorary secretary, Mr. W. Rees Jeffreys, at 45, Parliament Street, S.W. I may add that the Association really means business, and does not propose to drag out a supine existence, feebly bleating for an unobtainable Utopia; while the fact that among those who are actively engaged in furthering its objects are the Hon. John Scott Montagu, M.P., Mr. W. Worby Beaumont, and Colonel Crompton, R.E., should sufficiently commend it to the sympathies of automobilists.

Two correspondents have very properly called attention to a recent comment of mine on the subject of turning corners with a car, and the lifting of the off wheels at high speed. Whatever my other faults I hope that unreadiness to own myself in error is not one of them, and I frankly and freely acknowledge that my *obiter scriptum* was quite wrong. Perhaps the kind readers who have pointed out the lapse will accept my apologies, and charitably attribute it to the exigencies of the occasion. I cannot plead Christmas revels, or the effects of a Channel passage, but if I set the inaccurate comment down to haste, born of the desire to fly to Paris and the show without leaving arrears behind, I shall have named the actual cause of mine offending. *Humanum est errare*—you know the rest.

WE are informed by Messrs. D. Napier and Sons, Vine Street, Lambeth, S.E., that they are prepared to undertake repairs to motor-cars of all kinds. This should be welcome news to owners of automobiles who have experienced difficulty in getting repairs done by skilful mechanics.

STANDARDISATION IN MOTOR-CAR BUILDING.

THE stock answer to the demand for low-priced motor-cars is that types are not yet sufficiently fixed for their manufacture in such numbers as to ensure economy in production to the extent which has been attained in other branches of mechanical work, a statement true for the most part, and leading to a general aspiring towards "standardisation." This is, indeed, a word to conjure with in these days, and one accepted by many as a full, perfect, and sufficient explanation of American and German manufacturing success, and the panacea to restore our own precarious position in the same branch of industry. But, like most expressions useful in controversy, it owes much of its virtue to inexact definition, and, in connection with the present subject, offers at least two aspects which may be roughly distinguished as that of the manufacturer and that of the user, though naturally progress of any kind should affect both. The former of these involves the evolution of a type of machine sufficiently near perfection not to be liable to sudden supersession or changes needing important structural alterations, a good instance of the kind appearing in the modern bicycle. Here the result of a standard type has been to evolve, along with a certain number of bicycle firms, others whose business is specialised into the production of tubes, chains, bearings, and other components, and an immense number of local makers whose work consists solely in assembling the same. The only case in automobile work showing any parallelism is that of the American steam car, and though this is not without merit, it is at least questionable whether improvement has not been sacrificed to permanence of pattern, to demand which of the motor-car at this stage is somewhat premature, though the tendency to unification of type among cars in general gives promise of its approach in the future. When it arrives, the industry of assembling cars from parts supplied by big firms will probably receive a great impetus, though whether this is a desirable result is perhaps questionable.

The other aspect, which may be defined as the standardisation of parts, as opposed to that of design, is one which admits even now of partial realisation, and appeals more immediately to the user. The great original step in this direction, namely, the Whitworth thread, has benefited him to an extent which is not easily realised. It "comes natural" to hunt for a nut in a country blacksmith's shop in the full expectation of finding one to suit, or at least a tap to match, and what the motorist's troubles would have been with the chaos of screws existing in pre-standard days lies beyond his experience. Even here, however, the standard may have its disadvantages; a finer thread in some motor parts, especially where adjustment is necessary, would have points in its favour, and the writer has occasionally used such in defiance of future trouble in replacing studs and nuts that *would* work loose in spite of all efforts to lock them. Chains, fortunately, are fairly uniform, chiefly owing to their production having been for a time a practical monopoly, and the popularity of the tricycle has led to such a wide adoption of the De Dion ignition plug as might well be universal, most varieties being obtainable in this thread. It is to be regretted that nuts and bolt-heads have not, as regards their external sizes, yet fallen into standard line, most cars needing an absurd multiplicity of spanners, but beyond these and the lighter types of ball-bearings, it is difficult to suggest as yet any further practicable uniformity. The principle of interchangeability of parts, however, or a strict adherence to standard within the limits of one factory and one year's production of cars, might be much better observed, though it involves an adherence to gauge and template not always realised by even skilled workmen in this country, and until progress becomes slow enough for the principle of standardisation to extend to engines, gearing, and frames generally, the approach to it within these limits will have to suffice the motorist, and he will not be unreasonable in demanding it.

R. W. B.

It is on Wednesday, the 12th February—not the 13th—that the Lord Chief Justice Clerk of Scotland will read a paper on "Reminiscences" at the Automobile Club.

THE PARAGON SIGHT-FEED LUBRICATOR.

THE lubricator shown by the accompanying sectional drawing has been specially designed for use with petroleum spirit-motors, and has a number of advantageous features, among which should be mentioned its compactness. The filling arrangement consists of a screw-down slide filler. Referring to the illustration it will be seen that the slide A screws down on and around the lid of the cup, and has a loose plug which covers the filling hole when the slide is swung over to a closed position. The loose plug is so arranged that the wear on same can be adjusted by turning down the screw B. This construction makes it possible to secure a large filling hole—a very desirable feature.

The feed can be put on or off by raising or lowering the cam lever C. The rate of feed can be adjusted by turning the nut D, which is prevented from loosening by a spring E. By this arrangement the feed can be set and turned on or off without disturbing the rate of flow. The cup is thoroughly packed both around the stem and at the top and bottom of body and sight feed glasses, therefore cannot, it is claimed, become leaky. The whole cup is secured together by a special lock-nut construction, which is said to make it impossible for the cup to jar apart.

through the shaking of the engine, and also to dispense with the annoyance of oil leaks. The sight-feed glass R is large, and can readily be cleaned by unscrewing the upper part of the cup from the base piece. This lubricator is manufactured by the Lunkensheimer Company, of Cincinnati, Ohio.

THE Government of Porto Rico has ordered two automobiles for the use of the Public Works Department.

DEANS AND Co., LTD., has been registered with a capital of £5,000 in £1 shares, to take over the business of cycle and motor manufacturers and repairers, etc., carried on at Selby or elsewhere as Deans and Co. Registered office: The Holmes, Selby, Yorkshire.

THE Sussex Automobile Company, Limited, has been registered with a capital of £4,000 in £1 shares. Object, to acquire from H. C. Harris and W. L. Duck the business of agents and factors, makers and repairers of automobiles and accessories now carried on by them at 163, Western Road and Castle Street, Brighton, as the Sussex Automobile Company, and to carry on the said business. The first directors (to number not less than two nor more than five) are C. Harris (chairman) and W. L. Duck. Registered office, 163, Western Road, Brighton.

CORRESPONDENCE.

THE WEIGHT OF MOTOR-CAR BODIES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your article in a recent issue on the question of durability of motor-carriages and the excessive weight in the past of English coach-building, has, I venture to think, no difficulty, so far as English manufacturers are concerned, for the future. Less than two years ago the carriage bodies which I purchased, and had made for me, in England weighed nearly three hundredweight. To-day we are getting most beautiful designed, roomy and comfortable bodies of every description, luxuriously upholstered and sprung, the largest of which, to hold four people, weighs under 100 lbs. This result has not been achieved in one leap, but by continual improvement in detail, and by making the body entirely of aluminium, not a particle of wood being used in its construction. A new type of workman had to be employed and trained in making this type of body, but the result has been well worth the expenditure of time and money, as it means a reduction of over 200 lbs. in weight on a large motor-carriage.

Then, again, we come to the frame. Eighteen months ago we had to get a channel steel section, cut it into length and bolt it together, all of which meant weight. Now we have greatly improved material and a saving of nearly one hundredweight in the channel steel frame alone, owing to the better methods of construction, doing away with all joints in the frame, and at the same time a more suitable material. In the wheels the same happy state of affairs exists, a saving of 25 per cent. has been effected in the weight without any reduction in strength, owing to our having had time to get very much finer wood more suitable for the work it has to do.

I just mention these few points, but throughout the whole, at any rate of the "Napier" motor-carriage, improvements of this sort have been going on continuously since their first great success in the thousand miles competition organised by the Automobile Club. If the matter is of interest to your readers I shall be pleased to detail the various parts in which weight has been saved, and how it has been saved, at a latter date.—Yours truly,

S. F. EDGE.

MOTOR-BICYCLES FOR 1902.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am pleased to learn that I misconceived Mr. Teschemaker's attitude towards motor-cycling, that is to say, his attitude of three weeks ago, for I now observe that he appears to forget what he then wrote against it, as not one phrase in his previous tirade can by any possible means be read to convey what he now admits, that one "will get much enjoyment out of it." But if I have misconceived Mr. Teschemaker, I must this week return the compliment, for most assuredly I never tried to upset the point that a bicycle-motor will not usefully develop more power than its belt will transmit. To start with, this point was never made in his letter, and what I *did* imply was, that catching hold of the large pulley and making the belt slip on the small one, is not a fair test of the belt's capacity to transmit power, from the small, to the large, and that was Mr. Teschemaker's test and method of applying it in the sentence I criticised. His new reading of the previous letter turns an obscure point into an obvious fact, which I should no more try to upset than I should try to push a jibbing Panhard up Ben Nevis.

I trust that Mr. Teschemaker will get much pleasure out of the new motor-cycle he has ordered, and that he will write and tell us his experiences of it in due course. May I inquire if he has ever ridden a Wolfmuller or a Pennington? They were both rear driven direct by horizontal cylinders on to small wheels, and both "proved themselves," which, as Mr. Teschemaker says—and here I beg to agree with him—the Holden has yet to do. It certainly is a well-made and carefully-thought-out machine, and that is half the battle. There still remains, unfortunately, the other half.—Yours truly,

A. E. S. CRAIG.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Being the possessor of a Werner 1900-pattern motocycle I have been reading with much interest the many letters which have appeared in your columns on the subject of motor-bicycles, and the Werner in particular. As I am intending to purchase another motor-bicycle I have studied the new type Werner, and find that, practically, every fault in the front driver of which complaint was made has been remedied in the new.

I have particularly noted the following improvements, viz., carburettor, lubrication, flat-belt drive, absence of side slip, and general finish. The carburettor is now a simple automatic spray carburettor, no float being used. A means of lubricating the engine while running is provided, and a supply of oil for 200 miles can be carried. Regarding the drive, particular emphasis is laid upon the fact that in practice, and after trying many other types, the flat belt fitted to the new Werner has proved the most satisfactory. Side slip is said to be felt less than on an ordinary safety, owing to the length of wheel base, weight being low down and properly distributed between the wheels, and, what is most important, rear-driving; also tires with vulcanised non-slipping treads, made specially by the Dunlop Company, are fitted.

Contrary to a remark made by one of your correspondents (Mr. Fawcett, I believe), I am told that the new Werner is even faster than the old; the why and wherefore of this is not difficult to understand—a larger engine, spray carburettor, and more effective belt being fitted. I am also assured that the finish of the 1902 machines will be of a higher standard, as they

are being prepared specially for the English market. I hope that the correspondence in your columns re motor-bicycles will continue, as I am sure it will be of interest to all motorists and those intending to take up this really exhilarating pastime.—Yours faithfully,

J. L. PITCHER.

[1]

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your correspondent, "Electrical Engineer," wishes to know what the "regulator" is as applied to my Werner (1900). Allow me to say it is simply an ordinary throttle valve fixed in the supply-pipe just before the mixture enters the explosion-chamber. In the 1901 pattern Messrs. Werner have arranged it in a very neat form; mine, which was made soon after I bought the machine, is adjusted by a wheel and screw in such a way that the full power can be applied instantaneously if required. I shall be pleased to let "Electrical Engineer" see my machine should he like to make an appointment any time after January 10th, at 4, Oxford Road, Ealing.—Yours truly,

T. FREDK. HUNT.

MOTOR-CARS FOR THE TROPICS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In further reference to my letter published in yours of December 21st, I should like, with your kind permission, to make a few further remarks, as from what I see in the same issue I think they may be useful to your readers.

On page 768 it is stated that "Dr. Boverton Redwood expressed the opinion" ending with the following: "Experiments, however, proved that no such spark would ignite petroleum or the vapour rising from it." Now, from what I have heard of Dr. Boverton Redwood, I can only come to the conclusion that he has been wrongly reported, or that great ignorance on the subject must undoubtedly prevail even now in England.

I made a long series of experiments over sixteen years ago on this subject. I found later that I might have saved myself all this trouble by buying a book upon the subject which I saw later, as the knowledge was common property. However, personal experiments always teach one more, and the knowledge thus learned sticks to one. I used vapour of gasoline, benzoline, bisulphide of carbon, alcohol, etc. I used an electric spark from an induction coil giving $\frac{1}{2}$ in. in air; also from a frictional electric machine, and white-hot spiral of platinum (both free and also wound round a porcelain bar). I used all richnesses of vapour at atmospheric pressure, and I never got an explosion till the mixture was compressed, and then only when gas and air were in correct proportions. (I am writing 8,000 miles from my workshop and notebooks, but I think I got one explosion from a very hot flaming platinum on the point of melting.) An open flame I found, on the contrary, will explode at atmospheric pressure and almost any admixture. Further, I found that compression alone will, when carried far enough, explode a mixture spontaneously. Years later, when erecting Hornsby-Akroyd oil engines, I found this principle employed, and after I had erected a large number I tried it again on petrol, and found it worked all right. I think people are deceived by their acquaintance with coal gas, which ignites easily from a spark at atmospheric pressure. Pure hydrocarbon gas will not. If you doubt me try it by means of the usual gas lighter (frictional, giving a $\frac{3}{4}$ in. spark).

I went very fully into all this many years ago. I made a machine for making gas from any hydrocarbon, sufficient to supply a 3 in. pipe continuously. I had seven hundredweight of iron weights driving a large fan under water, supplying air to the carburettor; the weights drove clock-work, and had a fall of 20 feet. Gasoline came out best of all, and cost me 12s. 6d. per 1,000 feet, and drove a 5-h.p. engine well. I afterwards dropped it all, and used the vapour direct from a carburettor as everyone nowadays does. When I have secured a patent—in a short time I hope—I will tell you something else I found out, not at present in use.—Yours faithfully,

F. H. H.

THE "ALLUMEUR ELECTRO-CATALYTIQUE."

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The allusion by "Automan" in last week's *Journal* to the above ingenious invention has struck me a good deal, and its introduction to the market will, no doubt, be watched for with interest by motorists in this country. If a success, it should prove invaluable as a substitute for tube ignition, and enable one at least to get home, in the event of the ordinary electric ignition going wrong. Inability to advance or retard the sparking would be a disadvantage, but otherwise the idea sounds very promising.—Yours faithfully,

S. P. ALEXANDER, M.D., M.R.C.S.

A QUERY RE STEAM-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The answers to my query re exhaust steam showing from steam-cars are disappointing. The circumstances under which the car will run satisfactorily and keep within the law as to emitting steam are, according to "Condenser," that the air must be sufficiently cool to condense the exhaust steam, which on a hot summer's day is not to be met with, when the thermometer stands between 70 and 80 deg. in the shade.

"Chauffeur," in your issue of December 21st, admits that on a hill the condensers fail to condense all the steam, and as I live in the switch-back

county of Devon I should be in a chronic state of breaking the law, and being "run in" by the intelligent country police. I intend having a motor-car as soon as I can decide which sort. I lean to the steam-car because it is practically noiseless, and has little vibration, and one can stop and converse with a friend without having to raise one's voice or be shaken to pieces as with a petrol car, but with the latter one need not appear before the county bench unless one voluntarily breaks the law by excessive speed, but the steam-car breaks the law for one by the emission of steam on hills, and in cool or damp weather. In nearly all the photographs I have seen of running steam-cars the steam is visible. I grant the steam-car is the most comfortable in a level country and in towns, but for touring in a hilly country I am afraid it is a failure.—Yours truly,

NAVAL ENGINEER.

THE MOTOR UNION.

To the Editor of *The Motor-Car Journal*.

SIR,—Surprise has been expressed that the Motor Union has not been advertised. It has been felt wise that, before taking steps to make the Union generally known to the public, the Union should be able to show a report of work done, which would satisfy automobilists generally of its utility. I am directed to ask that you will kindly allow me to point out to your readers the following few particulars concerning the Motor Union:—

- (1) The Motor Union absorbed the Motor Vehicle Users Defence Association, which had done most useful work.
- (2) All members of the Automobile Club and its affiliated clubs are *ipso facto* members of the Motor Union.
- (3) All automobilists may become members of the Motor Union without election on payment of a subscription of £1 ls. per annum.
- (4) The Union does not attempt to defend prosecutions for furious driving unless it is abundantly clear that the prosecution is vexatious and without cause.
- (5) But the Union specially devotes itself to fighting cases in which great principles affecting automobilism generally are concerned.
- (6) At the same time, it renders, and is rendering, valuable advice to motorists who have had actions brought against them.

The following are a few of the principal cases which have recently been fought by the Motor Union:—

Steam-cars.—Mr. Arthur Sharpe was summoned under the following three heads:—(1) For working a locomotive without a licence; (2) for travelling at more than four miles an hour; (3) for failing to employ two persons to attend on the locomotive. The case was taken up by the Motor Union, with the result that the three charges were dismissed. If this case had failed it would have rendered steam-cars liable under the Traction Engine Act upon a temporary failure to conform to the Light Locomotives Act, and would have almost put an end to the use of steam-cars in this kingdom.

Storage of Petrol.—The appeal defended by the Union on behalf of Messrs. Napier and Sons established the fact that manufacturers, merchants, and agents of motor-cars may store petrol, or may use or keep the same on their premises for use, and for the purpose of running their cars, without a licence. If this appeal had not been defeated by the Motor Union power would have been given to local authorities throughout the country to refuse to grant licences to store petrol and otherwise to hamper manufacturers of motor-vehicles. The case was, therefore, of vital importance.

Damage to Vehicles.—The Hon. Leopold Canning's case was one in which a claim was made for damage to a milkcart. By the timely intervention of the Union the case was abandoned. In thanking the Union for their prompt action, Mr. Canning wrote:—"When the solicitors of this man found that I had the whole of the Automobile Club and the Motor Union behind me . . . their plans were completely frustrated, and when I showed them the letter in which you had promised to contribute not less than five guineas the case fell through at once."

A Collision Case.—In a recent case of collision at Leicester, a member of the Union wrote for advice which was at once given, and as a result the member in a letter of thanks says:—"You will no doubt be pleased to hear that through it I have been able to make a satisfactory settlement."

But the most important work which has been carried on by the Union in conjunction with the Automobile Club is the legislative work, viz., the attempt to bring about a change in the law affecting automobiles. A committee composed of very influential gentlemen is now sitting regularly with a view of preparing a Bill, and it is thought probable that this will be introduced into Parliament next session. It will be seen from the above short statement that the Union is by no means dead, but is an active, and, it is believed, extremely useful body. It is intended to make the purpose and work of the Union fully known at an early date. In the meantime, automobilists are reminded that they may join this body at once by sending one guinea to the Secretary of the Motor Union, Automobile Club, 4, Whitehall Court, S.W.—Yours truly,

C. JOHNSON,
Secretary.

WE hear that the New Orleans Motor Company, of Twickenham, are at work on a new four-cylinder car.

THE Belgian Automobile Club is considering a proposal to organise a 500-kilometre tour of Luxembourg during the coming season.

EDINBURGH AUTOCAR COMPANY (LIMITED).

A SPECIAL meeting of the shareholders of the Edinburgh Autocar Company (Limited) was held last week for the purpose of considering a resolution for the winding up of the company. At a recent meeting it was agreed that the directors should issue a prospectus asking for additional capital of £5,000, failing the raising of which the company should be wound up. The Chairman said the directors had gone fully into the matter of raising the capital. They issued a prospectus as widely as they thought advisable, and the result had not been what they expected. At least they had not got the £5,000, and they now awaited the shareholders' orders to proceed with the appointment of a liquidator to wind up the concern. They were at present working with six or seven cars, and the company had not been called upon to draw on the capital for ordinary expenses. It was no longer possible, however, to keep going with the small capital they had, and it would not be fair to any parties to continue the concern. He moved that the company be formally wound up, and that Mr. W. A. Middleton, C.A., be appointed liquidator. Mr. Robert McDonald seconded. In answer to a shareholder, the Chairman said they would see that the shareholders got every information possible. The motion was unanimously carried.

AUTOCAR SUPPLIES, LTD.

IN the Companies Winding-up Court, Mr. Justice Wright again heard an application arising out of a summons by the Autocar Supplies, Ltd., of Great Russell Street, for possession of the premises. Mr. Gore-Browne said the matter formerly stood over in order to see whether Mr. Selbach made an offer to the company by the previous day. Mr. Herbert Reed, K.C., with whom was Mr. Ford, said Mr. Selbach only returned from Paris on Friday the 20th ult. The Official Receiver said he had an offer of £580. Mr. Selbach was prepared to pay £550—10 per cent.—at once, and the balance within ten days. The Official Receiver accepted the offer, his Lordship intimating that unless Mr. Selbach completed the offer he had made he must go out of the premises.

THE MOTOR-CAR.

A song to the motor-car,
The wonderful, swift motor-car!
So stealthily gliding,
Slower traffic deriding,
'Tis a rollicking, gay motor-car!

A song to the motor-car,
The excitingly gay motor-car!
There's exhilaration
And wild exultation
In the rush of the fast motor-car!

A song to the motor-car,
The nerve-trying motor-car!
Dust clouds when 'tis light,
Eyes of fire when 'tis night—
Awe-inspiring's the motor-car!

A song to the motor-car,
The rushing Juggernaut car!
All dogs should have dread,
Lest like pan-cakes they're spread
On the track of the fast motor-car!

A song to the motor-car,
The cautious, though swift, motor-car!
Little children to shun
On its path when they run
Is a rule with the swift motor-car!

Brain and heart in the motor-car
Have had part in the motor-car.
The most patient skill,
Strong muscle and will,
Have evolved the fine, swift motor-car!

Then three cheers for the motor-car,
The time-saving, gay motor-car!
Soon all visits we'll pay,
Soon we'll shop day by day,
In our elegant, swift motor-car!

ALICE.

FURIOUS DRIVING CASES.

AT Perth, Frederick Jenkins, a motor-car driver, in the employment of Captain Slavenger, was charged with having, on 1st December, (1) on the public road leading from Perth to Coupar Angus, and at a part thereof in Scoone parish between the third milestone from Perth and Kinneir's Inn, driven a motor-car at a greater speed than twelve miles an hour; (2) and on said road, between the first and second milestones from Perth to Scoone, driven a car at a speed of fifteen miles an hour. Accused denied the charge. Two police constables, in the course of evidence, stated that they were stationed at the first and second milestones leading to Scoone, and they kept a note of the time the accused took to travel the mile, which

was a few seconds less than five minutes. Accordingly Jenkins had been travelling at the rate of over twelve miles an hour. Sheriff Sym, in deciding the case, said there were many instances on the roads in the neighbourhood where the pace should not nearly approach even twelve miles an hour. The only meaning of the words "twelve miles an hour" in the regulations was that in no case was that to be exceeded. For the first offence accused would have to pay a fine of £2 10s. On the second charge he would dismiss accused with an admonition.

At Edinburgh, Bailie Waterston gave judgment in the charge against Alexander Rose, a motor-car driver, who was accused of having on Saturday, 23rd November, driven a motor-car in Atholl Crescent, Atholl Place, and West Maitland Street in a furious and reckless manner. Evidence was heard at a previous sitting of the court. The magistrate said that taking the whole evidence into consideration, and also the previous good character of the accused, he found the charge not proven.

At Enfield Petty Sessions J. D. Hill, of Portland Mansions, Baker Street, London, W., was fined 10s., and costs, with the alternative of seven days' imprisonment, for furiously driving a motor-car to the common danger at Botany Bay, Enfield. It was alleged that he drove at a speed of between twenty and thirty miles an hour, a statement which he characterised as a ridiculous fabrication. He was driving at the rate of twelve miles an hour, he said, and the highest possible speed of the car was only sixteen miles an hour.

AN INTERESTING POINT OF LAW.

At Cullompton last week, Messrs. Fox Bros. and Co., of Wellington, were summoned for, being the owners of a locomotive, they did not cause it to be instantly stopped on one William Trott, who was driving in an opposite direction, holding up his hand as a signal. Mr. W. T. Booker (Wellington), who defended, contended that the offence was covered by the Act of 1865, whereas this was a motor-car used by Fox Bros. to convey wool between Wellington, Uffculme, Cullompton, and other places, and as with its vehicle it weighed less than four tons unladen, it came under the Light Locomotives Act, 1896, which exempted this offence as applied to such vehicles. In reply to the Bench, Mr. Booker added that the engine and vehicle were all on one platform, and he contended that it was not necessary to build the motor and vehicle separately, and link them together for use. The Bench read the Act as meaning that the vehicle must not weigh over three tons unladen to be regarded as a light locomotive. They decided that, inasmuch as the mechanical part of the engine and the trolley were all one vehicle in this case and weighed over three tons, the motor did not come under the Light Locomotives Act, 1896. They would state a case if necessary, as the point was an interesting one that ought, perhaps, to be cleared up. They also expressed a wish to hear the evidence.

W. Trott, farmer, Uffculme, said he met the motor-car in Commercial Road, Uffculme, on November 26th, and held up his hand at one hundred yards distance and again at fifty, also shouted, but no notice was taken by the driver of the car. Witness's horse swerved, and he narrowly escaped an accident. On every previous occasion he had met the car the driver had pulled up when requested.

Bennett and Curtis, the driver and stoker respectively of the motor-car, swore that the speed of the car was slackened at one hundred yards, as they saw Trott's horse was restive, although they did not see him hold up his hand, and at fifty yards from the horse the car was stopped dead. The engine was kept running, however, as that was sometimes necessary to keep down steam or pump water into the boiler. The magistrates said the fact that the engine was kept running perhaps accounted for the discrepancy in the evidence. The witnesses added that Trott backed into the carriage drive at their request, as the road was narrow, and they thanked him for doing so. The magistrates said, in view of the conflict of evidence (each party perhaps believing he was right), they would give the defendants the benefit of the doubt and dismiss the case. Mr. Booker asked whether, in view of the magistrates' reading of the law, the car must in future travel only four miles an hour, and have a third person to give assistance. Mr. Hepburn said a reduction in weight would meet the case, and bring the car within the Light Locomotives Act.

RESPONSIBILITY OF MOTOR-CAR DRIVERS.

In the Southampton County Court, E. W. Balne, of the Grapes Hotel, Southampton, sued F. Baker and Son, merchants, Northam Road, Southampton, from whom he claimed £1 in respect of damages to his motor-car, alleged to have been sustained whilst the car was standing in Castle Lane, Southampton, on Wednesday, September 18th, as the result of defendant's carman trying to pass the car with a horse attached to a coal cart. Mr. Godwin appeared for plaintiff. Plaintiff's evidence was to the effect that on the day referred to he left his motor-car standing outside the office of Messrs. Paris, Smith, and Randall, and that a coal cart belonging to defendants collided with the car and broke the splashboard off. Albert Lowe, clerk in the employ of Messrs. Paris, Smith, and Randall, said he moved the motor-car to allow the coal cart to pass, and left plenty of room for that purpose. The driver of the cart tried to drive his horse and cart past the car instead of leading the horse, and the cart collided with the car. The driver of the cart, for the defendants, said he had waited some minutes for someone to move the motor-car. He was careful in trying to

pass the car, but there was not room. His Honour said he did not think the owner of the motor-car had any right to leave it where he did unattended, and gave judgment for the defendants with costs.

MORE ABOUT A SPITTELEGATE PROSECUTION.

At the Spittlegate (Grantham) Petty Sessions, Mr. C. E. W. Lucas, on behalf of Mr. S. Harvey, nurseryman, of Nottingham, who was some weeks ago fined £5 and costs for furiously driving a motor-car on the Great North Road, again applied for a summons for perjury against Police-constable Bean. Sir Hugh Cholmeley, Bart., said the magistrates had given the application their careful consideration, and they came to the unanimous conclusion that that was a case in which they ought not to issue a summons against Police-constable Bean, and the application would be refused. Mr. Lucas said it was very unusual for a Bench to refuse a summons, and he would have to take instructions from his client as to further proceedings. Mr. Harvey said he could carry the matter further, and he would do so.

THROUGH A SHOP WINDOW.

At Westminster Police Court, Charles Robinson, motor-car driver, was charged with being drunk at Parkside, Knightsbridge, while in charge of a light locomotive. A charge of obstructing the police was preferred against Reynolds Barker, clerk, who gave an address at Chiswick. The police evidence was to the effect that the two men were in the motor-car early on Sunday morning, and that proceeding along Knightsbridge the machine was recklessly driven. Someone shouted, and the motor-car then ran on to the pavement and into the front of a shop window, which was smashed. Both the prisoners were evidently under the influence of drink, and wanted to drive off. When Robinson was taken into custody the other prisoner tried to get him away and asserted that the police were exceeding their duty. Mr. Dutton, who defended, said the fact was the motor skidded on the wet pavement. The prisoners had behaved foolishly, and of course the damage done would have to be paid for. Mr. Horace Smith said the conduct of the prisoners was most dangerous, and he fined each of them 40s.

On Tuesday, Mr. Gwilym Evans, the presiding magistrate at the Llanelly Police Court, warned motor-car owners against furious driving.

The rewards mentioned in our last issue with regard to the War Office motor-lorry trials, were somewhat premature. The Committee has not yet issued its report on the tests, and it may be some little time are it makes its appearance.

For the information of riders, the Chater Lea Manufacturing Company, of Golden Lane, E.C., have issued a leaflet giving particulars of their motor-bicycle fittings, with an illustration showing the machine built up. All the parts have been specially strengthened in view of increased strains and vibration, and they are in many respects similar to the firm's well-known tandem bicycle parts.

MR. H. J. BRETHERTON, a London engineer, recently wrote to the Winchcombe Rural District Council offering to run a motor-wagon or light traction engine from Cheltenham to Winchcombe if he could be assured of the support of the local inhabitants. The Council declined to assist in the matter. Electric trams are at present running along the greater part of the road to which Mr. Bretherton refers.

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, JANUARY 11, 1902.

[No. 149.

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

ENTRIES for the Gordon - Bennett Cup closed at midnight on the last day of the old year, and up to a late hour it looked as though no challenger would attempt to wrest the coveted trophy from its French holder. Literally at the eleventh hour the Automobile Club of France received a wire from the A.C.G.B.I. entering for the race. The contest will therefore lie between England and France.

It will be remembered that Mr. S. F. Edge's 50 h.p. Napier, which was entered for the event last year, was, though it ran in the Paris-Bordeaux, per force of circumstances withdrawn at the last moment. A condition of the Cup is that every part of the car competing must have been made in the country which it represents. Unfortunately, Mr. Edge was compelled to exchange his British tires, damaged on the road between Boulogne and Paris, for a set of foreign manufacture. As stated in our last issue, the firm who will endeavour to wrest the Cup from France is the Wolseley Tool and Motor-Car Company, Limited.

Maidenhead Bridge Tolls.

AN extensively-signed petition from Berks and Bucks has been presented to the Charity Commissioners against the alleged right of the Maidenhead Corporation to levy tolls over Maidenhead Bridge. The petitioners urge that when the bridge was built, in 1772, tolls were created for the maintenance and repayment of loans, and that the Corporation are now in receipt of yearly rents which are more than sufficient for maintenance purposes. They also contend that the funds received by the Maidenhead Corporation are charitable funds, and that the Corporation ceased to have a right to administer them in 1836, when their administration should have passed to trustees appointed by the Lord Chancellor.

The Dust Nuisance.

As previously announced, the Automobile Club recently offered a prize of 100 guineas and a diploma for a practical method of removing or alleviating the nuisance of dust arising, to the annoyance of other users of the road, from motor-vehicles fitted with pneumatic tires. At a meeting of the Club Committee, held on November 7th last, a report was submitted as to the devices submitted in competition for the prize. It has been decided that, as the report was to the effect that none of the devices submitted were satisfactory, the period for the submission of devices for competition for the prize shall be extended to Monday, 2nd June next. It is thought that this extension will give an opportunity to those submitting devices to make experiments during the dusty weather.

Electromobilism in 1901.

IN the current issue of the *Electrical Times* appears an article from the pen of Mr. Theodore G. Chambers on "A Review of Electromobilism in 1901." After reviewing the progress made with electrical vehicles on the Continent and in America,

Mr. Chambers remarks that "as to the prospects of the future, it may be definitely stated that the experimental stages have been passed. Electromobilism in England has suffered from several adverse influences. The premature birth and early failure of various electric carriage and omnibus companies before sufficient experience had been gained, together with the placing of inefficient carriages on the market, estranged both capitalist and purchaser. Efficient electromobiles of English construction can now, however, be placed upon the market at prices ranging from £250 to £400; constructed to run from 35 to 70 miles on one charge, economical in running and cheap to maintain. The accumulator of to-day, without claiming to be perfect, is a sound commercial article, with a known life and a known and reasonable cost of upkeep. There is already a large demand for electric cars for both town and country use. With the extension of light electric railways a large field is opened up for electromobile 'feeders' where permanent ways are impracticable. The future is full of possibilities, and there is no valid reason why English capital and English brains should not combine to found a permanent and lucrative industry."

A Good Start.

WHATEVER other people may have done, the proprietors of the Carlton Hotel have begun the New Year well. On January 1st a day and night service of electric motor-cars furnished by the City and Suburban Electric Vehicle Company was inaugurated, and as Lady Brassey was the first to employ one of the new vehicles, her ladyship may be regarded as having unofficially started the service. Unlike the cabs which plied for hire on the streets of London some three years ago, the Carlton landaulettes are essentially light and neat in appearance, and may be recognised by their colouring—black and pale yellow. Electricity as a motive power has, from its many obvious advantages where only short journeys are anticipated, found favour with English ladies from the Queen downwards. Experience of this most pleasing form of locomotion gained whilst enjoying the hospitality of the Carlton should do much to further the cause in England.

The Nice Week.

IN spite of reports to the contrary, the Nice automobile week will be held as usual. In reply to a telegraphic inquiry despatched from the Automobile Club the following has been received:—"The automobile week will take place from April 6th to 17th, with the mile race, the La Turbie race, a tour from Paris to Nice, and a trial of heavy vehicles from Paris to Monte Carlo.—SAUVAN, Mayor of Nice."

The Reading Automobile Club.

THE annual meeting of the Reading Automobile Club was held at the Club premises on Friday, the 3rd inst. The chair was taken by the president, Dr. Major, and a large number of members attended. The treasurer's report for 1901 was presented by Mr. H. Callas and approved by the members. The following gentlemen were elected officers for 1902:—President, Dr. Claude A. P. Truman; Vice-Presidents, the Mayor of Reading (Mr. A. H. Bull), Sir Charles Russell, Bart., Messrs. Arthur Russell, Alfred Harmsworth, Charles E. Keyser, W. H. Taylor, Dr. A. C. Major; Hon. Treasurer, Mr. G. Loftus Brigham; Hon. Secretary, Mr. J. Paxton Petty. The members of the old executive committee were all re-elected for another year, and two new members were added. Dr. A. C. Major was awarded the Club Challenge Cup for 1901, having gained the highest number of marks on the various Club runs held during the past year. The Club is certainly to be congratulated on the great increase in membership it has attained during the past year, and also upon its financial position, which, as gathered from the treasurer's report, is extremely satisfactory, showing a substantial balance on the year's working.

A WINTY PROSPECT.

(Allgemeine Automobil Zeitung.)

The War Office Motor-Lorry Trials.

THE results of the competitive trials with self-propelled lorries designed for military purposes, which took place at Aldershot last month, have now been announced. It will be remembered that the Secretary of State for War offered a series of three premiums of the value of £500, £250, and £100 respectively for the three mechanically-propelled wagons deemed most suitable for the transport of the supplies, stores, and necessities of a column of troops in the field. The total number of lorries entered for the trials was but eleven. From one cause or another this number was afterwards considerably reduced, and when the Judges finally assembled at Aldershot for the purpose of conducting the tests only five were submitted to their notice. This was certainly somewhat disappointing, but fortunately there is compensation in the fact that the Mechanical Transport Committee are in the main satisfied with the performances of at least two of the vehicles submitted to them, and have recommended their purchase by the War Department. The first prize of £500 is awarded to the lorry, official No. 6—makers, the Thornycroft Steam Wagon Company (Limited), Steam Wagon Works, Homefield, Chiswick. The second prize of £250 goes to the lorry, official No. 3—makers, Messrs. Edwin Foden and Co. (Limited), Elworth Works, Sandbach. The third prize of £100 is secured by the lorry, official No. 5—makers, the Straker Steam Vehicle Company (Limited), 9, Bush Lane, London, E.C. As already indicated, the War Office has also purchased the lorries to which the first and second prizes have been awarded, for army use, and they will in all probability be at once despatched to South Africa for further trial.

Motor-Car Driving School.

THE difficulty of obtaining trained and reliable *mecaniciens* is one which grows with the ever-increasing number of motor-car owners. A suggestion recently made by the Secretary of the Automobile Club is one which, if put into practice, should go far towards meeting the difficulty. It is that the Club should open a school and teach driving, not only to members, but to their servants and others who might be desirous of qualifying for posts as drivers, certified as efficient by the Club. The Committee approved generally of the suggestion, and referred the matter to the Standing Committee, who will report on the working of the scheme. There can be little doubt that such a school would be well patronised by members anxious to drive their own cars, as well as their servants, and in the event of its being opened, let us hope, by a steady succession of young men wishing to qualify for well-paid situations as professional drivers.

The New Four-Cylinder New Orleans Car.

IN our last issue, we mentioned that the New Orleans Motor Company (Limited) were introducing a new four-cylindered light car, and on Saturday we had the pleasure of a run on it to Brighton. There was a stiff head wind, the roads were very heavy and greasy, and the latter portion of the journey was made in the rain—so the opportunity was a fine one for testing the capability of a new car. The present vehicle is an experimental one, and has only three speeds, but the car when exhibited at the Automobile Club Show will have four speeds, with an engine developing about 14 h.p. It is a very speedy car on the level, while up hill it is a little wonder, "cutting out" on the top speed on most of the hills. The regulation is obtained by an ingenious contrivance, enabling the driver to dispense with the use of the brakes. This was particularly appreciated on Reigate Hill, which was in a dangerously greasy state. We may mention, in conclusion, that no adjustment was necessary either on the outward or homeward journeys.

Motor-Bicycles.

MR. MERVYN O'GORMAN writes to the *Speaker* in praise of the motor-bicycle which runs only in one track as compared with the three of the motor-tricycle, and has a freedom from smell which constitutes a great point in its favour. The charge of petrol required by a motor-bicycle is so small that though Mr. O'Gorman has frequently taken a number of lady friends in tow behind his bicycle he has never had any complaint of a smell of oil, except perhaps on an exceptionally lengthy hill. And then comes a series of confessions. "As a cyclist," says Mr. O'Gorman, "I find no restriction to my moving at twenty-seven miles per hour in the open, and I am quite willing to be punished if I ride at eight miles an hour through the crowded and tortuous village of Uxbridge, for there such riding may fairly be called furious and to the common danger. In fact, I rejoice in the freedom of moving at thirty-five miles an hour along the Oxford road, down the long straight stretches where there are no cross-roads nor bye-roads, nor any traffic."

The Motor-Car Question.

As already mentioned in these columns, there is an interesting article under this title from the pen of Mr. Alfred C. Harmsworth in the current issue of the *Badminton Magazine*. "Speaking as a magistrate," the author remarks, "I am well aware of the valuable nature of the work done by our British unpaid judges, but it would be better for the commercial prosperity of England, threatened as it is on every side, if some of them evinced a little more patriotism by studying the motor-car question before attempting to drive another trade permanently into the hands of the foreigners. I admit that it is not by any means pleasant when driving a young and spirited horse to come suddenly face to face with a noisy engine filled with people dressed in the costume of submarine divers. It is equally unpleasant to be

approached from behind by one of these infernal machines, whose advent is heralded by a raucous and most annoying horn. It is an experience with which I am well acquainted, and as a result I have gone to the very slight trouble of breaking my horses to several sizes and shapes of motor-cars. As a rule, half an hour's careful work, accompanied by kindness and by carrots, will accustom any horse to the noisiest motor in existence, more especially if the people in the motor-car speak to the horse. Unfortunately, many drivers of horses will not take the trouble. It would be well, I think, if the County Councils of England instead of ruining British motor-car manufacturers would provide their road surveyors and others with good motor-cars which could be used, among other purposes, for the training of horses in localities, for a small payment."

Motor-Cycling.

THAT 1902 is likely to see an enormous extension of the use of motor-bicycles there is now not the least doubt. For some time past new motor-bicycles have been making their appearance at a rapid rate, and that considerable interest is taken in them is shown by the many letters we have received from readers asking for further information. From the first number of the *Motor-Car Journal* the motor-cycle has received due consideration, and latterly a large part of our space has been devoted to the subject of motor-bicycles. The correspondence at present taking place in our columns has attracted attention not only at home, but also on the Continent, and shows in a striking manner what a large measure of interest is being taken in the question of motor-cycling, or rather motor-bicycling. While there are many who consider that the disadvantages of the motor-bicycle outweigh its advantages, yet even in its present form a good deal of pleasure, not to speak of useful information, can be got out of the little automobile. That there is still room for considerable improvement is freely admitted, and with so many minds at work progress is sure to be rapid. It will be our object in the future, as it has been in the past, to keep readers fully posted as to the improvements effected in existing types of motor-bicycles, and also as regards any new models that may make their appearance. Our correspondence columns will always be open for the discussion of interesting matters connected with the motor-bicycle and with the pastime of motor-bicycling, and it is to be hoped that advantage will be taken of this opportunity of interchanging ideas on the subject.

Licences Wanted.

FROM several quarters we learn that the Inland Revenue authorities are beginning to appreciate the popularity of motor-cars, and they are looking more vigorously than of yore after the licences. One cannot take a walk without seeing an automobile of some sort or other, and apparently this fact has awakened the authorities to the value of motor-cars for revenue purposes. One thing leads to another, and the fact that motor-cars are becoming more numerous seems to have led to the discovery that many motorists have mechanics in their entire service, with the result that many owners of cars have lately received demands for 15s.—the tax payable in respect of male servants. There is little doubt that motor-cars will loom largely in revenue returns in the future—why then do our local authorities harass and worry those engaged in a pastime that is proving so profitable to the country, to say nothing of the value of the industry.

More Taxation for Motorists.

At a meeting of the Ashby-de-la-Zouch District Council a letter was read from the Lutterworth Rural District Council stating that they had passed a resolution to draw the attention of the Chancellor of the Exchequer to the more adequate taxation of motor-carriages, motor-cycles, etc., and asking that

that part of the tax be allowed for keeping up the roads in the various districts. The Chairman said it was thought by many that the owners of motor-carriages should contribute to the making up of the roads, and a resolution was adopted, approving of the Lutterworth resolution. Why motor-cars should contribute to the cost of the maintenance of the roads we do not understand. They certainly do little to injure the surface of the highways—especially when compared with ordinary horse-drawn vehicles.

An Automobile Tour in Caucasia.

THE Grand Duke Nicolas Michailovitch of Russia, who is an ardent motorist, has lately made an automobile tour of Caucasia in a 10 h.p. Mors car, covering altogether about 1,200 versts. The Grand Duke reports that few motorists have any idea of the poor roads and the steep ascents and descents to be met with in Caucasia, not to speak of the miles and miles of uninhabited country. Before starting on the tour a number of day trips were made from Borjom. The population is a mixture of Georgians and Armenians (Christians) and Kurds and Turks (Mahomedans). At first the arrival of the motor-car was the signal for the natives to take to their heels, but little by little they got used to the "Devil's car," as they call it, and before many weeks were over the young Kurds were

rather too much *en evidence* whenever the car was pulled up. Our illustration from *La France Automobile* shows the vehicle with a crowd of interested spectators at Akhalzieh, about forty-five versts from Borjom.

A New Garage.

AUTOMOBILISTS who have a place of business in the City will welcome a new departure of which Mr. C. Harrington Moore informs us. He proposes to establish a garage within three minutes' walk of the Bank of England itself, and now the City man will be able to take full advantage of his week-ends, driving straight away from his office on Saturday instead of going home to fetch his car, or at best to the existing club garage at Westminster; while in many cases it may make the difference of returning on Monday morning from the coast instead of on Sunday night. The premises have already been secured, and are situated at the City end of Queen Victoria Street. They are therefore approachable by the Embankment from the west, and by the Southwark Bridge from the south. Apart from week-end jaunts, moreover, the suburban automobilist may now drive to the City daily and be able to leave his

car where it will be properly attended to until evening, and where also he can obtain petrol, oil, or any other requisites, which are things unknown at a mews, even if such a place could be found within the City precincts where the owner or lessee would be willing to house a motor-vehicle. The Westminster garage has proved a great success, and it is only reasonable to suppose that the new venture will prove equally advantageous to the automobilist community.

Important Speed and Brake Trials.

As announced in a recent issue, with a view of obtaining records of the space within which motor-vehicles can be stopped when driven at high speeds, a trial of brakes will be held by the Automobile Club to-day, the 11th inst. The trial will take place on a private road in Welbeck Park, which has been placed at the disposal of the Club for this purpose by the Duke of Portland. There is nothing which is likely to prove a more effective weapon in the hands of those who speak in Parliament in favour of the revision of the law than indisputable statistics as to the distance in which a motor-vehicle travelling at a good speed may be pulled up. It may be taken for granted that the sudden and strenuous application of the brakes when the vehicle is travelling at a high speed is not calculated to do good to the vehicle, and must of necessity damage the tires, but it is considered that in view of the importance of the question members would probably be willing to fit their vehicles with old tires for the occasion. The event should also be interesting from a sporting point of view, as it is proposed to time the cars over a measured distance (possibly a mile with a flying start), in both directions, the road being not quite horizontal. Additional records of the speed of the cars over the last 100 yards of the run will also be kept, so that the true speed of the cars at the end of the run may be ascertained. The brakes will be applied on passing the finishing post, and the timing of the last 100 yards will probably be effected by electricity. The results should be of value to manufacturers, as proving to the public the efficiency of the brakes fitted to their cars. As the trials take place on a private road, the speeds may be published. They are held at this period of the year as the evidence is required at once in connection with the proposed revision of the law. Members who are willing to enter vehicles are requested to communicate at once with the Club secretary. The following have already entered cars:—Mr. Mark Mayhew, 7 h.p. Panhard; Mr. A. Harmsworth, 6 h.p. Daimler; Mr. C. Jarrott, 16 h.p. Panhard; Mr. C. Friswell, 8 h.p. Peugeot; Mr. Victor Hart, 12 h.p. "Teras"; Mr. S. F. Edge, Napier car; the Daimler Company's 18 h.p. car; Mr. Stanton's 24 h.p. Daimler; Motor Manufacturing Company's 12 h.p. car.

Something Wanted.

THE experience of a gentleman who left his car unattended in High Street, Hampstead, whilst he entered a shop one evening this week, points to the desirability of some system by which the starting device can be locked when the car is at rest. The owner of the car in question had only been absent about three minutes when a little urchin went up to the vehicle and pulled a lever, with the result that the vehicle started off at a terrific pace down Haverstock-hill. When some 150 yards from the starting point the runaway collided with a truck at the side of the road, which the force of the impact overturned. Continuing its career the vehicle gained the steep incline of the hill, where it came to grief. A brewer's dray was delivering at a house when the motor-car, which was swaying to and fro, struck the side of it and completely overturned, rolling a distance of twenty yards down the hill. The fugitive, which had travelled a distance of nearly a mile without doing any personal damage, was smashed to pieces. A simple device to prevent such a catastrophe, to say nothing of the "lifting" of cars, if it does not already exist, should command a ready sale.

Fresh Fields and Pastures New.

A NEW sphere of utility is, according to the *Pall Mall Gazette*, to be opened up to the motor-car, in South American exploration. A well-known Spanish automobilist is reported to be organising an expedition to survey the northern boundary of Patagonia and Argentina, per automobile as far as possible, starting from Buenos Ayres, and following the Rio Negro to Lake Nuhuel-huapi, thence along the line of the Andes to the volcano of Louquimay, and on to the Chilian port of Valdivia, a total distance of somewhat over a thousand miles. Details as to the nature of the automobiles to be employed, or the extent to which they are expected to prove useful, are lacking, and it might be imagined that a few of the traditional Patagonians would be of service on occasions behind them, if one may judge by the nature of the country, which would be excellent for the testing—perhaps in more ways than one—of military lorries. At any rate, we wish the enterprising Spaniard success in his "thousand miles trial," which few of the drivers in the last one would care to tackle.

MR. MARK FOY, of Sydney, N.S.W., and his 10-h.p. Panhard car created some excitement by driving out to the Melbourne Cup with a number of his friends aboard. The car was driven across from Sydney to Melbourne the week previous to the Cup, and made good progress.

EARL RUSSELL, whose account of an automobile tour in Sussex is concluded in the present issue, made a claim on Wednesday against the Aldershot District Council for damages sustained to his motor-car. His lordship some time ago was driving along the Farnborough Road, which was then under repair, and he alleged that its unsatisfactory condition was the absolute cause of his colliding with a steam roller at work there. The Council considered that they were not to blame, and decided to contest Earl Russell's claim for damages.

ALREADY the Automobile Club's annual exhibition, which will be held at the Agricultural Hall in April next, promises to be a great success, second, in fact, only to the recent exhibition in Paris. More than 200 firms, including the cream of the Continental trade, have already booked space. Amongst the latest additions to the list of exhibitors are the Delahaye Company, the Georges Richard Company, Messrs. Gillet, Forest et Cie., Messrs. De Dietrich et Cie., M. Chaboche, Rochet-Petit, Messrs. Turgan and Foy, Société du Moteur Supra, Madame Longuemare, Messrs. Rupy et Cie., Messrs. Lejeune et Cie., L'Allumeur Electro-Catalytique, Spyker Bros. (of Amsterdam), and the Trompenburg Manufacturing Company, etc.

THE Fournier-Searchmont Automobile Company of Saratoga Springs was incorporated at Albany, N.Y., on December 16th, with a capital of £400,000, to manufacture motor-cars and other vehicles. *Automobile Topics* states that the incorporation of the Fournier-Searchmont Company means the formation of a new automobile manufacturing company in which Mr. Foxhall P. Keene as president, Mr. E. B. Gallagher, of the Searchmont Motor Company of Philadelphia, and M. Henry Fournier as mechanical directors, will be the leading spirits. The company will manufacture vehicles embodying such modifications of the leading French types as M. Fournier's familiarity with the subject indicates as advisable, and is said to start its career with 450 orders on its books.

FOR some time past we have been making a trial of a new lubricating oil for petroleum spirit motors, known as "Filtrate," that is being put on the market by Messrs. Edward Joy and Sons, of Junction Street, Hunslet Lane, Leeds. The oiling of a motor cylinder is, as is well known, one of the most difficult feats of lubrication known, owing, among other things, to the high temperature at which the oil is required to work. We have found "Filtrate" to answer its purpose exceedingly well; its fine viscosity seems to be well retained even in the most extreme heat. It has no tendency to char in the cylinder nor to "gum." The oil has a fine body, and, being filtered, is entirely free from grit.

SIX DAYS IN SUSSEX.

(Concluded from page 793.)

WE had lost the afternoon in Canterbury which we intended to have, but we did our duty by the cathedral next morning, and were conducted over everything till we were thoroughly tired out. We had the accumulators charged at Canterbury, but I do not recommend it, as the extortionate cycle agent wanted 4s., and actually insisted upon 3s. 6d. for the sixpenny-worth of current put into them. I could not get him to take my view that 400 per cent. was a fair profit, even allowing for trade charges. We started in the afternoon along the London Road, with its switchback surface, to Rochester without incident, but not very fast, though fast enough to cover the engineer from head to foot in a thick coating of white dust. The difficulty in arriving at Rochester is to know when you have arrived, and to ascertain

slipping occasionally, which I afterwards discovered to be due to the change speed lever being a little out of place. Soon afterwards it was apparent that there was something wrong with the water circulation, so, being tired and wet, we stopped at Southborough for lunch, and had some of the mud washed off the car. After some time my engineer discovered that the split pin in the centrifugal pump was missing, and it was, therefore, not revolving. As for some reason there is no stop-cock on the water tank, repairing this meant losing all our water. He put a new split pin in, and troubled himself no further about the one that was missing, connected up the pipe, and laboriously filled up the tank with water. It still would not circulate, and on taking the pipe down, it was found choked up with the broken pin. Then at last all was right, and we went on to Tunbridge Wells. Here it took a great many enquiries before we were properly directed to the High Street, and even then we could only raise two gallons of petrol in the whole town. We started off about 4 p.m. to East

OFF FOR A SPIN.

(La France Automobile.

which of the several towns nestling together by the Medway you are actually in at any moment. However, we were soon safely at the Bull, a hostelry as old-fashioned as its name implies, where our bedroom held some articles of Dickens bought from the sale at Gad's Hill. We explored the cathedral—which is not much—that evening, and went on to the castle and gardens, which are beautiful. The view of the Medway, however, which should be very fine, is entirely spoiled by the hideous railway bridge.

The next morning before we were up the sound of torrents of rain made us fear seriously for the day. At ten o'clock it was still raining hard, but we decided to start in spite of it, and crossed the Medway, turned to the left through Snodland, West Malling, and Hadlow to Tonbridge. The roads were not wide, but had good surface, and the motor was going well, although the rain fell incessantly and made it heavy travelling up hills. The car climbed up well out of Tonbridge, though I was troubled by the gear

Grinstead, and had the usual difficulty in finding the road at the beginning. About three miles from Tunbridge Wells there were several branches, and each was duly signposted, but the trouble was that the directions on the signposts were to small unknown places, which did not help one to decide which was the way to East Grinstead. The road was narrow, and would have had a good surface in dry weather, but the rain having abated a little now, it was greasy and dangerous. In the narrowest part we had a new and special trouble with donkeys. One was loose and the other was anchored by about 15 feet of chain to a wooden clog. At first I thought I had safely passed them, but with infernal ingenuity they succeeded in getting ahead of the car again while I was avoiding fouling the anchor chain, which they had already once drawn across and under the car. Having got ahead, they remained there for the best part of two miles, although there was an ample green margin at the side of the road for them to turn

into, and I only shook them off at last by driving them as hard as I could and tooting my horn at them till they were tired out. When we reached East Grinstead, at 5.45 p.m., we were too dispirited to push on to our proper destination at Horsham, so we stayed there for the night. To my agreeable surprise, I managed to get Pratt's motor spirit from Bridgland, an iron-monger in the town. Needless to say, there was nothing to see at East Grinstead, but we had the pleasure of the town band performing outside during our dinner.

Next morning was finer, though lowering, and we started about 9.30. The road to Crawley we found a little tricky, but after that it was easy enough to Horsham. During the heavy rain on the preceding day I had not been troubled with side-slip, but the roads were now very greasy, and my 90 mm. pneumatic tires were slipping badly, and speed had to be kept very low. As it was, I twice doubted whether the car would go round a corner or would prefer to skate sideways into the ditch, and finally on a hill, where, fortunately, the road was broader, she did turn completely round. Had I not had the speed down to about six or eight miles an hour, it might have been a very nasty accident; as it was it was startling. We went through Horsham without stopping, turned up the London road, and took the curious left-hand swing that leads to Billingshurst and Pulborough, the running being good on this part. Although it was early, we decided to lunch and try to get petrol in Pulborough, attracted by a magnificent notice-board about engineers and motor-car manufacturers. The engineer walked the 600 yards to the shop, which he reported to be a small shed, and said that he had seen a woman, whose husband was connected with the business, who told him we could have no petrol, and that they would open on Sunday for no one. The landlord, however, directed us to the house of a partner, whose wife gave us the keys, and so to our great satisfaction we got our two gallons of petrol, even on the Sunday.

At Pulborough we dropped the engineer, and found the roads much better, and the car going well. We ran by rather small roads through pretty country by Petworth, and through Cowdray Park to Midhurst; then along the Chichester Road up Cocking Hill in fine style, and nearly to Havant, where we swung back through Chilgrove, and up Chilgrove Hill to our stables at North Marden. Twenty-six miles non-stop in 1h. 50min., and a very pleasant conclusion to our tour.

I may perhaps be permitted to conclude with a few general observations. First as to the car. Five hours by the roadside and three hours at Southborough in the rain may seem a good deal, but most of the first trouble was due to ignorance on our part, and most of the second to stupidity. At the same time, it is true that the pin of the circulating pump should not break, nor nuts and bolts come out of the gear wheels; still more true is it that it would be well if motor-car builders designed their machinery with some regard to the possibility of getting nuts on and off, and fitted a gearcase whose top could be taken off without first removing the top of the car. What would be thought of a locomotive in which the engine driver could not tighten a loose cross-head without first dismounting his boiler! In designing cars, the motto seems to be, "Inaccessibility, be thou my god!" It is a fine long word, but it has no other merits on the road. A little attention to detail would obviate a great many of the needless hindrances to small repairs. Still, when all is said, this car, in which the gear was loose, the steering loose, and the ignition wires almost bare of cover, took us without overhauling an average of forty miles a day in all kinds of weather, and over all kinds of roads and hills. No horse could do as much.

Next as to manners on the road. We had a funny experience our first day. Running into Worthing, I was approaching very quietly on a broad road behind a phaeton with a pair of horses. I had just cut my engine off in order to glide by silently, when as I drew up alongside, the driver, a young man with too good a conceit of himself, turned round and said, "Where are your manners?" The question seemed to have no relation to anything that was happening, so I supposed he feared that his horses

were frightened, and that the irrelevance of the question was due to nervousness. However, no sooner did I drop back than he at once pulled to the offside of a perfectly empty road and deliberately obstructed my passage. Upon this I informed him that I should summon him if he persisted in this course, and he thereupon gave way. It appeared after all that manners were in question, and my only regret is that I do not know the name of the ill-bred young cub. His was the only instance of discourtesy I met with. Of the frightened horses nearly two out of three were more upset by their driver's nervousness than by their own. It frequently happens that horses will go by quietly enough if you approach and pass them silently while the driver continues steadily on his course. One who, as I do, drives and rides horses as well as drive a motor-car, is generally able to judge of this with certainty, but drivers of horses should remember that when once they hold up their hand they deprive you of all option, and you must stop, whether it is wise or unwise. In one case a horse that would have passed quite quietly was thoroughly alarmed by my being thus compelled to stop when within twenty yards of it. There are some wild brutes that should not be allowed out on the road at all, as they are more dangerous and uncertain than a hundred motor-cars. There can be no doubt that had good roads and motor-cars come first, no horse would ever have been allowed on a main road without a certificate of proper behaviour.

Is it not time the Automobile Club began making some hotel arrangements like the C.T.C.? A uniform charge of 1s. a night for stabling cars is the first arrangement that might reasonably be made. The Royal Hotel Mews at Worthing charged me 2s., which I consider excessive when nothing whatever was done to the car by the ostlers. To some extent owners can improve things now by bargaining beforehand, and insisting on being charged proper prices. I am told that at country inns it is the regular practice to charge a *chauffeur* more than the general public. I endeavoured to get a tariff of £1 for dinner, bed, and breakfast for three of us, one counting at servant's rates, of course. I did not, however, get quite this at fashionable resorts like Worthing and Hastings with a *table d'hôte* dinner, but I obtained reasonable compromises, especially from the Palace Hotel at Hastings. The Dorset Arms at East Grinstead informed me that they never put up outdoor servants; they had a tariff I could look at if I liked; they entertained no bargains and no reductions. We found the Commercial Hotel opposite reasonable and quite sufficient for our needs. Still, all this individual bargaining is a bore, especially at the end of a day, and it would be a great convenience if there could be a hotel indicated in each town to which one could go at once at a fixed tariff. I would suggest, say, 10s. for owner's dinner, bed, and breakfast, and the stabling of the car; 6s. more for wife, and 8s. for each additional person occupying a separate room. If something could be done on these lines before next summer, it would be a distinct boon, and I hope these hints may bear fruit.

RUSSELL.

IN reply to several correspondents, we may mention that the address of M. A. Wydts, the inventor of the Allumeur Electro-Catalytique, illustrated and described in our issue of December 28th, is 87, Avenue Gambetta, Paris (20).

THE Prince of Monaco has just issued a decree considerably affecting motorists on the Riviera. The order enacts, among other details, that the owner of a car shall be furnished with the certificate provided by law for owners of motor-cars in France. Every driver of a motor-car must possess a certificate of efficiency. But a declaration by the authorities of his own country and place of residence will be accepted as valid. The maximum speed allowed is put at 6½ miles an hour, to be slackened to walking-pace when descending a hill. All motor-car racing is forbidden in the principality. In the old town of Monaco motor-cars are entirely tabooed. Exception will, however, be made on fete days, when they will be allowed on the square in front of the palace. Every motor driver is to stop at once when so requested by the police.

THE DECAUVILLE 10 H.P. CAR.

FOR the 1902 season the Decauville Company will make a specialty of 10 h.p. cars, of which two illustrations are given herewith. It will come under the light car category, inasmuch as the weight comes out at between 11 and 12 cwt. The engine comprises two vertical cylinders 110 mm. diameter by

FIG. 1.—THE DECAUVILLE 10 H.P. TONNEAU.

110 mm. stroke, and at a speed of 1,000 revolutions per minute develops 10 h.p. A governor is provided, as also an accelerator, while the ignition is on the magneto-electric system. Particular attention has been devoted to the question of lubricating the various moving parts. Four forward speeds—from twelve to fifty-five kilometres per hour with the engine running at 1,000 revolutions—and a reverse motion are provided. The change-speed gear box is combined with the crank case, and an important feature is the fact that, when on the high-speed gear, the power of the engine is transmitted direct without the intervention of any spur wheels. From the gear box a universally-jointed shaft and bevel gearing convey the power to the rear live axle. The lubrication of the five principal bearings of the crank shaft and live axle is accomplished by means of rings similar to those in use on large dynamos, and the cranks themselves are centrifugally lubricated. The rear part of the *tonneau* is made detachable, so that the car can quickly be converted into a double phaeton or a simple two-seated vehicle, as shown in Fig. 2. We may add that the Motor-Car Co., Ltd., are the agents for the Decauville cars in this country.

THE *Golden Penny* has lately started a weekly column of motor-car notes and news.

AN electric motor is to furnish the propelling power of the fishing boat *Pioneer*, which has just been built at Lowestoft.

At the West Hartlepool Police Court a man charged with working a pony in an unfit state has expressed his willingness to buy a motor-car in place of the animal.

A MAN may learn to drive a motor-car in two days, but much experience may be necessary to enable him to re-start it when it has stopped without apparent cause.

THE New York Tire Company are about to vacate the Thavies Inn offices for larger premises on Snow Hill, E.C., where it is proposed to hold a large stock and to put down a vulcanising plant.

ACCORDING to an imaginative American reporter, motor quadrilles are the latest thing in fashionable dances, each lady and gentleman going through the figures in a smart little motor-car. Why not dancing in dirigible balloons, or waltzing in submarine boats?

CONTINENTAL NOTES.

BY "AUTOMAN."

THE self-propelled vehicle is really ubiquitous. It pushes itself into almost every form of modern life. It now appears regularly in literature, and has captured the novelist, the playwright, and the caricaturist. The theatre, music-hall, and circus have long since made use of it, and now Barnum and Bailey's have two record-men engaged to draw the Parisian public. Rigal rushes through the ring with all the lights out and the limelight playing on him, and Osmont has just signed a contract to climb a staircase with a 16 per cent. gradient on a motor-tricycle, and to come down again. The stairway is about fifty yards long and two yards wide, and will not have banisters at the sides or any protection whatever. To climb the stairway the front wheel will be less in diameter than the hind wheels by more than 12 in., but once at the top he will change his small front wheel for one of a much larger diameter before he comes down again. Twenty-five miles an hour up and down a staircase!

THE advent of the Yacht Club and the change in the rules of the A.C.F. as regards gambling has quite changed the aspect of affairs at the Place de la Concorde, as far as the first floor is concerned, and there an animated scene daily replaces the solemn silence of a few weeks ago, when the white-stockinged flunkeys were hardly able to extinguish a yawn as they opened the doors for the few automobilists that ventured to pass the luncheon hour in the Club. The first floor is now exclusively devoted to members, and friends are only allowed on the third floor, and only twice in one year can a member invite the same person. Ladies are no longer admitted except on gala nights, and even then a special invitation is required; in point of fact, steps are being taken to make the Club more and more exclusive.

ON the other hand, the A.C.F. are about to create a new and thoroughly democratic organisation which is to be called the "Société d'Encouragement au Sport Automobile." The subscription will be only 20 francs per annum, the object being to protect mutual interests. Ladies duly presented will also

FIG. 2.—THE DECAUVILLE 10 H.P. TWO-SEATED CAR.

be eligible as members, and a journal will be published by the organisation, to which all members will have the right to contribute.

THE A.C. of Nice is determined to organise a road race, and if the French Government persists in refusing to allow the Nice-Salon race, it is quite on the *tapis* that Ventimille to Turin and back will replace it. As everyone familiar with

the Riviera knows, Ventimille is the frontier town on the Italian Riviera. The road to Turin lies along the valley of Roya, where it recrosses the French frontier for ten miles and then returns to Italian territory. The road is narrow, with very many turns and twists, and rises nearly 3,000 feet in 35 miles over the Col di Tende, and then down again by Limone and Coni, and thence is level right to Turin. The road is very bad, and covered with deep ruts. The total distance from Ventimille to Turin is 105 miles, and will be severe on tires and springs. There is also a project on foot for a race from Ventimille to Abbazia on the Adriatic and back, but this is a long way—nearly 500 miles—and would require a great deal of organising. Abbazia is, of course, suggested because, like Nice, it is also a winter resort.

THERE has been a question between the Austrian Club and the A.C.F. about the order of starting for the Paris-Vienna race, the Austrian Club objecting, quite rightly, to the first numbers being booked by French makers. The question has been satisfactorily settled in the following manner: the two Clubs will draw lots for the places, and then distribute the same amongst their members.

ROAD racing brings me back once more to a subject which, as every reader of the *Journal* knows, deeply interests me, and that is how to find a means of bringing our English manufacturers to realise the vital importance of coming into line with their French competitors, with the object of bringing the trade to our workshops. I am very glad to see that the Wolseley Company have come up to scratch. There are many manufacturers, however, who have not the financial resources of the Wolseley Company, and who need encouragement in this direction, and who would be prepared to enter the lists if success would bring its reward, and an organised prize fund would put an end to their hesitation.

TALKING of the Wolseley Company, it is with great satisfaction that I chronicle that it is entirely owing to their enterprise that there is to be a Gordon-Bennett Cup race this year. The time for challenging the A.C.F., who hold the Cup, expired at midnight on the last day of 1901, and until the very last day there was no challenger. In Germany the Club is at outs with the makers of the Mercedes, and the difficulties have not yet been arranged and have prevented that firm from competing. Belgium, too, has some dispute on hand, and Switzerland could not compete owing to the lack of Swiss-made tires. At the last moment England, through the A.C.G.B. and I., sent a telegram to fling down the gauntlet, and so it is that, thanks to the Wolseley Company, there will be a race for the Cup. Curiously enough, the French press seem to think the challenge must come from the Napier car, and suppose that Napier must have greatly reduced the weight to come under the ton limit. The probable defenders will be Girardot, Fournier, and René de Knyff.

AN amusing story comes from Paris. A certain German pneumatic tire manufacturer gives away every New Year's Day pocket books to his agents and customers. The word "agent" in the French language means either *policeman* or *agent* in the English sense of the word. The tire manufacturer gave notice by means of the Press, that all the *agents* in Paris might call at their offices and would receive each a pocket book. What was their surprise to receive on the following day the visit of numbers of policemen in search of pocket books! Needless to say, they were not allowed to go away empty handed, but at the same time with injunctions not to persecute any automobilist who happened to be running on the firm's pneumatic tires.

A LADY who died recently bequeathed a sum of £80,000 to the French Society for the Prevention of Cruelty to Animals, on the understanding that, among other measures, arrangements should be made to provide motor-vans for the removal of horses

disabled by accidents and having fallen down in the streets of Paris. Acting on the lady's recommendation, the society has determined to devote an annual sum of £800 to this special purpose. The question has been taken up by Baron van Zuylen, who is a member of the committee of the Society for the Prevention of Cruelty to Animals, as well as chairman of the French Automobile Club. He invites tenders from all automobile makers for the construction of a motor-van specially adapted to the purpose named.

WINTER CLOTHING FOR MOTORISTS.

MESSRS. HOLDING & SON, of Maddox Street, W., are widely known as sporting and military tailors, and particularly as makers of motoring clothes, of which they have a great many specialities that we have no hesitation in describing as well-thought-out inventions. The other day we spent a half-hour inspecting some of Messrs. Holding's latest productions in the way of motor clothing for the winter.

We first inspected a special registered coat known as the "Ayrshire." When a man stands up in this coat it does not spread out round the bottom like a Russian peasant's sack, as many big coats do; and when the motorist sits down on his car it sets as freely on the lap as a lady's skirt, yet there is no strain on the knees, and there is full freedom for the feet to move underneath. To explain the coat still further, there is no opening anywhere in the bottom of it, and there is no material standing out in an unsightly way. The coat is made of treble Shetland, Mr. Holding finding that a coat made of this cloth sets best round the legs. The whole of the body is protected by a soft, comfortable leather lining, ventilated in certain parts.

We next turned our eyes on a similar type of coat, but made of "Auto Cloth." This coat was lined with thin soft kid, absolutely wind-resisting, and forming an exceedingly warm and comfortable protector for motorists. The "Kangaroo" leather vest with sleeves was next brought under our notice. Mr. Holding explained that this waistcoat is constructed of one part cloth, one part leather, and one part chamois leather, etc., so that it will suffice, except in really cold weather, for the adequate protection of all vital parts. We next came to a special cape, so constructed as to give the user absolute protection from the wind. It is made of waterproof melton, and owing to its peculiar construction it is held in position, allowing free use for the hands for the lever, steering wheel, etc. It cannot be blown up by wind, and it has no opening down the front.

One of Mr. Holding's latest productions is a special apron for motoring. It is shaped like a coat, and will fit a tall or short man; it has no opening to let in the wet, practically forms a pair of trousers, as well as an apron, and almost a coat. These are being made in leather, but at present are chiefly turned out in box cloth, well waterproofed.

We could go on describing many other special garments designed for motoring ladies as well as gentlemen, but space forbids. Suffice it to say that Messrs. Holding appear to be making a special study of the subject, and, what is more, to be receiving the patronage of motorists.

THE Reading Steam Car Company has made a contribution of £5 5s., and the Motor Construction Company of Nottingham of £1 1s., towards the funds of the Motor Union.

MR. J. A. KUNER, of 10, William's Walk, Colchester, informs us that he has recently laid down special plant for the purpose of charging the batteries of electric cars and the ignition accumulators of petrol cars.

MEMBERS of the Motor Union who are not members of the Automobile Club or of its affiliated clubs are reminded that they should at once send their subscription for the year 1902 to the Secretary. Until this is paid they are not entitled to claim the advantages of the Union.

THE RIDLEY VOITURETTE.

OUR illustrations (Figs. 1 and 2) show respectively a plan and elevation of a voiturette recently built by Mr. John Ridley, of 18, Ellys Road, Coventry. The frame is of tubular construction, in the fore part of which, under a bonnet, is a $3\frac{1}{2}$ h.p. De Dion water-cooled motor. The water circulation is maintained on the thermo-syphon system, no pump being used.

FIGS. 1 AND 2.—ELEVATION AND PLAN OF RIDLEY CAR.

Two speeds are provided, the power of the engine being conveyed through a universally-jointed longitudinal shaft and bevel gearing to the rear axle. The novelty of the design lies in the change-speed gear, which is combined with the bevel gear drive. To begin with, there is no balance or differential gear in the ordinary sense of the word, the rear road wheels being fitted to the single piece axle 8 (Fig. 3) by free-wheel clutches, so that the outer wheel can overrun when turning corners. It will be observed that the longitudinal

FIG. 3.—HORIZONTAL SECTION THROUGH GEAR BOX.

shaft 5 does not terminate at the bevel pinion, but is extended, and passes under the axle 8, thus avoiding the necessity for cutting either of them. Motion is transmitted from one shaft to the other by a form of bevel gearing consisting of pinions 11, 12 on the shaft 5, meshing with wheels 24, 25 on the axle 8. As the pinions and wheels are in different planes, the teeth of the latter have to be cut on the skew to gear properly. The pinions are

always in mesh with their respective wheels, but are only fixed to the shaft 5 one at a time by means of the sliding clutch 13, 14,

FIG. 4.—VERTICAL SECTION AND END VIEW OF GEAR BOX.

the parts of which are coupled so that the engagement of one pinion is preceded by the disengagement of the other. Thus when the clutch 13 is in gear with the pinion 11, the power is transmitted through the pair of bevel pinions 11 and 24, and when clutch 14 is engaged, through 12 and 25. The whole arrangement is boxed in by a casing provided with ball bearings for the shaft and axle. The extremity of the longitudinal shaft 5 is adapted to receive a starting handle. One advantage claimed for the skew bevel gear over ordinary bevel gear transmission is that one rigid shaft only is required between the rear axle and the motor-clutch. In ordinary bevel gears under similar circumstances, the shaft needs to be broken up and to have two flexible couplings. The Ridley gear needs but one, which is situated immediately behind the clutch at the front end. The simplicity of the gear also lies in the fact that it not only acts as a transmission gear to the rear axle, but as a change-speed gear at the same time, without taking up any more space in the gear box. The road wheels are fitted with solid rubber tires; four elliptical springs carry the frame, motor, etc., while the body is suspended on the frame by C springs. Complete, the car, which was built to demonstrate the advantage of the new gear, weighs about 5 cwt.

THE Gloucester County Council has just addressed a memorial to the Local Government Board, in favour of the numbering of motor-cars, and of certificates of efficiency for drivers of the same.

SIR LINDSAY WOOD is one of the latest recruits to automobilism, and is frequently to be seen with various members of his family driving a large motor-car in the neighbourhood of Chester-le-Street.

ON December 11th there came into force in Italy the new motor law, the most important clauses of which provide that speed must not, except in the case of duly-authorized races, exceed 25 kilometres ($15\frac{1}{2}$ miles) an hour, and that drivers must obtain certificates of efficiency.

MOTOR-CARS played an important part in conveying New Year good wishes and presents from Parisian to Parisian. In paying the five minutes' call on all one's friends and acquaintances which French etiquette demands they were indispensable, and as a means of conveying the numerous packets and parcels which change hands unbeatable.

WHILST Dr. Simmons, of Bishopstoke, was proceeding to Fair Oak on his motor-car a horse attached to a cart shied at the machine, notwithstanding the fact that it had stopped. The man in charge vainly tried to pull the animal up, running at its head, but he was knocked down and severely injured. Continuing its career, the horse collided with a laden coal lorry at Middle Hill Street, knocking the driver down (he being on foot at the horse's head) and breaking his leg below the knee. The two carts jammed, and this brought the runaway to a standstill. Dr. Simmons attended to the two victims.

FLOTSAM AND JETSAM.

BY "FLANEUR."

THE way cars are getting about is astonishing even to those who may account themselves *au courant* with the movement. That one should meet them on the road in great numbers at the week-ends is natural enough, but the real test of the growth of automobilism is the extent to which one finds one's neighbours following the noble pastime. For example, I lately changed my habitat, and was curious to determine how many people round about me in the new suburb might happen to drive cars. The first evidence I encountered was the frequent passing of a local doctor on a Benz. Then I discovered that at one end of the road in which I live was a fellow automobilist whom I had met on Club runs, and he informed me that just round the next corner was another *chauffeur* whose car I had also seen in public.

BARELY had I made the acquaintance of these two owners—and right good fellows they proved to be—ere I found that at the other end of my road was the owner of a car identical with my own, and by a singular coincidence I had found myself immediately behind him on the Southsea run, until, less fortunate than I, he had to stop to mend a puncture; at that time, however, the fact of our neighbourly propinquity was unknown to either of us. Not a hundred yards from him is another owner of a similar car, and, to add to this tale of coincidences, I may state that just as I breasted the summit of a steep hill near by, only a day or two ago, yet another twin car to my own topped the rise from the other side, and we met on the crest like two Dromios. I don't know for a fact that the owner of the other car was a resident, but it is at least possible. Then, too, I have found three more car-owners within a third of a mile of my house, all in one direction, and, in fact, by merely taking a half circle of that radius I could name a dozen automobilists at least, and there are probably more.

If there is one topic more than another as to which differences of opinion prevail it is that of wood v. wire wheels for motor-vehicles. We are all agreed, I take it, that the former are easier to clean; on the question of appearance it is vain to dogmatise, for "beauty is in the eye of the beholder," and it becomes a case of *chacun à son goût*. But the main issue is the relative strength of wood and wire spokes respectively, and I for one am on the side of the wires at all times for voituresses and light cars, while there are those who defend their use even for big cars. It is not, however, to air my individual opinion that I raise this topic, but to record an interesting juxtaposition of experiences which has lately come under my notice.

THE owner of one of the new 10 h.p. Lanchester cars, for example, had a disquieting adventure the other day, the circumstances being as follows. Driving along a country road he came suddenly upon a squad of gipsy ponies running loosely in the wake of a caravan. He pulled up short, and then, the ponies having divided and left an opening, he put his accelerator down and started forward. One of the untethered quadrupeds, however, selected the same moment for swinging across the course, and the car promptly cannoned off the animal's hind quarters. The car took the steep bank which bordered the road, and as the Lanchester is provided with an unusual amount of lateral movement, and is very low and broad as well, it went a long way up the bank before threatening to overtop its centre of gravity. But even its limit was just about reached, when an extraordinary thing happened. To use the driver's own words, the car seemed poised in mid-air, and just upon the point of toppling over, when the wire wheels sprung back, the body righted itself, and in another second or two the driver found himself down on the road again, and not underneath the car as he had expected, but driving *au naturel* instead.

As it happens, he is also the owner of another type of 10 h.p. car which is fitted with artillery wheels, and declares that had he been driving the last-named vehicle instead of the one

with wire wheels he would probably have been killed. It is open for a defender of the wooden wheel, no doubt, to say that the fact that the wire wheels bent outwardly before springing back was inferential evidence that they were weaker than artillery wheels, but I think the owner of the two cars would contend that the wire wheels were as strong as the others where-ever strength was required, but also possessed the quality of suppleness, which enabled them to recover themselves in the manner described.

AND now for the other case, which is that of Mr. and Miss Butler, the mishap to whose 5 h.p. Renault was described in the *Motor-Car Journal* last week. The wheels were smashed by the catastrophe, and Mr. Butler has expressed the opinion to me that wooden wheels would have been better in the circumstances. With all respect to his opinion I am not converted, for when one notes the immense vertical strength of the tangent wheel as seen in the common bicycle, with spokes as fine almost as piano wire, and when one considers also the lateral strength of the wire wheel, owing to the fact that the spokes diverge from the rim to the ends of the hub, it is difficult to account for the collapse of any wire wheel except on the theory that the builder has taken too great an advantage of its superiority of construction, and simply not put a sufficiency of metal into his spokes and rims.

A SMASH-UP, by the way, apart from the possible consequences to the occupants of the car, may look in effect a much more serious matter than it proves in fact. Mr. Butler tells me, for instance, that though the Renault seemed a wreck after his spill on the Versailles hill, a ten pound note would cover the damage. He also informs me that the company with which the car was insured raised no objections on the score of the accident having taken place abroad, and met the claim with agreeable promptitude.

It takes a good deal to hinder a man from following a pastime of the value of which he has become objectively convinced. I met this week a gentleman who labours under the serious disadvantage of possessing only one arm, and that one the left, which with many people is not only weaker than the right, but, where motoring is concerned, is coupled with the awkward circumstance that cars are usually built with the steering wheel and change-speed levers on the right. Graduating, however, on a small Peugeot the *chauffeur* in question has now gone the length of acquiring a 7 h.p. Panhard, a car which is not altogether a crawling caterpillar in the matter of speed.

AT first sight, no doubt, the experiment is suggestive of risk, but it may be added that the car was acquired directly from the Panhard et Levassor works, and that the owner used it in France for a time before bringing it home to England. Naturally he had to obtain the *permis de circulation* from the French authorities, and those who know the stringency of the official examination before a driving certificate is granted will not need to be assured that the car was well handled, notwithstanding the physical limitations of its owner. To some extent the car was specially built. The steering-wheel standard and levers are placed on the left-hand side, instead of the right, and a knee bracket is fixed midway down the standard, by which control can be maintained over the steering even when the side levers have to be used. The owner having been accustomed to direct steering, moreover, found the irreversible worm steering in his new car to require more leverage than he had anticipated, so fitted a short arm on to the wheel, but is curtailing it by degrees as he grows more accustomed to the car. He has just driven the car to town from Paris, and with complete success, and one must congratulate him on his resourcefulness and pluck.

UNITED MOTOR INDUSTRIES, LIMITED, of 42, Great Castle Street, W., have sent us an advance copy of a new price-list of lifting jacks for motor-cars and cycles, of which there are many types and sizes. Voltmetres and amperemetres, or the two combined, also figure in the list.

HERE AND THERE.

TUESDAY next, the 14th inst., is the date fixed for the usual quarterly 100-miles non-stop trial of the Automobile Club.

MESSRS. FRISWELL, LIMITED, have this week received an order for four Peugeots to be delivered in South Africa. They will be shipped next week.

EARL RUSSELL points out that the hill on the road from South Harting to Northmarden, about four miles from Petersfield, is very dangerous.

WHILST being driven down a hill at Barry, last Monday, a motor-car belonging to Mr. C. H. Bailey skidded and overturned. The driver, a youth named Davies, sustained injuries to his head which necessitated his removal to the hospital.

REIGATE HILL has for some time past been in an exceedingly slippery state, and in descending the hill a prominent member of the Automobile Club last week had a bad "side slip," resulting in the breaking of the axle of his new French voiturette.

THE Portsmouth Motor-Car Company, which was formed some few months ago, is now ready to commence operations, the first car having been delivered on the last day of the old year. It is in the form of a roomy elongated bus, capable of carrying about sixteen passengers. The car will in a few days be placed on the route between Fratton Road and the Dock-yard.

MR. W. S. GLASIER, of 5, Clarence Road, Southsea, East, informs us that he has storage accommodation, with pit, for four or five large cars, motor trikes, quads, etc. Petrol may also be obtained and batteries charged at any time, Sundays included.

THE English Motor Club had a terribly rough run to Peterborough on Saturday last, what with the wind, rain, and bad roads, particularly north of Hitchin. Nevertheless, all the starters save one reached the destination and dined at the Grand. The Nottingham branch of the Automobile Club should have met the party at Peterborough, but not a single representative put in an appearance.

THIRTY-SEVEN designs were submitted in competition for the prize of £5 offered by the Automobile Club for the best plaque for attachment to hotels and premises of repairers appointed by the Club. The Standing Committee recommended the selection of a design in which the map of the United Kingdom was introduced, subject to certain modifications, but eventually it was decided to keep the competition open until the 9th inst., before making a definite decision.

A USEFUL little accessory, in the shape of a spout for petroleum spirit cans to prevent spilling and consequent annoyance when filling the spirit tank from the ordinary two-gallon tins, has lately been put on the market by Messrs. Salsbury and Son. It consists of a curved pipe which screws into the aperture of the cans. The connection is properly curved so as to reach the aperture in the tank conveniently; its mouth has a gauze screen, and there is an air inlet which facilitates the flow of the spirit.

THE Glasgow Trials have had a further reaching effect than one would have supposed. The old theory of the lay mind that a motor-car is only useful on a well-laid and level road has been dispelled, and as a result the Colonies are now taking freely to the new order of locomotion. This is notoriously so at

Johannesburg, from which city the Hozier Engineering Company are, as a reward for the excellent work done at the trials, booking a large number of orders for Argyll cars.

THE Motor Power Company, Limited, have sent us a very large illustration of the 1902 model of the 9-h.p. Napier car. The point of interest in the vehicle is that not only are the motor, wheels, gear, etc., all made in England, but the complete carriage body is also made in this country. The Motor Power Company claim that they are the first to fit a motor-car with a body entirely of aluminium, no wood being used in the construction whatever.

A LETTER was submitted to the last meeting of the Committee of the Motor Union from Mr. J. E. Waller with reference to damage caused to his car by the swerving of an unattended horse. It was decided to vote a sum of ten guineas towards the prosecution of the owner of the unattended horse, as persons living in the locality have stated that the animal was dangerous and should not be left unattended.

At the last meeting of the Standing Committee of the Automobile Club a letter was submitted suggesting that the anniversary run should take place in August, that being the month during which the Locomotives on Highways Act of 1896 was passed. The Standing Committee recommended that no action should be taken in the matter at present, as it was hoped that before long the Club would be in a position to abandon the celebration of the Light Locomotives Act of 1896, and would instead celebrate the passing of a new Act.

WE are this week able to illustrate one of the several recent designs of vehicles introduced by the Singer Cycle Company, Limited, of Coventry. This is the tri-voiturette, of which a Singer motor-tricycle forms the basis. The Singer motor wheel was introduced in the autumn of 1899; since then it has been improved and perfected in several points of detail, one of the principal alterations being the addition of a simple and efficient mixture regulator, controlled by a small lever fitted to the

THE SINGER TRI-VOITURETTE.

handle-bar of the tricycle. The 2 h.p. engine, carburettor, gearing, magneto, and in fact everything additional to an ordinary cycle are contained in the front wheel of the tricycle. The additional seat is carried on a tubular extension of the tricycle frame; to give easy access, the seat is pivoted at one side, so that it can be swung round. This seat can also be reversed so that the passenger can sit with his back to the driver if desired. The weight of the vehicle illustrated comes out at about 200 lbs.

A SERIES of papers dealing with the principles and the chief details of construction of modern self-propelled road vehicles, by Mr. T. H. Hawley, with an appendix by Mr. F. Hall Bramley, has been issued in book form under the title, "Motors in Principle and Practice." The construction and working of internal combustion engines, and their accessory mechanism as applied to the propulsion of motor-cycles and light vehicles, are dealt with comprehensively, numerous illustrations being given. The purely theoretical aspect of the question is left alone, the work dealing with the subject matter from the practical standpoint. Everything connected with explosive engines, ignition, and the gearing used in the transmission of power is fully dealt with, and a brief outline of steam and electric systems is also given. The book should be found useful by cycle makers and repairers, for whom it is principally intended. The publishers are the Cycle Trade Publishing Company, Ltd., Wilson Street, Finsbury, E.C.

MR. P. BLAKEMORE, of Jordan Well, Coventry, is making a speciality of mudguards and light metal belt pulleys for motor-bicycles.

WARNING is given that the Barnsley Bridge over the Black Cart is barred to everything in the guise of a locomotive. From the wording of the order it would seem that motor-cars are included amongst the prohibited vehicles.

A CORONER's jury found a verdict of "Accidental death" in the case of William Ladds, killed while driving a motor-wagon down Rockingham Hill last week, as reported in our last issue. The jury returned their fees to the unfortunate widow, who is left with a large family of small children.

A PLAN to form a co-operative association of automobilists to establish petrol and lubricating oil stations along all the main highways of Italy is under consideration. It is thought that in this way it will be possible to avoid the present necessity of carrying large quantities of fuel and oil when on a long trip.

THE annual general meeting of the United Motor Industries, Limited, was held at the registered offices of the company on the 31st ult. The Chairman had a very satisfactory report to present, business having increased with marked rapidity, and shown a substantial profit. The retiring director by rotation was Mr. Charles Jarrott, who was unanimously re-elected.

MR. F. W. HUDLASS, of the Phoenix Motor Works, Southport, has just brought out a new 9 h.p. petrol motor, the diameter of

the cylinder being 156 millimetres by 156 millimetres stroke. The cylinder, together with its water jacket, is cast in one piece, so that there is no water joint. The jacket not only extends around the cylinder, but also round the valve chambers and the sparking plug. The inlet and exhaust valves are of large diameter, while the cam shaft and cams are all enclosed. The fly wheel is 18 inches diameter, and is so turned as to form part of the friction clutch: its weight is 100 lbs. The bearings are of ample size, and special attention has been paid to the question of lubricating the same.

ON Thursday last week the Duke of Sutherland drove to the Town Council meeting at Longton in his motor-car, and at the close of the sitting took the ex-Mayor, Alderman A. Edwards, for a drive. The Duke has become quite an enthusiastic motorist, and frequently uses his car to attend the meets of the North Staffordshire Hunt, of which he is the Master.

CYCLES, says *Vanity Fair*, are entirely discredited from the investment point of view, and it is a pity that the market in cycle and motor-car shares should be practically one and the same thing. There is no more reason why motor-car shares should be mixed up with cycles than with carriages or steam-engines.

THE Second House Dinner of the Winter Season will take place at the Automobile Club on Wednesday, the 22nd inst., at 7.30 p.m. After the House Dinner a paper will be read on "Proposed Amendments in the Law affecting Motor-Vehicles," by Mr. Roger W. Wallace, K.C. (Chairman of the Club). The reading of the paper will be followed by a discussion. After the House Dinner on March 12th Professor Hele-Shaw will read a paper on "Roller Bearings."

AT a meeting of the Scarborough Rural District Council last week, Mr. C. Leadley drew attention to the reckless manner in which motor-car drivers behave on country roads. Sir Edward Cayley pointed out that the County Council had already issued regulations making it imperative upon drivers of motor-cars to pull up whenever signals were shown by drivers of restless animals. He moved that a letter be sent to the police authorities drawing their attention to the accidents which had happened through want of care on the part of the drivers of motor-cars. This was agreed to, and it was also decided to write to the Local Government Board advocating the registration and numbering of motor-cars.

WE hear that the Metropolitan District Association of the Cyclists' Touring Club is organising a motor-cyclists' section. The first meeting of the section will be held at the rooms of the Society of Arts, John Street, Adelphi, W.C., on Tuesday, February 11th, at 8 p.m. It is hoped that by frequently meeting together to communicate experiences, by arranging club runs, and by other means, the section will be able to promote the sport of motor-cycling and assist in the evolution of a satisfactory machine. Arrangements have been made by which a number of motor-bicycles will be on view, and the chairman, Mr. W. Rees Jeffreys, would be glad to hear from any maker who would care to include his machine among the number.

THE other day at the depôt of the Auto-Carriage Company, Limited, Great Portland Street, W., we had an opportunity of inspecting one of the latest 12 h.p. Bardon cars. The vehicle is fitted with a two-cylinder horizontal engine, having four pistons, a noticeable feature being that the two inlet valves, two exhaust valves, and the sparking plugs are all fitted on the top so as to be readily accessible. Another novel point is in connection with the ignition lever, which is fitted in the dash-board in front of the driver. This is so arranged, that if it is not in the right position, it is impossible to turn the starting handle, so that there is no chance of the driver having a nasty knock by reason of back firing. The car is provided with four speeds forward, and reverse motion, all controlled by a single side lever. The body is a roomy tonneau, and the vehicle altogether is one of the finest we have seen turned out from the Bardon works.

THE Twentieth Century Travel Company, of 72, Comeragh Road, London, W., send us an illustration and particulars of their new "Lococar" motor-carriages. The power is supplied by internal-combustion engines, multi-cylindrical, of 24 h.p. and upwards, with water-cooled cylinders, placed forward. Pump circulation is employed, and radiators of large cooling surface are fixed in front of the motor cover. The ignition is, of course, electrical, while the lubrication is automatically maintained. The patent transmission provides four or more forward and reverse speeds, and obviates the use of chains, which, however, can be fitted if desired. The girder frame is built up of channel steel, with an extra long wheel base and wide track. To this are fastened, at each end, railway-pattern laminated steel springs. Petrol and water reservoirs of large capacity are fitted in readiness for long-distance travelling, which the "Lococar" carriages are primarily designed for. The design of the body is far removed from the ordinary type, in that it resembles the "cab" of a locomotive with a saloon attached. The carriage-work is composed of wood and aluminium, and the saloon-top can be removed quite easily in a few minutes when desired. Steering is controlled by an inclined hand-wheel, and all levers are ranged conveniently near the driver, who has an uninterrupted view.

CORRESPONDENCE.

RENEWING SPEED GEAR WHEELS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of last week I notice, under "Here and There," you illustrate and describe the system of Mr. Morriss, of King's Lynn, by which the third speed wheel can be renewed without throwing the whole sleeve away on the scrap heap. I take the liberty of pointing out that I was the first to do this, only not in the manner that Mr. Morriss does, as I do not split the wheel in two pieces, but maintain one solid ring. A similar device was afterwards brought out by Mr. Gilbert, of Lincoln. I wish also to mention that I have another arrangement by which all the gear wheels can be renewed from time to time when they are worn out. Splitting the gear wheels as Mr. Morriss does throws a strain on two bolts instead of four at once. The joint has a tendency to open and throw the gear wheel at a pitch.—Yours faithfully, CHAS. T. CROWDEN.

ALL-WEATHER CARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In a recent issue of the *Journal*, under "Comments," I notice you make a point of "all-weather" cars; saying—such a car has yet to be evolved. I beg to submit to your notice the enclosed illustra-

electrician, or someone who understands them, and who will tell him positively that his cells are charged. If they have had fair use they are not likely to be worn out; an internal fault, however, will be indicated by their inability to retain a charge. When fully charged each cell should show not less than 2.2 volts; that is, 4.4 volts for the pair. The coil is not likely to be wrong, but it is quite probable the trembler requires adjusting, or there may be a loose connection somewhere. The insulation of high-tension wires or sparking plug may have broken down. The sparking distance between the points and a plug may be too great or too small. If after verifying these points "Puzzled" still has trouble, he had better take the car to an expert, who would soon enlighten him as to the cause or causes of his difficulties. He would then be better able to decide whether or not he has been deceived as to the condition of the car, and take steps accordingly.—Yours truly, ALBERT E. OAKLEY.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Puzzled," I have been troubled in the same manner. For the first two or three months my primary battery charged the accumulators fairly well, but after that it would only charge them enough for a few hours' run. The accumulators are not at fault, as they act well when charged from a dynamo. I presume that "Puzzled" has put in fresh sal ammoniac solution, and scraped the zincs of his battery. I did, but obtained no improvement, so have sent the inner cells to the makers, Messrs. Peto and Radford, to test, and say whether they are at fault. From

ALL-WEATHER CARS—THE 10 H.P. MORS.

tion, which shows exactly such a car; it fulfils all you ask for, and has even other advantages, such as electric ceiling light inside, luggage rail round top, capacious locker under seats, in which to stow such unsightly spare accessories as air tubes, etc. It has all the advantages of the substantial family 'bus coupled with the speed and reliability of a high-class motor-vehicle. The 'bus top is removable by simply taking out four set screws, the wind screen to driver's seat also lifting out, when you have a very stylish wagonette.

The car shown has been some hundreds of miles in driving rain, at all possible hours of day and night, carrying ladies to parties, balls, etc., which you will admit is a most exacting duty for a motor-car, a duty undreamt of twelve months ago. The Chassis is a 10 h.p. Mors, by the Roadway Autocar Company, and the body is by Mr. W. T. Edwards, of Ashford, to the designs of the owner of the car, Mr. H. V. Holden, of Eastwell Park, Ashford.—Yours faithfully, E. S. HEADECH, Estate Engineer.

SOME IGNITION QUERIES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to your querist "Puzzled," it is quite likely his accumulators are not properly charged, as no form of Leclanche battery is really satisfactory for accumulator charging, at any rate for cells so large as those used in the Benz car, and anything like hard work soon spoils them. "Puzzled" should have his accumulators charged by an

advertisements we are led to expect that primary batteries have much longer lives.—Yours faithfully, H. HUNTER WOODS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Puzzled," allow me to state that having used my Benz car for the past four years, I was much troubled some time since with my accumulators running out, and tried for some months to charge them with large types of Leclanche cells. These, although charging them to a certain degree, are not sufficiently powerful to enable the accumulator to maintain the charge, owing to the more or less rapid polarisation of the cells. About two years back I obtained four Boron cells from the Boron Battery Company, of Liverpool, which firm construct a special generator for charging Benz accumulators. These have given me every satisfaction, and, although I have no interest in the company, I would strongly advise "Puzzled" to write to them, as by so doing he will, I am confident, derive some valuable advice upon the subject.—Yours truly, H. C. THOMPSON.

MOTOR-BICYCLES FOR 1902.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In following the many letters in your very interesting *Journal*, I note one from "W. McW." in the issue for December 21st, in which the claim is made to a wider field of experience in motor-bicycles than your other correspondents, as before riding one he built it. May I assure

W. McW." that he is not alone in that respect. I have been riding a motor-bicycle for three years now, and a friend also. Both these machines were built in a private workshop (my friend's), and both machines are still going strong. We also had no previous data to go upon, but the machines have cylinders 65 mm. bore by 70 mm. stroke, or about 2½ in. by 2½ in., and fly-wheels weighing 24 lbs. I am now finishing yet another machine. This has cylinders 80 mm. by 80 mm. stroke, and fly-wheels weighing 40 lbs. "W. McW." says his present engine has a bigger cylinder capacity than any now on the market. I am interested in this point. The Mitchell has a cylinder 75 mm. by 75 mm., or equal to 2½ h.p. De Dion engine. In the Shaw a 2½ De Dion is used; Calvert also uses 2½ to 2½ h.p., and King of Cambridge uses 2½ h.p. De Dion. Your correspondent also states that his whole engine only weighs 30 lbs. I should also like to know his weight of fly-wheels, which is a very important thing; for unless they are of very exceptional diameter I fear they are too light for an engine having a larger cylinder than 2½ De Dion.—Yours faithfully,
A. J. WESTLAKE.

PILOT BURNERS FOR LOCOMOBILES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Loco" re Pilot lights for steamers, I wish to inform him that a device of that description has appeared in your columns and was called, I believe, the Kelly generator. At any rate, I have seen a car so fitted at the offices of the Houk Automobile Company, Snow Hill, London. By its means a car could be left under steam for twenty-four hours if desired, and moreover the said generator does away with the torch as well, as the main burner is ignited by it.—Yours truly,
A BEAST ON A BURNER.

MOTOR-CARS FOR THE TROPICS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I feel very much obliged to your correspondents "F. H. H." and Mr. Leonard, who have answered my letter in your issue of the 14th December. With Mr. Leonard's assurance of the suitability of petrol for cars in high temperatures I am quite satisfied. Could he inform me whether different hygrometric conditions would affect its behaviour? The air in the Straits Settlements, where I work, is warm. It is also moist, being as a rule almost at saturation point. Would this affect the behaviour of a petrol car? Mr. Leonard omits to say what the flash point of petrol really is. By flash point, of course I mean the flash point as determined in the manner so well put by Mr. Leonard—the scientific flash point. You see, in the colonies as well as at home we have legislators, and they, in their wisdom, have enacted that, so far as our particular colony is concerned, no oil whose flash point is below 78 (this is the limit, I think) may be imported. I have an idea that the flash point of petrol is considerably higher, but you will see how important the point is in view of the present state of the law, apart from thermometers and hygrometers.

As I am a medical practitioner requiring a good many horses, I cordially endorse what Mr. Leonard says in his last paragraph, but I should think it is for the "trade" to prove the efficacy of motor-cars for the tropics. Should it be able to do this, it has an unlimited market at its command in those countries where the horse and trap is not a luxury but an actual necessity of life.

When I came home on leave I determined that I would take back with me a motor-car to replace the old "Waler" of commerce and the very uncommercial Malay syce. But having gone into the subject of motors, I find that "in the multitude of counsellors there is"—chaos! It seems to me that motor-car builders leave it to their clients to experiment on their behalf; and as this sort of experiment may run one into a loss of a few hundred pounds, some of us may have to confine our aspirations to the possession of the inexpensive motor-bike.

It is to be hoped that in the near future some motoring firm will be found to show a little business aptitude, and demonstrate to the "Britains beyond the seas" that motoring is not all woes, but a pastime, or means of locomotion, available for all, and not to be classified among those fads commonly relegated to the man with a hobby. Such a firm would, in my opinion, have no cause to regret its enterprise.—Yours truly,
P. FOWLER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Our attention has been called to the letters on the subject of motor-cars for the tropics appearing in your journal. We probably have as much interest as anybody in this subject, and have also probably devoted more time and attention to the matter, and have in all probability received more reports from India upon the use of both petroleum oil and petroleum spirit than other firms.

Petrol and gasoline are practically the same thing; there is occasionally a little difference in the density of two samples, the one of petrol and the other of gasoline, but if there be any difference it is so slight as to be negligible. The spirit petrol will flash below the freezing-point, it is obviously, therefore, more or less dangerous in this country however facts may be attempted to be glossed over; the numerous accidents arising from its use, and the explosions and burning out of cars sufficiently prove its great inflammability. If this be so then in a temperate climate, say 60 deg. Fahr., what then must it be in the tropical temperatures of 100 deg. Fahr.?

Putting aside the question of safety, we may mention that we had a report from a correspondent in one of the Presidency towns of India, who

had a Benz car there and who could only purchase the petroleum spirit in small quantities in bottles from different chemists, and by the time he had used it he informed us that the running of the car cost him 5s. per mile. We might add that, although we make our cars for use in this country to run with oil having a flashpoint of 75 deg. Fahr. or rather over, when building a car for India or other tropical climates the car is made to run with kerosene having a flashpoint of what is called 150 deg. Fahr.—Yours faithfully,
ROOTS AND VENABLES.
(J. S.).

TURNING CORNERS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I read in a recent issue of your paper that an artist "making the usual error" had depicted a motor-car in the Christmas number, I think, of the *Strand Magazine*, going round a sharp corner at evidently a high speed with the inside wheels off the ground, and I also read that "Flaneur" considered this wrong. The artist was right and your respected contributor wrong. The natural tendency of anything rounding a sharp curve is to capsize outwards; a cyclist on a motor-bicycle when going round a sharp curve at a fast speed leans inwards as much as ever he can to keep the inside wheel down, otherwise he would capsize outwards.

A railway track at a curve is built up on the outside line to make the train lean inwards, otherwise the train would topple over outwards, or in other words the inside wheels would lift beyond the point of equilibrium, and the carriages capsize outwards. I hope I have made this clear as ninety-nine people out of a hundred declare that the outside wheels lift, which is incorrect.—Yours faithfully,
RONALD E. HAYWOOD.

AN INTERESTING QUERY RE LOSS OF POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Could any of your readers explain the reason why a new trembler fitted to a car should cause a loss of power? I recently put a new trembler on a Boyer car (Aster engine), and although the car went fairly well, it was obviously not up to its proper form. Upon the old trembler, which was considerably worn, being replaced the lack of power was no longer apparent, and the engine developed splendidly. I should be very pleased if some one could throw some light upon this.—Yours truly,
FLASH.

VIBRATION AND BALANCE MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was much disappointed in the replies to the charge of copying. I should have liked to see half a dozen replies from makers, indignantly denying the accusation. How many firms are there, making a motor which is not of Daimler, De Dion, or Benz type?

There has been a great deal said about vibration. Are we going to sit down and accept it as an essential or "component part" of a petrol car? I have seen one French and one English car in which there was no perceptible vibration when standing with the motor running. I think it would be of general interest—to purchasers—if any possessors of, or experimenters with, a really balanced motor (balanced moving parts and explosions) would give their opinions thereon. I am aware that in large cars, with plenty of cylinders, the vibration is not greatly noticeable, but I should much like to hear of a balanced motor suitable for the smaller type of car, generally "well shaken before taken" along by a De Dion type motor.—Yours truly,
J. W. W. B.

QUERIES RE GREASE AND ACCUMULATORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will anyone kindly inform me what is the best grease or oil or mixture for gear boxes? Anything that I have hitherto tried has been of too thin a consistency and runs out badly at the bearings.

How can one tell when an accumulator is nearly exhausted? I have received through your paper more than one valuable wrinkle from Mr. Estcourt, and perhaps if this meets that gentleman's eye he will again favour myself and no doubt many others.—Yours truly,
AMATEUR.

MR. ARCHIBALD FORD writes:—"I can quite appreciate the ingenuity of your correspondent who wrote the letter the other week, in which he refers to fitting a small 4-volt electric lamp under the steering wheel of the Darracq in order to see to change the gear at night. But really, such a contrivance is absolutely unnecessary on a car like the Darracq. When the driver is familiar with his car it is the simplest thing in the world to pull the lever towards you as you desire to increase the speed or push it from you when climbing hills, and there is practically no chance at all of missing the notches after but ordinary experience."

WE learn that a movement is on foot in Dublin having for its object the formation of a motor-cycle club in that city.

WHY did the gear scream?—Because the mixture was being throttled.

M. SANTOS-DUMONT is now at Monte Carlo preparing for his aerial voyage across the Mediterranean. He hopes to begin operations about the middle of the month.

DIARY OF 1901.

AN INTERESTING AUTOMOBILE RECORD.

JANUARY.

English Motor Club's New Century run to Brighton.
Paper by Mr. Outhwaite on "Motor-cars for Public Services," at the Automobile Club.
Automobile Club's Demonstration to County Councillors at Warwick.
Formation of the Automobile Trade Protection Society.
Linsky cup race at Nice.
Result of French Alcohol Trials published.
Gilbert heavy oil car, Mytholme Doctor's car, and Baines motor-bicycle placed on the market.
Discussion on motor patent matters.
Irish Automobile Club formed.

FEBRUARY.

Motor vehicles for municipal purposes attract attention in London and other large cities.
French Motor-Car Exhibition.
Motor-Bus Service inaugurated at Hemel Hempstead.
Excelsior motor bicycle placed on the market.
Yorkshire Automobile Club holds its first annual dinner.
English Motor Club run to Farnham.
Pau Automobile Week.
Paper on Proposed 1,200 Miles Trial read by Mr. Mark Mayhew, at the Automobile Club.
Automobile Club demonstrate before East Suffolk County Councillors.
Mr. Balfour suggests motor-cars as a means of solving the "Housing Difficulty" of London.
Result of Electrical Car Trials announced.

MARCH.

Western section of Scottish Automobile Club formed, with headquarters at Glasgow.
Motor-car demonstration to Chief Constables by Automobile Club.
Motor Union formed.
Marked agitation amongst County Councils in favour of numbering motor-cars, and further reducing "legal limit."
Reading Automobile Club's exhibition of motor cars.
Paper on "A Motor Field Battery" read by Major H. A. Bethell, R.F.A., before the Royal Artillery Institution.
South-Western Motor-Car Company, Limited, inaugurate public service of motor-cars in South London suburbs.
Major Holden, Superintendent of the Royal Gun Factory, Woolwich, lectures on "The Automobile and its Possible Uses in War," at the Royal Artillery Institution.
Affiliation of the Manchester Automobile Club with A.C.G.B.I.
Lincolnshire Automobile Club Inaugural Banquet.
Demonstration at Worcester by A.C.G.B.I. and Midland Automobile Club, before Worcestershire and Staffordshire County Councils.
Belgian Motor-Car Exhibition held at Brussels.
Wolverhampton and District Automobile Club holds its first run.
Automobile fête at Nice.

APRIL.

Southampton Borough Council adopts resolution in favour of municipal motor-car service.
Automobile Club's Easter Tour to Salisbury and the New Forest.
Motor Races at the Crystal Palace.
Memorial of motor-vehicle manufacturers to the Local Government Board.
Albion Motor-car Company introduce Albion car.
Petroleum-Spirit Distance Contest at Sheen House Club.
Automobile Club run to Dunstable.
English Motor Club's Control Contest at Crystal Palace.
The London County Council purchase a Locomobile steam car for the Fire Brigade.

MAY.

Motor-Car Exhibition at the Agricultural Hall.
Consumption and hill-climbing trials at Dashwood Hill.
War Office offers prizes for self-propelled lorries for use in military operations.
Automobile Mutual Protection Association holds a meeting at the Agricultural Hall re Maybach carburettor test case.
Automobile Club run to Guildford.
Paris-Bordeaux and Gordon-Bennett Cup races.
Automobile Club's Whitsuntide tour to Oxford.
Eccles Town Council order a motor-fire engine.
The Queen's electric car attracts attention.

JUNE.

Paris-Berlin Race.
Heavy Motor-Vehicle Trials at Liverpool.
Automobile Club's demonstration to County Councils at London.
Automobile Club's demonstration to Incorporate Association of Municipal and County Engineers at Leicester.
English Motor Club's Hill Climbing Competition, at Tilburstow.
London County Council declines to accept a resolution of the Berks County Council, in favour of numbering motor-cars.

A representative meeting of manufacturers of and agents for motor cars pass a resolution to support one annual exhibition only.
The King goes to Windsor and back from Marlborough House on a motor-car.
British and Foreign Electric Vehicle Company's car "Powerful" makes a run of 94½ miles on one charge.

JULY.

Automobile Club's hill-climbing trial at Dashwood Hill.
French Automobile Club limits weight of future racing cars to 1,000 kilos.
Mr. Justice Farwell decides against the validity of the Maybach carburettor patent.
M. Santos Dumont commences a series of attempts to win the Deutsch prize by sailing round the Eiffel Tower in a motor balloon.
Conference held at the Automobile Club to consider the arrangements for charging electrical motor-cars.
Proposals to construct motordromes receive the serious attention of Automobile Clubs in various countries.

AUGUST.

Motor-car service for transport of goods established between London and Tunbridge Wells.
Irish tour of the Automobile Club.
Members of the Automobile Club assist with their cars at cavalry manoeuvres at Salisbury Plain and at cyclist manoeuvres at Aldershot.
The King "motors" at Homburg on his English-built Daimler.

SEPTEMBER.

Reliability Trials at Glasgow.
Speed Contest at Deauville.
British Association appoint committee to investigate the resistance of roads to motor-traction.
Motor-bus service between Putney and Piccadilly Circus instituted.
The "Powerful" electric car makes a long-distance run from London to Glasgow and back.

OCTOBER.

Legal speed of motor-cars in Scotland increased to twelve miles an hour.
M. Santos Dumont wins the Deutsch prize.
General indignation amongst motorists at police prosecutions for alleged furious driving.
Sixty convictions for furious driving take place in one day at Reigate.
Agitation for the abolition of the speed limit.
Liverpool Self-Propelled Traffic Association memorialise the President of the Local Government Board on the subject of increased tare limit for heavy motor-vehicles.
Motor Cycling Club formed.

NOVEMBER.

Brighton Road motor patrol instituted.
Annual dinner of the Automobile Club.
Fifth anniversary run of the Automobile Club to Southsea.
Secretary of State for War offers prizes for military tractors; entries to be made before January 1st, 1903.
Aero Club formed.
First ascent of members of the Aero Club.
Hill-climbing contests at Gaillon; British car wins.
The County Councils Association passes a resolution to the effect that the general law of the land as regards vehicles is sufficient for motor-cars, provided number plates are carried and drivers licensed.
South African Automobile Club formed at Cape Town.

DECEMBER.

War Office motor-wagon trials at Aldershot.
Circular issued by A.C.G.B.I. asking members to abstain from exceeding legal speed limit.
First winter meeting of British Aeronautical Society.
First ascent of members of the Aero Club, from Crystal Palace, without professional assistance.
Motor-bicycle record for mile and kilometre made on the road by Rigal; time, 53.3-5sec. and 33sec.
Motor-car exhibition held in Paris.
First of a series of papers on motoring entitled, "Ignition in Petroleum-Spirit Engines; Systems, Probable Failures: How to Discover and Remedy Them," intended for publication in a Badminton Library book on Motoring, read at the Automobile Club.

WERNER MOTORS, LIMITED, are removing from Brook Street, W., to larger premises at 19, Woodstock Street, W.

THE Nottingham and District Automobile Club holds its second annual dinner at the George Hotel, Nottingham, on Friday, the 10th inst. The A.C.G.B.I. fixed a club run down to Nottingham for the event. There were no fixed arrangements for the run to Nottingham, as it was thought preferable that members should be able to choose their own route, time of starting, and return.

FURIOUS DRIVING CASES.

At Stowmarket Petty Sessions, Frank Lanchester, Birmingham, was charged with driving a motor-car furiously at Stowmarket, to the danger of the public, on December 5th. Defendant did not appear, and sent a letter asking for the case to be adjourned on the grounds that it might prejudice a County Court case pending, and that his solicitor was unable to be present that day. The witnesses for the prosecution were present, and the Magistrates declined to accede to the request. Charles Gosling, Combs, said he saw a motor-car coming through Stowmarket from Ipswich; it did not pass him, and he thought it was going quite ten miles an hour. Samuel Pope, publican, thought the car was passing down the street at between sixteen and eighteen miles an hour. There were three or four carts about, but the driver was evidently a good one, and he got through without slowing and without mishap. Robert Bird, dealer, said the car went so fast it looked as if it was flying, and it frightened him. He put the rate at eighteen miles an hour. Later he went to Combs and found the car overturned; it had run into one of his ponies and broken its leg. Wm. Bird, son of the last witness, said he warned the driver to slow down, as he had a drove of colts on the road, but no notice was taken, with the result that one of the animals had its leg broken. The car was going a good eighteen miles an hour. The defendant was fined £5 and costs, £2 8s. 2d.

At the Dewsbury Borough Court, Richard Roslyn Kilner, eighteen, was summoned for furiously driving a motor-car, to the danger of the public. Mr. Walker appeared for the defendant, who pleaded not guilty. The evidence of police-constable Baker, supported by that of another officer, showed that on the 19th December, the defendant drove a motor-car through Dewsbury Market Place and Long Causeway, at the estimated rate of from seventeen to eighteen miles per hour. The defence was that the speed was only from seven to eight miles per hour, and Mr. Kilner, senior, to whom the car belonged, said that was its usual speed. It could be driven at twelve miles per hour, but not more than fourteen at the most; indeed, he was prepared to give any one a five pound note who, on a level, could drive the car at sixteen miles an hour for a mile. The Bench convicted, and said that as that was the first case of the kind they would take a lenient view. The defendant had to pay £3 3s. and costs.

At Hastings Benjamin Burbidge was summoned for furiously driving a motor-car at the Marina on December 18th. Mr. C. Davenport Jones prosecuted, and Mr. Cruttenden defended. P.C. Fairbairn said that at six o'clock on the evening named, when a little to the west of St. Leonard's Pier, he saw a motor-car coming along at the rate of about fourteen miles an hour. He called upon the defendant, who was driving, to stop, but he took no notice. The following day he saw defendant, and told him he should report him. In cross-examination, witness said he did not time defendant, and admitted he had no experience of judging pace. There was not much traffic about. Frederick Lock, cab-driver, gave it as his opinion that the car was travelling at a rate of twenty miles an hour; and, in answer to Mr. Cruttenden, he said he knew nothing about motor-cars, and did not want to. Frederick Bournier, another cabman, fixed the pace at between fifteen and twenty miles—he did not check the pace; and a signalman named Thomas Barnes thought the speed was twenty miles. Burbidge, in defence, asserted that he regulated the pace of the car so that it could not exceed nine miles an hour. Mr. C. F. Froud, the owner of the motor-car, said the journey in question was the first since a spill, six weeks back, and the driver had instructions to travel at eight miles an hour. Henry Hyland, a 'bus driver, said the car was coming along at about eight miles an hour. The defendant was given the benefit of the doubt.

At Bangor, the Marquess of Anglesey was summoned before the magistrates for furiously driving a motor-car. The summons was withdrawn upon an assurance being given that there would be no recurrence of the offence.

EXPERIENCES ON ICE.

MR. MARK MAYHEW has kindly supplied the following brief account of a recent experience:—

"My experiences were briefly as follows:—Left London on my 20 h.p. Panhard Saturday morning, 28th December, 7 o'clock; roads like asphalt, freezing hard. Breakfast at Hillingdon; left Hillingdon 9.30, raining hard. Made for Oxford; found Dashwood Hill covered with rough ice. Ascended second speed accelerated. Very fast. Top of Dashwood Hill to bottom of Aston Hill snow a foot deep. Bottom of Aston Hill to Oxford deep mud. Five miles out of Oxford suddenly hit solid ice running with water. Awful side slip. Hit side of road three times, left—right—left, after which straight again. Repetition of this a mile further on. Passenger's hair standing on end and teeth chattering. Onemile from Witney noticed sharp descent covered with ice, running with water. No time to pull up car, put brakes on at top of hill, stopped driving wheels dead, slid down to the bottom. Arrived at bottom, let in clutch on second speed, and began ascent of other side; car continued ascending while momentum lasted, then wheels began to slip, dropped into first speed, but when momentum all gone, car stopped going forward, wheels revolving on ground. Next stage, car sliding down hill backwards with wheels revolving forwards—curtain and green fire—policeman at bottom; apologised duly for speed and backward direction, explanation agreeably accepted, helped us cover wheels with strips of sacking, by means of which climbed hill and got into Witney; gave up for day. Tried to reach Cheltenham next day, but found after Northleach a three miles stretch of yesterday's sample, again stuck; friend and I

tried to push car round, both fell down, eventually pulled car round bodily from side of road. Went back to hotel."—*Automobile Club Notes and Notices.*

MOTOR-CAR, TRAP AND LAMP-POST.

At the Birmingham County Court, his Honour Judge Whitehorse and a jury were engaged for several hours hearing a case in which Samuel Kingston Cattell, of Alum Rock, sued Felix Chapman, of Steelhouse Lane, for damages alleged to have been caused by the negligence of the defendant in driving a motor-car. Mr T. G. Tyler appeared for the plaintiff, and Mr. Dorset (instructed by Messrs. Price and Adeock) represented the defendant. The allegation against the defendant was that on the afternoon of August 19, while in Sutton Road, Wyld Green, he drove a motor-car containing himself and three other persons so negligently that a horse attached to a trap of which the plaintiff was in charge was alarmed and ran away. In the course of the horse's career the trap collided with a lamp-post, knocked it down, and the trap and horse were damaged. The plaintiff claimed for depreciation in the value of the horse £10, and £5, the cost of the repairs to the trap. For the defence it was urged that there was no evidence of negligence, and after his Honour had summed up the jury found a verdict for the defendant.

ALLEGED BREACH OF WARRANTY.

In the Brighton County Court, J. R. Adler sued Messrs. Duck and Harris, 163, Western Road, Brighton, motor-car agents, for £25 as damages for breach of warranty upon the sale of a motor-car. Plaintiff's case was that he bought a second-hand motor-car for £105 of the defendants on their representation that it was a De Dion. He paid £25 deposit, but afterwards found that, although the motor was a De Dion, the car was a Cudell; and he then instructed his solicitor. For the defendants it was urged that the plaintiff knew throughout the transaction that the car was a De Dion motor with a Cudell body on it. At the same time they contended that it was perfectly correct to describe the car as a De Dion, the motor and the transmission gear, which were all genuine De Dion, being by far the most important parts of the whole. His Honour was occupied a long time in hearing the evidence, and the case, which had not been finished when the Court rose, was adjourned to January 17th.

ACTION FOR DAMAGES DISMISSED.

At Waterford Quarter Sessions, on Friday, before Judge Fitzgerald, Mr. Michael Hickey, farmer, Coolfin, Co. Waterford, sued Messrs. W. F. Peare, cycle manufacturer, and William Pope, merchant, Henrietta Street, Waterford, for the recovery of £50, damages for that the defendants, on October 6th, 1901, so negligently, furiously, and in violation of the Light Locomotives (Ireland) Order, 1896, on the public highway, drove motor-cars, or light locomotives, that they ran into the plaintiff's trap, then being lawfully driven on the said highway, whereby the plaintiff was injured, and his horse hurt, and his trap and harness broken. After a lengthy hearing, his Honour decided that the accident was due to the plaintiff's own negligence, and dismissed the case on the merits.

WE are asked to mention that the Boyer, Cannstatt Daimler and Fabrique Nationale cars, for which the Motor Traction Company, Limited, 27, Walnut Tree Walk, Kennington, S.E., are agents, are all being built with long and wide wheel base, viz., 6 ft. 7 in. by 4 ft. 4 in., and wheels of equal sizes.

THE Automobile Transport Company have opened the new year with "a few words on modern road locomotion," produced in an illustrated pamphlet descriptive of the company's "Twentieth Century" motor-vehicles. Not the least interesting page of the pamphlet is that which proves by figures the economy of the motor-car as compared with the horse-drawn vehicle.

THE Motor-Car Journal.

VOL. III.]

LONDON, SATURDAY, JANUARY 18, 1902.

[No. 150.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

IN addition to the luxurious private car which the King recently ordered from the Daimler Motor Company, we learn that His Majesty is purchasing from the company still another automobile. This will be a large and powerful vehicle of omnibus form, seating fourteen persons, and designed for use on the Sandringham estate, partly as a loaders' car for the Royal shooting parties, and partly for the conveyance of luggage to and from Wolferton station. The car will be fitted with a 22 h.p. motor, and with a special body designed to carry luggage on the roof, and also inside, the passengers' seats being made to let down when not required. The Kaiser, who is becoming quite as enthusiastic a *chauffeur* as King Edward, has, we learn, also just received delivery of a handsome 16 h.p. *tonneau* from the Cannstatt Daimler Works.

The Automobile Club Show.

IN our last issue we gave the names of several additions to the long list of firms that will exhibit at the Automobile Club Show at the Agricultural Hall in April next. Since then several additional firms have booked spaces, and altogether the exhibition promises to be the finest ever held in this country. An interesting item that we are able to publish this week is to the effect that Sir Arthur Bigge has informed Mr. Roger Wallace, K.C., the Chairman of the Automobile Club, that H.R.H. Prince of Wales hopes to pay a visit to the exhibition, and looks forward to doing so with great interest.

The Military Trials.

AFTER the attention drawn to the subject of motor-lorries for military purposes by the recent competitions at Aldershot, it seems a great pity that a dispute should have occurred in connection with the award. In all such competitions those who enter should undertake to abide by the judges' award, and if it is not in accordance with the facts, there are other ways of bringing the matter to the notice of the proper authorities than by declining to accept the prize that is actually awarded. Into the merits of the unfortunate dispute between the War Office and Messrs. E. Foden and Co. in connection with the recent army lorry trials we will not enter at length, save to congratulate Messrs. Foden on their decision to sell their lorry to the War Office for service in South Africa. There it will have every opportunity of being tested in actual warfare, and its undoubted merits will become far better known than in any trial or test in the "piping times of peace."

The Point Proved.

WITH regard to the trials which have taken place, Mr. Foden considers that these trials have conclusively proved that the traction-engine type is the true model for steam road tractors, as opposed to any modification of the ordinary type of motor-car. This is especially the case for military wagons, as it not only gives the paramount advantages of greater strength, durability, power, and economy in use out of all proportion to the slightly additional weight, but it also gives a great immediate advantage from the fact that any ordinary traction engine driver can be trained to the use of the wagon in a few days' time.

Motor-Wagons at the Gold Coast.

SPEAKING at the second ordinary general meeting of the Birrim Valley Gold Mining and Dredging Company, Limited, last week, the chairman stated that with reference to the question of transport, in addition to spending money on making roads for communication, the Gold Fields of Eastern Akim had incurred an expenditure of some thousands of pounds, in which this company had joined to the extent of £2,000, in providing steam-motor traction in the eastern part of the Gold Coast Colony. They had now a fairly good open road from the port of Accra up to the site where their dredge was to be erected, covering a distance of from sixty to sixty-two miles. To send up two tons of material to where they proposed to mine took no less than eighty carriers, and at 6s. 6d. each this worked out at £26. Now, having the road, they had provided 2½-ton steam motor-wagons, and they now estimated that they could take up two tons of material in one day, because the speed guaranteed was seven miles an hour. Reducing that to five miles an hour, in a working day of twelve hours they would be able to do what it took eighty men from three days and a half to four days to do at a cost of £26, for the small sum of £4. Therefore, when they actually got to work a very important item would be saved in the cost of transport.

The Police and Motor-cars.

"To run over a policeman is a very grave offence," remarks the *Belfast News Letter*. "Unfortunately, motorists do not confine their attentions to the police, but distribute them all over the body politic. Not unfrequently they run into hedges and ditches, and suffer physical injury themselves, and there are instances on record of five-bar gates having been cleared by youthful and enthusiastic drivers. Wheelmen in early days were bad enough, but the drivers of motor-cars go at treble their speed, especially when they leave the metropolis behind them. The wagoner with a heavy load behind his horse is often painfully undeceived when he imagines that it is the duty of a motorist to get out of his way. The modern Phaeton sounds his syren, whose startling voice is enough to demoralise nervous people unfamiliar with the muffled noise it makes. It often

approaches the unwary pedestrian in a cloud of dust, snorting along at express speed as it vomits forth its pestiferous fumes. If motorists would always collide with policemen their erratic speed would soon be regulated by the magisterial bench."

A Note for Ireland.

MOTORISTS have been so well received in Ireland that we are somewhat surprised that so representative a journal as the *News Letter* should take up the contrary attitude shown above. It declares that motorists regard the King's highway as being made and maintained in their interest alone—a silly suggestion, unworthy the reputation of our Irish contemporary. There are motorists who are not so well mannered as they should be, and there are drivers of horse-vehicles who regard the highway as theirs. But we must protest against this wholesale branding of motorists as unreasonable merely because some have been guilty of foolish indiscretion.

MR. C. FRISWELL ON HIS 20 H.P. PEUGEOT.

Money in the Air.

As will no doubt be remembered, the French Aero Club decided some months ago to arrange a grand International airship race for next summer. Though the "gate" at such an event is likely to be more speculative than profitable other inducements to intended competitors are forthcoming, and victory will be far from a barren honour. On the announcement of the event M. Deutsch at once gave £1,000. This first contribution has been followed by others equally generous, and it is now stated that the total amount of prizes endowed reaches no less than £20,000. As may be imagined, aerial navigators in France are in a ferment of excitement at the prospect of the coming season. The latest vessels, worked out on paper or built in small models, are those of M. Cavalier and M. Piraud. The former has devised a balloon shaped like a bird, having a species of tail in lieu of a rudder, and a pair of flexible wings on extensible rods. The latter's invention is an aeroplane, heavier than air, the wings of which are to reproduce exactly the movements of those of birds.

The Education of Animal Life.

SOME day books on natural history will contain a chapter on the educational influence of the motor-car on wild life. It is a rare thing to see a bird, hare, or rabbit near the metals of the railway, and although birds frequently perch on the telegraph wires they rarely come to grief from passing trains. With those who frequent the ordinary highway, however, the case has been different, and motorists often are confronted with birds that do not realise the speed of automobiles. Blackbirds have been the greatest victims from this cause, because of their habit of flying out from the hedges when alarmed, as well as

because they remain too long on the road. Probably the motor-car has been less destructive of cats than of any other form of animal life.

Accidents in France.

Le Velo's casualty list for France for the month of October shows 47 deaths and 668 injuries due to the horse; 14 deaths and 124 injuries due to the railway; 12 deaths and 97 injuries due to the bicycle; and 3 deaths and 50 injuries due to the motor-car. The horse was responsible for 61.84 per cent. of the total fatalities and 71.14 per cent. of the total injuries from the four causes; the railway for 18.42 and 13.20 per cent.; the bicycle for 15.75 and 10.33 per cent.; and the motor-car for 3.95 and 5.33 per cent. respectively.

Scarcity of Motor Spirit in America.

At a recent meeting of the National Association of Automobile Manufacturers, in New York, Mr. McGowan, a representative of the Standard Oil Company, gave an address, in which he stated that during the past year he had been making a special study of the requirements of gasoline engines and liquid fuel steam engines, and that he had found that in almost every case seventy-six test gasoline was required for the engines and burners now in use. As the demand had grown enormously it already exceeded the supply, which could not be increased for the reason that in distilling petroleum the first products are of very high test, and from these they decline very rapidly, so that not more than 2 or 3 per cent. of the product of any one test was available for automobile use. He stated that the large demand for seventy-six test was undoubtedly the cause of the great advance in the price of this grade of gasoline, and urged manufacturers to produce burners and carburettors which would use a lower test product, the lower the better, as there are more heat units and consequently more power in the lower grades of petroleum product than in the high grades.

Electric Vehicles.

ACCORDING to an article in the *World* fashionable folk are looking to electricity for effecting some marvellous developments in automobilism; and there is undoubtedly an increasing use being made of electric cars in the West End of London. This is largely owing to the well-directed efforts of the City and Suburban Electric Vehicle Company and other concerns in the industry, who have made special efforts to popularise and perfect the electric vehicle. We now hear that arrangements are being made for the introduction of Krieger carriages—so largely used in Paris—into this country. Some vehicles of this type have, we understand, already arrived, and the popularisation of such cars should prove attractive.

Progress.

TIME, and the active educational work pursued by the Automobile Club, is having the effect that might have been expected, and common-sense views as to the absurdity of the speed limit are being endorsed not only by the County Councils Association, but by some of the more enlightened of the Councils, including that of Gloucestershire. On the other hand, there is some want of unanimity as to the price to be paid for its abolition, and the clamour for numbering or marking will need to be carefully watched to ensure that automobilists do not receive invidious treatment as compared with other highway users without receiving a *quid pro quo*. Names instead of numbers would certainly be preferable if either are inevitable, but both offer a dangerous opening to malicious action on the part of prejudiced individuals, while the proposal for requiring a certificate of efficiency for the driver would be of little utility, as a driver who could not obtain it would be probably rare in the extreme. Still, it would be unobjectionable, and salutary—if the certificate could be applied impartially to drivers generally, those of hay-motors included!

British v. Foreign Cars.

A SHAREHOLDER in a British motor company has sent a most pathetic wail to financial editors, and confesses to a feeling of wonderment as to whether the motor-car press is subsidised by the French Government. "It is positively disgusting," says our anonymous friend, "to look through the journals and see paragraph after paragraph advertising foreign cars." When we remember the large proportion of foreign cars in use in this country there need be no surprise because they are so frequently mentioned. English-made vehicles are just as freely referred to, but the unfortunate part of the matter is that there are considerably fewer such cars in use. We wish there were more, and if the critic of the press will stir up public opinion against the present vexatious restrictions he will be doing something to bring his chances of profit a little nearer.

Motor Vehicles for Heavy Traffic.

UNDER the auspices of the Bradford Engineering Society, Mr. E. Shrapnell Smith delivered a lecture last week in the lecture-hall at the Bradford Municipal Technical College on "Motor Vehicles for Heavy Traffic." After explaining the various methods adopted by different makers of motors in the construction and arrangement of parts, Mr. Smith said we were accustomed to think that France, to whom credit certainly was due for reviving the interest in automobilism, was the first to experiment with self-propelled motors as a means of goods haulage, but, of course, as many engineers knew, there existed upon English roads between the years 1820 and 1835 a large number of efficient and satisfactory vehicles which, although used entirely for passenger service, would have been quite fit to deal with goods had it been thought desirable. Since 1878 much attention had been given to the subject, and, as was well known, motor-vehicles for haulage purposes were now practicable. A large number of photographs and diagrams were put upon the screen, by which Mr. Smith illustrated many of the vehicles which entered for the trial tests at Liverpool in 1898 and 1901.

Motor-Buses at Exeter.

THE Electric Traction Committee of the Exeter Town Council considers it desirable that information be obtained as to the practicability and suitability of introducing motor-buses, electric road-cars, and other means of passenger transit in the city, and that a sub-committee as a deputation be appointed to visit towns where any or either of these systems are in operation, and to report. Mr. Wreford, at the last meeting of the Council, moved the adoption of the recommendation. The Committee was desirous that the subject should be thoroughly threshed out. It wished to have an experience of the working of the various kinds of 'buses and cars, and also the cost. Mr. Stocker, in seconding, was sure the whole of the citizens would be glad to know that the inquiry was to be a thorough one. There was a great deal of difference of opinion with reference to electric traction, and the more extensive the inquiry the better. The report was adopted.

Horses and Motor-Cars.

IMPORTANT news comes from Preston, and the state of the market at the great horse fair held in that Lancashire town last week is significant. Preston is in the centre of the district where demonstrations of the value of motor haulage for heavy loads have been most frequent. Many of the leading manufacturers of the county have adopted a system of motors for drawing heavy loads, with the result that burdens have been taken from horses and economies effected in the stables. At the recent horse fair horses which two years ago would have realised £60 were sold for £45. Seeing that there was a good demand for horses for Army purposes, it cannot be said that the prices were unfairly reduced. Local experts ascribe the fall in value to the introduction of motor-vehicles for heavy traffic in certain large northern towns.

Protective Hastings.

MANY visitors to Hastings last summer were disappointed to discover that a by-law prevented their taking a trip in the seductive motor-cars that ply between the Cinque Port and its attractive little rival Bexhill. The only way to accomplish the desired trip was to journey first to Bexhill and return by motor-car to Hastings; passengers booked for the return journey, of course, having the right to make the homeward journey by motor-car. The reason for this apparently inexplicable restriction of the freedom of the stranger within her gates, to go and come as he pleased, was that Hastings, chary of granting licences to public motor-cars, hoped, by placing an embargo on Bexhill's homeward bound cars, to prevent her own visitors from wandering further afield, and scattering those pence and shillings elsewhere, which long usage, previous to the rise of her rival, has led her to regard as her own. With a view to a better understanding, the Bexhill Urban Council have approached the Hastings authorities with the suggestion that cars from both towns should be allowed to take up passengers at the end of the outward journey. Hastings, possibly because it has not a regular service to Bexhill, has declined the mutual facilities offered. The "dog-in-the-manger" policy, as one of the wise councillors of Hastings labelled the decision is hardly likely to add to the attractions of that town from a visitor's point of view.

MR. CREBER, OF BARRHEAD, N.B., OUT FOR A RUN IN THE SNOW.

A Motor Mail Service.

Hitherto the mail service between Manchester and Liverpool has been effected by means of two double-horsed vans, which leave the respective cities at 10 p.m. The thirty-five miles' journey takes about five hours, and twice *en route* each van is rehoused—once at Warrington and once at Prescott. But the old order changeth. An arrangement has been made with the Motor Haulage Company, Limited, whereby from March 1st next motor-vans are to be employed experimentally, which are expected to cover the distance in four hours. The two vans will leave their respective starting points at the same time, and stop only at Warrington. There the two drivers will change places, each conducting a different van and two tons of mails back to his starting point. The obvious advantages of such an innovation—which, granted a fair trial, cannot fail to succeed—are, at a modest estimate of speed, mails closing one hour later, and two motor-vans doing the work of two carts and twelve horses.

A Fine Show of Cars.

ONE of the finest collections of cars and most representative gatherings of *chauffeurs* ever brought together was that seen at Welbeck on Saturday, on the occasion of the trials held by the Automobile Club.

Amongst the cars we noticed Mr. Hargreaves's 22-h.p. Daimler, of bright aluminium; Mr. Oliver Stanton's 22-h.p. Daimler; Mr. Manville's, Mr. Bush's (Daimler Company), Mr. Crombie's and Mr. Owers's 16-h.p. Daimlers; Mr. Roger Wallace's 12-h.p. M.M.C.; Mr. Midgley's 16-h.p. Napier; Mr. Cordingley's and Mr. Edge's 9-h.p. Napiers; Mr. Rolls's and Mr. Mayhew's 20-h.p. Panhards; Mr. H. Du Cros, jun.'s, and Mr. Jarrott's 16-h.p. Panhards; Mr. Edmund's 9-h.p. Daimler; Mr. Friswell's Peugeot; Mr. Stocks's new De Dion; Mr. Johnson's New Orleans; Mr. Critchley's new "Brush," with 10-h.p. Abeille motor; Mr. Ginder's Locomobile; a Delahaye, etc. The trials were of a very interesting description, and were watched by a number of the most influential residents in the neighbourhood, as well as by Government inspectors and War Office officials.

A CONSULTATION IN WELBECK PARK.

Photo by]

[Mr C. Friswell.

Motor Houses at the Rear.

SUBURBAN house agents and the owners of eligible dwellings in the fashionable quarters of London offer to intending tenants conservatories, coach-houses, side entrances, rich garden soil, but the orthodox inducements to occupation have had their day, and the modern man who wishes to let his house must be able to add something more. The bicycle shed is no longer a novelty, and the addition of a motor-house will probably be superseded in time by a "balloon stable." Meanwhile we commend (for his recognition of the moving force of to-day) the advertiser of the houses at Hampstead "with motor-houses at the end of long gardens, with level gates to another road." Such establishments ought to prove worthy the attention of motorists thinking of living near the famous Heath—notorious and noisy at holiday seasons, but delightfully pleasant at other times.

Sweet and Bitter.

SHOULD a Bill about to be introduced by the French Government become law there is more than a prospect of the price of sugar doubling in this country. As most people know, the bulk of the sugar consumed in this country is the product of the French-grown beet. It is practically the same sugar as that

consumed in France, but only costs about half what our neighbours pay for it. The reason for this is that the French Government has, with a view to fostering agricultural interests, at the expense of someone else, for years past paid a bounty on all home-grown sugar exported. Now the Bill which is to come before the Chamber aims at making the refining of petrol a State monopoly, like the manufacture of matches and tobacco. This, if carried into effect, will remove the bonus from exported sugar and still further benefit agriculture, for the beet will, in common with many other roots and cereals, attain a higher market value, as the producer of that home-grown alcohol which the French Government hopes to make the motive power of all explosive engines. Automobilists may not take kindly to alcohol as a substitute for better-understood petrol, but a maternal Government, with the entire supply of petrol under its control, will no doubt find a way of bringing about the desired change. It would indeed be a strange conclusion to the many protests and Commissions on the "bounty" system if the coming of the automobile should set our West Indian sugar planters on their legs again.

The Evolution of the Automobile.

It is satisfactory to observe that the motor-vehicle is attaining to a certain dignity of its own. Originally it was simply the old horse-drawn carriage without the shafts; but now makers are realising that the highest standard of utility is not inconsistent with shapeliness and the grace which always belongs to appropriateness. This is decidedly an advance, and one which all must recognise as in the right direction. Of course the old vehicle body may be made the basis for the design of the newer superstructure, but that intended for the automobile must gradually evolve its own characteristics and not be allowed to slavishly follow the designs that have done duty from the very earliest times.

A MOTOR-CAR race, in which the cars are to run backwards, is, it is reported, being organised in Belgium.

THE first annual dinner in connection with the Wolverhampton and District Automobile Club was to be held on Thursday evening.

DURING the course of the week the British Automobile Commercial Syndicate, Limited, have sold to the Hon. Rupert Guinness a 12 h.p. Panhard car, and to the Hon. Walter Guinness an 8 h.p. Panhard car.

A MOTOR-CAR driver in the employment of M. Peugeot, of Paris, has been sentenced to a year's imprisonment, a fine of £8, and £400 damages for accidentally running upon the pavement and killing a child. M. Peugeot was held civilly responsible, and has been ordered to pay the damages.

THE Borough Engineer has reported to the Works Committee of the Kensington Borough Council that the Thornycroft Steam Wagon Company delivered a motor street-cleansing machine constructed under their contract with the Council, and that the same worked very satisfactorily during the agreed seven days' trial.

THE Turin correspondent of the *Velo* states that the King of Italy has just passed his examination as a motor-car driver. This took place in a building especially prepared for the occasion, and his Majesty not only performed the various evolutions in his phaeton, but displayed an intimate acquaintance with the working of the machinery.

MESSRS. ROOTS AND VENABLES send us a copy of a letter received from the Standard Oil Company, of New York, by one of their correspondents in Assam:—"Referring to your memorandum of 27th ult., *re* petrol or similar spirit for motors, we regret to say that the position regarding this article has not changed since you took this matter up two years ago. The Government regulations *re* the importation of same are so stringent that its importation in commercial quantities is practically impossible."

The Automobile Club Brake Trials.

By "FLANEUR."

MR. STANTON'S "LE CHAT NOIR."

THE CARS LINED UP.

Photo by]

FEEDING TIME—MR. EDMUNDS TO THE RESCUE.
TWO SNAPSHOTS OF CARS PERFORMING THE TEST.

[Mr. S. H. P. arce.

TO the list of successful demonstrations which the Automobile Club has organised from time to time must be added the brake trials in Welbeck Park, which took place on Saturday last. The Duke of Portland does not apply to the members of the Club the embargo which he was induced to place upon unattached automobilists by the inconsiderate

conduct of an individual, and no obstacle was placed in the way of the trials at one of the very few places in this country where they could be satisfactorily conducted. They were held, in fact, over the same piece of road, on the southern fringe of the Park, whereon the time tests were taken just before the close of the Thousand Miles Trial. One will always remember with interest

the performance of the Hon. C. S. Rolls's 12-h.p. Panhard on that occasion, and how remarkable the speed of forty-two miles an hour which he made on the downward course appeared to us at the time, though in the interim the achievement has been hopelessly eclipsed.

The object of the trials, of course, was to obtain evidence of a trustworthy character to be used when the Automobile Club presses its claims on the Legislature for an alteration of the law. Various opinions have been held and statements made as to the stopping capabilities of a motor-vehicle, but henceforth there can be no ambiguity on the subject, for the timing and measurements were officially taken, and a representative of the Local Government Board was also present in the person of Mr. Wilcocks. In every respect the trials were most systematically conducted, and actual and accurate records now take the place of speculative and hearsay evidence.

It is a far cry to Welbeck Park—over a hundred and fifty miles, indeed, by the Great North Road route—but this did not prevent the Club from making a tour of the event, once more emphasising the fact that automobilists are the only persons who can make long journeys on the road in winter—a fact, too, which hotel-keepers, at all events, should appreciate. Among those who left London on Thursday evening or Friday morning to dine with the Nottingham branch of the Automobile Club, and to witness the trials at Welbeck on the following morning, were Mr. Henry Edmunds on his 9-h.p. Daimler "Antrona"; Mr. Claude Johnson on his 7-h.p. New Orleans; Mr. C. Cordingley on his 9-h.p. Napier; Mr. J. S. Critchley on a new 8-h.p. Abeille; Mr. S. F. Edge on his 9-h.p. Napier; Mr. George Du Cros on his 12-h.p. Panhard; and Mr. C. L. Freeston on his 7-h.p. New Orleans. Mr. J. A. Holder drove a 7-h.p. Panhard from Birmingham; Mr. E. Reynolds an 8-h.p. Panhard from Sheffield; and several members of the Nottingham Club were also present with their cars.

The actual participants in the brake trials were as follows:—Mr. Oliver Stanton's 24-h.p. Daimler; Mr. Ernest Owers's 18-h.p. Daimler; Mr. Edmund Manville's 18-h.p. Daimler, driven by Mr. Bush; Mr. Walter G. Crombie's 18-h.p. Daimler; Mr. Edwin Midgley's 16-h.p. Napier; Mr. E. M. C. Instone's 12-h.p. Motor Manufacturing car; an 18-h.p. Daimler, driven by Mr. Lewis; Mr. C. Jarrott's 16-h.p. Panhard; Mr. C. Friswell's 8-h.p. Peugeot; Mr. J. W. Stocks's 4½-h.p. De Dion; and Mr. Letts's Locomobile, with Mr. Ginder driving. All these cars took part in the speed trials as well, with the addition of the 20-h.p. Panhard of the Hon. C. S. Rolls; the 20-h.p. Panhard of Mr. Mark Mayhew; and the 22-h.p. Daimler of Mr. J. R. Hargreaves.

The speed trials were first entered upon at eleven o'clock, and Mr. C. Friswell led the way with his Peugeot, Mr. Lyons Sampson taking the times at the initial tape, and Messrs. Bidlake and Swindley being at the far end of the course. The first speed tests were taken over the downward run, with a flying start in each case. Mr. Manville's big car came second, followed by Mr. Crombie, Mr. Owers, Mr. Jarrott, and Mr. Stanton. One noticed with interest that Mr. Owers had solid tires to his driving wheels and pneumatics on the front, after the fashion recently described by Mr. Wood in the *Notes and Notices* of the Automobile Club. These half-dozen cars were then driven again over the return course, also with flying starts from Cavendish Lodge.

Meanwhile everyone was inquiring where the remaining cars were, as it was known that several other intending competitors had left Nottingham that morning, and ploughed through the grease of the Mansfield Road. It was clear that they had not followed the official instructions, and instead of taking a turn to the right in Mansfield market place, and getting quickly on to the scene of the trials, they had presumptively gone straight forward in the direction of Worksop, and were meandering all over the Park, with the probability of their returning by the same route as was taken on the occasion of the Thousand Miles' Trial, when the cars approached the speed course from the north.

It was decided, therefore, to proceed with the brake trials, and the method of operation pursued was as follows:—Eighty-eight yards from the finishing tape, at each end of the mile course,

another tape was fixed, for the purpose of timing the cars over the final one-twentieth of a mile, and thus determining the speed at which they were travelling when the brakes came to be applied. The instructions were that this was to be done as the front wheels crossed the finishing line, and on coming to a stop the drivers, of course, waited while the measurements were taken, Colonel Crompton officiating as judge in this respect.

By the time the first half-dozen cars had completed their records the missing cars had turned up, nearly an hour and a half late, entering on the course, as had been anticipated, from the Cavendish Lodge end after a formidable detour. They were at once sent over the mile for the brake trials, so that the latter might be completed *en bloc*, the speed trials being deferred until all measurements were recorded. Of the stoppages generally, it may be said that those at the upper end of the mile were exceedingly good, while at the Cavendish Lodge end the results were less dramatic, for vital reasons. In the first place, the course was, as has been said, slightly downhill in the latter direction; in the second place the drivers went "all out," while on the return journey they endeavoured to comport themselves as if actually driving on the highway, with a certain amount of traffic to be reckoned with; and thirdly, the finishing point on the downhill course was perfectly wicked for the purpose, the surface being coated with thick grease. At the upper end the road was somewhat slimy, but less disconcertingly so than at Cavendish Lodge.

The spectators were chiefly clustered at the upper end, and were rewarded by some most excellent finishes. The first car up was Mr. Friswell's Peugeot. "Now for the exercise of muscular power," he cried as he approached the tape, and his front wheels had no sooner crossed than, lo! the back wheels skidded forward and were only two feet over the line when the car stopped dead in four yards. Then came Mr. Crombie's Daimler, which travelled much faster and pulled up less dramatically in consequence. The Locomobile followed, with a partially-detached band on the off front tire flopping weirdly, and gave a slight slew round as it came to a standstill. Mr. Instone pulled up in a few feet less space on the Motor Manufacturing "twelve-horse."

During the period of waiting for the next car up Mr. Friswell "obliged" the company with a comic interlude, in which a patient donkey in the adjoining meadow played a leading part. I cannot say whether this was the first occasion on which the driver of the Peugeot had ever essayed the *role* of Titania in the "Midsummer Night's Dream," but he certainly acted it to the life, and naturally the camera bearers were soon busy, a perfect fusillade of snapshots being fired at this unlooked-for *tableau vivant*.

This diversion over attention was again drawn to the brake trials, and the De Dion voiturette hove in sight. Warily went its driver, Mr. Stocks, for had he not applied his brakes when going at top speed at the other end, and swung his car round on the grease through the greater portion of a circle? This time the stop was accomplished without a sideslip. Then Mr. Lewis came along on his Daimler, followed by Mr. Manville's car, with which Mr. Bush made a splendid stop in 7 yards 4 inches, although the vehicle was going at a good pace. Still better was Mr. Stanton's pull-up, for his huge 24-h.p., Le Chat Noir, was grandly stopped in 6 yards 3 inches, amid involuntary applause. Bearing in mind that a considerable portion of this distance was occupied by the car's length itself it may be imagined what the optical effect of the stop amounted to, with the driving wheels nearly as close to the finishing tape as those of Mr. Friswell's car, a much lighter vehicle, of course. Mr. Owers followed in his Daimler; then came Mr. Midgley with the 16-h.p. Napier, and lastly Mr. Jarrott's 16-h.p. Panhard. All made good stops in proportion to the rate at which they travelled, but, of course, it is impossible to award the palm to any one car without knowing all the figures as to speed and weight, as well as the mere measurement of the stoppage. Meanwhile the spectators and competitors were verging on starvation, for it was something like six hours since they had breakfasted, and the raw air on that exposed site had sharpened their appetites just as much as the damp earth had chilled their marrow. But one noble spirit had risen to the occasion. No one

had noticed that Mr. Edmunds's car had left the Park, but the attention of the little crowd was suddenly diverted to the fact that he was back near the finishing line, and handing out bottles and comestibles, to all comers. Whisky, beer, and mineral waters were distributed with lavish hospitality, and the still more welcome sight of huge Melton Mowbray pies issuing from "Antrona's" capacious well met the eyes of the famishing *chauffeurs*. Time-keepers and journalists were loth to leave their posts, but that old campaigner, Colonel Crompton, came along bearing the half of an enormous pie which he had "commandeered," and shared forthwith with his fellow-officials. It seems that Mr. Edmunds had driven into Mansfield, and there laid in his generous store, and the relief was indeed welcome, for though we had all expected to be back at Nottingham for a very late lunch, owing to the length of the trials and the distance out and home, forty miles in all, we had not bargained for the long delay caused by the late arrivals on the scene. It will be a long time before any of those present cease to meet Mr. Edmunds or his car without warm recollections of his opportune and kindly services.

It now remained to complete the speed trials, and the late-comers made their double courses. Mr. Midgley's Napier went first, at a fine pace, and then Mr. J. R. Hargreaves turned out on his handsome new 22 h.p. Daimler, with a body somewhat similar in finish to his previous car. At the starting tape he had only got on to his second speed, the car being very highly geared, and as a matter of fact the fourth was never used, either on the upward or downward run. Mr. Stanton's car was next driven down, but steered this time by Mr. Bush, and Mr. Instone followed, his M.M.C. 12 h.p. going excellently for the power named.

Then a warning toot of a horn caused everyone to look up the approach, and Mr. Rolls's Panhard came sweeping on, and passed at a rousing pace, which was obviously in excess of anything that had preceded it. He had taken a long start, and incidentally passed between a standing car and a too venturesome photographer, who, though he had been warned beforehand, would persist in placing his camera too close to the road. When the big Panhard hurled by, the camera man retired precipitately backwards, and nearly turned head over heels into the hedge bottom.

After the meteoric flight of Mr. Rolls's Panhard it was supposed that the *piece de resistance* of the meet had been passed, but there was a mild surprise in store. The De Dion voiturette bustled over its speed mile, making more noise than all the other cars put together, and then an unfamiliar car, of orange hue, was seen approaching. It travelled, too, at a prodigious pace, and all of us wondered whose and what it was. As it neared the starting line, however, the driver's face was recognised, and shouts of "Mayhew!" rent the air. The car was his 20 h.p. Panhard, previously known to many with a racing body, but now fitted with a *tonneau* and touring rig generally. As the car flew down the course the prevalent impression was that it went faster than that of Mr. Rolls, but on this point I ventured to have my doubts, because there was so much more artificially suggestive of high speed in the yellow car than the other. For one thing, the *tonneau* was rocking considerably, whereas Mr. Rolls's car was entirely stripped; the latter, too, made rather less noise. Altogether, I thought it a very even thing, and, if any difference at all existed, I imagined Mr. Mayhew's car to be the slower, and such actually proved to be the case by about a second.

And this brings me to the interesting topic of speed judgment. I went prepared to make estimates of the pace of all the cars, and equally prepared to find myself wrong in many cases; in fact, the more mistakes I made the better I should have been pleased, for if an automobilist himself could not gauge the time how could a pedestrian or policeman, with no knowledge of technique, be likely to guess anywhere near the mark? Now, the most curious thing proved by the actual results is that it was easier to guess the pace of the fastest cars on the flying mile than that of the slower cars, or of any of the cars when travelling below their top speed as they crossed the tape in the brake trials. Most excellent estimates, for example, were made by Colonel Crompton

and Mr. Bidlake, who stood near me, as to the speed of one of the 20 h.p. Panhards, in one case the speed being appraised a fraction too high, and in the other a shade too low. My own guess, too, happened to be fairly close, but I found it difficult in the extreme to gauge the pace of cars of various weights and sizes when crossing the line in the brake trials, at from fourteen to twenty miles an hour.

On the return journey most of the cars travelled pretty much as they went down, but rather slower, of course, owing to the slight gradient, save that the 16 h.p. Napier of Mr. Midgley seemed much below her form. As regards the duel between the two fast Panhards, the pace of Mr. Mayhew's was undoubtedly the faster this time, though too little allowance was again made by some for the artificial factors above mentioned and the difference in the drivers' respective styles. The actual difference in the speed of the cars was three miles an hour in favour of Mr. Mayhew.

It was now verging on three o'clock, and a hasty exit from the Park was made, and Nottingham and a much needed lunch were aimed for. Later in the day the cars which had come from the south made for Grantham, over a winding, greasy road that made fast travelling no sinecure. Next day the homeward run was made to London, and some excellent journeys were made for the most part. Police aggressiveness made itself felt, however, at Stilton, Alconbury, and Hitchin, and in every case without cause, the police being stationed at points where no possible danger to the public could exist, even round Mr. Justice Darling's hypothetical corner, for no corners existed where the police were timing. It was simply a case of getting convictions, if possible.

The roads were very greasy for the most part, and where not greasy were covered with enormously long patches of loose stones in every county alike. Steam-rolling appeared to be quite unknown on the road which above all others is usually regarded as a well-kept highway. Presumably the responsible authorities think that no one is travelling at this time of year, and neglect their duties as a consequence, but they will have the automobilist to reckon with in tremendous numbers ere very long, and will need to mind their P's and Q's. The haphazard way in which the loose metal was thrown about was nothing short of disgusting, and the resources of civilisation seemed wholly at a discount.

What the Automobile Club will do with the figures obtained in the various tests remains to be seen. The chief features of regret were, firstly, the necessity of holding the trials at this time of year, in view of the coming session of Parliament, but with roads greasy and quite unsuitable for quick arrestation; and, secondly, the absence in the brake trials of cars of medium power, such as constitute the major portion of those in use upon the streets and roads at the present moment or likely to be in use for many a long day to come. All but the 8 h.p. Peugeot, the $4\frac{1}{2}$ h.p. De Dion, and the Locomobile were distinctly powerful cars, and in not the remotest sense representative of the automobilism of this country.

[LATER.

It is not proposed, I may now add, by the Automobile Club to publish every record made by the various cars, but the following average statements will be made:—The results showed that at the undermentioned speeds the cars could be stopped on an average in the following number of lengths—a length for this purpose being calculated to be 11 ft. 8 ins., as that is the average length of the cars engaged in the trials:—

- From 11 to 14 miles per hour in $1\frac{1}{2}$ times the car's length.
- From 15 to 17 miles per hour in twice the car's length.
- From 18 to 20 miles per hour in $2\frac{1}{2}$ times the car's length.
- From 20 to 24 miles per hour in $3\frac{1}{2}$ times the car's length.

It must be observed that these figures are averages. As a matter of fact one car travelling at 13 miles per hour was stopped in 4 yards; another travelling at $18\frac{1}{2}$ miles per hour was stopped in 7 yards, and another when going at 90 miles per hour was stopped in $12\frac{1}{2}$ yards. The average weight of the vehicles without passengers was 1 ton 4 cwt. From these results it will be seen that motor-cars can, on an average, be stopped when travelling at 20 miles an hour in less distance than the ordinary horse-drawn vehicle could be stopped when travelling at 10 miles per hour.

THE NOTTINGHAM AND DISTRICT AUTOMOBILE CLUB.

A LARGE gathering of motorists attended the second annual dinner of the Nottingham and District Automobile Club, at the George Hotel, Nottingham, on Friday evening last week. After the Royal toasts had been duly honoured, Mr. E. W. Wells proposed "The Parent Club," coupled with the name of Mr. Roger Wallace, K.C. They were pleased to know that the parent club was still legislating for the benefit of motorists, and that the Nottingham Club was affiliated with it, and had a voice in its meetings. Mr. Roger Wallace, K.C., responded. He was pleased to find that so many motorists from the parent club had been able to arrive, but regretted that some had been delayed on the road. Having complimented the County Surveyor upon the good roads in the district, Mr. Wallace went on to speak of the necessity for a central club, to impress upon the authorities the importance of the fact that motorists' privileges should not be restricted, and to obtain, if possible, further concessions. They wanted further facilities, and everything the parent club could do it would do to promote the welfare of automobilism. They had succeeded in doing a great deal, but fresh opposition was continually breaking out as the movement became more important. The affiliated clubs were more of a necessity than the parent club, because they could keep their eyes upon the members throughout their respective districts. In the Nottingham district a club was wanted, so that there might be somebody to look after those who had cars in the district, and those who might be travelling through the locality, and really to set a good tone and good manners to automobilists who came into the neighbourhood. They had one instance in reference to Welbeck Abbey, although they did not know who was responsible for it. At one time motor-cars could be driven through the grounds of Welbeck in the same way as ordinary carriages, but now they could not be. How did that come about? Like a great many restrictions imposed upon them, and disabilities under which they suffered, it was their own fault. The affiliated clubs would do a great good in trying to impress upon all members the necessity of doing what was right. The Chairman, Mr. R. Millington Knowles, J.P., submitted "The Nottingham and District Club." He said the club, which was celebrating its second anniversary, had been formed with several objects, one being in order to have an organisation which was able to offer hospitality to the parent club and other clubs interested in automobilism. Another object was that anyone wanting advice on the subject of automobilism might apply to the committee, and get information as to the cost of cars, repairs, and other matters. The club impressed upon its members the necessity, so far as possible, of complying with the law for the time being in everything connected with the driving of a motor-car. He did not say that some of them did not sometimes exceed the limit, but it was important that in going through villages they should behave properly and with due regard to other people who had an equal right to the road with themselves. As regards the condition of the roads, he believed that in the report of the 1,000-miles trial it was stated that in Nottinghamshire were the best roads on the route. He was pleased with that, because the roads were under the management of the County Council of which he had been a member from the beginning. That, however, was certainly due to their able and skilful County Surveyor, who, he believed, had been called in to advise as to the roads in the neighbouring county of Lincolnshire. Mr. A. R. Atkey, in reply, referred to the progress which the movement generally, and the Nottingham club in particular, had made. It was little more than twelve months since the club was formed, and subsequent events had fully justified the step then taken. He hoped the amicable relations between the authorities and automobilists in Nottingham would long continue.

Colonel L. L. Powell gave "The Visitors." Mr. T. W. Staplee Firth first responded. Motor-cars, he said, had come

to stay, in spite of the decision of the Lord Chief Justice that automobilists might be driving along a road to the danger of the public when there were no passengers there. That decision was against all legal precedents and the rules of logic and common sense, and the Lord Chief Justice might just as well try to stop the spread of the movement as King Canute tried to stop the waters of the sea. The tide had set in, and would not be stemmed, and motor-cars would become a great power in the land. Mr. S. F. Edge also replied, and in the course of his remarks spoke of the reliability of motor-cars, and complimented Nottinghamshire upon the excellent state of its roads.

Mr. C. E. W. Lucas gave "The Chairman," and, in doing so, referred to recent prosecutions of motorists in Lincolnshire, describing the ways of the Lincolnshire police as peculiar as those of Bret Harte's "Heathen Chinee," and warning members not to rely upon their timekeeping. The toast was enthusiastically received, and that of "The Press" was also honoured, on the proposition of Mr. M. R. Browne.

It has been decided by the Long Island Automobile Club to hold a second 100-mile endurance test on similar lines to the one so successfully carried through last April. The date has not yet been selected, but the event will take place early in May, or about two weeks later than last year.

A COMPANY has been formed in Germany to establish a motor-'bus line between Cologne-Wesseling and Cologne-Brühl, Pingsdorf, Bruhl, Wesseling. De Dietrich motor-omnibuses will be used. The seating capacity is twelve inside and two on the operator's seat. To avoid accidents, the door of the 'bus, when the latter is in motion, can be opened and closed only with the assistance of the driver from the seat.

M. G. NATHAN, of 27, Rue St. Sabin, Paris, has sent us an illustrated catalogue of motor-clothing for ladies and gentlemen which we commend to those who affect the *mode Parisien*. Leather and kid, lined and otherwise, to suit all climates, are the main components, though cloth is not tabooed. One garment, certainly new to this country, takes the form of loose knickers elongated into gaiters that come well over the foot.

A NEW steerable balloon, invented by M. Mawhood, of Antwerp, is attracting considerable attention in Belgium, and is to be examined by military experts. The balloon has the form of a cigar, in the interior of which is a central horizontal aluminium tube containing a propeller with eight blades, and communicating with the engine, which is situated directly under the basket. A rudder is placed at the extremity of the central tube.

AN electric trolley omnibus service has recently been started by Messrs. Siemens and Halske, of Berlin. The line is nearly twelve kilometres long, and extends through the valley of Biela-bach, from the village known as Königstein to Hütten and Königsbrunn. In passing another electric 'bus it is of course necessary to remove the trolley poles, while in passing other vehicles it is only necessary to steer to one side, as the poles are of sufficient length to allow a side movement of three metres from the trolley line. The controller is similar to that used for electric tram-cars of small size. A speed of $7\frac{1}{2}$ miles per hour is usually maintained, and the vehicles will hold twenty-one passengers.

THE Automobile Club of America, through its Law Committee, has petitioned the Acting Commissioner of Customs at Ottawa, Canada, to admit automobiles in use free into the Dominion for the purposes of touring, provided the owner files with the Collector of Customs a certificate of membership in a recognised association or club, and gives his name, residence, the duration of his trip, description and value of machine, and place through which his return will be made. An effort will also be made to obtain a reciprocal measure from the Treasury Department of the United States. At present, automobilists on the borders of the two countries are required to pay duty in full and take receipts therefor, redeemable on their return with their vehicles.

MECHANICAL FLIGHT UP-TO-DATE.

(All rights reserved.)

BY SIDNEY H. HOLLANDS.

II.—RATIONAL EXPERIMENTS.

THERE is one notable phenomenon in birds' flight that must be touched upon here—viz., that of "aspiration." This—which has been noticed with astonishment, and proved beyond doubt by more than one observant experimenter—consists in the fact of a bird being held against a wind, even more, actually urged forward against a head wind, by the action of that same wind on its wing-curves; so that there is not only the elimination of all resistance to the bird's forward motion, but there is actually negative resistance with many birds. This sounds paradoxical, and savours of "perpetual motion"; nevertheless, it is neither, and we must now accept it as an absolute fact.

Contrary to all preconceived notions, and, indeed, to all

previous experience of locomotion by land or by water, as well as in balloon propulsion, it has now been demonstrated beyond doubt that, given suitable sustaining and propelling surfaces, the necessary power for flight positively *decreases* with the speed. The astounding aerial feats of some birds are no longer inexplicable. To quote Mr. Lancaster, of Chicago—a keen observer—"I have succeeded in establishing to my own satisfaction these propositions" (quoted later on), he continues:—"Throwing the observed facts into a mechanical statement, they assume this form, viz., that a given weight, distributed in a nucleus flanked by flat surfaces, the whole in the shape (and weight) of a sailing bird, may be sustained in free air by means of some relation existing between itself and the atmosphere independently of any motive power exerted by itself."

Mr. H. Middleton, in a lecture on Flight, before the British Aeronautical Society, said:—"A curious property has been shown to be possessed by the curved surface (of wings), namely, that it is urged toward the direction its convexity is turned by a current of air directed against its edge, and moreover, if held in exactly the proper position, it will even move forward against the current." A demonstration was then given to illustrate this—to all appearance—paradoxical action. The apparatus consisted of two flat wooden discs of about 9 in. diameter and $\frac{5}{8}$ in. thick (Fig. 1), one of which had a central hole, fitted with a piece of tube of about $\frac{3}{4}$ in. bore, squarely and flush on one side. The other disc was suspended from the tube disc, and parallel to it, about $2\frac{1}{2}$ in. below, by three or four threads. When the discs were suspended horizontally, and a blast of compressed air was sent down through the tube, the hanging disc actually jumped up against the jet of wind, as if the upper disc had suddenly become magnetic, and "hugged" the upper disc as long as the blast was on, dropping off as soon as it was stopped. Two experiments which will further illustrate this remarkable wing-

and-wind action are as follow:—(1) A curved plate (Fig. 2), either suspended by a cord from C, or fixed to a pivoted arm free to move in a horizontal plane, will, on being impinged upon by an air-blast, B, actually move back towards B against the wind. (2) If a conical or bell-mouthed hole be made in a board or partition (Fig. 3), and a lighted candle be placed on the bell-mouth side, two or three inches off, while one blows through the hole from the other side, the flame will approach the orifice.

Under ordinary conditions, wind pressure (or conversely the resistance to motion through the air) is commonly held to increase as the square of the velocity (as in water)—which is true within somewhat wide limits, but it has been found that this simple law does not hold good for very high velocities. Thus, at 1,000 feet per second it is found to be as great as three times the square of the velocity, giving the enormous pressure of 20,952 lbs. per sq. foot, hence the startling statement by Professor Langley: "The air is a solid if you only hit it hard enough." Quite probably it is to this astounding property of air at great velocities that the apparently anomalous action of high explosives is due. These are quite commonly said to act in the direction of *greatest* resistance; that is obviously absurd. The true explanation would seem to be that the tremendously sudden and forcible generation and expansion of gas on the explosion of nitro-glycerine, etc., renders the air a more solid and unyielding abutment than the stone wall, door, etc., against which it is simply laid, and demolishes the solid, with only the free atmosphere to re-act against. Unquestionably these explosives, like all other forces, act in the direction of *least* resistance; but, rather naturally, many find it hard to believe that the gentle zephyr can be so transformed as to hold its own against a massive stone wall or an iron door.

An overweening care for steering largely prevails; this is characteristic of the "tadpole" stage of development in devotees to mechanical flight. An experienced balloonist has related that he has caused a large balloon to rotate by merely fanning himself while sitting in the car; so easy a matter is it for a body to turn or vary its course while sustained in air. In further illustration of this, Mr. George B. Starkweather, of Washington, thus describes the following curious experiment he made:—"The apparatus used was an average child, who was duly instructed to stand erect and rigid; it was then lifted off the ground by the operator, and thrown vertically a few feet up into the air, being told to turn if possible when in mid-air. We are told that

the child succeeded in doing this—either to right or left as requested—rotating without consciously or perceptibly moving a muscle, the act being apparently one of mere volition.

Propulsion—with consequent sustentation—with a safe degree of stability being at last fully mastered, it is certain that steering will give no trouble, and provision for it is quite a subordinate matter. Sir Frederick Bramwell said (in 1888):—

"The problem of travelling in the air will certainly be solved when a sufficiently light motor is attained." Recent experience has taught us that it does not wholly depend on that desideratum, but largely on a better understanding of the imperative conditions of true flight, whether natural or artificial. For true mechanical flight we have now all the lightness of motor we want: it is only the balloonists who need to go on lightening indefinitely.

Passive flight—the phenomena of which we may now be said to have fairly well mastered—will, when successfully adopted, reduce the necessary motor-power to a minimum. For this very valuable insight our best thanks are due to Lilienthal, Le Bris, Pilcher, Chanute, Lancaster, and Professors Langley and Pettigrew. It is written in Dr. Carpenter's "Animal Physiology," "The problem of human flight will never be solved until some source of power is discovered far surpassing that which man's muscular strength affords, and so portable in its nature as not materially to add to his weight."

So Dr. Carpenter, in common with Sir F. Bramwell, seemingly did not realise that something more was wanted. Herr Lilienthal (Berlin) wrote, in his article "Weshalb ist es so

schwierig das Fliegen zu erfinden?" ("Why is it so difficult to learn to fly?"), referring to the imitation of natural flight:—"The thing has still to be developed from the beginning. The difficulties to be eliminated are of a purely practical nature, but they are greater than at first appears. They should be made a special study of, and we should invent methods to investigate them in order to successfully overcome them. The method which is to lead to practical flight must be capable of development, be its beginnings ever so primitive; and by it we

must be afforded an opportunity of really skimming through the air, by which we may gain experience as to the stability of flight, the action of the wind, and safe landing, in order, by continual development, to gradually approach permanent free flight. Whether the imitation of natural flight is one way of many, or the only way, is to-day (1894) still matter of discussion."

Given a practicable machine, it can hardly be expected that flying will be other than an acquired art, and to be learnt equally with cycling, skating, or swimming. The experiences of at least three well-known authorities are practically in accord with those

of Herr Lilienthal, viz., Messrs. Chanute, Lancaster, and the late Mr. Percy Pilcher. Mr. Chanute has well remarked:—"There are probably scores of shapes which can be made available for such machines, just as there are hundreds of forms of birds which display various peculiarities in their flight; but in every case there will be the same requirements as to a light motor, absolutely automatic stability, and some device for gaining initial velocity, as well as for landing safely; this will require much experimenting." Referring to the valuable "cellular kite" experiments of Mr. Hargrave, that gentleman says:—"As few experimenters can afford to lay a rail track of sufficient length to properly try a flying machine, I thought it would be well-spent time if I not only devised but made and went up on a series of kites that could be converted into a flying machine by adding a motor. Or the kites to be merely used as a means of safely lifting a flying machine from the ground, trying it, and, if it flew, slipping the moorings, as it were, and flying free, and finally picking up the kite line and descending without risk. . . . One thing about these cellular kites is worth special mention: they are perfectly stable and certain in their action. . . . A safe means of ascent . . . is now at the service of any experimenter who wishes to use it."

(To be continued.)

A NOVEL SPARKING PLUG.

IN a recent issue we stated that an Italian engineer had devised a novel form of sparking plug. We are now able to give a sectional illustration of the arrangement. It will be seen that the plug comprises two insulated platinum rods, which make an angle of about 60 deg. with each other. Centrally over the sparking gap is a window which permits the spark to be

observed when the motor is in operation. The window consists of a transparent material of great resistance, so that it is able to withstand any pressure. The inventor of the arrangement is Signor G. Adami, of Messrs. Adami and Company, Florence.

THE Metropolitan Fire Brigade is at present carrying out extensive experiments with petroleum as fuel in place of coal. The experiments are only in their initial stages, but already several steamers and floats have been fitted with petroleum furnaces. The questions to be decided are whether the new fuel is more economical, whether it can produce steam more quickly, and also as to whether it is of advantage in the matter of general utility. So far as the tests have gone it has been proved that by the greater heat developed from petroleum, steam can be generated much more expeditiously.

The Chaboche Steam Delivery Van.

FIG. 1.—GENERAL VIEW OF VAN.

THE accompanying illustrations depict a new steam van, which has lately been completed by M. E. Chaboche, of Rue Rodier, Paris, and which comprises several interesting features. The frame of the car is built of channel steel, and is supported on the axles by plate springs. The general arrangement of the boiler, engine, and transmission gear is clearly shown in the plan view (Fig. 3). To deal first with the boiler, which is located in the fore-part of the frame, this is of the instantaneous vaporising type; it is composed of two concentric shells constituting the steam area, the inside shell enclosing coils of steel tubes of circular section. Care has been taken to construct the boiler with as few joints as possible, and the maker guarantees that they will withstand a pressure of fifty atmospheres. The boiler is fed from a *bouteille alimentaire* or special reservoir having a capacity of 20 litres. This reservoir is half filled with water, the remainder containing compressed air at the pressure at which the generator is required to work. The pressure in the reservoir can be varied between 15 and 30 kilogs. per square centimetre by means of a regulator placed under the seat of the driver. Thus, at ordinary pressures, the boiler can be fed from the reservoir without the intervention of the plunger pump, but this is used when it is necessary to get higher pressures in the generator. One of the advantages claimed for this system is that when the car is at a standstill there need be no pressure in the boiler, and it can be started without it being necessary to use a hand pump, because the pressure in the reservoir will allow of an equal pressure being attained in the generator. The car may be left to itself for several hours by taking care to replenish the fuel from time to time, and it can then be got ready for starting in five minutes. The fuel used is coal, which is prepared in paper bags containing about eleven pounds, one of which is dropped into the furnace at a time. The steam exhaust is carried away by a pipe underneath. When the car is starting, or the boiler is working at a high pressure in

order to overcome any special resistance, there is a small volume of exhaust, but under ordinary conditions there is little or no exhaust observable. The generator is flanked on each side by coal boxes carrying enough fuel to allow of the car running about sixty miles, this being the distance it is capable of covering at a speed of from nine to twelve miles an hour in Paris and nineteen miles on good country roads.

There are two reversing engines, one on each side of the frame, they are both of the same dimensions and collectively develop about 10 h.p. The crank chambers work in oil-containing chambers; while the valve gear is operated by means of a hand lever at the side of the driver. The engine shaft carries a central sprocket wheel, connected by a chain with the differential on the rear driving axle. This axle has a universal joint in the centre, that is to say, in the case containing the differential (see Fig. 2),

FIG. 2.—THE CHABOCHE REAR AXLE.

and both parts can be easily drawn out, so that the differential can be examined when required. The engine can be thrown in and out of gear with the transmission mechanism by means of a clutch to permit of the motor running when the car is at a standstill, and thus work the plunger pump to raise the pressure in the generator when it is necessary to overcome any great resistance at starting. The pedal-operated band brakes on the rear wheel hubs are double acting, and restrain any backward movement of the car, the brakes being operated both ways by the same pedal.

The driving of the car appears to be very simple. The driver has at his left hand the steering lever, and the lever for regulating the admission of steam to the cylinders, and the reversing lever at his right. With his right foot he operates the brake, and with his left the blowing out of any deposit of water in the cylinders. The car is usually stopped by closing the regulator admitting water to the boiler. This regulator consists of a small hand wheel immediately in front of the driver, with a long rod which opens or closes the pipe communicating with the reservoir. Above this are the safety valves. To the left of the driver are the feed pump and the rotary lubricator,

which feeds the exact quantity required to the cylinders, so that this important part of the mechanism requires little or no attention.

The front wheels are 36ins. diameter, and those at the rear 40ins., all being shod with solid rubber tires. The water tanks are situated underneath the seats of the van, and have a capacity of 230 litres, which is sufficient for a run of twenty-five miles. The generator will vaporise from 5.5 to 6 kilos. of water per kilog. of coal, and the consumption of fuel is from 600 grammes to one kilog. per kilometric ton. The consumption of lubricating oil is two litres per 100 kilos. The total weight of the van,

including coal and water, is given as about 2 tons 8 cwt., while it can carry a load of from 12 to 20 cwt. During the last delivery van competition of the French Automobile Club in Paris, a van of this type took gradients of from 14 to 15 per cent. at a high speed, and covered twenty miles in two hours. M. Chaboche is also constructing passenger vehicles on the same lines.

CONTINENTAL NOTES.

BY "AUTOMAN."

A FEW weeks ago I told the readers of the *Journal* of a competition which was on foot in France, the object of which was to demonstrate the value of motor-cars in time of war as a means of carrying despatches, and generally facilitating staff work. The competition is being organised by *La Locomotion*, and it has received the official approval of the Minister of War, General André, who has caused a letter to this effect to be written in his name to the editor of *La Locomotion*. The basis of the competition will be the carrying of despatches between different points on the frontier and Paris; also between the headquarters of various army corps.

THERE is a perfect deluge of automobile competitions at the present time, and if one half of them are carried out 1902 will be a busy year for the *chauffeurs* in France. The reason of these many competitions is that each automobile paper organises events for which it obtains the sanction and patronage of the A.C.F., at the same time relieving the Club of much work which would otherwise fall to its lot.

ON January 16th there will be a race for motor-tricycles carrying goods, or "tri-porteurs" as they are called, which might be very easily rendered into English as "tripesters" without offence to our Scotch friends, who object to the use of French words in connection with motoring. This novel competition is being organised by the *Auto-Velo*. There are to be two classes—(1) the open class; (2) the commercial class. Each "tripester" must carry in his box a sack of sand weighing a little over 88 lbs. The race will be from Paris to Versailles and back, twenty-one miles.

ON February 6th will take place a competition called the "Criterium de Consommation," likewise organised by the *Auto-Velo*. The distance to be covered by the automobile carriages is sixty-two miles, whilst for the heavy traction cars it is only thirty-seven miles. There are to be seven classes;—(1) Heavy carriages over one ton; (2) carriages between 12½ cwt. and one ton; (3) light carriages between 7½ cwt. and 12½ cwt.; (4) voitures between 4½ cwt. and 7½ cwt.; (5) motor-cycles up to 4½ cwt.; (6) motor-bicycles up to ¾ cwt.; (7) heavy traction cars carrying at least half a ton load. Medals will be awarded for the smallest consumption of fuel. The entries already include Mors, Charron, Darraq, Bardon, Boyer, Hurtu, Buchet, Clemont, Gillet-Forrest, etc.

La France Automobile is organising an important heavy traction competition of an ambitious nature. The course is to be from Paris to Monte Carlo, 697 miles, *viâ* Versailles, Anderre, Dijon, Lyons, Avignon, Marseilles, Toulon, Hyères, Fréjus, and Nice, finishing by the climb of the famous "La Turbie" hill. There will be classes for delivery wagons carrying half a ton, lorries carrying a ton, and omnibuses carrying from eight to twelve passengers. The arrival at Nice is timed to take place on April 7th, when the Nice races begin.

NOTHING is definitely fixed yet about the big event for Nice, but the *Auto-Velo* proposes the organisation of a race to Abbazia and back, 1,054 miles, and backs the suggestion with an offer of 30,000 francs in prizes. The race would take seven days, from April 2nd to 9th, with three days off, the 5th and 6th, for a

nautical fête at Fiume, and the 7th for a fête at Abbazia, where many crowned heads are expected to be. It, therefore, represents about 240 miles per day for five days, which should be easy running even on Italian roads. A special train will follow the cars.

I WAS just now writing "sarcastic" of the opposition to the use of French words in connection with automobilism, but there are certainly precedents in French, and it really serves us right to have these words pushed on us, for they come from the head centre of the industry. In times gone by when England was the head centre of the railway industry it was the other way about, and even yet the English words still hold the field in France. *Chemin de fer* is, of course, a translation for the "iron road," but the "rails" still exist under that name, and likewise the "tickets," "station," and many other terms. On the turf, of course, everything is English, including "starter," "jockey," "mail coach," "groom," "stand," etc. So after all the French are only having a very natural revenge.

FOURNIER came back from America on the "Kronprinz," and landed at Cherbourg at the end of last week. He is thoroughly Americanised, and has been "hob-nobbing" with the richest in the land, but has kept an eye to the main chance. He had not been twenty-four hours in Paris before he had sold a car to one of the Armours, of Chicago, who was amongst the passengers on the "Kronprinz." He has not, however, changed since the last time I saw him at the Opera House in Berlin, on the gala night after his brilliant victory. Fournier is still the same polite and amiable fellow without any affectation. All the world knows, of course, that he is now at the head of a big American concern which will manufacture motor-cars in the neighbourhood of Philadelphia, and which will soon bid fair to compete with the world in the automobile trade. Fournier is over on a visit, and sails again very shortly to America. He is vice-president of the American company, which will be called the Fournier Automobile Company, and not the Fournier-Searchmont Automobile Company as has been commonly reported. The new company will take over the works of the Searchmont Automobile Company.

AN apparatus for measuring the intensity of the explosions in the cylinders of internal combustion and explosion engines is being tested at several of the automobile factories, notably at the works of De Dion-Bouton, at Puteaux. It is the invention of a Belgian named Mathot, and is, so to speak, an indicator for explosion engines similar to the indicator for steam-engines. Fixed to a cock in the explosion chamber it has a clock-work movement which unrolls a paper strip, on which the pressure in the cylinder is registered. A diagram is produced by a stylograph, which is held on a little spring piston actuated by the internal pressure, and surrounded by a water-jacket to prevent it from seizing with the high temperature. The diagram gives both the compression and explosion in a most striking manner, and registers the slightest change in the carburation and

also any advance or retard in the ignition. It will be a most useful addition to the workshop, greatly facilitating the testing and regulating of both motors and carburettors.

THE VAN LANGENDONCK LIGHT CAR.

THE accompanying illustration shows the new light car which has lately been introduced by La Compagnie Générale d'Automobiles, of Rue de Brabant, Brussels. Power is supplied by a De Dion 5 h.p. or Buchet 8½ h.p. two-cylinder motor, at the desire of the purchaser; the engine is located under a bonnet in the fore part of the frame. The water circulation is maintained by means of a chain-driven pump and radiator, the latter being fitted in the front of the motor bonnet. The power of the engine is transmitted through a large friction clutch to the change-speed gear-box, which comprises three pinions, any one of which can be made to mesh with corresponding gear-wheels on a parallel shaft. Three speeds forward and a reverse motion are available, the former being controlled by a hand lever on the steering column and the reverse by a pedal. The change-speed gear-box is so arranged that it may readily be inspected. From the gear-box the power is transmitted by a longitudinal shaft and bevel gearing direct to the rear differential "live" axle. Three band brakes are fitted,

one acting on a drum on the differential gear the others being on drums connected to the hubs of each of the rear wheels, the latter acting both forward or backward. Steering is controlled by a horizontal irreversible hand wheel. The main frame is constructed of iron and wood, well stayed, the engine and change-speed gear being supported on two parallel tubes. The road wheels are of the cycle type, shod with pneumatic tires. The motor and transmission gear being mounted on an independent frame,

THE VAN LANGENDONCK LIGHT CAR.

any type of carriage body—spider, *tonneau*, etc.—can be fitted.

THE municipal authorities of St. Petersburg are reported to have issued a notice forbidding the use of all steam cars, with the exception of the Serpollet type, in that city.

AN American journal says that the roadside hostels beyond Brooklyn and on Staten Island are doing better business with motorists than they ever did with New Yorkers of a previous generation who drove fast horses.

A CERTAIN Senor Anchorena is said to be about to embark upon an exploring and hunting expedition in Patagonia. Some half dozen other gentlemen are to accompany the Senor into the unknown wilds, where the automobile will be their principal means of transport.

A MOTOR-CYCLE race, the first of its kind in the country, recently took place at Yokohama, Japan. There were three competitors, mounted respectively on a motor-quadracycle, a motor-tricycle, and a motor-bicycle. The distance was two miles, and this was covered by the rider of the motor-bicycle in 5min. 25sec.

AERIAL STUDIES.

1. **T**HE Professor—"Always straight in front of you, and don't lose control of the brake."
2. Beware of descending too rapidly.
3. Look out for the police when travelling at high speed.
4. Keep to the left.

5. To do repairs *en route*, hook on to a steeple or lightning conductor.
6. Avoid chimneys.
7. Keep your head in an encounter with the birds of the air.
8. And, above all, don't tumble off!—"La Nature."

A NUMBER of apartment houses recently built in New York city contain "automobile stables."

THE Locomobile Company of America, of New York, report that their exports for the first ten months of 1901 amounted to £32,400.

ACCORDING to the U.S. First Assistant Postmaster-General, the poor condition of the roads in Indiana prevents the extension of rural mail delivery by motor-cars.

THIRTEEN hundred owners of automobiles have registered with the New York State authorities under the new law. The number furnishes an illustration of the remarkably rapid growth of the industry.

ON Wednesday last Mr. Letts, of the Locomobile Company of America, sailed on board the "Celtic" for New York to inspect the latest models of Locomobiles and also to make arrangements with regard to their exhibit at the Automobile Club's show in April next. Mr. Letts will probably be absent a month, and hopes to bring back, amongst other new models, a delivery van manufactured by the company.

ACCESSIBILITY.

ACCESSIBILITY of parts, and especially of parts subjected to wear, is one of the most essential features of any motor or motor-car. In the earlier automobiles probably no feature of value was more neglected than this. The inventor began with his motor, placing it on the frame, and then piling the accessories and other parts around it wherever room could be found. The result was that as a rule, whenever something on the engine broke or needed readjustment, practically the whole vehicle had to be pulled to pieces to get at the parts affected, and repairs on the road were almost out of the question. The earlier worker naturally did not take the broad view of the whole combination of a vehicle like present designers, who have many models to serve as their guides. Probably, also, they failed to appreciate the importance of accessibility, which, although it might have been forecasted by a theoretical consideration of the nature of the machinery employed and the conditions under which it works, has only been fully established by road experience with actual machines.

In a petrol vehicle that which requires most frequent attention is the motor, or, to come down to narrower limits, the valve and ignition mechanism of the motor. The motor should therefore be so designed that all the parts constituting the valve and ignition mechanism can be easily withdrawn and without disturbing any of the other parts. This requirement has received full consideration in the design of many of the better motors of to-day, and we have examples, remarks the *Horseless Age*, which are probably not far from perfection in this respect. However, it is not sufficient that the parts of a motor be easily dismantled when the latter is placed on the shop bench or on a testing stand. The motor must be so placed in the vehicle that these same parts are readily accessible when it is in position. This requirement demands the exercise of no little ingenuity on the part of the designer when determining the general arrangement of parts and when designing the body. It is certainly objectionable to be compelled to get below the vehicle to reach certain parts.

A ready accessibility of parts not only aids in quickly repairing a fault; it also facilitates locating it. Locating the defective part and removing it from the machine usually consume the greater amount of time lost on the road, and a reduction in the time lost through such delays greatly increases the practicability of automobiles. One French firm, in order to facilitate repairs, etc., arranges the mechanism of its vehicle in five groups of parts, which can each be taken from the frame separately. This seems to be a promising line of progress in the direction of accessibility.

The whole problem we are here dealing with may be summarised as follows:—The various operating parts of a vehicle must be so assembled that they can easily be taken off when required. The parts must be compared with each other as regards rapidity of wear and liability to damage, and those most affected must be placed in the most accessible positions. The mechanism must be divided into groups which are as nearly as possible independent of each other.

WE hear that Mr. C. T. Crowden, of Leamington, is contemplating an early visit to the United States with a view to looking up the leading fire-brigade authorities in connection with the question of motor-fire-engines.

AT the last general committee meeting of the National Cyclists' Union it was suggested that the Union should hold a championship for motor-cycles, but the matter was held over until the next meeting.

CHENHALLS MOTOR-CARS, LIMITED, has been registered with a capital of £20,000, to acquire from J. S. Chenhalls the benefit of certain inventions relating to generators, motors, and wheels for use in the manufacture of motor-cars, locomotives, etc., and to carry on the business of motor-car manufacturers, etc. The first directors are J. S. Chenhalls, S. Ashdown, and R. J. Akers. The registered office is at 59, Ebrington Street, Plymouth.

HERE AND THERE.

WE hear that Mr. F. W. Hudlass, of the Phoenix Motor Works, Southport, is at work on the construction of a 20-h.p. double-cylinder car.

THE King and Queen were expected at Pennhouse, Amersham, Bucks, on Friday, on a visit to Earl and Countess Howe. In the event of the weather proving favourable, it was proposed to make the journey on a motor-car.

A VERDICT of "Accidental death" was returned at the inquest held at Folkestone on the body of the Hon. R. R. Dobell, the Canadian Minister killed on Saturday last in a riding accident at Sandgate. His horse, which was hired, had shied at a motor-car proceeding at a slow pace.

THE Clifton Motor and Cycle Company, 2A, Boyce's Avenue, Clifton, Bristol, has storage accommodation for motor-cars. Petrol, greases, oils, spare parts, etc., are also kept in stock.

A CORRESPONDENT, signing himself "Troubled," is anxious to know the name and address of the makers of the accumulators used on the Panhard cars.

THE distinction of being the first bridegroom in Liverpool to arrive at church on a motor-car is claimed for Mr. Thomas Worrall, who was married at St. Bride's Church on New Year's Day.

MR. SYDNEY G. CUMMINGS, of Cheshunt, Herts, has taken up an agency for a well-known insurance company, and can undertake the insurance of motor-cycles and cars against fire, third party risks, and burglary.

A GENERAL VIEW OF THE RECENT PARIS MOTOR-CAR SHOW, SHOWING THE TATIN MOTOR BALLOON.

ONE of the most important discussions of the season is to take place at the Automobile Club on Wednesday, the 22nd inst., when Mr. Roger W. Wallace, K.C., the Chairman, will read a paper on "The Proposed Alterations in the Existing Law Affecting Motor Vehicles."

AT the meeting of the Uxbridge Rural District Council last week a letter was read from Lord Ebury, complaining of the state of the roads at Northwood, Middlesex, which concluded by saying, "At the end of the winter I propose to send the Council in a bill for providing my carriages with new tires."

WE hear that the Surrey Court of Quarter Sessions has authorised Captain Sant, the Chief Constable, to purchase seventeen bicycles for the use of the County Constabulary, and one for himself. Automobilists had better beware of not exceeding the speed limit when driving through Surrey.

MR. F. R. SIMMS, who has taken a deep interest in aeronautics for a long time past, besides building his own flying machine, is we hear, constructing, in conjunction with Messrs. Spencer Brothers, an improved motor balloon on the Santos Dumont system.

NOTWITHSTANDING other statements to the contrary, we are able to state that Messrs. Humber, Limited, Messrs. Hewetson's, Limited, and Messrs. W. T. and S. E. Botwood have decided to only exhibit their vehicles at the Automobile Club Show in April next.

A SEPARATE depot under the name of the Minerva Motor Repair Department has been opened at 158, High Holborn, W.C., where is kept a stock of every part of the Minerva engine and its accessories, varying from a flywheel down to the smallest screw or washer.

WHILST Dr. Wyatt Smith, of Woking, was driving round the district in his motor-car, visiting patients, a horse became frightened at the noise made by the machine, and, backing, overturned it, throwing out both the doctor and his driver, each of whom was severely bruised.

EARL RUSSELL in his account of the six-days' tour in Essex, concluded in our last issue, referred to an extortionate charge at Canterbury for re-charging accumulators. Mr. E. J. Philpot, 42, High Street, Canterbury, writes us asking us to mention that the statement made does not apply to him.

THE alleged reckless driving of motor-cars at Branstone has formed the subject of a communication from the Council's clerk to the local police. Superintendent Hickling has promised to give the matter his attention, and, in the event of his finding a motorist going faster than the law allows, to take proceedings.

THE other day we had an opportunity of inspecting a novel combination of carburettor and inlet valve for bicycle motors that will shortly be on the market. Owing to matters relating to the patents, we cannot say more at present, but hope to describe the arrangement in a later issue.

THE accompanying illustration shows the flat base tire which the New York Tyre Company are making for use on motor-

vehicles weighing upwards of one ton. Tires of this type are, we understand, being used by Lord Brassey and several other motorists on 12 h.p. Daimler cars.

MR. R. W. COLE suggests that while the speed of automobiles should not be more than twelve miles an hour after dark, twenty miles an hour should be allowed in the day time. The better way would be to abolish the speed limit altogether—as is advocated by a colonel who has written to the daily papers from the Army and Navy Club.

ON Saturday, the 4th inst., Portsmouth and Gosport Motors, Ltd., inaugurated their service by a run to Fareham and back. Unfortunately the weather was wet, but the trip was thoroughly appreciated, and the merits of the "Cambria," the larger of the two motor 'buses which are running between Fratton and the Dockyard, were thoroughly tested. It is a commodious vehicle, built by Messrs. G. F. Milnes and Company, of London. It has engines of 8½ h.p., and seating capacity for sixteen persons. The other car, the "Albion," is of an earlier date, and seats ten passengers. Included in the party on the inaugural run was the Mayor of Portsmouth (Major Dupree).

MR. H. G. WELLS, the novelist, anticipates a time when all passenger traffic will be carried on special roads on motor-cars, and when railways will find their chief work in carrying minerals and heavy goods.

THE *Field* has again drawn attention to the necessity of maintaining the chief highways of the country in good condition, in view of the "through traffic" that may be expected on the main roads by the adoption of the automobile for heavy transport.

THE Graphic Cycles Syndicate, Limited, Blenheim Grove, Peckham, S.E., inform us that they are the sole agents in Great Britain and the Colonies for 7, 9, and 14 h.p. D'Champs light carriages; also that they are now in a position to undertake motor-car work of every description.

MESSRS. STAUNTON AND CO., of the Excelsior Works, Blythe Street, E., are bringing out a new speed indicator for motor-carriages, which not only registers the distance travelled, but shows the speed at which the car is running at any moment. We hope to give some further particulars of the new device in an early issue.

JAMES AND BROWNE, LIMITED, has been registered with a capital of £10,000 to acquire the business now carried on by T. B. Browne and F. L. Martineau, at 78A, Queen Street, Hammersmith, as James and Browne, and to carry on the business of automobile, flying machine, and submarine manufacturers, etc.

WE hear that a patent has lately been taken out for an entirely new method of obtaining motive power for the propulsion of motor-cars, launches, etc. It is not an explosive motor, and yet is very compact and simple. The inventor states that his new motor is more easily managed and controlled than steam engines, and much more economical. We hope to refer to the matter again in a subsequent issue.

AT a meeting of the Bangor City Council, last week, Mr. Myrddin Jones moved the suspension of the standing orders for the purpose of calling attention to the furious driving of motor-cars through the narrow streets of the town. He further moved that the attention of the police be called to the matter. He did not refer to the case that had been in the courts, but to certain wild people who came from Llandudno and elsewhere. The motion was carried.

THE General Motor-car Works, of 10, Elm Street, Gray's Inn Road, W.C., have introduced a new condenser for steam-cars, and radiator for petrol motors. The device is neat in appearance, and has no parts that can be bent or damaged when cleaning the car. It is made in two sizes, of tinned iron, enamelled, or tinned copper, and in a space of 24 inches by 12 inches 78 square feet of cooling surface are provided.

WE had an opportunity of inspecting one day last week a 9 h.p. Napier car, which has been built to the order of the Maharajah of Balrampur. The body, which has been constructed by Mr. Mulliner, of Northampton, is arranged in the form of a wagonette with doors behind. The sides take the form of double curves, so that all four passengers in the hind part of the vehicle can face forward. At the back, besides an easy step, are two standing boards for the prince's Indian servants. The body and wheels are painted a brilliant green colour, relieved with lines of gold, and present a striking appearance.

THE Simms Manufacturing Company, Limited, 55A, Southwark Park Road, Bermondsey, inform us that they are now laying down very light four-cylinder engines, to use either petroleum spirit or petroleum, the first of which will make its appearance at the Automobile Club's Show in April next. The sizes will be 20, 30, and 50 b.h.p. They are also building similar engines, but of heavier construction, for the motor-car trade, suitable for either light or heavy traction. Among the special features of the motors we may mention the Simms-Bosch magneto-electric ignition and timing gear, a sensitive governor acting by way of throttle on the inlet of gas and air, mechanical lift of inlet and exhaust valves (of same diameter and interchangeable), all of which will be worked by one countershaft.

CORRESPONDENCE.

MOTOR-BICYCLES FOR 1902.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Perhaps I may be permitted to say a few words in reply to those who have done me the honour of criticising my letter. I am glad to hear that Mr. Lambe is bringing out an improved bicycle; and, should it be the success he anticipates, we will hope that some of your correspondents will at last have something good to say of an English machine, and will no longer find it necessary to champion the cause of the foreigner.

In reply to Mr. Bennett, I cannot see that it matters whether Mr. Tessier smashed a combustion chamber with his knee or whether the damage was done by contact with the ground; the inference apparently is the same, viz., that a bicycle motor should be placed where it is least likely to be injured. I think we must allow my conjecture as to the death of the 1901 model of Werner to stand a little longer, as this is a question which will not be settled by the makers, but by the public. It will be interesting to see how it stands competition with the later model and with other machines. With regard to the lubrication question, as both systems are well known to be efficient in good hands, I think that Mr. Bennett will see that neither is in need of support from an amateur. I can, however, show Mr. Bennett a De Dion water-cooled engine, which, after two years' constant use, will not show leakage from any part of the crank-case, although lubricated with double the standard charge of oil; and I shall be pleased to submit it to any test whatever, in respect of lubrication, as against his Werner engine. This is a matter, however, for private arrangement, not for a correspondence column. I note that Mr. Bennett has come to the conclusion that two-hundred-mile rides are "too long" for him. I should like, however, to have seen this admission incorporated in the account of his ride.

Mr. Craig seems in a somewhat aggressive mood, and would apparently like to break a lance with someone over the merits of the Holden bicycle. I am sorry that I cannot oblige him, if for no other reason because I do not think that the merits of this machine can be known as yet, seeing that the machine delivered to me a fortnight since was, I believe, the first one sold. Mr. Craig has a new grievance—that my views have changed in three weeks. If, however, he reads this letter he will see that he is mistaken.

I thought the letter of MM. Werner Freres, viewed as an advertisement, exceedingly good; but there seems to be a certain Gallic inconsistency in their reference to myself. If their motto is *laissez dire*, why refer to my letter at all? And, further, if the latter does not contain intelligent criticism, how can it do harm to any maker of motor-bicycles? As a matter of fact, my letter was intended to be read in relation to a series of laudatory statements with regard to this machine. Were these statements (including a recent account in a contemporary of a ride up a mountain) collected, the only possible inference would be that no further improvement is possible, or at all events desirable, in the design of motor-bicycles. My own view, on the contrary, and that probably of at least some of your readers, is that no type of motor-vehicle is more in need of improvement than the motor-bicycle. In order to bring the matter to a definite issue, I may state it in this way. The motorist has long since emancipated himself from the disabilities of the belt; the motor-cyclist either has not or cannot. The motorist is no longer to be seen assisting his vehicle up hills; the motor-cyclist generally does so. The motorist fits an efficient silencer; the motor-cyclist is quite satisfied with a pepper-caster at the end of two inches of pipe. The motorist has efficient brakes; the motor-cyclist very inadequate ones, in view of the pace at which he rides.

If there is anything in these considerations, then I say that, judged by the standards applied to other motor-vehicles, the motor-cycle is woefully deficient. If not so judged, then motor-cycling is not motor-cycling.

I have taken a certain French model as representative because it is the one most frequently seen, it has the greatest number of imitators, and, lastly, we are told that it is theoretically correct. Of course, there are others, some of which are, I think, better; and I much hope we may yet see an efficient, comfortable and powerful motor-bicycle. My view, however, is that that day will not come until we can persuade our designers that the best type is not that which has a wholly unprotected belt and a high-speed motor attached to the handlebar.

In conclusion, permit me to say that, although the motor-bicycle controversy appears to be about to apply for a non-stop certificate, I must declare my own innings closed, and very humbly apologise for the space I have occupied.—Yours truly, W. E. TESCHMAKER.

THE DEWSBURY FURIOUS DRIVING CASE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As another beautiful specimen of "Justices' justice," let me commend to your notice the report in your last issue. One or two points are worthy of notice. The police-constable swore the car was going seventeen or eighteen miles an hour, but in cross-examination he said he had the car in view one minute, and in that time it travelled 200 or 220 yards, a slight difference, as our solicitor pointed out. He admitted

there was no one on the road near the car, and nobody's life endangered, also that he made no sign whatever to warn or stop my son, neither had he ever cautioned him. Also, he interpolated the word "fast." My son, who had been assisting to repair the car, said he had been trying the car to see how it would go, which is a very different thing. When the magistrates retired to consider their decision there was a general feeling in court, such had been the evidence, even amongst some of the police force, that the case could not be otherwise than dismissed. Hence there was no small surprise when the "lenient" fine was announced, especially seeing that in this case £5 was the highest fine that could have been inflicted. Rumour whispers that the magistrates' clerk, who owns a horse or two, and who showed some animus all through the hearing of the case, had a good deal to do with influencing the magisterial decision—but that is conjecture.

Motorists travelling through Dewsbury had better adopt a funereal pace, or, without any warning, they may, a week or two after, receive a summons to appear before this Bench of worthy Justices and their clerk. Seeing that my son had no witness—he took up his friend on his way back—and considering the animus in the general magisterial mind, my solicitor strongly advises me not to proceed with the appeal, and I have decided not to throw away good money after bad. Please excuse length of letter, but I consider a little explanation is due, and I think you will agree that such proceedings are a disgrace to the name of justice.—Yours truly, J. R. KILNER.

BRAKES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am surprised, after reading of the constant brake accidents recorded in your *Journal* that some such device as shown in the accompanying illustrations has not been adopted by our makers. It is a device well known to engineers in the form of a clutch, but would appear to lend itself well for such a purpose. All the working parts would be fixed on the back axle, the brake blocks merely being expanded into the inside of the sprocket wheel rim; tremendous force could be applied in this way, and the device would act, of course, equally well in either direction.

Using metal to metal surfaces, they would ordinarily be greased, so as not to brake too suddenly, and on a long and steep descent, where others fail by heating and charring, the braking action of this would increase as the grease became used up; but if suitable metals were chosen there should be no fear of the apparatus firing or jamming together. It should add very little to the trouble of a car only requiring a little attention from the oil-can when the other parts of the mechanism were being lubricated. I shall be glad to know if anything of this sort has been tried, and, if so, the experiences gained with it.—Yours truly, PERCY N. HOOPER, A.M.I.C.E.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I note in your issue of January 4 a Comment, entitled "Brakes Again," which deals with the necessity of sufficient brake-power on motor-wagons. No motor-wagon can be used with safety on hard, slippery roads unless its driving wheels are constructed to take a set of frost pins, such as are included in the equipment of traction engines, and enable the driving wheels to grip the hard, frozen surface. As is well known to road locomotive drivers, metal wheels can be locked by brakes, yet continue to slip down hill, unless provided with spikes or pins. A friend of mine has just met with one of these easily prevented accidents; in his case slipping backwards down a hill, the driving wheels revolving in a forward direction all the time. Frost spikes, of course, correspond to the roughing of horses' shoes. I think if you could insert this letter it would prove useful in drawing attention to a great danger, against which there is a simple remedy.—Yours truly, FRED PAGE.

BAD ROADS, AND A HINT TO COUNTY COUNCILS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In driving over some of the main roads at this season of the year, it is only reasonable to conclude that those in authority do not at present realise to what extent pneumatic and other tires are damaged by the loose stones which are apparently strewed indiscriminately all over the road, and left for the wheels of passing vehicles to roll in. Those who, like myself, enjoy a drive in a motor-car in almost any kind of weather, go prepared to

brave the elements and mud, but when it comes to crashing with pneumatic, or even solid rubber tires, through sharp flints, it makes one wish for the time which is rapidly approaching, when all road surveyors will be provided with motor-cars, in which to visit the (stone)fields of their operations.

The Essex County Council have set a very good example in this respect by purchasing a De Dion-Bouton car for the use of their chief surveyor, Mr. Sheldon, and every owner of a motor, or other rubber-shod vehicle, will, I feel sure, join with me in hoping that other Councils will follow this excellent lead in the very near future. In the meantime, I would suggest that where it is necessary to cover the whole of the road with stones, the steam roller be brought into requisition as speedily as possible in every district. The North Road between Norman Cross and Alconbury is, at the present time, in an atrocious condition, practically covered with stones the whole of the way, other portions of the road between the latter place and London being in a similar state. The above facts were brought very forcibly to my notice the other week end, when the English Motor Club drove to Peterboro' with the object of meeting there the members of the Nottingham Automobile Club, who were possibly prevented from putting in an appearance through the state of the roads in that direction.—Yours faithfully,
J. W. STOCKS.

STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If you can find room in your paper for a few random remarks of mine you will be conferring a favour probably on others besides myself, as there must be many others looking for a well-built steam car to seat four, and at a moderate price, say £250, capable of travelling fifty to sixty miles on one tank of water. As an Englishman I have naturally expected such a car to be built in England, but the steam-car seems to be represented by vehicles of foreign make, which owing to their flimsy construction cannot possibly last more than three or four years, and which require another £50 spent on them to enable one to travel any distance without stopping for water.

I have read of a new "steamer" made in the Midlands which carries a condenser which must weigh 500 lbs. I suppose this is to make ten gallons of water do the work of sixty. I should imagine it would be preferable to carry the extra quantity of water, which is certainly getting lighter all the time, which is not true of the condenser. Having heard what the petrol car maker says of the "steamers" and *vice versa*, I naturally turn my attention to electricity only to be more hopelessly muddled. A description appeared in the *Daily Mail* recently of the much heralded new invention of Edison, but it seems that it is necessary to have an oil motor, which in conjunction with a dynamo, and at an expense of tenpence, will give six brake h.p. per hour on the car. As I am told there will be a loss of 40 per cent. of the power put into the oil motor in the first instance and that given out from the battery on to the wheels, this is surely an expensive power; moreover, the battery will weigh 50 lbs. per h.p., and I am informed by an engineer of wide experience that a properly constructed steam motor with the necessary paraphernalia for generating power and transmitting it to the wheels can be constructed at a total weight of 15 lbs. per brake h.p. If this is the case, surely such a car can easily carry fifty gallons of water and then not weigh more than 1,200 lbs. with 8 b.h.p.—Yours truly,

COMMON SENSE.

FRANCE COPYING ENGLAND.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read the letters in your issue of December 28th from Messrs. Hector and Edge, in which it is claimed that Napier used an aluminium jacket with cast-iron cylinder lining (or *chemisette*, as our neighbours call them) before the French did. In the 24 h.p. Mors for 1900, and I believe for 1899, this system was adopted. Levegh's, Baron de Cater's, and Prince Orloff's cars were all so fitted, I know, as I have personally examined them. I think enquiry will show that Mors was first in this. Also your correspondents seem unaware that Mors has also never fitted lamp ignition to his machines, and they were in existence long before the Napier. Then, as regards the cylinder and head cast together, here undoubtedly De Dion was first, though Walton, of Derby, cast the cylinders of his "Derby" oil engine in pairs—heads and all—three years ago; I have a pair so cast which I obtained two years ago. Again, as to straight exhaust valve stems, Mors was undoubtedly first; Panhard copied this feature last year. As to maximum power for weight, I fancy the 40 h.p. Mors is quite equal to the 50 h.p. Napier in this respect.

I do not wish to be misunderstood in making these remarks, I have no trade interest to serve, and I take the greatest interest in the Napier and Wolseley cars and their developments; also I badly want to see a Napier in this year's big French races, and, still more, I wish to see it win. But do not let us deceive ourselves or make claims to which we have no right. That will only earn the contempt of our friends and rivals, not their respect. I can only presume that Panhard has so overshadowed Mors that Messrs. Hector and Edge have overlooked the latter, although Mors has consistently won all the recent big races, and personally I think will continue to do so. In my opinion, make-and-break low-tension ignition is more suitable for big engines than the high tension, as the spark is infinitely hotter and the resultant explosion more instantaneous—advantages of great import where high power and big volumes of gas are concerned.—Yours faithfully,
A. J. WESTLAKE.

QUERIES RE DE DION MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a 2½ h.p. De Dion tricycle, and for several months could not get out of it a powerful explosion. I have had fitted a stronger spring on the exhaust valve, and now have as much power again from the engine. I find, however, that my exhaust pipe and all round the exhaust box gets completely red hot after going a very little distance. I saw a letter on a similar subject in the *Journal* a few months ago, but never saw the question answered. I shall be greatly obliged if any reader can explain what is wrong.—Yours truly,
G. C. HARDY.

AN INTERESTING QUERY RE LOSS OF POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reply to "Flash," the following will probably explain his trouble. The platinum on the new trembler is of course thicker than that on the old, and consequently the screw should be adjusted further away. Let me explain the working of the Aster ignition gear, and I shall be more readily understood. Unlike the De Dion, the Aster is a positive make and break: the cam forces the trembler against the screw and this makes the contact; as the spark is not produced until the contact is broken, it follows that the more rapid the break, or in other words, the farther the screw is adjusted away from the trembler, the more rapidly the engine will run. In practice I find that it is next to impossible to correctly adjust the Aster contact unless the engine is running, and so I proceed as follows: The trembler being in position, loosen the small binding screw, and the platinum tipped screw will run easily with the fingers, without using the screwdriver; screw up the platinum screw till it touches the trembler, then take it back one turn, and start the engine; now move the platinum screw about with the fingers until you find the position where the engine runs fastest, without missing fire, cut off the current, and screw the binding screw up tight. It will be noticed that as you advance the platinum-tipped screw, the engine will gradually slow down, until it finally stops because there is contact, but no break; you withdraw the screw, the engine pace will increase; continue withdrawing, it will miss fire, and finally stop, because there is break, but no contact.

Having sold some thirty Boyer cars last year, perhaps "Flash's" was one of them; if so, and he is in London, I should be very pleased to put him right, and could do so in a very few minutes.—Yours faithfully,
C. WOISTENBOROUGH.

MOTOR-CARS FOR THE TROPICS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I fully sympathise with Dr. Fowlie. I am a medical man in the service of British Guiana—a little known tropical colony of Great Britain—with a climate much as the Straits. I wished to take a small motor-vehicle back with me, but all my enquiries have as yet landed me in chaos. After a good deal of trouble I was told the flash point of petrol is 80 deg. Fahr. I see in your issue of January 11th this is stated to be below freezing point. Surely this cannot be, or the words are used in different senses.

I shall be very glad to hear from you or any of your correspondents which is the best motor-quadracycle to take to a tropical colony. The temperature is between 80 deg. and 90 deg. Very damp air is laden with moisture. The roads are good and flat—not such a thing as even rising ground. To my letters of enquiries most of the replies gave me the impression that the various firms think they are doing one a favour in replying at all—and as to selling one, that is an act of extreme condescension for which, like a certain character in "The Mikado," they require a very heavy result.—Yours truly,

G. D. ROWLAND.

THE Automobile Club of America is preparing to enforce the law which compels the Commissioner of Highways to erect signposts at road-crossings on the petition of twenty-five property owners of the county.

AN interesting exhibit at the Paris Salon was the keel of the navigable balloon "La France," constructed by the brothers Renard and Krebs in 1884 and 1885 in the military balloon works near Paris. It is made of very strong bamboo, and carries in the one end a set of secondary cells, which give the power to an electric motor which causes a propeller to revolve by means of gearing and a long protruding shaft. The navigable balloon made some seven aerial trips in 1884 and 1885, and several times succeeded in coming back to the starting point, but the charge of electricity able to be carried in the accumulators and the weight of the motor and accumulators rendered the machine quite impracticable. It was, however, the embryonic idea of Santos Dumont's machine, and it was here that M. Santos Dumont got the shape and general construction of his keel, though the improvement in the latter, no doubt, is the reason of its success.

SPACE AT THE AUTOMOBILE CLUB'S SHOW.

WHEN, in June last, the trade decided that several motor exhibitions were not only unnecessary, but would prove disastrous to the industry, and, by unanimous resolutions, determined that there should only be one motor exhibition in London per annum, and that, for the present, that one exhibition should be the Automobile Club's Exhibition at the Agricultural Hall, the question was raised by Mr. S. F. Edge, how it was proposed to prevent manufacturers and agents from acting in defiance of the decision of the trade. It was then unanimously resolved that those who exhibited elsewhere, in defiance of the decision of the trade, might be refused by the Automobile Club the right to exhibit at the one exhibition selected by the trade.

The Committee of the Club took no part in the voting on these questions, but since the trade came to its decisions the Club Committee have felt it their duty to the trade to do all in their power to ensure the decision of the trade being adhered to.

It was recently pointed out that manufacturers might attempt to exhibit their cars through agents at other exhibitions, and the Club Committee immediately published an announcement that such action would be regarded by them as being disloyal to the decision of the trade, and that those who acted in any such manner would not be permitted to exhibit at the Automobile Club's Exhibition.

On Monday night, the 30th December, the Standing Committee sat as the Allotments Committee of the Club, and dealt with a request from Messrs. Cordingley and Company that space at the Agricultural Hall Exhibition, of April next, should now be definitely allotted to applicants, a list of nearly 200 names being submitted.

In the first place, the applications of firms who had exhibited at the Stanley Show and the National Show were disallowed.

It was agreed that the applications for space of a large number of firms who have been loyal to the decision of the trade might be granted subject to the conditions previously announced by the Club, and subject to the following additional stipulation.

It was pointed out that a manufacturer might show his cars in defiance of the decision of the trade at another exhibition, and then seek to gain the additional advantage of showing his cars through an agent at the Club's exhibition.

It is clear that an agent who agreed to such an arrangement would be aiding the disloyal manufacturer in circumventing the precautions which were decided upon by the trade to prevent disloyal firms from having an advantage over loyal firms by securing the display of their cars at two exhibitions, whereas the cars of loyal firms would only be displayed at one exhibition.

The Allotments Committee therefore decided that all allotments of space should be made, on the definite understanding that the firm or person to whom the space is allotted agrees that there shall not be exhibited thereon cars which have been exhibited in defiance of the decision of the trade, or cars of a similar type to those so exhibited, or cars made or sold by firms which have forfeited their right to exhibit at the Club's Exhibition, and the firm or person to whom the space is allotted shall further agree that if such cars be exhibited the Committee have the right, at the applicant's risk and expense, to forthwith remove such cars from the space and from the exhibition premises.

The intention of this provision is clear, viz., to prevent disloyal firms from exhibiting at another exhibition under their own names and then securing the display of their vehicles at the Club's Exhibition through an agent.

In the event of a car having been exhibited at another exhibition by an agent, independently of the manufacturer, it is not intended that the manufacturer should be debarred from exhibiting his cars at the Club's Exhibition.

The conditions of allotment are as follows:—

- (1) That the applicant for space (company, firm, or individual) has not exhibited since the 11th June, 1901, and shall not exhibit prior to the Club's Exhibition of April 1902, motors or motor vehicles, or anything connected with motors or motor vehicles other than motor cycles, parts of motor cycles, or accessories to motor cycles, at any other exhibition within twenty miles of Charing Cross.
- (2) (a) That no company or firm for which, or person for whom, the applicant is the recognised agent,
(b) That no company, firm or person, appointed by the parties referred to in paragraph (a) as agent, or appointed or permitted to exhibit under any name on their behalf,
(c) And that no company, firm, or person, appointed by the applicant as agent, or appointed or permitted to exhibit under any name whatsoever on the applicant's behalf,
has exhibited, or shall exhibit during the same period, motors or motor vehicles, or anything connected with motors or motor vehicles other than motor cycles, parts of motor cycles, or accessories to motor cycles, at any other exhibition within twenty miles of Charing Cross, except with the approval in writing of the Committee of the Automobile Club.
- (3) That the applicant agrees that there shall not be exhibited on the space cars which have been exhibited in defiance of the decision of the trade or cars of a type similar to those so exhibited, or cars made or sold by firms which have forfeited their right to exhibit at the Club's Exhibition; and the applicant further agrees that if such cars be exhibited the Committee shall have the right,

at the applicant's risk and expense, to forthwith remove such cars from the space and from the exhibition premises.

Note.—The intention of these conditions is to prevent companies, firms, or individuals from acting disloyally to the decision of the trade by exhibiting the motor vehicles which they manufacture or sell through an agent or another channel at exhibitions other than the Automobile Club's Exhibition, or by exhibiting cars at another exhibition in defiance of the decision of the trade, and attempting to again exhibit them at the Club Exhibition under another name or through an agent. The only circumstances under which the conditions could be relaxed would be in the event of the Committee being satisfied that vehicles made or sold by the applicant were exhibited by another company, firm, or person at another exhibition contrary to the wish of the applicant, and that the applicant was powerless to prevent, by legal or other measures, such display of the vehicles with which he is concerned. The conditions may also be relaxed if it be shown that a disloyal firm which has exhibited cars elsewhere would in no way benefit by and is in no way connected with the display of similar cars by the applicant.—*Automobile Club Notes and Notices.*

WRIT SERVING AT AN EXHIBITION.

IN the Court of Appeal on Monday an appeal in the case of Dunlop Pneumatic Tyre Company, Limited, and another v. Actien Gesellschaft Fur Motor (Cudell), by the defendant company against the refusal of Mr. Justice Channell, at Chambers, to make an order setting aside the service of the writ in the action was heard. The defendants had exhibited some motor-cars at the National Cycle Show recently held at the Crystal Palace, their stall being in charge of a gentleman named Struck, who had an assistant named Müller. One of the motors exhibited was of the class known as the Cudell, of eight h.p., the wheels of which were supplied with pneumatic tires of a kind which the plaintiff company alleged were an infringement of their patent. The show only remained open a week, but the Master gave leave to serve the writ on the agent of the company at the exhibition, as he considered defendant company, although a foreign corporation, registered in Germany, and without any offices in England, was yet "carrying on business so as to be resident" within the jurisdiction of this Court. The defendants thereupon appealed to the judge in chambers, who, as before stated, refused to order the writ to be set aside; hence the present appeal. The Master of the Rolls, in giving judgment dismissing the appeal, said this was an action for infringement of patent, and the defendants took up the position that the service of the writ on their representative at the Crystal Palace ought to be set aside on the ground that by merely exposing goods for sale at an exhibition, a foreign company did not thereby carry on business here in such a way that they could be sued by a writ served on their representative. It had been held over and over again that the real test was whether the foreign company conducted its business here at some definite place, and not the duration of the time that business was done by them in this country. Here the German company carried on business at a particular place by an agent, who represented them alone. They therefore came within the jurisdiction of this Court, and the service of the writ was regular and ought not to be set aside. The Lords Justices concurred in the appeal being dismissed with costs.

BLOWING OFF STEAM.

AT Chertsey, William B. Bragg, no occupation, of Byfleet, was summoned for driving a locomotive from which steam was blown off, at a greater speed than four miles an hour, at Weybridge, on December 27th. The defendant admitted going more than four miles an hour, but submitted that he was entitled to do so by the Light Locomotives Act. Police-constable Bettison deposed to seeing the defendant driving a four-wheel motor in Heath Road, Weybridge. A cloud of steam came out from behind, "like the smoke from an engine." He was then coming up an incline, and the steam continued to come from the rear of the motor when he was on level ground for 150 yards. Witness stopped him, and called his attention to the steam, and he replied, "Your inspector stopped me the other day for the same thing," adding, in answer to witness, "He told me I should probably hear something further about it." Defendant also said that he had been to London, and ascertained that he could let off his steam when going up-hill. In reply to the defendant, witness said the defendant did not say anything about an accident to the condenser, which caused the steam. A brother of the defendant, who is the owner of the car, stated that the steam was due to a leakage in the condenser. A few days before the alleged offence, Inspector Marks stopped him, and witness pointed out the leak. The inspector then let him to believe that he was allowed to let off the steam when going up-hill. Inspector Marks was called, and admitted that a certain portion of this statement was correct. Mr. Begg did show him the faulty condenser, and, as witness regarded it as an accident, he did not take proceedings. An expert witness who supplied the car gave evidence, from which it appeared that the steam was due to a leakage in the pipes of the condenser, and he explained to the Bench that the car was so constructed that it could be driven without any emission of steam or vapour. This apparently satisfied the Bench that the Act under which the case was brought did not apply, and the summons was therefore dismissed.

PERTH MOTOR-CAR FATALITY.

At a sitting of Perth Circuit Court last week, Lord Trayner presiding, Thomas Goudie, blacksmith, was charged with having, on the November 16,

1901, at the junction of High Street and Scott Street, Perth, while in charge of a motor-car, driven the car against James Cross, son of Thomas Cross, labourer, High Street, and killed him, and, further, driven the same car against James Paterson, hairdresser, 5, Milne Street, Perth, William Fyfe, tailor, and Christina Fyfe, his daughter, both residing in Stormount Street, Perth, whereby these persons were injured. The accused, who pleaded "Not Guilty," described his movements on the evening of November 16th. After leaving Conacher's shop he was going at the rate of five or six miles an hour. He had difficulty with the crowd, although they made an opening for him. When the car turned it gave a lurch, and his foot left the pedal. The car lurched forward, and the accident happened before he could regain his pedal, which took about a second or two. John Duncan, owner of the motor-car, said the streets were greasy on the night in question. He examined the street on Monday morning, and found it in bad repair. The street had been repaired there since. The causeway was sunk away from the rails, and he regarded that as a danger when turning his car. In his opinion he saw enough in the street to explain the accident. Accused was a careful driver. Other evidence having been heard the jury found the charge proven, but recommended the accused to leniency. Lord Trayner, in passing sentence, said he would be doing violence to the evidence, and certainly to his own feelings, if he did not regard this as a very light case of culpable homicide. He was very glad that the jury had appended to their verdict a strong recommendation to mercy, as it enabled him—as the Court is always willing to do—to give a lighter sentence than it might do otherwise. Under the whole circumstances, he thought that the ends of justice would be sufficiently vindicated and that pursuer would be sufficiently punished by a sentence of imprisonment for three months.

FURIOUS DRIVING CASES.

At Watford Cyril Potter was charged with furiously driving a motor-car at Watford on November 28th. Defendant did not appear, but was represented by his driver. Police-sergeant Appleby said that on Thursday, November 28th, he was on duty in the High Street when he saw a motor-car being driven at a pace of at least from fifteen to twenty miles an hour. He went into the Police station and telephoned to the Bushey Police station, and the car was stopped by the Bushey Police, and the defendant's name and address taken. There was a lot of traffic about at the time, and a steam-roller was in the road; there were two or three ladies in the car at the time. Police-constable Smart corroborated the evidence as to the pace, and said he never had time to call to the motorists, for "they simply went past like a flash of lightning." Police-constable Hobbs, stationed at Rickmansworth, from information received, stopped the car and obtained the defendant's name and address. The defendant was sitting by the side of the driver. A fine of £5, and 8s. costs, was imposed.

At Brentwood, Charles Warren, of Ipswich, and Arthur Barnes, of Cheltenham Road, South Croydon, were summoned for driving motor-cars at a greater speed than twelve miles an hour between Brentwood and Romford. Mr. Warren, it was alleged, put on speed after passing a constable and did six miles in seventeen minutes, Mr. Barnes covering the same distance in twenty minutes. The speed was ascertained through the agency of the police telephone. The defendants stated that the road was clear of all traffic, and they were unaware they were going so fast. They were each fined £1, and 10s. costs.

At York Police Court, Walter Booth, of Bradford, was summoned for furiously driving a motor-car in Spurriergate and Low Ousegate. P.C. Waddington stated that on the 27th December, about half-past three in the afternoon, he was on duty at the corner of Spurriergate when he heard a motor-car approaching from the direction of Coney Street. He heard a horn blown, and on looking round saw the defendant in a motor-car. Before he could turn his head to see if the road was clear the defendant came round the corner at twelve miles an hour and collided with a doorway, doing some damage. He was also on the wrong side of the road when in Spurriergate. There was nothing in the way at the time. If he had turned the corner at a lower speed nothing would have happened. When witness went up to the defendant and told him he would be reported he said that the machine skidded when going round the corner. Two more witnesses supported this statement. The defendant said it was ridiculous to say that he was going twelve miles an hour, especially along such a narrow street. He saw the policeman and he was not going to run headlong into danger. The policeman did not even put up his hand to warn him. He had paid for the damage to the shop. While turning the corner one of the wheels skidded. Had it not been for the wet state of the road, which was made of wood blocks, he would have got round the corner all right. If he had been going at twelve miles an hour round that corner and collided with the shopdoor, he would have broken his neck; as it was he was not even thrown out of the car. He had driven a car through Bradford every day for over a year and had never been stopped. The Bench said as the policeman had stated that he did not hold up his hand and also seeing that there was no sand on the road the case would be dismissed.

At Cheshunt, Louis Fleischmann, of Burton Grange, Cheshunt, was summoned for driving a motor-car at a greater speed than twelve miles an hour on the public highway. Defendant did not appear, and was defended by Mr. T. W. Staplee Firth. Acting-sergeant Albert Willoughby deposed that at 9.30 a.m., December 2nd, when on duty at Turners Hill, close to the police station, he saw defendant's motor-car being driven along College Road towards the police station. It turned down Turners Hill at a very rapid rate. Witness looked at his watch as the car passed and saw

that the time was 9.3. Station-sergeant Gurnett deposed that at about 9.5 a.m. on December 2nd, he saw the defendant driving a four-wheeled motor-car at a much greater speed than twelve miles an hour. When witness saw the motor it was passing under the railway bridge at Theobalds Grove. Witness stopped the car at the corner of Eleanor Road. The time was then exactly 9.5. Witness added that it was in consequence of complaints received from inhabitants of Waltham Cross and Cheshunt that he kept observation on defendant's car. At 8.30 a.m. on the morning in question witness compared his watch with those of Sergeants Kendal and Willoughby. The distance from Cheshunt Police-station to Eleanor Road was 1,585 yards. Defendant's car covered that distance in two minutes, and was therefore going at twenty-seven miles an hour. The three watches were compared again at 9.30 a.m., and they were found to agree. Cross-examined by Mr. Firth: I have never told anyone that I intended to catch Mr. Fleischmann. Sergeant Kendal corroborated the evidence of the other officers. Mr. Rackham, driver of the car, gave evidence to the effect that the maximum speed on the occasion in question was ten and a half miles an hour. It was absolutely untrue that the car had ever knocked down anyone, or that any woman had ever thrown a pail at it. The car was a touring vehicle, and only geared to about twelve miles an hour. Mr. Firth, addressing the Bench, said the police had long desired to ambush Mr. Fleischmann. They had listened to tales by nervous gentlemen and had acted the part of the stalking horse. These three full-blown sergeants, all armed with watches, went out quite biased and with the deliberate intention of catching Mr. Fleischmann. The watches were not stop-watches and the chain with which the distance had been measured was not in court. The police had been over zealous, and their watches had evidently gone wrong. The Bench complimented the police on the way in which they had conducted the case, which was the first of its kind at Cheshunt, and ordered defendant to pay a fine of 40s. and costs, £2 8s. 6d. in all.

In Dumfries Sheriff Court, Hugh Johnstone, Paisley, was charged with driving a motor-car through Closeburn Village, on the Dumfries and Glasgow Road, at a greater speed than twelve miles an hour, on October 14th. The accused was at the time engaged driving for the Countess of Selkirk. Witnesses stated that the accused was going at the rate of from seventeen to twenty miles an hour, and an accident resulted, a farm horse taking fright and knocking down its driver, who was run over by a wheel of his cart. Giving evidence for himself, Johnstone stated that at the time the speed of the car was not more than seven miles an hour. In proof of this he said that the children amused themselves by jumping on and off the back step of the car. Sheriff Campion gave the accused the benefit of the doubt and found the charge not proven.

At Bridgend Police-court, William Long, a motor-car driver, was fined 15s. for not being in a position to have control over his car, which belongs to Mr. T. Morgan, Pontyclun.

WE learn that Werner Motors, Limited, have just secured an order for six of the latest pattern Werner motor-bicycles to be sent to Rhodesia, South Africa.

To prevent the freezing of the water in motors, the Vulcan Company, of 32, Kurfurstendamm, Berlin, W., has introduced a new product called Calcidum, which is added to the water. Half water and half Calcidum is claimed to prevent the freezing of water up to 15 degrees of frost, and larger or smaller quantities can be used as required. Calcidum can also be used for gas engines, acetelyne apparatus, etc.

MR. C. HARDY, of Bulwell Hall, Notts, whose interesting account of a tour in Scotland on his 5 h.p. Delahaye, appeared in this journal a little time back, has, we hear, just placed an order with the Wolseley Company for one of their 20 h.p. cars; the body work of which will be executed by Mulliners. It is expected that it will, when finished, be one of the most luxurious cars in the country, and as it will be in the hands of a keen motorist we shall expect to hear of the car again both here and abroad.

THE Motor-Car Journal.

VOL. III.]

LONDON, SATURDAY, JANUARY 25, 1902.

[No. 151.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

SEASONS have no respect for royalty, but King Edward in his motor-car shows no inclination to forego what is now his favourite pastime. His Majesty spent the week-end at Penn House as the guest of the Earl and Countess Howe, and took the opportunity of making some excursions through the lovely scenery that lies about Amersham. On the conclusion of his visit on Tuesday last, the King, still faithful to his automobile, chose that as the means of making the return journey to Windsor. His Majesty left Penn House about ten o'clock, and travelled through South Bucks in charming weather, crossing the river by Windsor

Bridge, and arriving at the Castle at ten minutes past eleven. The journey, which was occasionally favoured with bright sunshine, was accomplished in about an hour. The Royal progress as the motor-car ascended Thames Street, Windsor, and turned smartly round by the statue of Queen Victoria, was watched with the keenest interest.

That Fool of an Act.

No product of the human intellect is perfect, even the Light Locomotives Act, but the faults hitherto pointed out in its composition have chiefly related to the tare of heavy vehicles and the imposition of a maximum speed for light ones some 30 per cent. below the fastest mail-coach speed of the early years of last century. A further one is brought to mind by the remarks of a correspondent last week, who very justly points out that safety with goods-vans in frosty weather is much increased by the use of "roughed" wheels, as usual with traction engines. This would obviously be the case, but unfortunately all vehicles, to come under the Act of 1896, must be provided with smooth tires, no projection being allowed, except in the case of the tires being of rubber or such like material—in which case, it may be remarked, they are of no use on anything heavier than a bicycle. It is a wise provision on the whole that smooth tires alone should be allowed on public roads, but while the iron-shod hoofs of that champion road disintegrator, the horse (who would far rather trot on the turf, poor beast), are permitted, it would certainly be defensible to allow the employment of spur-shod wheels, or their equivalent, under such abnormal road conditions as have prevailed lately. However, as one of W. S. Gilbert's characters observes, "It's a fool of an Act, but it can't be helped."

The Huntsman's Agitation.

THE discussion as to the presence of motor-cars at hunting meets continues with vigour and venom in the journals devoted to outdoor sports. It is not likely to do any harm to automobilism, but rather to bring out its points of utility in conveying sportsmen to the scene of their pleasures with the

minimum of inconvenience and in the shortest possible time. The Warwickshire Hunt started the agitation, and it is satisfactory to observe that many influential huntsmen have already disassociated themselves from such retrograde ideas. Leading sportsmen recognise the pleasure of both hunting and motoring, and if they can be combined who shall say "nay"? Captain Langrishe is the Master of a well-known Irish Hunt, and generally drives to the meet in his motor-car; so does the Duke of Beaufort, the Earl of Carnarvon, Lord Harrington, and others who stand high as horsemen and as automobilists.

The Foreign Motor-Car.

TOWARDS the discussion now going on in the financial Press with regard to foreign and British motor-cars, Mr. Charles Jarrott makes a contribution in which he declares that "business has gone abroad because the English manufacturer and English manufacturing companies have proved themselves incapable of meeting the demand over here." Undoubtedly this has been true in the past, but it is becoming increasingly less accurate as local authorities cease their irritating restrictive policy, and manufacturers recognise the points which the British public regard as essential in modern automobiles. We believe that the forthcoming Motor-car Exhibition at the Agricultural Hall will have a great effect on the British automobile industry, not only in educating the public, but also in educating the manufacturers themselves.

Yorkshire Automobile Club.

MEMBERS are invited to attend and bring friends to the Club dinner, which will be held at the Great Northern Hotel, Leeds, at 7.30 on the evening of Thursday, January 30th. Application for tickets (which are 3s. each) should be made before the 27th, and intended guests are reminded that the hotel offers ample accommodation for cars. The annual general meeting of the Club will follow, at which the yearly report and balance-sheet will be submitted, new rules considered, future arrangements discussed, and officers for the year elected.

Maidenhead Bridge Tolls.

IN our issue of the 11th inst., we referred to the petition from gentlemen in Berks and Bucks to the Charity Commissioners with regard to the tolls levied on Maidenhead bridge. The agitation against the tolls is growing, and if prosecuted with vigour may result in a better condition of things. The Highways Committee of the Maidenhead Town Council had been asked by the Charity Commissioners for a copy of the accounts with regard to the bridge for the last three years, showing not only the receipts for tolls but also the way in which this money has been expended. The lessee of the bridge is also becoming anxious, for he has written the Council as to the toll for motor-bicycles, and has received a reply saying that the Council is not disposed to sanction a toll for motor-bicycles—the only reasonable reply they could give. Mr. Joseph Taylor is taking a leading part in the agitation and will address meetings on the subject anywhere in the two counties immediately concerned in the freedom of the King's

Highway. Should the Charity Commissioners decline to intervene and take over the Trust, the toll will be paid under protest and the case carried to the High Court of Justice. Already a subscription fund has been started, contributions to which can be sent to Mr. Joseph Taylor, Poor Law Guardian, High Street, Eton, Mr. Cecil Howlett, Rural District Council, High Street, Eton, Mr. Joseph Fullbrook, Slough, or the bankers, Messrs. Barclay and Co., Slough, Bucks.

Leaving a Horse Unattended.

AN inquiry having been received as to the Act under which a driver could be summoned for leaving his horse unattended, it has been ascertained that Section 78 of the Highways Act of William IV. covers the point. This Act provides that:—"If the driver of any carriage whatsoever shall quit the same, and go on the other side of the hedge or fence enclosing same, or negligently or wilfully be at such distance from such carriage, or in any such situation whilst it shall be passing upon such highway, that he cannot have the direction and government of the horse or cattle drawing the same, he shall, on conviction for such offence, forfeit a sum not exceeding £5, or if the driver be the owner of the vehicle, a sum not exceeding £10, or in default of payment he may have hard labour for not more than six weeks."

A Prosecution.

ON Saturday, the 4th inst., Mr. E. J. Waller was motoring to Hampton Hill with Mr. Staplee Firth. As they were driving down the High Street, Wandsworth, an unattended horse, yoked to a four-wheeled van, on hearing the motor-car approach, dashed out in front of them, and in order to prevent a serious collision Mr. Waller put on the brakes hard, but in consequence of the greasy state of the road a serious side-slip caused the car to turn completely round, and the near hind wheel came into violent contact with the kerb. A collision, however, with the horse in question was thus avoided. The back axle was bent, and the car had to be left at Wandsworth. Subsequently, Mr. Staplee Firth applied for a summons at the South-Western Police Court against the owner of the horse, and the same was granted and made returnable for the 14th inst. The case was heard on that day, and the owner of the unattended horse was fined 10s. and costs.

A New Eldorado.

THAT automobilism has made rapid progress during the past year and is expected to make even greater headway during the coming twelve months is a generally conceded fact in motoring circles. But that this view is not confined thereto, but is being shared in other quarters, is evidenced by the rumours of the approaching appearance of half a dozen new automobile papers. For the sake of the trade it is to be hoped that it is not to pass through the same experience as the cycle industry, which was at one time supporting quite a multitude of papers—reduced now, fortunately, to three or four. With five British journals, two of which are published weekly, entirely devoted to automobilism and the motor-car industry, we think the movement is sufficiently well supported, and the trade sufficiently well served without the latter having further burdens put upon it, and hope in the interest of the trade that once again rumour will support its old character of proving a false jade.

Motor-Cyclists in Hyde Park.

CYCLISTS have long regarded with envy the possessors of motor-bicycles and similar machines who have been able to use Hyde Park throughout the day, while the poor pedallers have been restricted to a few hours in the morning. We understand the attention of the Commissioner of Works is

to be called to what some cyclists regard as an anomaly. But it is rather like the dog in the manger attitude to grumble because motor-bicyclists appear to be favoured. Instead of seeking to prevent motor-cyclists having this privilege the cyclists should try and secure it for themselves—or else become motor-bicyclists.

Motor-Cars for Parcels Work.

A CORNISH friend of the *Motor-Car Journal*, who is also a friend of the *Drapers' Record*, sends us a cutting from the latter periodical to which we are invited to reply. It appears that our textile contemporary has an idea that the Post Office does not adopt the automobile because it has been unable to find a reliable one. We are reminded that in the early days of the industry an experiment was tried in carrying parcels by motor-car between London and Redhill. At first it was satisfactory, but difficulties subsequently developed and the plan was not continued. In various country districts, notably near Lincoln, the automobile has frequently proved its serviceability in easing the postal authorities during seasons of unusual stress and strain. Unfortunately, the officials at St. Martin's le Grand are slow and hard to move; hence their dilatoriness with regard to the new locomotion. We are surprised that the *Drapers' Record* should be sceptical as to the value of automobiles in parcel delivery work, seeing that some of the leading London drapers have adopted them with advantage.

Motor-Cars at Exeter.

MR. H. A. WILLING, Chairman of the Exeter Chamber of Commerce, in addressing the annual meeting of that body on the 15th inst., commended Exeter as an almost ideal city in which to start the manufacture of motor-cars. The situation of the capital of Devonshire and the railway facilities it offered combined to make Exeter a very desirable seat for this industry, and he was confident that if it were well placed and managed in an enterprising spirit, works might be carried on to give employment to a thousand hands. Mr. Willing is the head of a large gas engineering firm in Exeter, with branches at Cardiff and in London. His idea of Exeter as a centre for the motor-car industry rather took business men by surprise because they had not thought of it. The subject, however, has been favourably discussed in commercial circles, and the Devonshire Press commends the notion. It is expected that the Exeter Chamber of Commerce will further ventilate the subject, which is the most promising of the many schemes which are being aired to make the city more of a manufacturing centre.

The Wolverhampton Club.

THE members of the Wolverhampton and District Automobile Club held their first annual dinner on January 16th at the headquarters, the Victoria Hotel. Alderman Levi Johnson presided over a numerous gathering, among those present being the Mayor (Mr. C. P. Plant), Capt. Burnett (Chief Constable), Messrs. S. R. Rhodes (hon. secretary), A. E. Jenks (hon. treasurer), F. F. Sharpe, R. R. Rhodes, H. W. Jenks, T. F. Young, H. Van Tromp, G. H. Evans, E. Lisle, T. Cureton, E. Lisle, jun., and others, about fifty in all. The toast of "The King" having been duly honoured, Mr. Cureton proposed "Our Civic Rulers." The Mayor, in responding, said he trusted that the manufacture of motor-cars would become a most important industry and become beneficial to the town, especially in the case of heavy automobiles for corporation and public works. Mr. H. Van Tromp proposed "The Club," and said a few words about the growth of the Club and the mileage done. Mr. S. R. Rhodes responded in an eloquent speech, setting forth the importance of drivers being careful, giving due consideration to the public, and then he thought they would have the same fairness shown to them, and all prejudice removed. He gave a short history of the formation, growth, and increase of interest shown in the

Club since the commencement, and thought they could congratulate themselves on the result of the first year. Letters of apology were read from Sir H. H. Fowler, M.P., Sir Alfred Hickman, M.P., Mr. H. Norman, M.P., the Chief Constable of Staffordshire (Capt. Anson), and Mr. Claude Johnson, of the A.C.G.B.I., and the President, Alderman Marston, J.P., the Chief Constable of Staffordshire remarking in his letter that he thought if all cars carried numbers, as they did in France, the legal limit of twelve miles per hour might be abolished.

A King's Enthusiasm.

OF all the crowned heads now interested in automobilism none are more enthusiastic than Victor Emmanuel III. of Italy. On the anniversary of Queen Helen's birthday the royal pair journeyed to Castel-Poiziano by motor-car, returning to Rome the same evening. Still more recently a royal party consisting of the King and Queen, the Dowager Queen, the Duke and Duchess of Gênes, and General Brusati, who occupied two cars, made a 65-kilometre tour of Castel-Gandolfo, the lake of Albane, Frascati, and Colonna. Last of all, it is announced that King Victor Emmanuel will in May next make a tour of the island of Sicily, for the first time employing the motor-car officially.

More Balloon Ascents.

THREE successful balloon ascents were made from the neighbourhood of London at the latter end of last week. On Saturday morning, at Sevenoaks, Messrs. P. and S. Spencer, who were accompanied by Mr. Leslie Bucknall and Mr. James Dixon, jun., made the first of a series of trips, Mr. Bucknall's ultimate ambition being, it is said, to cross the Channel. On Friday the Hon. R. S. Rolls ascended from the Crystal Palace, and after a successful voyage came to ground in the neighbourhood of Sevenoaks. The other ascent was made the same day from the Gas Light and Coke Company's premises at Fulham, with the object of proceeding in the direction of Brighton, but owing to a very light wind the party were only able to reach Tunbridge Wells. The special object of this ascent was the study of the hygrometric conditions of the atmosphere at varying altitudes, but the conditions were such that little could be done.

Base Ingratitude.

AFTER listening to a most satisfactory financial statement concerning its local "bone orchard," a recent meeting of the Liverpool Burial Board went the way of many another board and entered a protest against motor-cars. It seems that one was recently seen in the cemetery. Though traps are allowed to drive through the cemetery at a walking pace, it was proposed and carried that motor-cars be excluded. Accepting the popular belief that motor-cars do much to fill the cemeteries, such a decision can only be regarded as monstrously unfair. On the other hand, it is just possible that the Board has been influenced by a kindly desire to exclude anything at all suggestive of the hereafter of anyone committed to its charge.

The Automobile Club of South Africa.

THE members of the newly-formed Automobile Club of South Africa held their inaugural run on December 14th to Kalk Bay. The meeting of the cars took place in Greenmarket Square, Cape Town, and the assemblage and departure attracted quite a number of spectators. The vehicles were representative of all the modern styles, and among the members who took an active part in the proceedings were Messrs. B. Bartholomew, with a Benz car and a steam car; Mr. A. G. Fuller (the secretary)

with a Royal Enfield quad; and Mr. A. T. Hennessey, with a Deauville car. In addition to these, Mr. Frank Wheeler was present with a neat little steam car, and there were also a wagonette and a char-a-banc for the convenience of invited guests. The trip was made to Mr. Arderne's residence at Kalk Bay, and altogether the automobilists experienced an exhilarating afternoon.

Growth of the French Motor Industry.

"THE use of the motor-car has during recent years made such strides in France that it has given rise to a most important and ever-increasing industry. Thousands of mechanics are now employed in the construction of motors, cars, and their component parts, and it is not too much to say that France is ahead of any other country in this line of manufacture. The consequences of this industry are also far reaching, owing to the numerous subsidiary industries which it either creates or fosters." These remarks are from the report of Mr. A. P. Inglis, British Consul-General, in a report on the trade of France issued by the Foreign Office. He illustrates the growth of the motor industry by pointing out that the race which was run last year between Paris and Berlin brought orders to French firms valued at no less than 108,000,000 francs (£4,320,000).

MOTORING AND SHOOTING. MR. F. F. WELLINGTON AND FRIENDS AT KELVEDON, ESSEX.

Motor-Cars in Winter.

THOSE automobilists whose experience does not yet include winter use of their vehicles will probably welcome a few remarks on the special precautions necessary in their operation at this season of the year. Carelessness in leaving steam and petrol vehicles exposed to freezing temperatures with water in tanks has been the cause of much annoyance, and users are especially liable to suffer from this trouble at the beginning of the cold season, when a sudden drop in temperature often comes unexpectedly. In petrol vehicles the cracking of the engine cylinders is the most serious result of this oversight. With steam cars the piping and tanks are sure to burst if the water is allowed to freeze. In the case of petrol vehicles an efficient method of preventing the water from freezing at temperatures below the freezing point is to add glycerine, although the *Horseless Age* considers that calcium chloride is preferable, as it does not deteriorate the rubber connections. Steam carriages must not be exposed, when not in use, for any length of time to freezing temperatures. When left in the stable either all the water must be drawn from the tanks or else the stable must be heated, the

latter being probably the method most generally employed by steam-car owners. At periods of extreme cold lubricating oils have a greater viscosity than during the warm season, and to feed the oil at the same rate requires, therefore, a greater opening of the lubricator. When there is snow on the ground the traction or adhesion of the wheels is naturally reduced, and the liability to skid or side slip is increased. The same conditions prevail when frost sets in shortly after rain, and in all such cases special care in driving is necessary.

The Motor and the Microbe.

illumination. The conversion of sugars and starches into alcohol by fermentation is a process due to the agency of micro-organisms. Alcohol can be employed in motor-cars and also in lamps for the production of an incandescent light by the heating of the Welsbach mantle in the spirit flame. Hence the tribute of the *Lancet* to the value of microbes.

Pestered with Motoring.

A CORRESPONDENT of the *Sporting Times* writes to congratulate the editor of that organ upon the fact that it is one of the few papers left "in which the reader is not pestered with motoring." It is significant of the popularity of the motor-car that practically every class of journal in the British Isles attempts to increase influence and circulation by the publication of motor-car news of varying value and dubious originality. Certainly no comparatively modern invention has so rapidly come into popular recognition as the motor-car, and the fact that nearly every newspaper is in favour of the automobile is significant indeed.

For English Adaptation.

FROM an American source we have received a photograph of a "popcorn and peanut automobile." The engine has a double cylinder $2\frac{1}{2}$ in. by 4 in., and the boiler is 16 in. by 18 in., with 325 $\frac{1}{2}$ -in. flues. The water-tank has a capacity of fifty gallons, and the corn and peanut roaster is operated by the engine. The hood of the boiler is under the popcorn receptacle, so that it is kept hot, while the exhaust steam passes through a heater in the water-tank and keeps the peanuts hot. Here is a capital idea for the aristocrats of the London coster fraternity. Why not have a combined boot-black, chestnut, potato, and hot water machine so arranged that the feet could rest over the exhaust steam, which would be carried from thence to a small cistern for hot water, near to a supply of something stronger. The idea offers endless combinations, and busy people might have their boots cleaned while partaking of hot refreshments and in the intervals of making business calls. The automobile as a time-saver is worthy a paper at the Automobile Club.

A Lucid Definition.

prove conclusive.

Noise and Motor-Cars

OUR attention has just been called to a new phase of the question of noise in motor-cars—the effect on the body of the noise produced by exhaust and machinery. Petrol cars need only be considered here, as this is the only kind having noise-producing devices in the body—or under a bonnet. We had been

under the impression, remarks an American contemporary, that the wooden panels of the carriage body acted as an absorber and greatly muffled the noise of the motor. It is well known, however, that wood under some conditions may act as an intensifier of sound, as it does, for instance, in the sounding board. It is stated that motor-vehicle bodies with solid panels frequently act the same as a sounding board, increasing the noise instead of reducing it. A discussion of this point might disclose some interesting facts.

A Motor Muff.

How to keep warm is a problem that exercises most of us when driving in such weather as we have been favoured with lately, and a difficult part of the problem lies in a suitable protection to the hands. Thick gloves are apt to be inconveniently in the way for getting a comfortable grasp of wheel or gear levers, and wheels in which part of their metallic basis appears at the edge are peculiarly cold to handle. A successful device for the purpose consists in a woollen or other thick cap for the wheel, somewhat like a tam-o'-shanter, with two short sleeve-like apertures for the hands. Fitting loosely, it does not interfere with getting a grip in any position, and when supplemented by an "Instra" warmer tied to one of the wheel spokes, it should make the chilliest *chauffeur* comfortable.

THE Prescott Automobile Manufacturing Company, of New York, has just made a first shipment of steam vehicles to England.

ON Wednesday last, Mr. Mark Mayhew, L.C.C., was fined £5 and costs at Kirkham for having driven a motor-car at excessive speed along East Beach, Lytham. It was stated that Mr. Mayhew, accompanied by three lady friends, drove his car at the rate of forty miles an hour.

THE British agency for the voiturettes and light cars made by La Compagnie Générale des Automobiles Rochet-Petit, of Paris, has been secured by the British and Foreign Motor Car Company, Limited, of 27, Islington, Liverpool. Both types have already been illustrated in the *Journal*.

ACCORDING to the American mail just to hand, negotiations are in hand for the absorption of the Overman Automobile Company by the Locomobile Company of America. It is understood that the latter will acquire the stock, patents, and other assets of the Overman Company, and will merge the latter's business into its own.

MR. T. HYLER WHITE, of Canterbury Road, West Croydon, who is practising as a consulting engineer in connection with steam and petrol cars, has sent us a useful little pocket card showing the speed of cars in miles per hour, and kilometres per hour, at times for one mile varying from one up to sixty minutes. We understand that copies of the card may be had for the asking.

THE Vehicle Equipment Company, Brooklyn, have lately constructed a heavy electric motor-lorry for the Central Brewing Company, of New York. It weighs about 7,500 lbs., and will carry thirty half barrels—three tons—of beer at the rate of seven miles per hour, running thirty-five miles on one charge of the batteries.

MESSRS. JAMES AND BROWNE write, re the subject of brakes:—"It will interest Mr. Percy Hooper to know that our new car is fitted with patent side brakes, having cast iron shoes acting on the *inside* of the chain rings on the driving wheels. These brakes are very light, give no end thrusts, tending to force the wheels outwards or inwards, and, owing to the metals used for the friction surfaces, do not fire, and act equally well both backwards and forwards. They moreover cannot rattle, as the spring which holds the shoes in the off position locks all the moving parts. A great advantage over the rim brakes fitted to some modern cars is that they do not vary in action owing to the rims, being so near the road, getting covered with mud, water, etc.

THE ABEILLE PETROL MOTOR.

THE drawings below illustrate the Abeille petrol motor, manufactured by M. A. de Mesmay, at St. Quentin, France, and which is being introduced into this country by the Brush Engineering Co., Ltd. (Automobile Department). It is a double-cylinder engine, and has a bore of cylinder of 92 millimètres (3.68 inches), a piston stroke of 132 millimètres (5.28 inches), and a normal speed of 900 revolutions per minute. The

FIG. 1.—GENERAL VIEW OF FOUR-CYLINDER MOTOR.

crank chamber is cast integral with the supporting brackets, which latter are strongly ribbed. This construction has been preferred to dividing the case on a horizontal plane through the crank axis, as in the latter case M. de Mesmay states that the entire impulse of the motor has to be borne by the bolts holding the two halves of the case together. To this casing are fixed the cylinders, cast integral in pairs, with their jacket, and surmounted by a double head. The jacket openings for the water are so located that every corner is cooled and no steam cushion can form. The valves can be easily removed without taking down any of the piping. Being placed one above the other, all

FIGS. 2 AND 3.—ELEVATIONS OF TWO-CYLINDER MOTOR.

that is necessary is to loosen a nut to withdraw first the inlet valve and its seat, and then the exhaust valve. The sparking plugs are placed vertically in the centre of the compression space. The crank shaft carries at one end a powerful flywheel forming part of the friction clutch, while the other end serves to start the motor. The cam shaft is driven by means of three pinions inside the crank case. The cams act on short levers, one end of which is pivoted to the casing, and the other end of which lifts the push rods and exhaust valves. The cam shaft extends outside the casing, on the front side, to receive the contact breaker. The

latter consists of a simple brush contact, and is used in conjunction with a magnetic-trembler coil, which avoids the delicate adjustments of the mechanical trembler. The other end of the cam shaft carries the centrifugal governor P acting on the admission through the intermediary of a valve interposed between the carburettor and the admission valve. When the motor is at rest, or when running at normal speed, the rod Q (Fig. 6) of the governor, forming a stop for the valve, holds the latter open in

FIGS. 4 AND 5.—SECTIONAL ELEVATIONS TWO-CYLINDER MOTOR.

proportion to the section of the passage by compressing the coiled spring R. When the speed of the motor increases the governor begins to act, and its rod ceases to act on the valve. The latter, pushed by its spring, moves into place on its seat and entirely interrupts communication between the carburettor and the engine. A charge being no longer introduced, the motor slows down and the governor resumes its original position; the valve opens and the mixture is again admitted. The periods of admission and cut-out follow each other very rapidly, and there is no sensible variation of the speed of the engine. This construction is claimed to have the following advantages:—
1. High economy, since the consumption of fuel ceases completely when the normal speed of the motor is exceeded.
2. Great simplicity; the governor acts directly without any bell

FIG. 6.—GOVERNOR ARRANGEMENT.

cranks, etc. 3. The motor can never race; because, if the governor spring should accidentally break, the valve would close immediately automatically and stop the engine. The Abeille carburettor, used with the engine, is of the constant level spray type. The circulating pump is located on the rear bearing plate of the engine casing as low as possible, so that the water will always flow to it by gravity. It is operated by a toothed wheel keyed to the motor shaft and a pinion formed integral with the

shaft of the turbine. The wheel and pinion are enclosed within the crank casing. Lubrication is chiefly by splashing in the crank casing in which all movable parts are enclosed. Other parts which are not sufficiently lubricated by this means are provided with unions for connection to a multiple oiler. The motor, it is claimed, will operate equally satisfactorily with alcohol, without any changes or modifications having to be made. The rated capacity of the double cylinder motor illustrated in Figs. 2 to 6 is 8 h.p. A 16 h.p. 4-cylinder motor (Fig. 1) on similar lines is also being turned out from the same works. It may be added that the two-cylinder engine weighs 275lbs.

CARE OF TIRES.

NOW is the time to look to one's tires, whether the car be taken out for an occasional winter run, or stalled till brighter weather and cleaner roads come with the spring. In the first place the car should be jacked up till not a wheel touches the ground. Relieved from all weight it is neither necessary to remove or even deflate the tires.

The laying up of the car for the winter offers an excellent opportunity for investigating the condition of tires, also the rims; and, if necessary, of undertaking repairs. In any case the tires may be removed, and if found undamaged, wrapped in paper, which will preserve them from the deteriorating effect of the air, and consigned to some cool place which the rays of the sun will not penetrate. Should cover or air-chamber be found imperfect, now is the time to send them to the maker for thorough overhauling and repairing. The rims of the wheels, which are as liable to damage as the tires, and to imperfections to which many a tire trouble may be traced, require careful examination. To carry this out, the band which usually lies 'twixt tire and rim must be removed. This done, the wheel should be slowly turned and the rim closely examined with the fingers. Should the edge be found to be flattened, it is easily adjusted with a pair of pincers; if cut, a file will remove the roughness. Usually the rim will be found rusty, a condition most injurious to the tire cover. Apply emery paper with care, particularly in the locality of the cuts; then paint with two coatings of white lead, and one of varnish.

When satisfied that the rims are in good condition, the tires may, if perfect, be replaced. Care must, however, be taken that they are not exposed to the sun; also that they do not carry the weight of the car when standing idle.

SPRATT'S PATENT, LIMITED, have, we understand, placed an order for a one-ton Milnes petrol motor delivery van.

THE Sirdar Rubber Company, Limited, have taken larger premises at Shirland Mews, Paddington, W., where the complete process of tiring wheels is carried out.

THE popular *tonneau* body is finding a competitor in the double phaeton, in which the back seats are parallel with the front. For winter driving the double phaeton can be changed into a *limousine* by enclosing the back, like a small omnibus.

FOR the 1902 season the Hozier Engineering Company, Limited, of Bridgeton, Glasgow, will make a speciality of an 8 h.p. light car. This will be fitted with the Motor Manufacturing Company's De Dion pattern engine (bore 100 mm., stroke 130 mm.) or with the Simms engine having the Simms-Bosch ignition to the customer's order. The design of the gearing is the same as fitted to the voiturette, but all parts have been strengthened to transmit the extra horse power.

MESSRS. FRANK F. WELLINGTON, Limited, 39, St. George's Square, Regent's Park Road, N.W., intimate that they will in future require a subscription of 1s. 6d. per annum for their monthly list of motor-cars, etc., for sale. The reasons for discontinuing the free circulation of the list are the enormous cost of distribution and the knowledge that a large percentage of the buyers introduced by Messrs. Wellington fail to pay the commission due to them.

FLOTSAM AND JETSAM.

By "FLANEUR."

WHO are our enemies?" was a question I took occasion to ask in this JOURNAL some two or three weeks ago, and it is becoming daily more apparent that the Chief Constables of certain counties are qualifying for the doubtful honour. Some amount of pressure, no doubt, may be brought to bear upon them by interested or hopelessly unprogressive persons, but that the chiefs of the police should have so little backbone as to pander to foolish importunity is painful and deplorable. They must know perfectly well themselves that motor-cars are not the dangerous things that popular imagination painted them in the first instance, and they must equally well know that, speaking broadly, they are skilfully and carefully driven. Skill, indeed, is a prime essential wherever the driver is concerned, and, whatever may be done with horses, we cannot put boobies in command of automobiles. It is a pity, forsooth, that the Chief Constables do not pay more attention to the fact that three fourths of the horse-drawn vehicles one meets on country roads are in the hands of incompetent drivers, many of whom are boys barely in their teens.

As for the question of care, I must confess to feeling strongly on this subject. The phrase "reckless driving" as applied to automobiles and automobilists is one that gets appreciably on my nerves, for having seen as much, perhaps, of horseless traffic as most people, I want to know where the reckless drivers are. I do not say that the existence of a careless automobilist is impossible, but I must be allowed to protest against the use of the expression, "Oh, well, there are black sheep in every flock" whenever we hear of someone having complained of "reckless conduct" in respect of any particular *chauffeur*. Far better is it to assume the probability in the first instance of the complaint having been proffered by someone wholly ignorant of motor-car control. To this type of person everything about a motor-car is evil, and if a horse be frightened the fault must *ipso facto* be attributed to the driver of the car, who will likewise be accused of travelling at excessive speed. But to all appearances our Chief Constables are encouraging this species of complainant, and every police notice I have seen on the subject makes mention of "complaints" without any reference to whether they are just or not, or whether they have been investigated by the Chief Constable concerned.

TAKE, for example, the following precious document, with which I was served by a policeman in Hitchin market-place a few days ago. Knowing the narrow entrance to the town of old I had driven in extremely slowly, and then drew the car to a standstill in the square, as I was halting to buy petrol. Forthwith a policeman handed me this printed screed, dated from the office of the Chief Constable at Hatfield:—

"The Chief Constable desires to inform owners and drivers of motor-cars in the county of Hertford that constant complaints are made to him of the alarm and danger to the public caused by the reckless driving of some of these vehicles. The Chief Constable reminds owners and drivers that the speed at which a motor-car may be driven on a highway is limited by law to twelve miles an hour. It by no means follows that this speed may be sustained when motor-cars are passing or meeting other vehicles or horses, or when passing through towns, villages, or other inhabited places. On each of these occasions it is incumbent on the drivers of motor-cars to reduce their speed to such a pace as would be safe and reasonable were the vehicle drawn by horse instead of mechanical power. Failure to observe this precaution will render the driver of the motor-car liable to prosecution under Article IV., Section I., of the Locomotives on Highways Act, 1896. Owners and drivers of motor-cars are also reminded of the necessity of reducing the speed of the car when passing cross-roads or turning corners, and on approaching such cross-roads or

corners the horn or bell of the motor-car should always be sounded, so as to give notice of the approach of the vehicle."

HENRY DANIELL, Lt.-Colonel,
Chief Constable of Herts.

IN various respects this document calls for the severest condemnation. I dispute, in the first instance, the right to serve it in the manner which I have described. Had I driven into Hitchin at a somewhat rapid pace the constable in the marketplace might excusably have stopped me and handed me the leaflet as a salutary reminder that he might eventually be under the necessity of resorting to extremities in the shape of issuing a summons. But no; the mere fact of my having a motor-car appeared to render me in his eyes a suspect, and when I glanced at the document, gathered its purport, and put it in my pocket without reading it right through in reverent awe, he was so annoyed as to be scarcely civil when I asked for the address of a Hitchin firm. Now, I say deliberately that, without some measure of provocation, the policeman had no more justification for handing me or any other driver the notice above quoted than he would have to serve pedestrians with a printed intimation, for example, that watch-snatching was on the increase, and reminding them that stealing would render them liable to prosecution under such and such an article and section of the Larceny Acts. To treat a man as a suspect simply because he is seen dismounting from a motor-car is an abominable impertinence, and so far from wishing to direct such a criticism from the convenient shelter of journalistic anonymity, nothing would give me greater pleasure than to meet Lt.-Colonel Daniell face to face and express my views by word of mouth.

AND while charitably endeavouring to ascribe the best of motives to the Chief Constable of Hertfordshire in this matter I am bound to take into consideration the only facts in his career which have ever made me aware of his existence. Some years ago Lt.-Colonel Daniell issued an illegal placard, instructing cyclists *not to remove their feet from the pedals* when descending hills! This had to be withdrawn forthwith, and subsequently the Chief Constable became a cyclist himself and "coasted." Secondly, it was Lt.-Colonel Daniell who, at the Automobile Club conference with Chief Constables, endeavoured to burke the discussion in such a way as to make it appear that all present were in favour of the numbering of cars. When the only Chief Constable in the room who was a practical automobilist expressed his firm belief in the future of automobilism, and said that numbering was quite unnecessary, it was Lt.-Colonel Daniell who, instead of welcoming this valuable expression of opinion from one person who was competent to judge, brushed it aside in cavalier fashion, and "regretted that any attempt should have been made to destroy the unanimity of the proceedings." From which I was led to conclude that a desire for fair play and the quality of receptivity to new ideas were things it was scarcely logical to expect from Lt.-Colonel Daniell.

BUT if the issuing of his *pronunciamento* is open to question, an analysis of its terms finds the Chief Constable of Herts still more at fault. Really, one must need rub one's eyes in amazement at the magnitude of his claim in the fourth clause. "On each of these occasions it is incumbent on the drivers of motor-cars

to reduce their speed to such a space as would be safe and reasonable were the vehicle *drawn by horse* instead of mechanical power." As an individual automobilist I flatly challenge Lt.-Colonel Daniell to find one word in the Act which justifies this unwarrantable assumption, or even in the Local Government Board regulations which he has, singularly enough, confounded with the Act. The section to which he obviously refers is as follows:—"He shall not drive the light locomotive at any speed greater than is reasonable and proper, having regard to the traffic on the highway, or so as to endanger the life and limb of any person, or to the common danger of passengers." Where in this is the reference to the horse as standard? Within the limit of twelve miles an hour there is the obligation only to drive at a speed which is "reasonable and proper," and these adjectives must obviously be construed in relation to the particular circumstances of the traffic, coupled with the brake-power of the car, its compactness, and its qualities of quick steering. The horse is absolutely no criterion whatsoever, either in law or equity. It is bad enough that we should be forced to submit to the maximum of twelve miles an hour on the supposed basis of the quadruped's highest speed, but inside that ridiculous limitation a comparison to the horse is nothing short of attempted tyranny, and must be resisted accordingly.

THE BAILLEAU VOITURETTE.

THE BAILLEAU VOITURETTE.

WHILE naturally a good deal of our time, when visiting the recent automobile exhibition in Paris, was taken up in examining the latest productions of such well-known firms as Panhard, Mors, Delahaye, Decauville, Serpollet, etc., we did not omit to inspect, if but briefly, a number of the exhibits of small cars, and whilst doing this we came across a little vehicle which we deem worthy of illustration, if only on the score of the relatively low price at which it has been put on the market. Practically

speaking, the machine follows the lines of a motor-quadracycle, but instead of the riders being located one behind the other, they can sit side by side. The frame is of tubular construction, the engine being supported behind the rear axle, just as in the ordinary quad, the power being transmitted through a gear giving two speeds and free engine of the Dupont or Bozier type. The little car is fitted with inclined hand-wheel steering, and with foot and hand brakes. The cycle-type road wheels are shod with pneumatic tires, and furnished with wide mudguards. We have already mentioned that the car is relatively low in price. Fitted with a $2\frac{3}{4}$ h.p. De Dion motor, with water-cooled head, it is listed in France at only £96, while for an additional £8 a De Dion water-cooled (by natural circulation) engine can be substituted. The dummy bonnet in front, which is utilised as a tool chest, gives the car a smart appearance. M. A. Bailleau, of 61, Grande Rue, Longjumeau (S. et O.), the builder, is also making a specialty of converting motor-quadracycles to voiturettes on the lines of that illustrated, and has received so many orders for conversions that an immediate extension of his works has been rendered necessary.

A GREAT deal of surprise and no little amusement has been caused among the Chinese community in Hong Kong by the spectacle of a well-dressed Chinaman careering along the Praya on a motor-cycle.

THE NEW PEUGEOT CARS.

WE are this week able to illustrate two of the new types of Peugeot cars which are now being introduced into this country by Messrs. Friswell, Limited, the English agents. Fig. 1 shows the Baby Peugeot—a light two-seated vehicle with ample luggage room at the rear. The motive power is supplied by a vertical single cylinder engine of 5 h.p., carried under a bonnet under the fore part of a tubular frame. The ignition is electrical, while the water circulation is maintained by pump and radiators. Two speeds forward and a reverse motion, controlled by a single lever at the side, are provided.

FIG. 1.—THE 5 H.P. BABY PEUGEOT.

The engine is connected by a friction clutch to the gear box, while from the latter the power is conveyed to the rear "live" axle by a universally-jointed shaft and bevel gear. A pedal, located close to the driver's foot, actuates a powerful band-brake on the differential gear; while there are hand-operated band-brakes on drums connected to the hubs of each of the rear road wheels. The petrol tank has a capacity of three gallons, sufficient for a run of about 120 miles. Inclined wheel steering, equal-sized road wheels of the cycle type, Clipper-Michelin pneumatic tires (650 x 65) are other features of the little car, which weighs complete about 5½ cwt., and which, in view of its relatively low price, should meet with a large sale in this country.

Fig. 2 shows the Peugeot 8 h.p. car, in which a number of novel features are to be found, more especially in connection with the vertical double-cylinder engine, which is set in the fore-part of a low-built channel steel frame, under a Mors-like bonnet.

FIG. 2.—THE 8 H.P. PEUGEOT.

The engine, which runs at a normal speed of about 750 revolutions per minute, is fitted with duplicate ignition arrangements—incandescent tube, and the Simms-Bosch magneto-electric; pump and radiators maintain the water circulation, a feature of the gear-driven pump being its location in such a position that it cannot be damaged. Reversing the usual order of things, Messrs. Peugeot in their new double-cylinder engine have placed the

exhaust valve on the top and the inlet valve below, and operate the latter mechanically instead of by the suction of the piston. A governor is provided, which, should the engine exceed the normal speed, shuts off the petrol supply to the carburettor. As regards the transmission in the 8 h.p. car, three speeds forward and reverse motion, controlled by one lever, are provided; the arrangement adopted being very similar to that of the Panhard and Daimler systems, that is to say the engine transmits its power to the rear road wheels through the medium of a friction clutch, gear box, differential countershaft, and the usual duplicate set of chains and chain wheels. The car, which weighs complete about 14 cwt., is fitted with inclined wheel steering, pedal and hand lever operated band brakes, equal-sized artillery type road wheels, and 90 mm. pneumatic tires. As regards bodies, Messrs. Friswell intend to make standards of the *tonneau* and double-phæton types, the rear portions of each of which can be readily detached. In changing from horizontal motors at the rear to vertical engines at the front, Messrs. Peugeot have made a change which, while undoubtedly of a radical order, cannot by any means be termed a hastily-considered one, as an inspection of their latest productions will prove.

CONTINENTAL NOTES.

BY "AUTOMAN."

THE latest echo of the famous Paris-Berlin Motor-car race was recorded in the *Journal Officiel* a few days ago, where the name of M. Emile Mors, manufacturer of automobile vehicles, appears amongst the list of those to whom the coveted red ribbon has been accorded. As no doubt most of the readers of the *Journal* already know the Cross of the Legion of Honour is the distinction to which every Frenchman aspires, and those who are successful in earning it are entitled to carry a little red ribbon in their button-holes. M. Emile Mors, the head of the great concern in Paris, and the undoubted inspiring genius of the victories of the Paris-Toulouse, Paris-Bordeaux, and Paris-Berlin races, has now the Cross and red ribbon, which everyone will admit is well earned. His is the only concern that has been able to make headway against Panhard and Levassor.

SPEAKING of M. Mors takes me back in memory to the hot and dusty roads at the entrance to Aix-la-Chapelle and Hanover and to the racecourse at Berlin, waiting for the first glimpse of Fournier. All throughout that long and tiring three days, with its night journeys and long waits, I had the opportunity of making the acquaintance and appreciating the qualities of patient perseverance of M. Mors. Although he is thoroughly French, and Parisian at that, he is more like an Englishman in both appearance and manners—stout, small, and thickset, with long Saxon hair and beard and blue eyes, and a stolid, calm manner of speaking.

COMING back to Fournier, too, for a moment. I happened to be sitting with him the other day in the *tonneau* seat of a motor-car in the streets of Paris, and I was quite surprised to see how frightfully nervous he is when being driven. It was not that the driver was a bad one, but simply because he was being driven. I had the greatest difficulty, chaffingly, to induce him to light a cigarette and look the other way, and even when he did succeed in lighting it he could not smoke it, and this at a pace of about fifteen miles an hour!

LAST week I felt constrained to remark that it was raining automobile competitions in France, and I gave some particulars of the chief events. I find, however, that the list is by no means complete, and the Government now announces an official "alcohol" competition in May next, ending in an exhibition to be held

the last week in May. Alcohol is beginning to arouse interest, too, in Belgium, where a movement is on foot to get the Government to take off the tax on all alcohol employed for power, light, and heat, and to send a delegation to attend the French trials.

THE regulations for the Nice Cup have been somewhat modified by the A.C. of Nice. The following are the articles which have been changed:—Article 4. The Nice Cup shall be competed for every year, between March 1st and June 30th, over a route chosen by the member of the Club who holds the cup. Article 6. The race is open to all four-wheeled vehicles weighing more than 5 cwt., and less than 1 ton, etc. Article 11. For 1902 the date and the course shall be notified by the member of the Club holding the cup, after the necessary permissions have been obtained. Article 13. No vehicle will be classed that has not averaged over 18½ miles an hour.

WE shall soon again have the general interest aroused in the experiences of M. Santos-Dumont. His balloon shed is now completed on the shores of the Mediterranean, and the inflating of his airship has begun. In a very short time he will be out, this time above the ocean instead of over the tops of trees and chimneys. It is to be hoped that the sea will be as kind to him as were the roofs and trees, if he should happen to come down accidentally. Needless to say his faithful henchman, M. Emanuel Aimé will be there to report his prowess and second his efforts. For the present his experiments will be confined to journeys in the famous No. 6, with which he secured the Deutsch prize, and he will, after a few successful trials, attempt to fly over the sea to Corsica, a distance of about 120 miles. It is a hazardous undertaking, and few others besides the little Brazilian would dare to attempt it. True, he will be accompanied, or rather followed, by quite a fleet of fast yachts, but as he expects to do the journey in three hours an accident *en route* will leave little chance of help arriving in time to be useful.

THE postal authorities in various continental countries are beginning to wake up to the superiority of the automobile over horse traction. It is I suppose a gradual transformation which will take place steadily during the next decade, when manufacturers have a little more time to devote to the business outlets of the trade instead of giving all their attention to the pleasure side. The Paris petrol postal vans are quite an institution now, and there is a movement on foot in Brussels to carry the postmen to the various points of the town and suburbs where their beats begin, by means of motor-cars instead of the horse-drawn vehicles employed at present for this purpose. A company is being formed for the purpose of contracting with the postal authorities to take over this work, at the same price that horse traction costs, the advantage being, of course, a quicker service. In addition to this a parcel post service by automobile is in the air and likewise a service from Brussels to Antwerp.

VERCINGETORIX, on his automobile chariot, has taken his last ride, and has at length arrived at his destination of Clermont-Ferrand safe and sound, and still brandishing the deadly weapon which gave Julius Cæsar's legions so much trouble. The motor vehicle that has carried this eleven tons of bronze is a De Dion and Bouton steam wagon with a 35-h.p. engine. All along the road the famous Gaul has caused a sensation, and it has been a grand opportunity for the stump orators of every little French "Slocum Podger" to air their rhetoric. However, he has arrived safely, and has done a great civilising work on his way by making many motophobes look more kindly on mechanical road traction.

MR. A. J. DAVIS, of Ringwood, Hants, asks us to mention that he has now storage accommodation for a number of motor-cars.

A NEW CONDENSER FOR STEAM CARS.

IN view of the recent police prosecutions in cases where white steam has been given off from the exhaust of steam cars when running, the means by which this trouble may be overcome are worth consideration. Given a sufficiently large area of surface exposed to the air, it is possible to condense the greater part of the steam, the residue being passed into the flue and burnt by the heated gases, but the difficulty hitherto has been to construct an atmospheric condenser, at a reasonable cost and at the same time neat and compact in form, so that it may be fitted under the body of the car without presenting an unsightly appearance. Messrs. Clubbe and Southey, who

have been experimenting in this direction for some time past remark that condensers with soldered joints sooner or later give way under vibration and leak. Those of tubular type are costly in manufacture owing to the large number of joints, and for the given amount of space they occupy do not altogether effect the purpose for which they are intended.

In most cases, considerable back pressure is produced in them caused by the "wire drawing" of the steam in the tubes, and the radiating plates, fitted on the tubes to increase the effective cooling surface, are liable to be choked with mud and are easily damaged when cleaning. In their new condenser, which we illustrate above, the objections to the tubular form are claimed to be overcome by substituting flat metal chambers between the walls of which the exhaust steam is caused to circulate; the joints between the elements are made with elastic washers, and are unaffected by severe and long continued vibration, there

being a clear way of two squares inches area through it, after a few minutes' working. Another advantage claimed is that there is no back pressure. The elements are made of tinned iron sheets seamed together, and can be cleaned easily without fear of damage; they are held in a strong frame constructed of two gun metal castings, bolted together with steel rods which make all the joints automatically when clamping up.

In the condenser type the elements are connected in two sets in parallel, but the arrangement is also useful for radiators for cooling water on petrol cars, in which case they are coupled up in series as shown above. The condensers are being put on the market by the General Motor-car Works, 16, Elm Street, London, W.C.

THE NEW ORLEANS FOUR-CYLINDER MOTOR-CAR.

IN our issue of January 11th last we referred to a trial run we had experienced on the new four-cylinder car lately completed by the New Orleans Motor Company, Twickenham. We are this week enabled to publish some interesting illustrations of the new car, and to give a few particulars relating to it. We may first mention that the frame is of tubular construction, and, as will be seen, the four-cylinder engine is set in the fore-part, as usual under a bonnet. The normal speed of the motor is 850 revolutions per minute; it develops about 15 actual h.p., and is fitted with a governor acting on the throttle. The transmission is very much on the lines of the well-known 7 h.p. New Orleans car—that is to say, the power is transmitted from the engine to the

FIGS. 1 AND 2.—TWO VIEWS OF FRONT END OF NEW ORLEANS FOUR-CYLINDER CAR, WITH BONNET REMOVED TO SHOW MOTOR.

rear live axle through the medium of a friction clutch, gear box, universally-jointed shaft, and bevel gear. Four speeds forward, controlled by one lever, are provided, a second lever actuating the reverse motion. The car is built low and mounted on equal-sized artillery wheels, shod with 90 m.m. pneumatic tires. The illustration shows the vehicle fitted with a two-seated racing body, but, of course, other types, such as *tonneau* and double phaeton, can be fitted according to the desire of the customer. The vehicle complete weighs from 15 to 16 cwt.; it can attain a speed of about 36 miles an hour, while its hill-climbing capabilities are of a high order.

MR. ALBERT R. SHATTUCK, President of the Automobile Club of America, announces the following results of the census just taken of automobile owners in the Club: Total membership, 351; number of automobile owners, 254; number of automobiles owned by members, 358.

THE MOTOR-CAR IN FRANCE TO-DAY.

M. R. HART O. BERG, who has resided in Paris for the last ten years, and who has for most of that time been closely identified with automobilism, especially since the subject has become so widespread in general interest there, recently delivered a lecture on the above subject at the Automobile Club of America, before the largest gathering the Club rooms have ever held since the opening of the new headquarters. Mr. Berg, who is also a member of the A.C.A., commenced by saying that he had been asked to talk for an hour, the time it takes nowadays to run in an automobile over the ordinary country road from Paris almost to Rheims. With slight condensation the paper was as follows:—

Among the world's best examples of evolution that of the automobile has been more exaggeratedly rapid, more pronouncedly energetic than any other recent mechanical development. This terrific advance has not been without costly trials and experiments and a concentration of thought which, first finding its encouragement in France, still continues to hold the lead in that country. This is but natural. The topographical conditions of France lend themselves so well to the development not only of speeds and flying runs, but to long and continued excursions, which, added to the exhilaration of moderate speed, make touring both possible and enjoyable.

Less than ten years ago, the late M. Levassor, whom I believe to be the father of practical automobilism, using the hydro-carbon motor of Herr Daimler, tried again and again to construct a mechanically-propelled vehicle that would carry him but once around the fortifications encircling Paris without necessitating his stopping for repairs, or without his having some exasperating accident. It took him almost two years to fully accomplish this now almost ridiculously insignificant run. It was M. Levassor who first conceived the idea, as far as I know, of putting the motor in front of the dashboard, and it was due, I believe, to this disposition of the motor and the distribution of the mechanical parts of the carriage which necessarily follows when the motor is placed in front of the dash, that encouraged to ultimate success the various refinements which M. Levassor afterwards worked out.

The French are most prolific in ideas and have a power of concentration almost unlimited. No sooner is one machine built by a Frenchman than another is immediately planned by him to contain corrections and more recently developed practice, each individual inventor working well within the lines undertaken by him, and each one seemingly quite content to bring to perfection a specific organ or unit of the machine, disregarding in a measure the vehicle as an entity, led on, as it were, by the gratification experienced by him in realising the perfect working of one particular element or unit of the whole. In other words, the French type of automobile of 1901 is not the result of work of any one man or firm of builders, but the type has been practically worked out unit by unit by specialists who have made each particular organ a study of their own. For instance, M. Lemoine, the head of the firm of the largest French axle builders, has made a specific type of axle and hub which seems to meet the exigencies of road runs. Michelin has developed a tire, as you all know, to meet the conditions of the weights of French carriages and the peculiar roads which run through France. Longuemare has developed a carburettor of the float type which has long been recognised as standard.

Then comes the long list of motor manufacturers. Bouton of the De Dion Company, a man who even to-day can be seen from seven in the morning to seven at night in his blue blouse, superintending the manufacture of thousands of motors. Buchet, who has made a special effort to reduce the weight of high-speed motors. The little 20 h.p. four-cylinder motor which he manufactured for Santos-Dumont and which was used so successfully in all of the latter's experiments, weighed, I believe, but 82 kilos, and I am told that he actually got 24 h.p. out of this motor. I might go on and enumerate to you the names of men in France

who have in this way specialised and developed each particular organ of the now recognised types, and it is largely on this account that the French are to-day building carriages in which the element of experiment has been eliminated. There are three distinct types of automobiles manufactured in France to-day—the steam, the electric, and the petrol-propelled. In 1889 I spent most of the summer in Paris at the Universal Exhibition, and I was much impressed, as was everybody, with the boilerless steam-engine of Serpollet. In a small pavilion on the banks of the Seine Serpollet showed his little engine running, pounding, generating power, and using, as you all know, his capillary tube system. Serpollet was not long in building a motor-carriage in which he incorporated his little piece of copper tube, through which was pierced the smallest kind of a hole. Water was pumped through this, and by the application of heat, immediately produced steam, as it was needed, for his small single-action engines. Unfortunately, this hole soon became clogged: it was enlarged, and afterwards a series of tubes was used. Then Serpollet made a carriage with a device ingenious enough, regulating the supply of fuel and the supply of water, the relation of the proportion of these supplies being controlled by one lever. This is about the only steam carriage, other than those for heavy traction, which has appeared in France. It runs through the streets noiselessly, and is easily controlled, but I found as a result of experience that one had to have not only a knowledge of mechanics to run this carriage, but one also had to be on the constant alert at every change of grade, when more or less water or more fuel had to be sent to the flash tubes, and instead of looking at the scenery and enjoying the fresh breeze, the air often became blue

about me, and I became very tired of focussing my eyes on the jumping steam-gauge. I have seen very few other steam carriages of the light type running through the streets of Paris.

I now come to electric carriages. During the five years that I have run an electric carriage through Paris (and I was one of the first to have an electric carriage there), I have had but once what the French call a *panne*. I was just at the back of the Madeleine when I suddenly came to a stand. At that time there were not many electric carriages in Paris, and I was immediately surrounded by a gaping crowd. I sent a mechanic for the vehicle, and he found that a bolt had fallen into the motor and had broken a connection. I believe he fixed this in about five minutes and brought the carriage back to the charging station. I may tell you here of rather an amusing incident which helped to enliven a *fete* given some years ago at the French Automobile Club pavilion in the Bois de Boulogne. I had the pleasure of taking out Baron von Zuylen in my Columbia carriage to this *fete*. There were a number of electric carriages drawn up in the garden of the automobile pavilion, and while we were at dinner we were startled by a sudden cry of fire. I must tell you that it had come on to rain very heavily, and the downpour getting into one of Krieger's batteries, made a short circuit, causing his carriage to immediately burst into flames. I believe this is about the only instance I have ever known where rather a serious conflagration was brought about by too much water.

But these are all reminiscences, and Krieger soon found a way to protect his battery. To-day the Krieger type of electric carriage for coupes, victorias, landaulets, etc., is well established in Paris, and they have, I should say, perhaps 150 of them running about the streets. You will remember perhaps that this type of carriage has the steering and driving wheels in front; there are two motors, compound wound; the batteries are divided, part being in front and part in rear. The controller is vertical, having, I believe, at present seven positions, four ahead, one braking position, and two backward. The controller is of the recuperative type, and I believe works very satisfactorily. The control is hand operated and the lever is immediately beneath the steering wheel. This makes it very handy and quick in action. The front steering wheels with their attached motors, which now, by the way, are being hung on springs, are necessarily very heavy, and a big reduction in the steering gear is required. Pneumatic tires are used entirely on the front or motor wheels, while solid tires are being used on the rear wheels.

The Jenatzky type of vehicle is chain-driven, although this company has manufactured some carriages with two motors driven from the rear. Their distinctive feature, however, is a foot control in addition to the hand control; that is, a lever worked by the foot throws in more or less resistance and consequently regulates the speed of the carriage.

The firm of Jeanteaud has also constructed a number of electric vehicles, but rarely more than one or two of the same type, all of which, however, have features about them of the more or less automatic interlocking can't-make-any-mistake variety. Jean-teaud's motor has usually been hung on a frame, and the carriages have

FIG. 3.—THE NEW ORLEANS FOUR-CYLINDER MOTOR-CAR. (See opposite page).

been chain-driven. There have been several other electric carriages built in Paris. Perhaps M. Milde has made more practical types than any other French manufacturer.

Let me here say a word about batteries which are so intimately connected with, and render operative, the electric carriage. I simply wish to recall to you the much-talked-of Fulmen type, which has very large capacity and more or less limited life. The Plante system has been almost entirely abandoned, as this type is too heavy for electric road traction. The Heinz and the Aigle battery, both being of the pasted plate type, are perhaps now used more than any others. The common pasted plate battery, such as is now produced by Heinz, one of the largest manufacturers, seems to work very well, is very cheap, and the positive plates can be changed at a small cost. Batteries of this type weighing under 500 kilos at a discharge of 20 amperes, have a capacity of about 140 ampere hours. A good feature of most of the French batteries, and one which has always recommended itself to me, is that each element of the battery is attached to its neighbouring elements by nuts and bolts. This practice has been carried to perfection in France, and when an element for some cause or another goes down in capacity, it can easily be removed and replaced by a new one, not necessitating any burning together, as was the practice at one time.

(To be continued.)

HERE AND THERE.

SINCE the introduction of motor-cycles Messrs. Middlemore and Lamplugh, Limited, saddle manufacturers, Coventry, have been devoting their attention to devising a saddle suitable for these types of machines. It has been evident to them that owing to a greater speed obtained on a motor-bicycle or tricycle it was

essential that a saddle should be produced that would minimise the extra vibration, and be sufficiently large to give a fair amount of comfort when the rider was not pedalling. The accompanying illustration of their saddle is the outcome of experience, and during the past few months one of our representatives has been testing the same on a motor-bicycle, and expresses himself well satisfied with it.

A WINTON motor-car has been tested at Utica, N.Y., in the collection of mails, and the vehicle covered the route in one hour and twenty-five minutes, as against over two hours taken by horse-drawn vans.

Two four-seated steam-cars recently made the journey from San Jose, California, to the Lick Observatory on Mount Hamilton, a distance of twenty-eight miles. The total height climbed was 4,400 feet, the first twenty-one miles having a rise of 2,200 feet, and the last seven miles 2,200 feet, or an average of 7 per cent.

ROME is about to adopt the automobile for postal service in the form of small vehicles, each of which will replace three carts and three horses. Preliminary experiments have demonstrated the rapidity of the mail transit between the various post offices and central depôt. It is now proposed to enter on a six months' trial, which, if found successful, will result in the permanent adoption of the motor mail cart, not only in the capital but also in the large provincial towns of Italy.

THE Brush Engineering Company, Limited, of Falcon Works, Loughborough, Leicestershire, are, we learn, commencing the manufacture of petrol motor-carriages. A car fitted with a two-cylinder engine of 8 h.p., at 800 revolutions per minute, is already on the market. This vehicle is of light construction, the weight complete ready for the road being 14½ cwt. It has a chain drive and equal sized wheels, fitted with 85 or 90 mm. tires. Two forms of ignition can be fitted, the standard being the Brush-Dawson magneto, but, in addition, the ordinary electric or tube can be provided. Two double-acting brakes are fitted, the sprocket bracket being especially powerful. The clutch spring is mounted immediately behind the single cone clutch, all parts of the clutch mechanism being therefore easy of access and adjustment. A four-cylinder 16 h.p. car will be completed next month, two of these vehicles being already sold to well-known automobilists. The weight of this machine complete will be well under a ton. The wheels will be of equal size, 870 by 90. With the exception that four speeds will be fitted instead of three, the car will be similar to the two-cylinder type. Both frames are made to the new standards adopted by the French makers, that is, the size of the frame behind the dashboard is, in the case of the two-cylinder car, 80 centimetres wide by 1 metre 75 centimetres, and the four-cylinder car 85 centimetres wide by 2 metres long. The wheel base of the two-cylinder car is 6ft. 6in., and that of the four-cylinder 7ft. 2in. The Brush Engineering Company already employ 1,500 men, and have a high reputation for general engineering work.

At Messrs. Mann and Overton's depôt in Mortimer Street, W., we were shown the other day the 1902 model Marshall car. It was fitted with a *tonneau* body, and the long wheel base and skew splash guards gave it a very rakish appearance. The engine, fitted under a bonnet in front, is of the well-known Bûchet type,

giving off 12 h.p. The gearing is of the usual Parhard type, giving three speeds forward and one reverse, actuated by a side lever. Equal sized wood wheels shod with Clipper-Michelin tires, 31½ in. by 3½ in., are fitted, to which the drive is carried through a "Cardan" joint on to a live axle. The compensated brake, the sprag abolished, and in its place a ratchet on the back axle, the governor of Marshall's design, the neat oil-tanks, etc., all show that much trouble and time have been spent on the details. A run round Regent's Park justified all we were told of the car, and unfortunately landed our driver in the police court, charged with driving at the rate of twenty-five miles an hour; he was also told that the limit of speed in the Park is eight miles per hour, a fact which we should think is not very generally known.

THE United Motor Industries, Limited, 42, Great Castle Street, W., ask us to mention that they believe some firm or individual in the suburbs of London are using the cans of their "D" oil and filling them with other and inferior quality lubricating oil, and selling it as genuine "D" oil. They warn the public to be on their guard against this form of fraud, and if they receive any oil purporting to be "D" lubricating oil, which does not appear to be the same quality and description as the genuine, to at once communicate with them.

A SIMPLE and yet effective arrangement has been invented by Mr. Lloyd, of the Quadrant Cycle Company, Limited, Birmingham, and applied to the "Quadrant" motor-cycles, whereby one lever combines the functions of the four usually required to manipulate the motor. This new single lever controls the supply of gas, the timing of the spark, the electric switch, and the valve-lifter, thus considerably simplifying the manipulation of the machine.

THE first annual "gravity feed" (dinner) of the Wolverhampton and District Automobile Club took place on January 16, Alderman Marston, J.P., presiding. An eight-course menu provided ample scope for many suggestive terms dear to the heart of the automobilist. "Float feed" stood for the usual thick and clear, followed by "water jacketed" (fish), "clutch levers" (oyster patties), and so on to "silencers."

ONE of the many useful accessories now frequently found fitted on the dashboards of motor-cars is a watch or small clock. Many forms of these are in use, but the accompanying illustration shows a timepiece which has been specially designed by Messrs. S. Smith and Son, of 9, Strand, London, W.C., for use on auto-

mobiles. The outer case, which is dust and rainproof, is made of hardened white metal, nickel-plated, and within it the watch is securely locked, the case itself being attached to the dashboard by screws, the heads of which are inside the case, thus making detachment of watch or case impossible. The movement of the watch, which is keyless with lever escapement, has been particularly designed to withstand vibration. The motor timepiece, as it is called—which, by the way, is not too large for the pocket—is carefully fitted into the locked case to prevent all shaking or damage, and has a distinctly printed dial.

IN our report of the Automobile Club Brake Trials a printer's error made "Flaneur" state that a car "when going at ninety miles an hour was stopped in 12½ yards." The speed should have been twenty miles.

IN answer to "Troubled," Messrs. Brandes and Perkins, of 178, Lockhurst Lane, Coventry, write that they are the general representatives of the makers of the ignition accumulators used by Messrs. Panhard.

LONDON EXPRESS MOTOR SERVICE, LIMITED, was registered last week with a capital of £20,000 in £1 shares. Object, to adopt a certain agreement, and to carry on the business of an omnibus company in all its branches (primarily between Putney and Piccadilly), with either steam, electric, petrol, or other power, etc. The first directors (to number not less than two nor more than five) are H. F. Highton, G. R. Roger, and G. E. Kent.

A FEW weeks ago we intimated that Messrs. Edward J. Morant and Hamilton H. M. Dent, two well-known New Forest motorists, proposed to open motor repairing works and a dépôt at Lyndhurst. We are now pleased to state that arrangements are so far advanced that there is every prospect of the new establishment opening its doors early next month under the name of "Imperial Motor and Cycle Repairing Works," not "New Forest" as we originally stated.

THE British and Foreign Motor-car Company, Ltd., has been registered with a capital of £10,000 in £1 shares. Object, to adopt an agreement made by this company with W. Price, and, generally, to carry on business as builders of and dealers in motor-cars and apparatus and implements connected therewith, and the component parts thereof, etc. No initial public issue. The first directors (to be not less than two nor more than five) are W. Price, of 50, West Derby Street, Liverpool, and H. B. Ingomalls, of Deane Road, Fairfield, Liverpool.

No one who has not had actual experience can appreciate to the full the delights of motoring on such a day as Sunday last in the London district. Well wrapped up, so as to be amply protected from the searching cold, the automobilist was a person to envy. The sun shone brightly, the air was as clear as the proverbial bell, fresh and invigorating in the highest degree, and everything conspired to set one's blood coursing through the veins at mill-race speed. We were only out for a short spin Richmond way, but even in that small distance we met quite a large number of motor-cars, tricycles, quads, and several motor-bicycles.

UNITED MOTOR INDUSTRIES, of 42, Great Castle Street, W., are issuing a new illustrated catalogue, in which "Loyal" radiators for water-cooled engines hold first place. An efficiency 50 per cent. higher, and a length of 25 per cent. less than any other radiator called upon to do the same work are claimed for the "Loyal." The long list of well-known cars fitted with this particular radiator are substantial guarantees of the genuineness of such claims. Other appliances connected with circulation, such as pumps, indicators, and pressure gauges, for which United Motor Industries are the sole British agents, are worth attention.

DENNIS BROTHERS, LIMITED, Guildford, of "Speed King" fame, have sent us a new and complete catalogue, in which their 8 and 10 h.p. motor-cars for 1902 figure conspicuously. The smaller car, a four-seated *tonneau*, is fitted with genuine De Dion-Bouton engine, is gear driven, with three forward speeds and reverse, will travel up to thirty miles an hour, is guaranteed to climb any hill on a main road, and turns the scale at something between 9 and 10 cwt. The larger car, 10 h.p., is seated for four or six, has a twin-cylinder governed engine, is practically noiseless, can travel at thirty-eight miles an hour on the flat, and mount a hill of one in ten at nineteen miles an hour. A convertible motor-quad (3 h.p.), which made a name for itself last year, appears, with certain improvements, this year. A 3 h.p. motor-tricycle, which carries with it a good record, has many points of simplicity to commend it. Lastly, the "Speed King" motor-bicycle with 1½ h.p. engine, easily detached, and capable of attaining a speed of thirty miles an hour, has many excellent points.

IMPORTS OF MOTOR-CARS, CYCLES, AND PARTS.

BELOW we publish our monthly official list of the imports of motor-cars and cycles and parts thereof into the United Kingdom during December, 1901.

Shipped From	To	Description.	No.	Value.

MOTORMOBILE, LIMITED, has been registered with a capital of £1,000 to acquire any patents and inventions in relation to cycles, motors, motor-cycles, motor-cars, or other carriages, to develop and to carry on the business of manufacturers of and dealers in cycles and motors, etc. The registered office is at 27 and 29, Laystall Street, Rosebery Avenue, W.C.

THE "automobile frown" is the latest result of automobilism. Dr. Carlton Simon (an American, of course) has discovered that with frequent riders on motor-cars "there is a distinct contraction of the muscles of the forehead and eyes, producing a frown which, by continued habit, remains in evidence upon the face." The "automobile wrinkle" will probably be the next development in this direction.

CORRESPONDENCE.

ACCESSIBILITY.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I was somewhat interested in reading Earl Russell's account of a six days' tour in Sussex on my old Panhard car fitted with a Napier engine, in which he referred to the inaccessibility of the top of the gear case. This was one of the points that originally struck me when driving this carriage, and it has been entirely altered on the Napier, so that the removing of a very few nuts enables the whole gear case to be dismantled by the most inexperienced person. Points of this sort, although they do not appeal very much yet to many automobilists, will be great selling points in years to come.—Yours truly,

S. F. EDGE.

AN OLD MOTOR-BICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Reading a comment in a recent issue of the *Journal* headed "Where do Old Cars go to?" I was prompted to send you the enclosed photo of what I should think is one of the earliest motor-bicycles made in this country. It was built by H. Taylor, cycle agent, of Kettering. You will notice by the photo that superfluous paraphernalia such as pedals were discarded. To mount required the acrobatic feat of running the machine along and jumping on from the side—no easy trick for an ordinary person to perform. The motor was water-cooled, had a spray

AN OLD MOTOR BICYCLE.

carburettor, tube ignition, and developed anything between $\frac{1}{2}$ to $1\frac{1}{2}$ h.p. This early automobile made its debut in Kettering about the middle of 1892, and had but a short and varied career.—Yours truly,

H. A. PALMER.

QUERIES RE DE DION MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have a genuine $2\frac{1}{2}$ h.p. air-cooled motor (De Dion) complete with carburettor, silencer, coil, etc. After going to much trouble and expense, I have fitted it to a tandem bicycle. My trouble now is that I cannot get a regular make and break spark; the whole lot is new, including the "Meyra" battery, also the coil, which is, I believe, the old pattern having four terminals at one end, consisting of PP and MM and the usual sparking plug terminal at the other. I have wired it exactly according to the usual De Dion method, viz., the P and N of battery to the two P's on coil, and the two M's to the contact breaker (which latter I know is in perfect order), and the earth wire from the crank chamber to the brass band on coil farthest away from spark plug end. With this combination I get absolutely no spark at all. Now, after wasting much time and patience, I discovered that by connecting the battery to PP, one wire, however, passing through the contact breaker, the two M's on coil being connected in no way with anything with the blade in notch of cam, I could get a very fine spark by drawing the connecting plug sharply out of switch, the curious part, however, being that upon agitating the blade of trembler the plug would spark about once in ten times, although a large spark is visible at every touch between the platinum point and blade. Again, upon turning the starting handle, I could get absolutely no spark whatever. To make sure the wires are right I changed them, with a like result. From these experiments I gather that the two terminals marked M must be "shorted" inside the coil in some way, but would this matter if the two P's are carried through the contact breaker, in order, of course, to get the make and break that way. I have no instruments nor the knowledge to test the coil. In what way, therefore, can I find out if it is defective? On the other hand, if it is defective, how is it that I get a good spark by sharply withdrawing the connecting plug? Trusting that someone will enlighten me as to what is wrong.—Yours truly,

"PERIGRINE."

RENEWING SPEED GEAR WHEELS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to Mr. Chas. T. Crowden's letter in your issue of January 11th, regarding my method of renewing a third speed on a Daimler gear sleeve, I would say, as one of the pioneers of the motor-car industry from the passing of the Act, and one of the first to take up Daimler cars on public seaside and private hiring services, that I claim to have gained a large and varied experience in reference to same, and I further claim during this time, simply from using ordinary intelligence and common-sense in dealing with a difficulty which everyone, more or less, has met with in reference to a Daimler car, to have met with no little success.

It is only right that credit should be given where credit is due, and as Mr. Crowden makes such a bold assertion that he was "the first one" to convert a Daimler gear sleeve, in order to arrive at this point, perhaps he will verify his statement by giving the date on which he first converted a sleeve on his system. For years I have been asking the Daimler Co. to supply a gear sleeve with a detachable third speed, and, although they have not supplied these with their standard type cars, they, in the early days, renewed third speeds for me as a special favour, and in confirmation of this I may state that I can, if necessary, produce invoices relating to charges made for converting sleeves to my order. I may state, however, that this system was not, in my idea, altogether satisfactory, as it necessitated specially designed and expensive third and fourth speeds, which were bolted together, and could only be used in conjunction with each other.

I am not applying for a patent for renewing a third speed itself, but upon what I claim to be an absolutely perfect system. Mr. Crowden states that he does not split his speed gear in two pieces, but maintains one solid ring. In the absence of any particulars, I take it that his system is similar to Mr. Gilbert's, which he also refers to, viz., cutting the sleeve in two halves to enable the third speed flange to be reached. Perhaps it will interest Mr. Crowden to learn that it was I who lent my good friend Mr. Gilbert the first Daimler gear sleeve he ever had to experiment upon, and that after its conversion the sleeve was used by me in one of my own cars for trial, and experiment. This system, as Mr. Crowden doubtless is well aware, cannot be considered an entire success, for many reasons. I have found the sleeve apt to twist where joined together, thus causing it to bind on the shaft, and there is also the great disadvantage that a sleeve must always be returned to the firm or person who converted it when future third speeds are required to be fitted. In my system the solidity of the sleeve is maintained, and anyone can fit future third speeds without calling in the aid of an engineer.

Mr. Crowden also states he has another method whereby he claims to be able to renew all of the speeds as required, but why is there any necessity for this? It is a well-known fact that the speeds on a Daimler sleeve are all detachable, except the first and second, and these require renewing very rarely indeed.

I do not claim any novelty in the mere fact of renewing a third speed, but for the system upon which it is renewed, and if Mr. Crowden will refer to the illustration showing my method of attachment, he will see that the flange dovetailing into the recess is the one vital point of the arrangement, and I claim that when bolted together with the four bolts the whole becomes as strong as the original solid third speed. Everyone conversant with a Panhard gear is aware that the drive of a fourth speed Daimler gear ring depends entirely on four bolts, whereas, in my system, my third speed, in addition to the four bolts, has the assistance of the deep recess and flange. Not only this, but after the sleeve has once been converted, the fitting of future third speeds is an exceedingly simple matter and can be done by anyone. Further, it is not necessary to interfere with the standard fourth speed in any way whatever. All the halves are made true to gauge, are interchangeable, and can be stocked and fitted in precisely the same manner as the present standard Daimler fourth speed rings.—Yours faithfully,

FRANK MORRIS.

THE MOTOR-CYCLE TAX.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am writing to draw attention to the question of the motor-cycle tax. I am sorry to see that so little interest appears to be taken in the matter in connection with the new Motor-Car Act. I also think that the tax on small cars is unduly high, and should be lowered; the motor-cycle tax will be very heavy on cycle dealers when motor-cycles come to be much hired out.—Yours truly,

CECIL JACKSON.

MOTOR-CARS FOR THE TROPICS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to Dr. Fowlie's letter in your issue of the 11th inst., we do not think the humidity of the atmosphere in the Straits Settlements would be likely to prevent the satisfactory working of a petrol motor-car. Thanks to the courtesy of Sir Fred. Abel, of the Imperial Institute, we have a summary of the meteorological observations taken at Singapore during the year 1900. He gives the mean temperature of the air there as 80° F., the computed vapour tension as nearly nine-tenths of an inch, and the mean humidity as 79 per cent. of the possible maximum. The meteorological reports show that the humidity of the air at Kew for the same year was also about 80 per cent. of the possible maximum, but, the mean temperature in this country being only about 54° F., the absolute amount of moisture in the air was only about one-third of that present at

Singapore, the average tension of vapour at Kew being computed as .34 of an inch.

It would not be difficult, however, for Dr. Fowlie to satisfy himself about this by testing the motors in a sort of Turkish bath atmosphere under such conditions as may be considered normal, say, at Singapore. The temperature of a small workshop—windows and doors being closed—might readily be raised by means of steam pipes, say to 80° or 90° F.; wet steam might then be gradually introduced into this room until its atmosphere became saturated with it, or, at all events, until it had taken up about 80 per cent. of the moisture it was capable of carrying. If the motors on trial were then tested, with satisfactory results, we think the Doctor would consider he could safely run the risk of taking them out with him. Of course, care should be taken that the motors had a fair trial under these peculiar conditions. Everyone knows that the carburettor has to be constantly adjusted so as to produce the best results even under the varying conditions of our own climate. It would probably be found that the proportion of air to petrol vapour which should be introduced into the cylinders of the motors to produce the greatest efficiency, would be different when moist air at 80° F. was used from that which gives the best results under the normal conditions prevalent in this country.

Dr. Fowlie says we omitted to state what the flash point of petrol really was. We said in our letter, "Petrol flashes at the ordinary temperature of the atmosphere or even at the lowest temperature known in this country," when tested by the Abel close test, as prescribed in the Petroleum Acts. Perhaps we should make our meaning clearer by saying that, whether the temperature of the air is, say, 10° F., which we suppose is about the lowest winter temperature in this country, or whether the temperature is 100° F. or any other temperature known to us, petrol, when gradually heated from some lower temperature in an enclosed cup, as prescribed in the Petroleum Acts, will give off such an amount of inflammable vapour as will ignite when brought into contact with a flame. The lowest point at which petrol will flash when brought into contact with a flame has, we believe, never been determined. It will certainly flash below 10° F. Dr. Fowlie believes that in the Straits Settlements no oil whose flash point is below 78° is allowed to be imported. We think he will find that he is mistaken in this, because our firm have shipped benzine, petrol, etc., to Singapore, and we have never heard that it was illegal to do so. It will most likely be found that the law of the Straits Settlements is probably much the same in this respect as the law of England, and that no mineral oil of a flash point of less than 73° may be imported except under certain specified conditions as to landing and storage. It is very possible that this is just where the shoe will pinch, and Messrs. Roots and Venables have drawn attention to what seems to show that this same difficulty undoubtedly exists in India, and they give one instance where on account of the excessively high price of petroleum spirit the cost of the running of a Benz car was as much as 5s. per mile. We would submit, however, that this is a case where our cousins, "the Britons beyond the seas," must help themselves, as we in this country have had to do in the past.

We all look on "The Locomotives on Highways Act" of 1896 and the Regulations issued by the Secretary of State under that Act, which, under certain conditions to ensure safety, permits the free storage without a licence of 60 gallons of petrol, as the Magna Charta of automobilism. Previous to that Act Mr. F. R. Simms had introduced Daimler motors into this country, and Mr. Hewetson Benz motors, but the efforts of these and other pioneers of automobilism would have been of no avail unless Sir David Salomons, the Hon. Evelyn Ellis, Dr. Redwood, and other men of light and leading, had seen the great possibilities of automobilism, and had used their influence to get the law altered which for so long a time had stood in the way of all progress in this country. We may add also that progress would have been very slow even then had not the Automobile Club so ably followed up these early efforts. For these reasons, therefore, we would appeal to Dr. Fowlie, to your correspondent in the last issue of the *Journal*, Dr. Rowland, and to other Britons beyond the seas, who believe in the great value of automobilism, especially in tropical countries, and who still labour under artificial restrictions, to approach their local Legislatures with a view to amend the law. We can state with full confidence that the authorities at the Home Office, if appealed to by the authorities of India or the Colonies, would be very glad to give them the results of their experience, so that rules could be framed which while securing public safety, would not kill automobilism by prohibitive regulations. If the industry were put on a proper footing there is no reason why petrol in India should cost much more than it does in many parts of this country. Unfortunately, however, it is not only with the legislators that there is difficulty. Some of the steamship companies refuse to carry petrol, even when it is packed under such conditions as would make an accident practically impossible. We have had a continuous experience of nearly forty years in shipping such liquids and, when packed under conditions which we would contend are amply proved by this experience to be suitable, we have not known of a single accident. Yet some steamship companies will not carry petrol at all, or only as a great favour. The consequence is, there is often a great delay in making shipments, and a large proportion of the trade is likely to be diverted to Germany or the United States, where the shipbrokers are less prejudicial or less bigoted. —Yours faithfully,

For CARLESS, CAPEL, AND LEONARD)

WM. J. LEONARD.

THAT WONDERFUL MOTOR.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Since April last, when I read some remarks of the *Journal* as to the invention of a wonderful new motor, I have carefully searched your

columns week by week, but without result, as far as the new motor is concerned.

Where is the motor that Mr. Engleheart had seen in Paris, and which, it was stated, would use the crudest petroleum, that has so perfect an exhaust, and that enables all needful manipulations to be controlled in one switch? Is it a fairy tale, or shall we see it at the Exhibition in April next? —Yours truly,

ROBERT J. BIRT.

GOVERNORS OF DAIMLER CARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I shall be glad if some of your correspondents would kindly advise me as to the desirability of removing the governor in a 6 h.p. Daimler car that has electric ignition, and say what would be the advantages or disadvantages of so doing. Could the valve rods then be made straight and without joints, i.e., simplifying the engine? I shall be glad also to hear of any other points that may be of value while the car is under repair. —Yours faithfully,

"TURNER."

MOTOR BICYCLES FOR 1902.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—With reference to Mr. A. J. Westlake's letter on the above subject, I may say that my cycle-motor has a cylinder bore 2½ in. by 2½ in. stroke, and the weight of the fly-wheel (there is only one) is 9 lbs., the diameter of same being 10½ in. Needless to say, the fly-wheel is outside the crank case. I find it to be of ample power, for I can start the engine by hand, if necessary, by pulling over the first explosion; and, moreover, the machine will drive quite steadily at about three miles an hour, which is a comfort sometimes in a crowded street. As regards the bicycle motors which Mr. Westlake has designed, I note that he has been sufficiently generous in the amount of metal which he has put into the fly-wheels, which I presume are of the enclosed type. This point is where the bicycle people seem to go wrong. In a well-made motor I recently examined (the Thomas), with cylinder 2½ in. by 2½ in., the discs were 5½ in. over all dia. and section of rim 1 in. by 1 in.; the combined weight would be about 9 lbs., and no attempt was made at balancing. Naturally, the vibration of the frame when the engine was running was excessive. I should be glad to know what transmission Mr. Westlake proposes to employ on his new machine, with 80 mm. by 180 mm. engine. Even with my motor, which is small in comparison, I find a 1 in. belt an improvement on one ¾ in. wide, but in the present instance no doubt a positive drive will be employed. —Yours faithfully,

W. M. W.

MESSRS. HUTTON AND COMPANY, of Warminster, Wilts, have just brought out a new double-lifting jack for motor-cars, somewhat on the lines of the Ailsa Craig.

At the quarterly meeting of the Kesteven Joint Committee, held last week, Mr. William Hutchinson called attention to furious driving of motor-cars on the Great North Road, and asked if the new Chief Constable could not be instructed to look a little more strictly into the regulation of the pace. The Chairman said it was a question which the Bench might mention to police superintendents. Sir Hugh Cholmeley remarked that people seemed to think they ought not to set traps to catch motorists. Mr. Hutchinson said reckless motor driving was not seen on one day only, it was an every-day occurrence.

IN this country, as in France, riders of the motor-quad, whilst admitting the handiness of the type, are alive to its discomforts, especially those of the back rider. The Princes Autocar Company, Northampton, are, we hear, introducing a voiturette which we think will make a favourable impression as a more comfortable and convenient substitute for the quad, especially as its price will not exceed that of the latter. It is an up-to-date model car in miniature, with two-seated light body on tubular frame, 4 h.p. Aster water-cooled engine, two-speed gear, inclined wheel steering, and pedal and lever brakes. On the high gear the car will attain a speed of twenty-five miles an hour, and on the low gear will, it is claimed, mount the worst of hills found on main roads. The Princes Company are also introducing a chain-driven motor-bicycle fitted with progressive engagement clutch. The engine is of 1½ h.p., and it is claimed that this machine is a long way ahead of any belt-driven bicycle in the application of the power of the motor. The clutch provides a free engine at will and renders any exhaust lift mechanism unnecessary, whilst the engagement can be made so gradually that the bicycle is put in motion without appreciable jump or jar. A new system of breaking the electrical circuit is used, which dispenses with the use of the switch handle.

CLAIM FOR MATERIAL SUPPLIED.

At Lynn, William S. Millett sued Frank Morriss, London Road, Lynn, motor manufacturer, for £1 5s. 8d. for materials alleged to have been supplied. Plaintiff's case was that he had made several motor-car bodies for the defendant, the last being a *tonneau* for which he had received £11. When that one was finished defendant said, "You can start on two more like that, and order the stuff immediately." Accordingly witness ordered some wood (oak, poplar, and American white wood) and also several locks for tool boxes. He commenced work on the two cars, cutting out the sides. He had not at that time delivered the first *tonneau* car, and when he delivered it defendant said the price of these two bodies was too dear and he could not take any more at the same price and offered £8 10s. Witness told him that he could not sell them at that price, and reminded him that he had given an order for two more and that he (witness) had bought materials. He then asked the defendant to take the materials off his hands, or refund the outlay, producing the invoices for them to show what he had paid, but defendant only offered 10s. Defendant said that during a conversation after the other cars had been completed plaintiff asked about future work. Witness reminded him that the work he had just completed was in the nature of an experiment, because aluminium was used, and he (Mr. Morriss) was convinced that they could be made much cheaper. Plaintiff then asked him his price, and he (Mr. Morriss) replied that it would be, roughly, about £7 or £8 and that he (plaintiff) could go on building two more bodies at that price. A little while afterwards plaintiff sent a quantity of wood to witness' premises, for which he (Mr. Morriss) subsequently offered 10s. George Wright, foreman coachbuilder, valued the wood in question at 9s. His Honour held that plaintiff was entitled to recover, and gave judgment for the amount claimed with costs.

FURIOUS DRIVING.

At Ayr, before Sheriff Campbell Sharp, E. J. Thomson, Montgomery Castle, Tarbolton, was charged with driving a motor-car beyond the regulation speed of twelve miles an hour. Accused pleaded guilty. The Fiscal said what called attention to the contravention was that a woman was nearly run down at a crossroads. This was the first prosecution of the kind in Ayrshire. It was the case that there had been considerable complaint and cause for complaint on the part of persons using the roads for other purposes than for motor-cars. Mr. J. E. Shaw, who appeared for accused, pointed out that there had been no injury to anyone by the action of accused, who was known as a careful driver. The Sheriff said the regulations must be respected, and imposed a fine of £2.

NO RED LIGHT.

AUTOMOBILISTS are largely unaware that they must either have visible red glass at the back of their side lights or exhibit a red light at the rear of the motor-car. For infringing this rule Mr. William Warren was fined 10s. at Slough last week, when he pleaded ignorance of this regulation.

LAUNDRY CART v. MOTOR-CAR.

MESSRS. GARDINER AND Co., who trade as clothiers under the style of the Scotch Stores, Limited, last week sued, in the King's Bench, the Anglo-American Laundry, of Lower Tooting, to recover damages for injury to a motor-car. Mr. Glyn, K.C., and Mr. Spence appeared for the plaintiffs; and Mr. Spencer Bower represented the defendants. Mr. Glyn said plaintiffs' case was that their motor-car, which was used for the delivery of goods, was, about one o'clock in the day of May 6th last year, standing outside their premises at Chapel Street, Edgware Road. The driver had just started his motor when the defendants' van, rapidly driven round the corner from the main thoroughfare, on the wrong side, collided with the motor-car. Plaintiffs' driver bore out the statement of counsel, and said he did not see the van before it struck the car. It came so quickly. In cross-examination by Mr. Bower, witness said the petrol for the car, which travelled sixty miles a day, cost £1 a week or more. He did not know anything about the cost of horses and vans. The jury returned a verdict for the plaintiff, with £40 damages and costs.

ALLEGED BREACH OF WARRANTY.

In the Brighton County Court, Akler v. Duck and Harris, a part-heard case was concluded, in which John Robert Akler sought to recover from Duck and Harris, 163, Western Road, motor-car agents, £25 as damages for a breach of warranty upon the sale of a motor-car. Mr. J. C. Buckwell now appeared for the plaintiff and Mr. E. M. Marx for the defendants. At the last hearing the case for the plaintiff—which was that he agreed to buy a hundred-guinea motor-car on the defendants' representation that it was a De Dion, but that after paying deposits amounting to £25, he found it was a Cudell car with a De Dion motor—was closed, and the defendant's case opened. Mr. Buckwell now asked his Honour to be allowed to amend the form of the claim. Mr. Marx opposed, and his Honour said the matter could stand over for the present. If he found a substantial case for giving plaintiff judgment he would amend if there

was any form standing in the way. Evidence for the defendants was then continued. H. C. Harris, one of the defendants, said that prior to October 17th the plaintiff made several trips in the car, and on that date he came back from a trip to Rottingdean, and said he was perfectly satisfied with the running of the car, and that he would have it. Next day he paid a deposit, and witness gave him a receipt. Subsequently plaintiff suggested that they should sell the car for him. In cross-examination, witness said he gave the plaintiff a receipt in which he described the car as a genuine De Dion voiturette, and he still contended that that was a proper description of it. He knew at the time that the body of the car was made by Cudell. Messrs. Williams (manager to Friswell, Limited, Holborn Viaduct, and D. Weigell (Managing Director of the British Automobile Commercial Syndicate, Limited), both gave expert evidence to the effect that the description of this car as a De Dion voiturette was perfectly correct. His Honour said that had plaintiff been entitled to a judgment he would have allowed any reasonable amendment of the claim; but as far as misrepresentation, which was the main part of his case, was concerned, plaintiff failed altogether, and he dismissed the action with costs.

NO LIGHT AND A SMASH.

At the Kidderminster County Bench, last week, Edward Marsh, metal dealer, was charged with having, on December 4th, driven a vehicle along the Bewdley Road without a light. Mr. Thursfield, instructed by the police, appeared in support of the charge, and Mr. Norris Foster (instructed by Mr. H. G. Ivens) for the defendant. Mr. Thursfield said that, owing to the defendant not carrying a light, a serious accident occurred. Mr. Rowland B. Worth and Mr. T. S. Smith were going along the Bewdley Road in a motor-car, when out of the darkness a horse and cart loomed up. The next moment Mr. Worth, who was driving the motor-car, found himself under the horse's neck. The car was practically wrecked. There was no light on the cart, which was defendant's, and it had been seen further along the road before this without one. Defendant admitted his lamp was not alight when the accident occurred. It had gone out previously, and he walked to the top of Lea Bank by the side of the horse. He was actually in the act of relighting his lamp when the motor-car dashed into him. The Bench said they had carefully considered the case, and should dismiss it.

MR. J. S. CRITCHLEY has resigned his seat on the Board of the Daimler Motor Company, as the Brush Engineering Company, of Falcon Works, Loughborough, and the British Electric Traction Company are entering into the manufacture of motor carriages.

THE Long-Acre Motor-Car Company, Limited, has been registered with a capital of £10,000, to carry on business as manufacturers of and dealers in motors of every description, and all apparatus and implements used in connection with the same. The management and control of the business of the company will be vested in Claude Browne (as the first manager).

MESSRS. MALICET AND BLIN, of Aubervilliers, near Paris, have sent us a copy of their new catalogue of motor-car parts. This firm appears to make a speciality of gear wheels of every variety and shape, differential gears, change-speed gears for motor-cycles and cars. Pumps, Cardan shafts, universal joints, and steering gears are other products of this firm, whose catalogue should be in the hands of all constructors of motor-cars.

THE Motor-Car Journal.

VOL. III.]

LONDON, SATURDAY, FEBRUARY 1, 1902.

[No. 152.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

MR. WALTER LONG has intimated that he will receive a deputation from the County Councils Association who desire to support the following resolution on light locomotives unanimously adopted by their Executive Council:—“(1) That the general law of the land for all vehicles, as extended by the special regulations issued requiring the drivers of motor-cars to stop on the request of any police-constable or of any person having charge of a restive horse, if scrupulously observed and rigorously enforced, is at present sufficient to secure the public safety provided that each motor-car has affixed to it some number so as to afford an easy and complete means of identification; (2) that it is desirable that the statutory limit of speed be abolished; and (3) that the present penalty clauses of the Highways Act are insufficient as applied to motor-cars.”

A Good Move.

At a meeting of the London County Council last week, Mr. Foster moved: “That, in consequence of the growing evil, resulting in loss of life and injuries to persons, damage to business, and danger and delay to vehicular traffic, caused by the frequent and continuous opening of roads, it be referred to the Highways Committee to consider and report as to the best means for the Council to procure such statutory powers as to secure that all persons or companies having Parliamentary powers to open the roads shall be compelled to give adequate notice to the Council before exercising such powers, and that the Council shall have the power to make such regulations, and have such supervision as will ensure such work being done expeditiously, and with full regard to the public safety and business interests.” Captain Swinton seconded the motion, which was agreed to without discussion.

A Measured M Dover.

THE increase in the number of motor-cars passing through the town of Dover has caused at least one of the local town councillors to think. And, having thought, he has gravely suggested to his colleagues that a measured mile should be marked in one of the thoroughfares of the town and policemen with stop watches stationed at each end to test the speed of motorists passing that way. The idea provoked some discussion but no decision was arrived at. Probably the next proposal will be the erection of a fence against motor-cars or ploughing up a section of roadway to give them trouble.

A Scheme for Cheshire.

MR. CHAPLIN and others intimately interested in the agricultural industries of the country, have declared their belief in the value of the motor-car, so far as the development of the rural districts are concerned, and after much discussion of the automobile by the farming authorities of Cheshire a prac-

tical scheme has been drawn up by Mr. C. Basil Nixon. Mr. Nixon suggests that a company or syndicate of the agriculturists of North Cheshire should be formed with three specific objects: (1) the maintenance and repair of motor-cars, (2) the carriage of produce and goods, (3) warehousing and merchandising farm produce. Steam lorries are suggested for the work, and these would be “stabled” in a depot in the vicinity of Alderley Edge, while at that place and at Manchester arrangements could be made for the storage, cleaning, and repairing of automobiles belonging to private gentlemen and trading firms. The advantages of the employment of motor-vehicles are numerous, and the saving in carting to and from the respective stations at each end of the journey would be a substantial item. So far as the initial stages of the experiment are concerned three routes will be selected for the transit of milk, radiating from Alderley Edge, and having their extremities at Broken Cross, Marton, and Tibley Lane End. The cars would travel from these points to the Manchester depot, carrying fifty-six railway milk churns and moving at the rate of six miles an hour. The scheme proposed by Mr. Nixon is worthy the consideration of agriculturists and the co-operation of automobile manufacturers.

On the Portsmouth Road.

THE numerous automobilists who weekly pass through Guildford will be interested to hear that the awkward detour at the foot of the town will no longer be necessary for them. After a phenomenally long period of rebuilding, the old bridge is to be at last reopened to traffic on Tuesday next (the 4th inst.), and the numerous narrow shaves caused by the barricade at the foot of the steep High Street (fortunately unaccompanied, as far as we know, by any motor mishap, though we recently saw a carriage with wheel smashed by the unexpected turn) will be things of the past.

Engineers and Motor-Cars.

Dr. OLIVER LODGE, the Principal of the University of Birmingham, has been addressing the Engineering Society at the University on the advances to be immediately expected in the applications of science to ordinary life. He said he hoped to see a great development of the motor-car industry and especially of motor-waggons running on improved roads, and opening up agricultural districts. He urged the desirability of differentiating the traffic of a city—keeping some routes for quick vehicles, whether horse or motor, others for waggons and heavy traffic, and others for electric trams, etc. The Institution of Junior Engineers at their annual dinner on Saturday also heard something of the motor-car, Sir Alexander Binnie saying that we had got to a point where the roadways could not be maintained under the continual hammering of the horses' hoofs. While he spoke in high terms of electric traction he mentioned another method of locomotion which was rapidly coming to the front. Unfortunately, it was not coming so quickly as might be owing to the checks of legislation. Parliament had entirely misunderstood what was to come in the near future. They could look forward to the abolition of the horse on the public roads. The motor-car had come to stay, and it

was their duty to try and make it more sightly. It was a splendid mode of locomotion; but though it required improvement, still more it needed to be released from the trammels placed on it by short-sighted legislation.

The Future of the Police.

BRITISH motorists will sympathise with their German *confreres*, who, according to the artist of *Das Schnauferl*, have anything but a peaceful time. It is easy enough to deal with the motorist, but he has to be caught first. Therein lies the difficulty which the German police may eventually overcome by the adoption of roller skates for their pedal extremities and the use of long hooked sticks for arresting the motorists. While the enthusiasm of the police is thus finding vent on the roadway, the citizens may be developing the art of muscular development begging from door to door, and picking pockets with

impunity. Such is the prospect pictured by the artist, who thus conveys a timely hint to the police to mind their own business and leave unoffending automobilists alone.

Trials for 1902.

UNDER the chairmanship of the Hon. J. Scott Montagu, M.P., a meeting of manufacturers and others interested in the automobile industry has been held at the Automobile Club, to consider the question of trials to take place this year.

After much discussion it was agreed to have a trial as soon after the Coronation as convenient, that it should be limited to six days' duration, and that London should be the centre, the daily runs of from 123 to 164 miles, starting from and concluding in the metropolis. The organisation of the event will be in the hands of a committee of eighteen members, nine of whom will be appointed by the Automobile Club, the representatives of the trade being Messrs. Astell, Austin, Burford, Chambers, Critchley, Edge, Jarrott, Letts, and Lisle. With regard to the awards of the judges, it was resolved that they should follow actual results, and all points in reference to competing cars for which marks are given to be published with reasons for the same. Another suggestion which was made was that trials of delivery vans, the brake horse-power of motors, and the efficiency of transmission by registering brake horse-power on road wheels should be held. Discussion also took place with regard to the reliability of cars, and a proposal that makers should run cars under Club observation for 200 miles per day over a lengthy period was referred to the Organisation Committee of the Club.

"Cranks."

NOR the least instructive portion of mechanical exhibitions is that supplied by the "cranks," whose exhibits, if not serving as an excellent illustration of some natural law by their flat defiance of it, are frequently half-fledged anticipations of some principle which will reappear under more suitable conditions later on. It would be of interest to note how many

ideas which have fallen flat or been classed as fads at the cycle shows of the past twenty years have developed into more or less essential parts of modern automobilism; even the ordinary steering-wheel was applied in lieu of a bicycle handle-bar long before its use on modern cars, while the spring sprocket, to equalise driving effort, had its origin there some years previous to its reappearance—with rubber instead of steel buffers, a doubtful advantage—as an automobile component. The difficulty and expense of automobile experiments serve to keep most of the eccentric inventors away from motor exhibitions; but a good deal of harmless amusement, and possibly now and then a good idea, is lost thereby. Hence every encouragement should be given to the man with ideas.

The Decline of the Two-cylinder Engine.

A GOOD deal has been said lately about the diminishing number of two-cylinder cars that are produced, the statement, of course, rather referring to the trend of the industry in France than in this country, and being therefore interesting as a symptom which may probably show itself on this side in due course. It can hardly be said that it has done so yet, and the causes at work on the other side that have conduced to the popularity of cars with a rather large one-cylinder engine are not far to seek. A better appreciation of the value of speed with, it must be admitted, a concomitant indifference to durability, have led to a demand for the maximum of power at the lowest price among the purchasers of small cars. The development of the De Dion type of engine has provided a way of meeting this, and the practical success of the result has somewhat obscured the fact that if four cylinders are worth their price on a big car, two have an exactly proportionate value on a moderate-sized one, and it cannot be very long before the wheel will turn again in their favour. Though a perfect torque, at least approximately, can only be obtained by the former, the latter will give what is much more important, namely, a perfect balance of reciprocating parts, and it may be reasonably surmised that a two-cylinder motor with its parts arranged to attain this end will not lose the place it deserves among the engines of the future.

Motoring and Health.

A WRITER of a column of generalities about motoring in the *Newcastle Leader* urges that because of its effect on the complexion the pastime is not likely to remain permanently popular with ladies. This is hardly a new objection, but it deserves a word of criticism. So far as the external aspect of the matter is concerned, the veils and masks ordinarily used are sufficient to protect the delicate skin of the fairest lady; while the healthiness of the sport and its general effect in raising the tone of the system must favourably affect the appearance of men and women alike. The glow that is produced throughout the system by a motor ride has no mere transient effect; it restores health and promotes vitality, thus doing considerably more than all the quacks and their nostrums to preserve the complexion of the human race.

Exaggeration at Bristol.

BRISTOL papers have lately recorded an alarming accident caused by horses being frightened by a motor-car, and the case is a good illustration of the sensational methods by which automobilism is temporarily thwarted at the present time. The first account published in the Bristol daily papers reported that a coachman was taking two ladies for a drive across Durdham Downs. "Just as they were nearing the Gully," wrote the reporter, "the coachman saw a motor-car approaching him from the opposite direction. It was a large heavy car making a great deal of noise, and so he raised his whip twice as a signal to the driver to pull up. No notice was, apparently, taken and the motor-car came pounding along."

When the horses shied, the ladies jumped out, and the animals rushed towards the river, ending their careers by jumping over a precipice and wrecking the carriage. On the following day the same journal had to confess that the motor-car was only a small one travelling very slowly at the time. Neither the driver of the car nor the other occupant saw any signal from the coachman, and there was no sign of any restiveness about the horses until they were within twenty-five or thirty yards of the motor-car. Then one of the horses began to rear, and both the car and the motor were instantly stopped, the car being pulled up within two yards—evidence of the complete control which the driver had. The horses were then about twenty yards off. Both occupants of the car are of opinion that the coachman attempted to pass the car, but the horses suddenly swerved to the right, and the pole snapped. Then the animals became unmanageable, with the broken pole among their legs. The motor-car remained stationary for at least half an hour, and was not driven off as alleged. On the contrary, the driver of the car spoke to the ladies when they got out of their carriage; and later in the afternoon called at their residence and left his card. This is an illustration of how a good many similar stories are "written up" to the detriment of automobilism.

Automobile Houses.

PRIVATE owners of motor vehicles have not given that attention to the housing of their cars that the importance of the matter demands. Of course, owners of "studs" of four or five cars who have expert mechanics do not need any warning; but those who only possess one car should see that the shed or house in which it is stalled is properly protected from the weather and adequately adapted to the purpose. Otherwise disappointment may result from the neglect of ordinary precautions. This is a subject worthy of discussion by the Automobile Club or in our columns. Probably this paragraph may lead to useful suggestions and designs.

The King of Sports.

THE storm of denunciation that Mr. Kipling has drawn on his devoted head by sacrilegious treatment of the national deity of sport is enough to show the dangers of a frontal attack in such cases, and each patriotic defender has made an heroic effort to show that his particular pastime is the training ground of all the virtues. But if it be asked what sport does most to elicit the qualities of initiative, self-reliance, nerve, and pluck, few of us, after considering the records of "la haute automobilisme,"—in which we may surely include such events as our own 1,000-miles trial of happy memory—can long hesitate to express a verdict, though it does not now afford the opportunities for muscular development that it used to in the early days. Jestings apart, however, those who agree with the utterances of such a prophet as the author of "Anticipations"—and they have a weight of reason on their side—will see a mighty power for progress in a sport which does so much to lead its votaries in the ways of that future ruler of humanity—the engineer.

Progress with Electrical Accumulators.

A HIGHLY interesting lecture on "Some Recent Automobile Apparatus" was delivered at a recent meeting of the Automobile Club of America by Mr. Hiram Percy Maxim. The petrol engine and the electric storage battery were considered the only sources of energy that in the end would prove suitable for automobiles, the former for all work in which economy of power development is the main consideration, the latter where other factors prevail. The discussion was strictly limited to tried devices which have been before the public for some length of time, and it was pointed out by Mr. Maxim that the progress made during the past three years in storage battery efficiency represented an advance of more than one hundred per cent., and that the dangers of ruining batteries by incompetent re-charging

of them had been practically removed through the introduction of the automatic charging plant, which obviates the most prolific source of battery depreciation in the past. During the early part of his discourse Mr. Maxim expressed the opinion that the Automobile Club of America could do nothing of greater value for the advancement of automobilism than to arrange a competitive contest for electric storage batteries, by which all makers of batteries would have an opportunity to demonstrate what their batteries would do at the present stage of the industry, the contest to be uninfluenced by any ideas that might prevail in regard to the supposed commercial standing of the various makers.

Motor Fire-Engines.

WHEN the various advantages of mechanical over horse traction are considered and a search is made for commercial applications in which these advantages stand out most prominently, fire service would seem to take the first place. Some of the requirements of vehicles in this branch are the ability to start at any time at a moment's notice, high speed and reliability. The automobile possesses all these, and in addition the important one of low cost of maintenance when not in actual use. Fire apparatus is used very intermittently; days and even weeks may elapse before a call is received. Yet all this time the horses must be fed to get perhaps an hour's use out of them at the end of the period. The automobile should prove much more economical, seeing that it needs but little attention when not in use. A start in the substitution of mechanically-propelled fire apparatus for horse-drawn engines has been made in many leading cities both in Europe and America. Fire departments are naturally conservative, but the advantages of the motor-car for that particular work are so obvious that a steady increase to a final exclusive application of automobile traction, in large cities, may safely be predicted.

Covered Vehicles.

THERE is clearly a demand for motor-cars which protect the occupant from inclement weather both in winter and summer. This class of vehicles should not be confined to electric power, which to a great extent is the case at present. Nor should it be necessary to add an immense weight to the car. It would seem that the longer mileage range a vehicle has, the more reason there is for closing at least some part of it in, for naturally a vehicle with long range of travel will be likely to have its passengers exposed more to the weather than where the range is limited.

Views of an Anti-Scorcher.

AN "Anti-Scorcher" sends the following suggestion for the suppression of the furious driving of motor-cars:—"Let every owner be forced to take out a licence, and let every car be numbered. On a first conviction let the licence be endorsed as with cabmen. On a second conviction let the licence be withdrawn for a month or more. A fine of £5 is a trifle." There is nothing very alarming in the idea, and we only call attention to it to emphasise the phrase "as with cabmen." There is a disposition on the part of some members of the public to regard motorists as hired drivers whose only concern is to get over the ground quickly. They forget that motorists are gentlemen—mainly gentlemen of leisure and almost universally of considerable means. The notion of the licence and the number is absurd. What is wanted is that certificates of competency should be issued, and no one allowed to drive on the highway without such permit. Competent drivers, sensible police, and a tolerant public would soon cause such letters as those of the "Anti-Scorcher" (who is probably an "anti-motorist") to be relegated to the waste-paper basket of daily newspapers instead of blossoming forth in their columns in the largest of print.

No Numbering Wanted.

At the same time it should be noted that the County Councils Association has declined to endorse the suggestion of the Gloucestershire County Council that certificates of efficiency should be granted by the Board of Trade, and the only suggestion that remains for practical discussion is as to the numbering of cars. This, however, motorists will dismiss at once. They have considered it, and rejected it, for it savours too much of the spirit evidenced by the correspondent referred to in the preceding paragraph, who would deal with motorists "as with cabmen."

Mud Plugging.

THE heavy going recently has strongly brought home to many motorists the utility of having a reserve of power in their engines. When thick mud prevails, the tractive power of a car diminishes very much; and unless the motor has ample strength considerable difficulty may be experienced in travelling up hills of even medium gradient—hills which when dry roads prevailed could be romped up. The motorist in selecting his car should not reckon the horse-power on too favourable a basis. If he wants a machine which will be efficient all the year round he must give due consideration to the circumstance that heavy and muddy roads must be provided for. It is always wise to be a little generous in the matter of horse-power. The feeling that even on the severest gradients the engines are not being strained to the utmost is most comforting. Of course, the horse-power must not be mere catalogue figures, but actual fact. The driver, too, must take extra care in heavy weather to see that every part is working at proper efficiency, for, if through bad adjustment, etc., there is a leakage of power, the advantage of extra strong engines is nullified to a great extent. There are few such exacting tests as a long run over undulating roads covered with thick mud. Both motor and motorists are severely tried.

Discussions at the Club.

THE last two house dinners of the Automobile Club have been followed by discussions on two such dissimilar subjects as "Proposed Amendments in the Law affecting Motor Vehicles" and "Steam Cars," the authors of the opening papers being Mr. Roger W. Wallace, K.C., and Mr. H. Staner respectively. As these papers will form part of the forthcoming Badminton volume on Motoring, our readers will have an opportunity of making their acquaintance at a later date. Suffice it now to say that a good

discussion followed the reading of the paper on Steam Cars, many useful suggestions being made by Messrs. Dugdale, Clarkson, Knight, Bayldon, White, Turnbull, Firth, and others. Colonel Crompton was in the chair, and paid a high tribute to the value of the idea embodied in the White steam-carriage, in which, by simply using the superheated steam, a great economy in the consumption of water and petrol has been secured.

"MOTOR-BICYCLES" is the subject of the next paper to be read before the Cycle Engineers' Institute on Thursday, February 6th, by Mr. A. Craig at the Grand Hotel, Birmingham. Considering the great interest now evinced in the motor-bicycle, there should be a large attendance.

ONE of the Motor Manufacturing Company's cars was driven from Coventry to London on Saturday, fitted with a set of Martin tires, with the object of carrying out a practical test of this make of tires by daily trips for the next ten days between London and Brighton.

FRANK F. WELLINGTON, Ltd., announce a competition among users of their sparking plug. The prizes will be awarded for plugs which have travelled the greatest distance and been in use for the longest period. The last day for sending in applications is the 17th inst.

ON Monday Dr. F. W. Hutchinson, of Cambridge, made a balloon ascent from the grounds of the Crystal Palace in order to make investigations into the presence of bacilli in the atmosphere at various elevations. The balloon descended in the afternoon near Canterbury.

BOTH candidates at the Hampstead Parliamentary election last week were well supplied with motor-cars by their supporters, Mr. Milvain having the assistance of a Weston steam car, which performed about three journeys to one of the horse-drawn vehicles engaged on similar duty. Motor-cars were also a feature of the Dewsbury election.

A MOTOR club for Southsea and district is in course of formation. Mr. W. S. Glasier, 5, Clarence Road, Southsea, is interesting himself in the matter, and the object of the Club is to form a programme of runs, to promote hill-climbing contests, and to affiliate with the Motor Union. The preliminary meeting was announced to be held on Friday, January 31st, at the Empress Hall, St. Edward's Road, Southsea.

THE first annual meeting of the Wolverhampton Automobile Club took place at the Victoria Hotel, on January 27. The balance-sheet, which showed a balance in hand of a considerable amount, was adopted, also the report, which was very satisfactory. The president for 1902 was then elected, and fell to Alderman Levi Johnson, who was vice-president last year. The Mayor, Mr. C. P. Plant, was elected vice-president; hon. treasurer, Mr. A. E. Jenks; hon. sec., Mr. S. R. Rhodes. A vote of thanks to the treasurer and secretary for 1901 was carried unanimously.

THE recently-formed Long Acre Motor Car Company, Ltd., have now commenced business at 37, Long Acre, London, W.C. They are the sole London agents for the Wolseley Tool and Motor Car Company, Ltd., of Birmingham, and have several cars for immediate delivery. Mr. Claude Browne, the general manager, informs us that they are equipped for repair work of all kinds, have storage accommodation for a number of cars, and intend carrying a large stock of accessories. A speciality will be made of repairs to and spare parts for Wolseley cars.

THE first great result of the relaxation of frontier difficulties will, no doubt, be the creation of a demand for good roads, a demand which is keenly felt in Belgium, and which is already producing results. The creation of good roads in other countries will bring thousands of automobilists from France, their present happy hunting ground, and as travel and mutual intercourse between foreign nations very soon obliterate racial prejudices, important political and economic change is sure to follow as the indirect result of the popularisation of the motor-car.

FLOTSAM AND JETSAM.

BY "FLANEUR."

WHEN the hardy annuals in the shape of works of reference begin to make their appearance in January or February it is not uninteresting to note their comments on matters that show signs of evolution from year to year. I have been conning over the motor "information" in "Whitaker's Almanack," and find it, alas! to be quite unworthy of that time-honoured publication. Clearly it has been written by someone quite unfamiliar with automobile topics, and scanty though it be it contrives to score several errors of commission, with a plentitude of errors of omission into the bargain. Under the head of "Regulations for motor-cars," "Whitaker" informs us that "a lamp is to be carried during the period between one hour after sunset," etc., etc., and that "If drawing another vehicle, it must have the name of its owner and his address conspicuously painted on it, together with its weight on the right or off side in letters white on black, or black on white, not less than one inch in height." One must regard the spectacle of a lamp drawing another vehicle as a distinct automobile curiosity, and one is altogether at a loss to know whether it is the lamp, or the front car, or the drawn car that must bear the name of its owner, etc., conspicuously painted on it, or whether it is the weight of the lamp, the front car, or the drawn car which is to be stated.

FURTHER on we are informed that in Scotland "the limit of speed is fixed at ten miles an hour if the locomotive be under one and a-half ton unladen," which, as Euclid says, is absurd. The ten miles limit was raised to twelve six months ago, as any one competent to write in works of reference would know. In another section of the volume, under the head of "Scientific and Engineering Summary, 1901," there is a twenty-eight line paragraph side-headed "The Motor-Car." It is as jejune a summary as could well be imagined, and consists almost entirely of descriptions of an automobile bakery and an automobile kitchen! Lastly, it winds up with the astounding information that "the greatest advance during the year"—the italics are mine—is the use of alcohol and ether instead of petrol for motor-car engines, a change to the advantage of the British farmer. Truly a mighty advance! It is to be feared that the distressed agriculturist who starts a beetroot plantation on the strength of this erudite deliverance and comes knocking at the doors of motor-car factories or depôts with tins of alcohol will find a rude awakening to be his fate.

THERE are certain precautions, in connection with car management, which become a matter of habitude, and yet which may well strike the casual onlooker as superfluous. Possibly the automobilist himself at times is tempted to relax his vigilance, but at a heavy cost. For instance, there is the matter of filling up one's tank with petrol. The usual thing, of course, is to use a handkerchief, piece of linen, or a gauze funnel in order to filter the liquid as it flows into the tank; but when one has poured out scores

and scores of gallons without observing any sediment it is easy to think lightly of the precaution, and possibly abandon it occasionally if in a hurry, and a tundish is not handy.

BUT it does not pay! It is easy enough to suppose that the petrol manufacturers are scrupulously careful, and that the presence of grit within their cans is rendered practically impossible. But mistakes will happen, and then there is the agent to take into account. You may buy your petrol from a local man, to encourage him to stock it, instead of from the manufacturers direct, and another chance of possible impurity is added in this way. The agent has probably a number of loose cans which are constantly passing to and fro between himself and his various customers, and which he replenishes when empty from a tank. No doubt he is as careful as may be, but one of his workmen may be otherwise. I was forcibly reminded of this possibility the other day, for after emptying a two-gallon tin into my tank I was horrified to find quite a number of particles of dirt remaining on the gauze membrane of my tundish.

SOME were as large as good-sized pellets, while there were plenty more which would have worked sad havoc with my carburettor but for the fineness of the gauze. For the benefit of

chauffeurs I may point out here what, of course, no experienced hand needs to be reminded of, namely, that nothing is more aggravating to a driver than interruption of the petrol flow through the presence of minute particles of sediment. They return again and again to the charge like hungry flies, and are more baffling even than troubles with the ignition. "Filter your petrol" is a maxim which cannot be too seriously laid to heart at the outset of every automobilist's career.

EN ROUTE FROM NEW YORK TO CHICAGO IN AN 8 H.P. PANHARD.

[Automobile Topics.]

IN another direction, too, I have lately had an illustration of the fact that one must not regard the petrol-can as necessarily without flaw. Before starting on a journey I had placed a couple of tins in my *tonneau*, after the plan adopted by many others of carrying a reserve, and keeping it as such by buying on the road whenever feasible; you thus make it worth people's while to stock petrol in various parts of the country, and are always sure of having some at hand in case you do not come across an agent. At the end of the journey I found the floor of my *tonneau* to be quite wet, and on examination discovered that petrol had been oozing out of one of the cans—in minute quantities, of course, but it was escaping all the same. Now one is accustomed to believe that one could build a fire round a tin of petrol, and that unless the heat were sufficient to melt the joints there would be no conflagration. But that a leaky tin is a possible, if uncommon, factor to be reckoned with is shown by the circumstance above described.

A MOTOR-CAR and cycle parade is among the suggested entertainments at Windsor in connection with the Coronation festivities,

Mechanical Flight Up-to-Date.

[All rights reserved.]

BY SIDNEY H. HOLLANDS.

CHAPTER III.—ANTI-LEVITATION.

THE heading of this chapter may sufficiently indicate that the present writer holds adverse opinions—he will even go further, and say adverse convictions—on ballooning (with or without a self-contained motor) as a *definite* means of aerial locomotion. These views he fortunately holds in common with the best living and deceased authorities. The late F. W. Brearey, B.Sc. (formerly hon. sec. of the British Aeronautical Society from its foundation in 1867) truly said:—"A total misapprehension of the principles of flight is displayed whenever a balloon is recommended to take off part of the weight of any mechanical arrangement."

We have no better authority than the foregoing gentleman. The late Duke of Argyll—another sound authority on true flight—wrote, in his excellent book "The Reign of Law":—"Of one thing we may be sure, that if man is ever destined to navigate the air, it will be in machines formed in strict obedience to the mechanical laws which have been employed by the Creator for the same purpose in flying animals." Mr. George Griffith, a recent, but orthodox, authority, wrote under the heading "The Futility of Using Inflated Airships":—"If you make your gas-envelope sufficiently rigid (to be forced through the much denser air) you have to add so much weight, that the lifting power of the gas is, virtually, reduced quite two-thirds. Again, if you are to have a motor powerful enough to drive such a gas-envelope through the air its weight increases enormously with every horsepower that it develops; and here comes in the hopeless contradiction against which every aerostat has come to grief."

In the fish or in the submarine boat, moving in a medium over eight hundred times denser than air, these can be, and are practically unyielding solids, i.e., the conditions admit of such a rigid structure that they are enabled to force their way through the water without collapse or deformation. We can have no such conditions in the case of a buoyant, or semi-buoyant, gas-vessel forced through air. The following remarks, therefore, are not in advocacy of ballooning systems, but to indicate their fundamental fallacy, their uselessness for all practical commercial purposes, and their ultimate abandonment in favour of practicable systems of true controllable flight. The present writer, indeed, endorses the significant dictum of Mr. Lawrence Hargrave, who has remarked that:—"We should have been flying long since but for the unfortunate invention of the balloon."

To take first two ballooning schemes which have had, and still have, their advocates, viz.:—First, that of taking advantage of winds blowing in different directions at different altitudes, as this is perhaps the least extravagant of all the purely ballooning projects. It is probable, however, that no one has implicit faith in the *definite* navigation of the atmosphere by recourse to the little-known air-currents prevailing, if they do so, at various altitudes. This scheme, if practicable, would almost certainly be the only one by which balloons could reach any desired place, when any considerable wind was blowing. Supposing now that a balloonist desires to make a N.N.W. course, being in London and wishing to reach Glasgow; the wind at the earth's surface—and for perhaps 1,000 feet above it—happening then to be a ten-knot breeze from the westward. The balloonist has first to rise until he strikes an accommodating S.S.E. wind, of greater or less velocity, which is prepared to steadily continue in the same direction for at least ten or twelve hours, wafting him N.N.W., and this is supposing a speed with the assumed fair wind of about forty miles an hour at least. The gas-bag rises, but has to climb through the 1,000 vertical feet of the ten-knot breeze at the outset. It continues to climb, at an acute angle with the horizon,

steadily drifting eastward meanwhile; and by the time that height is reached, our ballooning friend may sadly note that he has made, perhaps, a mile to the east of his starting point. However, he still rises, and presently may find that his course has changed to the south-east; or he may not, but continue travelling east for an indefinite time and height. If the former alternative occurs, and he makes another mile or so to the south-east, his chance of reaching Glasgow in a hurry will not be promising. In short, if he has luck, and does eventually strike a current

H = Height above which no Aviator need rise
Note: Each div. of scale = 528 ft.

just suiting his destination (even one point off his true course would land him very wide of the mark at the journey's end), that wind must be constant in direction and velocity for many hours, and he has then to climb down again through perhaps 8,000 or 10,000 feet of adverse currents of previously unknown

direction. If our hypothetical voyager struck anywhere within ten miles of Glasgow it would be by either a fluke or a miracle.

The second of these schemes for definite balloon-transit is as ingenious as it is impracticable. This, which was proposed many years ago, resembles the foregoing scheme, in that the balloon was to carry no motor (in the ordinary sense), but, unlike the other, was not intended to drift with the wind, but to make headway against it if need be, employing, alternately, levitation and gravitation to effect this. The appliance through which these forces were to act was a large rectangular pivotted aeroplane, on a central horizontal axis which intersected the vertical centre-line of the balloon, and had a very large oval hole in its centre, occupied by the balloon (see illustration). The ends of the axle, or rather the two gudgeons formed at mid-length on opposite sides of the plane-frame, were carried in lateral bearings on a light frame springing from the car, and embracing the balloon above. This aeroplane was, therefore, balanced, being mounted similarly to an ordinary swing dressing-glass, and was to be inclined in either direction by means of cords from the car. A rudder was to be carried in the wake of the aeroplane, on a vertical axis, and also worked from the car by yoke lines independently. The *modus operandi* was to be as follows:—The balloon, when on the ground before starting, would have its plane tilted up; and would be so placed that the elevated front edge of the plane faced in the direction it was desired to travel. The balloon being then let go, would ascend at a more or less

PROPOSED BALLOONING SCHEME—ALTERNATE LEVITATION AND GRAVITATION.

acute angle with the horizon, according to the degree of inclination of the aeroplane, and its vertical speed (neglecting, for the present, the effect of the prevailing wind), the air-pressure on the upper inclined surface of the plane, due to the ascending effort, effecting this.

When a certain altitude had been reached the "skipper" would swing his plane to the opposite slope, and immediately partly open the escape-valve to cause a descent of the balloon, which would then still be impelled ahead, but at a downward angle, the air pressure being then on the underside of the plane, and due to gravitation. When the balloon had approached the earth the plane would be swung back to its former upward angle, and some ballast at once discharged to bring levitation into play again, which would complete one cycle of operations. It is obvious from the foregoing description that unless there were an abundant and extravagant surplus of both—gas for the essential factor of buoyancy, and of ballast for that of gravity—one cycle, or one and a-half, perhaps, is about all it would run to, even supposing that other practical difficulties did not render the scheme unworkable. The balloon would still be at the mercy of the prevailing wind, and would travel principally to leeward.

Notwithstanding the qualified success of the recent Parisian inflated navigable air-ship—navigable only under favourable

weather conditions, and then, as was proved, with much peril—the position of aerial navigation is *not* materially affected thereby; not even when it is conceded that M. Santos-Dumont's plucky exploit is an advance on all precedent on buoyancy lines. The inherent and ineradicable defects of an inflated aerial vessel remain; whether it is wholly or only partly gas-sustained really matters little, it is still essentially a very-fair-weather vessel. We have seen, too, the enormous size of such a vessel necessary to carry only one passenger. If used in warfare it must form a gigantic target for hostile projectiles, must be very seriously affected by wind, rain, and unavoidable leakage of gas, with consequent loss of buoyancy; also by alternations of sunshine and gloom, causing fluctuations of buoyancy. Finally, it must ever be of perilous longitudinal instability.

It is still as certainly inevitable that the *ultimate* navigable aerial vehicle will *not* be an inflated one, but a true power-sustained aviator, or mechanical flying machine. The true flying vehicle is as independent of, and as unaffected practically by, average wind as those natural flying machines (and admirable studies!), the birds, the flying mammals, and certain flying insects are. A well-known smart engineer-journalist once characteristically remarked: "We have in the bird a machine burning concentrated fuel in a large furnace at a tremendous rate." Our artificial magnified bird must do likewise. An eminent French authority said: "The bird flies, and he is not a balloon; he is a beautiful piece of mechanism. An eagle would have to expand himself to fill fifty cubic metres in order to support himself by levitation. A balloon finds support from the air, so belongs to, or forms part of, the medium in which it floats. Under such conditions how can its mass (bulk), which offers such great resistance to motion *through* the air, make its way *against* the wind?" "The apparatus must be heavier in order to be stronger than air." Buoyancy eliminates gravity, and without gravity—in itself a *sine qua non* of true flight—we can have neither inertia nor momentum, which are also absolute essentials.

(To be continued.)

THE British Aluminium Casting Company, Limited, of Cambridge Street Works, Birmingham, are now turning their attention to aluminium castings for automobile purposes.

THE *Petit Parisien* states that in the early part of the spring experiments will be made with a new navigable balloon, constructed on the plans of Colonel Renard, Director of the French Military Aerostatic School at Chalais-Meudon. The balloon will be propelled by a petrol motor.

THE Liverpool Cycle and Motor Show, held under the patronage of the Liverpool Self-propelled Traffic Association, will be opened at St George's Hall, Liverpool, at three o'clock on Tuesday, February 4th, the ceremony being performed by the Hon. A. Stanley, M.P. for the Ormskirk Division of Lancashire. From what we can hear, the show promises to be very successful.

At the last meeting of the Standing Committee of the Automobile Club a letter was submitted from Mr. Rees Jeffreys, enclosing a copy of an article which he had contributed to the *Motor-Car Journal* of December 28th last with reference to the action of the police. It was recommended that no action should be taken, for the present, by the Club, and Mr. Jeffreys was thanked for the trouble he had taken in making the suggestion.

THE other day we had a look over the premises of Messrs. Friwell, Limited, of Holborn Viaduct, E.C., and were somewhat surprised to find that one floor has been entirely set apart as a shop where motor-cars can be repainted and revarnished. Messrs. Friwell are now in a position to undertake work of this kind to any private car, and at the time of our visit two or three vehicles were in the painters' hands. On another floor arrangements have been made for the re-charging of ignition cells at the shortest notice, upwards of thirty cells being connected up with the electric light mains on the occasion of our visit.

CONTINENTAL NOTES.

By "AUTOMAN."

THE Continental Rubber Company, of Hanover, who are rivals of Michelin in the manufacture of motor tires, have arranged with the Dunlop Company so that they will in future be allowed to import their tires into England under a royalty. They have made big strides during the past year, and have devoted time and money to perfecting and testing their outer covers. Happening to be in Hanover a few days ago, I called on the managing directors, and was shown over their extensive works by my friend Herr Tischbein, the manager.

AN old Canstatt Daimler car, weighing about 30 cwt., is used to test the tires, and Herr Tischbein explained by means of a tabulated register the positive economy of big tires over small ones, and the mathematically exact wearing powers of the different sizes, under, of course, similar circumstances. If there is any difference between the Michelin and the Continental tire it lies in the fact that the tread of the latter is slightly narrower, and the sides, perhaps, a little harder. It is claimed by some *chauffeurs* that they are faster and less liable to skid, because of the narrowness of the tread, but this is merely a matter of opinion, and I give it for what it is worth. It is said, too, that the Continental is harder to pull over the first time, due, no doubt, to the stiffness of the edges. The Continental-Caoutchouc and Gutta Percha Company, which is its full title, was founded in 1872, with a couple of hundred workmen, and it is now a vast undertaking employing more than 2,000 hands, the works covering nearly seven acres of ground.

JUST before leaving the works, Mr. Tischbein showed me his motor-house, in which, amongst other cars, I noticed the famous Mercedes that was run by Barras and which came to grief in a bad accident just before the Paris-Berlin motor-car race.

By degrees, slowly but surely, the automobile is becoming an important instrument for the propagation of civilisation in its various forms and phases. It has already, in the notable instance of the Paris-Berlin race, brought about a mutual intercourse between two great nations that have been divided and estranged for more than a quarter of a century, and gradually the Governments of the Continent are consenting to relax their frontier regulations in favour of the motor-car, so that the day may not be far distant when it will be possible to travel all over the Continent without let or hindrance. Unofficially, France and Belgium have now agreed on a mutual *tryptique* for the automobile, and I believe the decision will be made official before these lines are in print.

It must not be thought that Dogberry is only a native production of conservative England. He is also to be found amongst the "flora and fauna" of other nations, for only the other day an automobilist in France was condemned to "criminal responsibility" under the following conditions:—The noise of his automobile frightened a mule of recognised vicious habits, and the mule run away and smashed up the carriage to which he had the misfortune to be harnessed, and in the course of his "rake's progress," he spilled and injured the occupants of the vehicle. The automobilist was held by the country judge to be criminally and civilly responsible.

THE mysteries of the automobile racing season are beginning to leak out. Mors is bringing out two new cars, a heavy car just under the limit of weight and a light car weighing about 12½ cwt. Both these vehicles have an entirely new carburettor and an entirely new system of transmission. It is said that this

means of transmission is much more efficient than the present plan. Fournier, Foxhall Keene, and Rolls are down for heavy cars, and Gilles Hourgières is going to drive a light car.

FOURNIER has been chosen as one of the defenders of the Gordon-Bennett Cup, and he will drive a new Mors car with Continental tires if the Continental Co. succeed in manufacturing them in time in France. If not, Fournier will use Michelin tires. With regard to the new system of transmission of the Mors cars, Fournier says that the new system is so simple and practical that as soon as it was explained to him he made up his mind to have it at once. "J'ai signé des deux mains," said he. It is quite possible that Panhard and Levassor will not be represented at all in the Gordon-Bennett, on account of the personality of the *chauffeurs* who have been chosen as defenders, but it would be a great pity, for it would add immense interest to the race for it to be a three-sided contest, national as well as international, and a repetition of the old duel between the two French giants.

F. M. SANTOS DUMONT made two ascents in his airship on Tuesday at Monaco with brilliant success. The first was made in the morning, when the balloon was hauled out of the shed on to the beach, balanced, and the motor put in motion. The balloon ascended easily and gracefully. He ascended for the second time in the afternoon, and spent twenty-five minutes performing evolutions in the bay and before the pigeon-shooting ground.

[La Vie au Grand Air.

The steering of the airship was entirely satisfactory. The above illustration shows the special house which has been erected on the Boulevard de la Condamine, Monaco, for the accommodation of the airship. It faces the bay, and has consequently had to be built very strongly. It is no less than 180 ft. long, 32 ft. wide, and 50 ft. high. The two heavy iron gates, which weigh over 4 tons each, run on wheels, and are so well balanced that they can be opened by a boy.

THE STAUNTON SPEED INDICATOR AND ODOMETER.

MOTORISTS mindful of the restrictions of the law are at present bound to keep well within the limits of the legal speed—twelve miles per hour. The statement is often made, that certain positions of the change-speed lever correspond to so many miles per hour, but this relation only holds good under certain conditions of the road and the motor equipment. Speed indicators of various types, which would relieve one of a good deal of anxiety when running through districts in which the attention of the police is devoted more to motorists than to such evil-doers as burglars, pickpockets, etc., have at one time or another made their appearance, and we are this week able to give an illustration and a brief description of still another speed indicator and odometer that has just been put on the market by Messrs. Staunton and Company, of the Excelsior Works, Blyth Street, Bethnal Green, E. Our illustration shows the dial of the instrument, which is contained in a metal case measuring four inches by three inches by three and a quarter inches, attached by clips to the dashboard in full view of the driver. There are, altogether, seven dials, five of which form a group to the right, showing the aggregate mileage travelled up to ten thousand miles. When this distance has been covered, the record commences again automatically. The upper left hand dial registers automatically the maximum speed attained by the car during each fifty yards, so that on stopping the dial shows the highest speed reached during the last fifty yards. If preferred

this dial can be made to register the highest speed for the last 100 or even 440 yards. The lower left hand dial registers the rate of speed at any moment. The instrument that we inspected the other day was arranged to register the speed up to twenty-five per hour, but it can be made to register up to forty, or even sixty miles an hour. As regards the operation of the device, a friction wheel is carried on the hub of one of the front road-wheels of the car. In contact with this is a second small friction wheel carried on an adjustable bracket attached to the axle or other suitable part of the vehicle, the connection between the friction wheel and the recording apparatus being by means of a length of flexible steel shafting. The indicator is the outcome of several years' experiment, and has, we understand, been submitted to a lengthy trial before being put on the market.

A COMMUNICATION from the Gloucestershire County Council with regard to the speed of motor-cars has been ordered to lie on the table of the Northamptonshire County Council.

A SURBITON correspondent reports that a dog was killed by a motorist driving along the Portsmouth Road, nearly opposite Uxbridge Road, the other day. Dogs must really be careful. If they persist in getting underneath a motor-car there is no more chance for them than in the case of a horse-drawn vehicle.

THE MOTOR-CAR IN FRANCE TO-DAY.

(Concluded from page 849.)

COMING now to petrol cars, let me divide them into two types—the carriage and the so-called *voiturette*. The carriage type has come to stay. It is almost perfection to-day, while the *voiturette* class is still undergoing constant changes. The carriage type, or heavier vehicle, has been the more successful, as makers could put weight into their carriage, and in order to run at the now desired speeds weight is what is necessary. The motors now being used in carriages of this type are so-called slow-running, the number of revolutions per minute, without acceleration, being limited to about 800, and in motors, where the stroke is short, the number of revolutions can be accelerated up to 1,100 and 1,200 a minute, without danger of pounding. There has been a gradual cutting down of stroke recently, the diameter of the cylinder and the length of stroke in many instances now being almost equal. Almost all the successful motors of to-day are of a vertical type, and are placed in front of the dash. Two cylinders are used almost universally in carriages developing up to 8 h.p. and four cylinders above this. The inlet valves are so arranged as to be easily removed and examined; the exhaust valves, made of a special steel, are lifted by cams, and are so arranged as to be readily taken out; the pistons are all fitted with oil grooves; the bearings of the crank shaft are large; in fact, all the bearings of the motor are exaggerated in every way, and on this account have long life and are not likely to heat. With a few rare exceptions two-cylinder motors are governed. Governors are usually of the ball type.

A method of control has been almost universally adopted in France, and this is entirely regulated, as you know, by the feet. There are two pedals, the left-hand one releasing the clutch, while the right-hand one releases the clutch and then applies the brakes. The hands are therefore always free for steering purposes, and, as the steering is done by a wheel and is non-reversible, except when very high speeds are obtained, the steering can be done very readily with one hand. The change gear is worked by a lever convenient to the right hand. But little attention has been paid in France to the silencer. People have become accustomed to the puff-puff of the exhaust; horses are no longer frightened, and in muffling the carriage too much there is some back pressure which naturally detracts from the maximum power of the engine. I have often heard French carriages called "noisy." I believe that they can all be muffled down to be as noiseless as can be wished; this, of course, as I have just said, with a slight reduction of the maximum power of the motor. The oiling devices are now taken care of automatically. When the motor is set in operation, oil or grease is sent to the various parts of the car needing them.

With regard to the subject of pumps, I may tell you that the gear-pump is not in great favour in France. The high-speed centrifugal pump, run by friction from the flywheel, has been adopted almost universally. The flanged radiator seems to give perfect satisfaction, although the Germans have put on some of their carriages the beehive radiator, cutting the supply of water down very considerably. But our good French friends argue this way against the beehive radiator: Suppose it takes 60 litres of water to cool an engine using a flanged radiator, and only 7 litres to cool an engine where a beehive radiator is used, if everything always worked perfectly, there could be no question, and the beehive radiator, although it costs more, would be preferable; but if there be a small leak somewhere, if one of the joints in the water circulation be bad, it might take three hours for the water to leak out of a 60-litre tank, when the same leak in the 7-litre tank would leave the tank dry in less than half an hour. Some day, I have no doubt, the water circulation, pipes, joints, etc., will be so perfected as to allow of the beehive or other similar radiator being used. The second type of petrol carriage, the *voiturette*, is still too young to be considered as definite. In *voiturettes* the general practice has been to use one motor of the

high-speed class. This represents a tremendous piston speed and a consequent wear, which, to my mind, is not practical. In other respects the organs of the voiturette are very similar to those of the carriage, but I am afraid that these voiturettes are now built too light, and it does not take very much pounding to knock them to pieces. I have still to say a few words about very heavy carriages and lorries in France. Very few large steam lorries have been built. England perhaps has made more advance than any other country in this direction. In Germany there is a large manufacturer who makes a specialty of petrol-driven lorries, and the recent trials of such vehicles at the German, Austrian, and, I believe, Russian army manoeuvres, have given much encouragement, and it is my opinion that this field is a very large one. The arrangement of the various organs of these petrol-driven lorries is very much the same as the general French type. They are much heavier and will stand much knocking about.

You will all be glad to learn, at least those who are more moderate in their ideas, that the speed question does not interest people in France so much now as it did a year or two ago. That carriages should be built with power to carry them up hill at a good rate of speed and through sand and mud everyone agrees, but this touring through the country at the rate of sixty or seventy kilometres an hour has done much to stimulate legal action against automobilists. Thirty miles an hour is a very fair speed, and when one can make an average of twenty-five miles an hour it would seem to me all that can be desired. In order to make this new means of locomotion popular outside of the more sportive element one must relieve it of the dangers consequent on excessive speeds. Really, a jolt through the country at from twenty to twenty-five miles an hour gives one the opportunity of seeing the scenery and of enjoying the society of one's travelling companions. The day of the leather jacket, black trousers and cap has passed in France; people get into their automobiles as they would into their carriages, and with just as much certainty of getting to their destination in the time calculated as they would by taking a train.

The great popularity of the automobile in France to-day is not altogether due to the perfection of the French machine. Credit must be given to the officers and members of the French Automobile Club, as they certainly have used all their energy, time, and efforts to gain the public approbation for a means of locomotion which, beginning in a sport, finds its own commercial side in its practicability. The officers of the French Club have done an immense amount of work in getting passed reasonable laws referring to the running of automobiles; they have stimulated the legislation and necessary appropriation for the maintenance of roads; they have encouraged the establishment of modern conveniences and good food in the hotels along the lines of communication, which long since had fallen into desuetude consequent on the abandonment of the ancient diligences; they have established intercommunications between countries, and made it possible for the touring automobilist to disregard the national frontier. A man may go now from Paris to St. Petersburg, or from Berlin to Madrid, but with few Custom House formalities.

BEFORE the Derby Society of Engineers Mr. Henry Fowler, A.M.I.C.E., read a paper the other evening on "Motor-cars for Heavy Traction," in the course of which he advocated the abolition of the present tare limit.

COMPARING the ways of the present with the manners of the past, the *Onlooker* says that at one time for a young girl to be seen driving in a hansom cabriolet argued a want of the domestic virtues. Nowadays she goes to dances in a private motor-car, and no one turns a hair.

THE congestion of traffic in Brentford since a double line of tram-rails was laid has caused much indignation among the market gardeners of the towns beyond. To provide for tramways without widening the roads is a foolish policy. The adoption of a motor-car service would have been as useful to the locality, without causing any inconvenience.

THE VIPEN DETACHABLE SIDE FLANGE RIMS.

THE following is a short description of an improved rim for the wheels of motor-cars or road vehicles having pneumatic or other elastic tires, which has been invented by Mr. H. Lavaggi, of the East Riding Cycle and Motor-Car Works, Grosvenor Street, Hull. The figure shows a sectional view of a motor-car wheel fitted with Mr. Lavaggi's improved rim. The rim is made in two parts, one part consisting of a hoop A provided

FIG. 1.—WHEEL WITH FLANGE DETACHED.

with an upturned side B, which forms one edge of the rim, the other side of the hoop being open. The other part consists of a loose ring C of suitable depth. The hoop is secured to the periphery of the wheel by means of bolts, or screws, and the loose ring C is fixed by bolts E to the side of the wheel, forming, together with the upturned side B of the hoop A, the complete

FIG. 2.—WHEEL WITH FLANGE IN POSITION.

rim. It may be mentioned that the loose side C is sufficiently large to enable its upturned edge to pass over the thickened edge of the tire cover when it is placed in position. By this means

the edge of the cover does not require to be forced under the turned edge. Another point to which attention may be drawn is that the bolts are fixtures, and when the tire is passed on to the hoop part A, the loose ring is slipped on to the bolts with the greatest ease and facility, it only being necessary to nip the nuts up to firmly fix the loose ring and so bind the tire within the rim. With this improved construction of rim, nothing can, it is claimed, be simpler than the removal or fixing of a pneumatic tire, as all that is required is to unscrew the nuts and remove the loose side, when the tire cover, and the air tube also, if necessary, can be drawn off the open side, no other tool beyond a spanner for the nuts being necessary. The rim has, we understand,

FIGS. 3 AND 4.—SECTION OF VIPEN RIM.

been thoroughly tested on the back wheels (32in. by 3 in.) of a voiturette, and has given the utmost satisfaction. The rim will take either a thickened edge, or a wired-on, tire, and can be fitted to any existing wooden wheel. The East Riding Company inform us that all their 1902 cars will be fitted with Vipen rims.

THE proprietors of the Westminster Motor-Car Garage in Page Street, Westminster, S.W., are, we hear, about to put down special plant for charging the batteries of electric vehicles. At present only ignition cells can be recharged, and the additional facilities will no doubt be greatly appreciated.

BOSTON, U.S.A., is to have a club for aerial navigation, like the one recently formed in London, and, like that club, too, the idea started with a certain group in the local organisation of automobilists. The new organisation, which has adopted the name of the Aero Club of New England, will study the general subject of aerial navigation, but more particularly is intended to make ascents and to own an airship.

A NEW sparking plug has been devised by Mr. R. J. Paton, of 37, Gunnersbury Lane, Acton. The feature of the plug is that no cement whatever is used; the porcelain is in one piece, of special design, and is held in position by a nut and lock-nut. The plug is made gas tight by asbestos washers and asbestos string. Another feature of the plug is the adjustable sparking points; the metal portion of the plug terminates in a bridge piece, in the centre of which is fitted a small screw forming a point, which by means of the screw thread can be fixed in any desired position. The plug is neatly made, and its design is such that it should prove an addition to the already long list of various sparking plugs on the market.

MR. WALTER CREBER, of Barrhead, N.B., not being able to have a motor inspection pit, has sent us a photograph of a portable stand he has made to enable the under side of his car to be examined in comparative comfort. The stand, which also facilitates the operation of cleaning the car, practically consists of two stout trestles connected together by two strong planks, thus forming a platform for the car, which can be held in position by wedge blocks. The car is got on to the stand by means of two planks running from one of the trestles to the ground. Mr. Creber considers that hotel proprietors not able to have an inspection pit in their yards would do well to equip them with a platform of the type above outlined.

JOINTS AND PACKINGS.

BY R. W. BUTTEMER.

A LARGE proportion of the minor troubles which fall to the lot of the automobilist have their origin in faulty and leaky joints, and, in view of the large and increasing number of recruits to the ranks of car-owners whose mechanical training is only at its commencement, a short and somewhat elementary treatment of the usual methods of packing and re-making such joints may not be without its uses. Joints are numerous—often unnecessarily so—in most modern motor designs, and any improvements which reduce their number or size—as the frequent practice of casting cylinder and cover in one piece, or that provide for ground joints without packing—are to be welcomed, provided that they do not involve castings being too complicated or necessary renewals being costly; but some will be inevitable in any design, and the materials available for making them may next be considered. Of these the principal are soft metals, fusible or infusible, as lead and copper; asbestos, in the form of soft or hard sheet, string, and sheet of a third variety on a wire-gauze base and containing some rubber admixture, which, though used for steam-pipe joints, is to be avoided for most motor-car purposes; leather; rubber; and finally the old familiar hemp and red lead, which latter is mixed with an equal part of white lead and made into a thick paste with linseed oil, and is always useful when making screwed unions in pipes which do not have to be often disunited.

The selection of these will depend on the purposes of the joint, whether it has to resist high temperatures, steam heat only, water, oil, or petrol; and the best joint of all is one in which no packing is needed, i.e., when the surfaces can be got to such a degree of truth that when drawn together with only a smear of oil or red lead, or even without this, a tight union is obtained. This may be done easily and cheaply by grinding when the surfaces are not large and studs or other projections do not interfere with the necessary rotation of one surface on the other; while when this is impracticable it must be done by scraping, which, though an expensive method, requiring some skill, would, in the writer's opinion, repay its more frequent employment. In default of this, packing is necessary, and the most usual material for this is asbestos, the chief objections to which are its fragility, necessitating care in handling, and the fact that it does not stand water well, though unaffected by heat or dry steam. One principle to be borne in mind when making joints is that the thinner the packing is, the better, and the thin hard blue asbestos sheet is on the whole most satisfactory, especially where a water joint is unavoidable. For this purpose it should be soaked in linseed oil, or smeared with tallow (the writer generally makes the tallow into a thin cream with a little petrol, which ensures its rapidly penetrating the sheet), and may be also blacklead on each surface to render its removal easier when the joint is to be re-made; but with a difficult joint this is better omitted. Blacklead has an awkward way of forming hard concretions on iron surfaces which are very adherent, and the greatest care must be taken in removing such, with any fragments of old packing, especially about the bases of studs, etc., before beginning to make a joint, and clearing out the grooves usually present to retain the packing. Bolt holes should be punched (or, better, cut with small curved scissors) amply large, and burrs of asbestos round them avoided, while there should be no broken lines or folds in the sheet. Where the bolts are light, or few in number, the softer white asbestos may be employed, and screwed up at intervals, allowing time before the engine is used again. For combustion joints only, the asbestos may be used plain, or rubbed with a little blacklead and grease.

A useful packing is made of asbestos covered with thin copper where small joints only are concerned, but it is not easy to get sufficient pull on it safely in the case of a large area. In small cycle engines, where such a joint is used for the cylinder head, it is frequently left too broad, and cutting it down to about one-eighth or three-sixteenths will enable a better joint to be made without excessive pull on the bolts.

Water and steam joints in circulating pipes may be made with good rubber, which is not always easy to get, or more usually with leather; this, however, when the joint admits of it, is apt to swell and partially block the pipe. Asbestos will do, but does not always last; while hemp and red lead do very well in the case of screwed unions, though inapplicable to flange joints. A ring of soft sheet lead also makes a good packing where the union is strong enough to admit of screwing it up. For high pressure steam asbestos is most suitable, but joints should not be in positions where condensed steam may soak them.

Joints in petrol pipes are best made with leather washers, softened with water, not oil; while a useful tip that the writer has found handy in emergency is that the glue and treacle mixture used for printers' rollers forms a cement, unaffected by petrol, capable of fixing a gauge-glass or stopping a leak, which is better if made with more glue and thus harder than usual; or glue with a small addition of glycerine will answer the same purpose.

If a joint is not tight with gentle screwing up, it is probable that the cause is to be found in want of care in cleaning the sur-

THE TREVISAN MOTOR-BICYCLE.

A SOMEWHAT novel motor-bicycle has lately been devised and put on the market in Italy by Signor A. Trevisan, of Padua. An illustration of the machine is given herewith, from which it will be seen that the engine is of the horizontal type; it comprises two air-cooled cylinders, the piston rods of which are directly connected to the spindle of the rear wheel. Electrical ignition is employed, while the engine is provided with a special arrangement of valves. The machine weighs complete 80 lbs., and can, it is stated, attain a speed of twenty-five miles per hour. The maker claims great stability for his motor-bicycle by reason of the low centre of gravity.

THE works, plant, and business of the Kingsburgh Motor Construction Company, Ltd., at Granton, Edinburgh, are to be put up for sale by auction on the 5th February, as a going concern.

THE TREVISAN MOTOR-BICYCLE.

faces, and re-making is necessary. Violence will seldom mend matters, and usually leads to that most awkward of accidents—a broken stud.

DURING his last week-end visit to Dalmeny, Lord Rosebery made use of a motor-car in his journeyings to and from Edinburgh.

THE car entered by the Wolseley Tool and Motor-Car Co., Ltd., for the Gordon-Bennett race will, we hear, be fitted with Collier Twin tires.

THE new three-cylinder motor-car introduced by Messrs. J. W. Brooke and Co., Ltd., was out for its trial run at Lowestoft last Saturday, with, we hear, successful results. We hope to give full particulars of the car in an early issue.

MR. C. JOHNSON, of 18, Argyll Mansions, Addison Bridge, W., would be glad if the gentleman who is a motor cyclist and who was standing with the policeman, by the Obelisk, at the fork of the road near Alconbury, on Sunday, 12th January, would communicate with him immediately.

At a Board meeting held on Tuesday, the 21st ult., the directors of Friswell, Limited, declared a dividend of 6 per cent. on the preference and 9 per cent. on the ordinary shares for the year ending 31st December, 1901.

MESSRS. PETO AND RADFORD have found it necessary to increase their sales department, and have therefore fitted up the whole of their premises to accommodate the electric ignition trade, additional offices having been taken at 55, Hatton Garden, E.C. They are also introducing this season an entirely novel accumulator plate, specially designed for motor-car work, and are devoting particular attention to motor-cycle batteries.

MR. MARK MAYHEW, L.C.C., the vice-chairman of the Automobile Club, has sent a vigorously-written letter to the press, protesting against the way in which the roads in Lincolnshire and Huntingdonshire are repaired. He points out that if the roads were mended by stages and rolled at once their surface would be at all times greatly improved, and the amount of mending eventually required considerably reduced.

HERE AND THERE.

A SERIES of weekly lectures on internal combustion motors is about to be given at the French Automobile Club, in Paris, by M. G. Moreau.

MR. T. BARON RUSSELL declares that in twenty years' time it will be illegal to use a horse in the streets of London—a sanguine declaration that is not likely to help the automobile movement, no matter how well-intentioned is the author.

STILL another arrangement for renewing the third-speed rings of change-speed gears of the Panhard and Daimler types is that which has been lately introduced by Mr. J. F. Scott, of 37, Elm Row, Edinburgh, the rings being made detachable

from the sleeve. Fig. 1 is a longitudinal sectional side elevation of the new sleeve, from which it will be seen that the sleeve A is provided with a flange *a* to and upon which is bolted the toothed wheel ring B, or third speed wheel, by means of the bolts C. As shown in Fig. 1 the third and fourth speed wheels abut: the required distance between the two wheels being obtained by forming the third speed wheel B with a flange or collar piece *b* which abuts a similar flange or collar piece on the side of the fourth speed wheel D. The bolts C are passed through both collars or flanges and into the flange *a* of the sleeve. The ends of the bolts which pass into the flange of the sleeve are formed with a tapered head so that the head of the bolt is flush with the side of the flange. The other ends of the bolts are provided with nuts, as shown, so that the whole can be screwed up tight. Thus, by unscrewing the nuts and withdrawing the bolts, the

ring of the fourth speed gear wheel D can be withdrawn from off the sleeve and then the ring of the third speed wheel B can be similarly removed and be substituted by a new third speed wheel. We understand that the manufacture of the Scott sleeve has been taken up by Messrs. Smith and Coventry, Ltd., engineers, Salford.

MR. G. W. DAVEY, Stoke Bishop, Bristol, invites drivers of motor-tricycles or motor-bicycles to drive to his place by appointment, and give his horses a little tuition. He has a motor-car, and will be pleased to give similar education to the horses of anyone in Bristol.

THE Hon. C. S. Rolls and Mr. S. F. Edge have been elected members of the Aeronautical Society. The next meeting of the society will be held in March, when Mr. Rolls will exhibit a collection of old prints descriptive of ballooning.

JUSTICES of the peace, says *Truth*, regard the motor-car driver as a legitimate prey for the county funds. They are only too pleased to get the full fine out of the driver, and the intelligent constable is naturally delighted to find such an easy victim.

INDIANA horsemen are complaining of the alleged encroachment of the automobile upon the primary use of the public highways. They denounce the courts for holding that automobiles have equal rights with other vehicles drawn by horses, an attitude not wholly unfamiliar in this country.

AMONG the honorary members of the Acetylene Association which has lately been registered by licence of the Board of Trade are Sir David Salomons, Bart., Professor C. Vernon Boys, F.R.S., and Sir Hiram Maxim. The object of the Association is to advance acetylene gas engineering and manufacture in the interests of the public, and of the industry.

AN attempt at humour in the *War Cry* consists of a cartoon in which two motor-cars are depicted—one, the Speedwell, goes steadily on its way; the other, the vehicle of the Snoretown Corps, which has got into ruts, and consequent difficulties. Apparently the moral to both motorists and Salvationists is to avoid ruts. So far as the former are concerned, it depends upon the road surveyors.

FROM Messrs. W. J. Davies and Sons, of the Emery and Blacklead Mills, Weston Street, London, S.E., we have received a sample tin of a very fine emery powder specially prepared for the grinding in of the valves of petroleum spirit engines. It is used with thick oil as usual, and is guaranteed to do its work in half the time of the ordinary flour emery, and to leave a much more durable surface. We hope to try the new powder, and report upon it in due course.

MOTOR-car insurance, including the cost of legal defence in cases of alleged furious driving, is the latest development of the Compensation and Guarantee Fund, Limited. For an annual premium the fund insures owners of private automobiles to the extent of £200 against claims by members of the general public for accidental injury to person or property, against loss by theft, and against the costs of legal defence, in cases of alleged furious driving.

"MOTOR-CAR Impressions" is the title of a slight sketch in the February number of *Harper's Magazine*, by M. Maurice Maeterlinck, the Belgian dramatist and poet, who writes dreamily and enthusiastically about the automobile. "I touch the magic handles," says the author, who has mounted his "poggriff." "The fairy horse obeys. . . . I conquer the plains, which bow down before me. The pace grows faster and faster; the delirious wheels send forth a shrill and eager cry. The trees shrink back in dread of disaster; or bend tumultuously forward, and their myriad leaves, quick to the almost insensate joy of the force that is chanting its hymn, breathe in my ears the eloquent psalm of Space, admiring and welcoming the enemy that has hitherto always been vanquished, but now is triumphant—Speed."

A NEW catalogue of electric carriages has been issued by the City and Suburban Electric Carriage Company, of 6, Denman Street, W. The selection of vehicles illustrated includes a dog-cart to seat two, the Victrollette as supplied to the Queen, three-seated and four seated electric mail phaetons, a touring phaeton fitted with a battery giving a distance of 100 miles at thirteen miles per hour, or seventy miles at twenty-six miles per hour on one change of current, and a rear-driven victoria, electric landaulettes, broughams, hansom, omnibuses, and delivery vans are also included in this catalogue of vehicles of good and fashionable design, embodying the most recent improvements, and the results of six years' public experience. The City and Suburban Electric Carriage Company have supplied their carriages to many members of the nobility.

CORRESPONDENCE.

FRANCE COPYING ENGLAND.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the letter of a correspondent of yours signed A. J. Westlake, in the issue of January 18th, he suggests that the Napier was not the first to use a number of improvements in motor-car engines which have since been copied by the French. On going into dates I find that the first Napier engine was designed with the separate water-jacket, so that aluminium could be used, in October 1898. Even your correspondent does not suggest that Mors used this before 1899. I myself actually had a car running in France in 1900 made on this principle, but we had the Napier engine made before the Napier car. In regard to the straight exhaust valve stems, Napier was the first firm of repute to use these with the modern type of vertical engine, and we used these before Mors even made a modern type of engine.

Re maximum power for weight; there need be no argument on this point. The 50 h.p. Napier engine can be tested on the brake and weighed by any competent person, providing Mr. Westlake will produce the necessary evidence in regard to the Mors. I quite appreciate his wish to see the Napier car succeed abroad, and I feel sure under the circumstances he will not object to my clearly setting out the facts of the matter, all of which can be proved by documentary evidence.—Yours truly,

S. F. EDGE.

THE AUTOMOBILE CLUB SHOW.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Allow me to burst forth with a few remarks on the subject of the forthcoming Agricultural Hall Show. In company with various exhibitors within the last few days, many remarks have been made with regard to the opening day; it was pointed out that, if the show was to be opened under very grand auspices, the exhibitors would have to have everything ready by 10 a.m. on the opening day, April 19th.

If we look back to the last show, and remember how many of us were behind in our exhibits, we cannot help but feel that to be dilatory a second time, and under such great auspices as we expect to open with this year, it will seriously affect the show; therefore, as a means to preventing a recurrence of the delay in this respect, allow me to suggest that the exhibitors agree to a £5 fine in all cases where their stands are not ready at the time as above specified; or, if it would be better, make it £5 for the first day's tardiness, and £1 per day for each successive day.

Further, that these fines, which would be collected by the management or a committee, would go to a fund for the purpose of ending up the show with a grand dinner, or for some philanthropic cause.

I would like to hear the opinions of other exhibitors through the *Journal*.—Yours faithfully,

THE NEW YORK TYRE CO., LTD.

BERNE NADALL.

Managing Director.

THE HERTFORDSHIRE POLICE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with surprise, and certainly regret, the references, in "Flotsam and Jetsam" last week, to the Hitchin and Hertfordshire police. I cannot enter into the rights and wrongs of the incident "Flaneur" records against them for obvious reasons, but as a resident in Hitchin, and as one who has been for the last two and a half years a constant driver of a motor-car in Hitchin, and throughout every portion of the county, I cannot endorse the remarks as to the general bearing of the Hitchin or the County police, or of the Chief-Constable, Lieut.-Colonel Daniell, towards automobilists. As far as I know there has as yet been no persecution whatever in Hertfordshire, and no prosecution for riding beyond the legal limit on an open road away from towns, and only isolated cases of driving to the common danger in towns, notably, I am told, a flagrant case at St. Albans, for which we as a county and "Flaneur" himself are suffering and must expect to suffer.

For my own part I have ever found the Hitchin police, from our Deputy-Chief-Constable downwards, civil and obliging to a degree, and so far as my knowledge goes they have never even held up a hand to the driver of a motor-car, although some of them travel through the streets of the town quite as fast as they should. I have made enquiries and am told that "Flaneur" is mistaken in thinking the policeman who handed him Colonel Daniell's recently issued notice did so in any other than a polite and well-meaning way. Surely it is better for the police to issue a warning and to hand copies of it to drivers, than suddenly act in a more aggressive manner without first doing so. With regard to the remarks as to Colonel Daniell himself, I am also at variance with the writer of your notes, for I am certain that had the Colonel been strongly prejudiced against motor-cars, we should have had many more "furious" driving prosecutions in the county than we have had. How happy would the life of the automobilist be if he only had the Hitchin and the Hertfordshire police to deal with!

Is not "Flaneur's" article, written it would seem without intimate knowledge of the attitude of the police of the county in question towards

motor cars, likely to do more harm than good? Who can wonder if the Hitchin police force, for instance, come to the conclusion, after reading it, that they may as well have something to be blamed for, as be blamed for nothing, for I am convinced that their behaviour towards motor-cars has been up to now decidedly lenient, to say the least.—Yours very faithfully,

F. R. CARLING.

THE RECENT BRAKE TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In a recent issue of the *Journal* I note that in the report of the Automobile Club brake trials the distance from London to Welbeck is stated to be over 150 miles. I think it is a pity that the Club should have to go this great distance, when Cirencester Park, within ninety miles of town, would be an absolutely ideal place in which to hold motor-car trials, especially speed tests, as a perfectly straight run of about five miles could be indulged in over a broad and slightly undulating road.

Might I suggest that the Automobile Club should endeavour to obtain Earl Bathurst's permission to hold their next trial in this beautiful park? I am confident that all automobilists who are acquainted with the locality I refer to will endorse my opinion that no better place for the purpose can be found in all England.—Yours truly,

F. M. BOSTOCK.

MECHANICAL FLIGHT UP TO DATE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read with great interest the articles on arial flight by Mr. S. H. Hollands, but I have seen no mention of the tail of a bird being used for soaring purposes. I have lately been carefully watching the flight of crows in a strong wind, and it seems to me that the bird, by inclining its tail (with the same action as a ship's propeller), with its windward edge down and its leeward edge up, so lets the wind glide over the upper surface of it as to force down its tail end, and incline its aeroplanes, or wings, at an angle with the wind and shoots up a short distance like a kite, then it brings its tail to a horizontal position, and falls at a slight angle by gravity, then twists its tail again, and shoots up again, and so on in a switchback manner.

I think that if an airship could be constructed (or perhaps has already been) on these lines, and given some sort of push upwards answering to a bird's spring at starting, it could successfully fly in a strong wind. I am a beginner in every sense of the word in this subject, and perhaps this theory is quite an ancient and long ago discovered one, but I have not heard of it, and I thought it would raise an interesting discussion on the flight of birds.—Yours truly,

A. C. E. WHITTARD.

MR. FRANK MORRIS writes:—Permit me to apologise for a mistake that was made in my letter *re* Renewing Speed Gear Wheels in the last issue, owing to the omission of a line in par. 4:—"It is a well-known fact that the speeds on a Daimler gear sleeve, 'after being connected upon my system,' are then all detachable, &c."

In connection with the discussion on motor-bicycles for 1902, Mr. G. H. Smith, of the United Motor Industries, Ltd., writes:—"Judging from Mr. Teschemaker's letter in your issue of January, 18th I judge that that gentleman, although he knows evidently a good deal about motor-bicycles, is not yet acquainted with the Chapelle motor-bicycle with two speed gear, or he could not have made the remark that motor-cyclists are generally to be seen assisting their vehicles up hills, without in fairness alluding to the Chapelle, which machine is a brilliant exception in this respect. Being fitted with a two-speed gear there is practically no hill that the bicycle will not surmount without pedalling at all, and even if a precipitous path is encountered on some mountain side that no horse vehicle could possibly surmount, even then, thanks to the two-speed gear, the Chapelle will take itself up and half pull its driver who is walking by its side. If Mr. Teschemaker would kindly give me an opportunity of doing so I shall be very pleased to give him a practical demonstration of the hill-climbing qualities of the Chapelle."

ALLEGED THEFT OF A MOTOR-CYCLE.

FREDERICK WILLIAM DAVIES, 22, a cycle maker, of 18, Mansfield-street, Aldgate, and Andrew Mabon, 28, a cycle maker, of 17, Birnam-road, Tollington Park, Holloway, were charged, at Clerkenwell Police-court, with being concerned with others, not in custody, in stealing and receiving from the Agricultural Hall on December 2nd a motor-cycle, value £35, the property of Edward De Poorter and Co., Ltd. On the day following the conclusion of the Stanley Show, December 2nd, a Derby motor was missed from the prosecutor's stall. Recently an advertisement appeared in a cycle paper offering a Derby motor for sale at 19, Clerkenwell Road. The prosecutor's manager, Theodore Andrae, went to the address, and there saw the stolen motor. It was not fitted to the same machine to which it was attached when stolen. Mabon said he purchased the machine from the prisoner Davies. Subsequently Davies was visited at his address, and said he purchased the motor, which was detached, for £7. The defence was that Davies purchased the motor from a traveller for £7, and sold it the following day to Mabon for £8. A stout denial was given to the charge. Prisoners were committed for trial, Mabon being allowed bail.

NO LIGHTS.

At the Iver Petty Sessions, Cecil Hamilton, of Windsor, was summoned for driving a motor-car on the highway at Iver without showing a light at the rear, on the night of January 2. The chairman said it ought to be more widely known that it was necessary to have a light behind on a motor-car as well as in front. Defendant was fined 2s. 6d., and 7s. 6d. costs.

At Arundel Petty Sessions, Mortimer Mievill was charged with driving a motor-car without having a light placed thereon in the proper position—the right side. In defence defendant said the light was blown out, but there was a strong light on the left-hand side of the car. He was fined £1, including costs.

At Tunbridge Petty Sessions, Frederick Clarkson was summoned for driving a motor-car without having a lighted lamp attached, at Southborough, on January 2. P.C. Marsh proved the case, and a fine of 19s. 6d., including costs, was imposed.

THE FAULT OF THE TRAM-CAR.

In the Southampton County Court, Augustus Lickfold, commercial traveller, Southampton, sued H. H. Reynolds, former, of Pink's Farm, Diben, from whom he sought to recover £1 2s. 6d. in respect of damages to his motor-car. Plaintiff said his motor-car was standing outside Messrs. Tyrrell and Green's premises in Above Bar Street, Southampton, on the occasion in respect to which the claim was brought. Defendant, who was leading a horse and cart past at the time, had to pull up behind the motor-car whilst a tramcar passed, and on proceeding to pass the motor-car did not allow sufficient clearance, and knocked off the mudguard and smashed the lamp on the motor-car. To repair the damage would cost £1 2s. 6d. A porter in the employ of Messrs. Tyrrell and Green said he witnessed the collision. Defendant had plenty of room to pass the motor-car with his cart, but did not draw clear, and the cart collided with the motor-car, which was stationary close to the causeway. Defendant said his horse had been startled by the motor-car just previously, and a tramcar coming up behind made it restive. He was leading his horse, but it jumped in towards the causeway and the cart caught the motor-car. The tramcar passed his horse on the opposite side to the motor-car. His Honour said the defendant appeared to have done what he could to lead his horse, and the tramcar was to blame. He gave judgment for the defendant, but refused defendant's application for costs.

THEY NEVER WOULD BE MISSED.

With Apologies to Gilbert and Sullivan.

Often at a motor show some awful bores are met,
I've made a little list, I've made a little list,
Of some that we could do without—they're many—and you bet
They never would be missed, they never would be missed.
There are confounded people, who to the enclosure go,
And when a motor goes wrong say, "I always told you so,"
And all those who to play with the little taps insist
They never would be missed, they never would be missed.
There's the local record-breaker, and the friends of his who race,
The great and mighty country judge—I've got him on the list,
All folks who come to the gate and want to pay half price,
They never would be missed, they never would be missed.
There are lots of country Bobbies there, all eyes, and mouth, and ear,
We got 'em on the list, we got 'em on the list,
The folks who look on motors as things you may curse yet fear
They never would be missed, they never would be missed.
There's the man who drives an awful creak, and swears it is the best,
And other chaps most up to date all touring with the rest,
In fact, it hardly matters whom you put upon the list,
For they'd very few be missed, they'd very few be missed.

MOTOR MAD.

COLT V. MOTOR-CAR.

At the Stowmarket County Court, before Judge Eardley Wilmot, R. Bird, horse dealer, Saxmundham, sued Frank Lanchester, Birmingham, for £10 10s., the value of a colt killed by the defendant while driving a motor-car at Trot Hill, Stowmarket, on December 12th last. There was a counter-claim against Bird for damage to the motor-car, caused by the pony, which formed one of a herd being allowed to travel on the highway untethered. Mr. E. Holley appeared for the plaintiff; defendant did not appear. In stating the facts, Mr. E. Holley said the defendant was travelling on his motor-car at a very high speed, and ran into a drove of ponies belonging to the plaintiff, one of the animals being so seriously injured that it had to be shot. Defendant's solicitors had wired on the previous day, saying they were willing to abandon their claim, and would agree to pay his client's claim, promising to remit the amount by telegraph. Nothing had been received from them, and he now applied for judgment and costs. This his Honour (Judge Eardley Wilmot) at once granted.

ISSUING A WRIT.

A motion has been heard in Dublin, on behalf of Mr. Lane Joynt, Merrion Square, Dublin, for leave to issue a writ for service out of the jurisdiction upon Hutton and Co., who carry on business at Northallerton, Yorkshire, claiming damages for breach of warranty of a motor-car supplied to him. The court granted the order sought.

ALLEGED NEGLIGENT DRIVING OF A MOTOR-CAR.

At Marylebone County Court, on Tuesday, before Judge Stonor and a jury, Mr. Emmanuel George Holt, cab-driver, 22, Monro Mews, Golborne Road, North Kensington, W., brought an action against Mr. Fred Frentzel, 119, Elgin Crescent, Notting Hill, W., and Norland Mews, Addison Road, W., and Dr. E. Lehwess, 66, Holland Park Avenue, W., claiming £50 damages in respect of personal injuries, said to have resulted from the negligent driving of a motor-car by the defendants.

Mr. Bartlett Ellis appeared for the plaintiff, and Mr. Staplee Firth on behalf of both the defendants.

The plaintiff stated that on March 20th last he was driving a four-wheel cab along the Bayswater Road, in the direction of Notting Hill. He was keeping well in to his near side, being only about two feet from the kerb, and proceeding just beyond a walking pace. When he had reached Albion Street something came "bash" into the rear of the cab. He was pitched into the gutter. The next thing he remembered was lying upon the pavement, with a crowd of persons standing around. Then he was taken by two constables in a cab to the hospital, and afterwards home. Two of his ribs were fractured. For five weeks he remained in bed, and then pleurisy and pneumonia set in. He was unable to go back to work for nine weeks, and while prior to the accident he was able to earn about 30s. a week, he could now only clear about 25s. On the day following the accident Dr. Lehwess called, and gave half a sovereign to his (plaintiff's) daughter, and two days later both Dr. Lehwess and Mr. Frentzel came and gave another half-sovereign. In correspondence, however, the defendants denied liability in regard to the accident.

After medical and other evidence in support of the plaintiff's case, Dr. Lehwess said Mr. Frentzel was driving the car. When it was almost abreast of the cab the latter suddenly turned, the horse evidently crossing to turn down Hyde Park Street, and the hind off wheel of the cab caught the front near wheel of the motor-car. The cabman, who appeared to have been asleep on his box, then fell into the gutter.

After further evidence the jury were unable to agree. A new trial of the case was put down for March 11th.

FURIOUS DRIVING.

At Altrincham, Ralph Jackson, motor and cycle maker, Altrincham, was summoned for furiously driving a motor-car on the highway, and also that in passing another carriage he did not keep his car on the off side of the road, and further did not give notice by horn or other instrument. For the first and second charges he was fined 40s. and costs in each case, and for the third 20s. and costs.

THE PURCHASE OF A CHAR-A-BANC.

SHERIFF HENDERSON has decided an action in the Edinburgh Sheriff Court at the instance of Frank Morris, King's Lynn, against the Edinburgh Autocar Company (Limited). The pursuer sought payment of a sum of £24 17s. 6d., and the facts of the case as set forth by him are as follows:—On or about April 20th 1901, pursuer, by letter, purchased from the defendants an M.M.C. char-a-banc belonging to them, at the price of £40. One of the conditions stipulated was that it be despatched to the pursuer, free of rail, from Edinburgh. The defendants accepted that offer, and the pursuer remitted a cheque for £40 in settlement of the price agreed on. The pursuer further averred that the char-a-banc was not in accordance with the statement in their list of cars for sale, in respect that several expensive parts were wanting, and that the top and bottom portion of the gear box of the machine had not been forwarded. Although written to, the defendants have refused or delayed to forward the necessary parts, and the pursuer claims the sum mentioned. In their defences, defendants referred the pursuer to their offer, the list of cars, and letter of acceptance for their terms. After hearing counsel at a debate on the matter, the Sheriff found for the pursuer, and granted decree for £15, with expenses on the higher scale.

THE Motor-Car Journal.

VOL. III.]

LONDON, SATURDAY, FEBRUARY 8, 1902.

[No. 153.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

NOW that a general agreement seems to have been arrived at in favour of abolishing speed limitations with regard to motor-cars, suggestions for the identification of owners are being considered by the Local Government Board. At the deputation, to which reference is made on another page of the present issue, Mr. W. W. B. Hulton, the Chairman of the Main Roads Committee of the Lancashire County Council, said he hoped Mr. Long would consider that the crest or the coronet on the carriage and the livery of its owner formed a sufficient means of identification within six or ten miles of the permanent residence of the owner. If it were considered necessary to have some mark, then it should not be put on a conspicuous place, but so located that a police-constable could get the information required as was now done with hired hackney carriages.

Yorkshire Automobile Club.

UNDER the presidency of Dr. Thresh, the Yorkshire Automobile Club has held a very successful annual meeting. The membership has increased to forty-six, and candidates now awaiting election will bring the number up to sixty. The accounts showed a balance of £4 in hand, and after the report and balance-sheet had been adopted the following officers were elected for the current year: President, Lord St. Oswald; vice-presidents, Mr. H. Benn (Cleckheaton), Mr. T. E. King (Harrogate), Dr. Farrow (Cleckheaton), Dr. Thresh (Armley), and Mr. A. W. M. Bosville (Bridlington); Mr. L. Hey was re-elected hon. treasurer; and Mr. A. W. Dougill (Leeds) hon. secretary, with Mr. H. F. Cheswright and Dr. Allbutt representatives of the Club to the A.C.G.B.I. and the Motor Union.

Motor-car Stabling.

A LARGE majority of motorists are converts from what our Gallic neighbours call "hippisme," and consequently use their old stables for their new steeds; but though a good stable is adaptable as a very satisfactory motor-house, the problem of automobile accommodation is not best solved by the architect who proceeds on old-fashioned stable lines. In towns, the stable is generally perforce in close proximity to the house, but in country districts it is usually as remote from it as possible, an arrangement obviously preferable for hygienic reasons where horses are concerned, but quite unnecessary and inconvenient in the case of motors. A motor-house we saw recently was built abutting on the outer wall of the kitchen, from which hot-water pipes, forming part of the house system, were carried to warm it in cold weather; while in another case the car-shed, also warmed in a similar way, took the form of a well-appointed room accessible from the hall, so that preparations for starting could be made comfortably in cold weather. Such luxurious appointments cost little where a new house is concerned, and deserve the attention of architects.

Warming Motor-Houses.

THE warming of existing stables is a more difficult question. It is objectionable to leave lamps burning in the proximity of petrol containers, unless a safety stove somewhat on the Davy lamp principle could be supplied for the purpose; a flue under the concrete floor, with an outside grate like a greenhouse or a Roman bath, would be better, but is expensive. Well-closing doors, the exception rather than the rule in ordinary coach-houses, will do much to keep frost out of a brick building unless severe, but, of course, a corrugated iron one—often used for cars—is no protection against cold. With oil cars, the use of glycerine in the cooling water, or the emptying of tanks, removes the risk attending frost, except that of injury to the tires, which do not benefit by low and variable temperatures; but with steam cars the trouble of running off the water is too great for some protection against frost not to be demanded. Where the stabling has to adjoin the house, the advantage of the automobile over the horse is manifest; and apart from questions of hygiene, there is the fact that—if oil and grease cans are securely closed—no attraction is left for the ubiquitous and troublesome rodent!

Nottingham Automobile Club.

THERE was a good attendance at the second annual meeting of the Nottingham Automobile Club, when Mr. E. W. Wells presided in the absence of Mr. R. M. Knowles. The Club now numbers sixty-five members, and the committee have held twenty-five meetings during the past year. Among other useful work accomplished has been the reduction of the toll at Gunthorpe Bridge from 2s. to 1s. The balance-sheet presented to the meeting by Mr. A. R. Atkey, the hon. sec., was extremely favourable, there being several pounds in hand. Mr. R. M. Knowles was re-elected president, Messrs. T. Bayley, M.P., E. W. Wells, G. H. Kirk and G. Cowen vice-presidents. Mr. A. R. Atkey was unanimously re-elected hon. secretary and treasurer, and the following members were chosen on the committee:—Messrs. W. D. Wells, H. Rimington, S. Harvey, sen., R. Cripps, R. Harbidge, M. Ross Browne, T. Sharp and B. Winter. The president and secretary were elected as representatives of the Club upon the Council of the Motor Union.

In South Africa.

ON a previous occasion we referred to the boom in motor-cars that was to be expected in South Africa, and already news comes that this has fairly set in. Automobiles are now to be seen in the streets of Capetown, Port Elizabeth, Kimberley, Durban, and Johannesburg, while Bulawayo has also joined in the favourable attitude which South Africa is assuming towards automobiles. As soon as the railway arrangements will allow of their being brought up from the coast in larger numbers than at present a great many will be employed along the Main Reef. At Mafeking the automobile movement has received some little discouragement; otherwise the outlook

for business is decidedly good. During the present week the Motor Manufacturing Company, Limited, has booked an order for twelve 12 h.p. public-service cars for use in South Africa.

Welsh Neglect of Main Roads.

AMONG Welsh main roads, that from Aberdare to Aberaman is of considerable importance, and a favourite one for public services of brakes, cabs and motor-cars. There is complete unanimity among the owners of these various types of vehicles in condemning the County Council, which has neglected this road in a disgraceful fashion. It runs through the most populous district in the Aberdare Valley, and lately presented the appearance of a canal of mud. To spoil that, very rough stones were laid down in such large quantities that traffic has been impeded, and some of the motor-cars have been prevented from completing their journeys owing to the terrible state of the roads. In the early days of the last century the turnpike people laid stones upon the roadway to endanger the experimental motor-cars then running in some parts of the country; and the action of the Welsh county authority is singularly similar.

FOURNIER RETURNS FROM AMERICA--THE INTERVIEWERS' RACE.
[Das Schmaufert.]

Law and Justice.

A RECENT case of the attempted enforcement of an obsolete law—it may not be unnecessary to say it had no connection with automobilism—has elicited a comparison of the opinions of two Chief Justices, one at the commencement of last century, the other of the present date, on the subject of obsolete laws still unrepealed, which may interest motorists at the present juncture. The last-century jurist opines that “these laws were not intended to be enforced except at proper seasons, when there is a necessity for it, or, more properly speaking, were not intended to be enforced at all, but were merely made *in terrorem*.” The modern lawyer holds that “efforts to thus evade an obnoxious penal statute can hardly be justified, and the better course would be to allow it to be enforced, so that, its injustice being made manifest, it might more speedily be repealed.” The remark of a daily contemporary on this is “that experience has shown that an obsolete law can only be removed from the statute book by the constant breaking of it.” Comment is hardly necessary, though it may be remarked that the last argument of motophobes against “repeal” is the now repudiated idea of a century ago, that a law may be made not for consistent enforcement, but *in terrorem*.

Horses as Public Dangers.

IN 1862 a learned judge declared that a horse which would not stand the sight or sound of a locomotive constituted a public danger. Hence he said, the owner should be punished, not the owner of the locomotive. If such a decision was regarded as wisdom in 1862 it surely ought to be accepted in 1902. In fact, its recognition is even more desirable now than then, for the number of locomotives on the road has been supplemented by hundreds of light locomotives whose owners run many risks from the wild and fractious horses they meet on the King's highway. It seems eminently reasonable to make owners of horses careful as to their training and watchful as to the danger their animals are likely to do by shying or other equine antics.

Out of Date.

SOME of the illustrated papers must be sadly in want of subjects, for the *Pictorial World* lately published a page of illustrations which, however accurate they might have been five years ago, are certainly out of date at the present time. The reader is led to imagine that nothing can be seen of the country owing to the dust raised by the automobile, and a car in the midst of a drove of pigs is certainly depicted from imagination and not from observation. “And when the benzine gives out,” we are told by the letterpress, “the result is apt to be ignominious, with a horse drawing the car and its passengers on its homeward way.” Really the *Pictorial World* ought to know better.

An Interesting Experiment.

It is stated that an interesting experiment is being carried out on an American railroad. A new engine has had all its component parts carefully weighed prior to being put on the road, the intention being to re-weigh them after a definite term of service, and so estimate the proportional durability of the several parts of its design. We have some recollection of a similar experiment having been made with a bicycle of Professor Boys' some years ago, and it would certainly be instructive in the highest degree if made with a modern automobile. The ideal car should be like the deacon's “one-hoss shay,” so designed that as far as possible necessary repairs should all be required simultaneously, but the variable way in which different cars fail shows a state of things far from realising this aspiration. A really good series of scientific automobile experiments is a field which—except perhaps in the electrical branch—has hardly yet been touched, but should (in supplement to ordinary road trials *bien entendu*) prove particularly valuable to modern constructors.

A Sheffield Absurdity.

WHEN will the police authorities add common sense to their qualifications? Recently a Sheffield engineer was out with an experimental car, which broke down, as it happened, opposite the residence of a limb of the law. The engineer removed the car to the side of the road and went in search of a horse. While he was gone the policeman kept the car under observation, and lit the lamp when the night grew dark. A few days later the unfortunate motorist had to answer two charges in the local police court, (1) for causing an obstruction and (2) leaving the car without a light.

A Motor-Bicycle Trip.

MR. J. H. ADAMS went for a trip the other day on the Holden bicycle, filled with a trailer. The particular machine has covered 850 miles, and, starting from Brixton, the journey to Woking, *via* Barnes, Richmond Park, and Cobham, was accomplished in 13½ hours. Save for the spring of the saddle breaking a mile before Cobham, no stop occurred beyond that

occasioned by the greeting of a friend. All the stiff little inclines were taken without a stop, and on the return journey there was no stop till a voluntary one at Kingston. Then on to Brixton, the trip was completed in just under two hours. The occupant of the trailer rode the whole way, and seeing that no pedals were on the machine, pedalling was impossible. On the run of 61 miles a gallon of petrol was used.

How to Learn.

THE first object of every good motorist is, or should be, to get to know as much as possible about his car. It is related of a manufacturer who employed a Willans' steam engine in his factory, that his reply to some questions about its mechanism was: "It has three holes; steam goes in at one, comes out at another, and you put oil into the third; it works perfectly, and that's all I know or care to." Fortune seldom blesses car-owners with such limited knowledge, but it is quite remarkable what a small stock seems to keep some drivers on the road. It was different in the early days of motoring—and how small a proportion of modern automobilists remember them, recent though they were! But unpleasant—and educational—experiences are rarer now, and in the absence of any organised instruction, there is nothing more valuable than an afternoon spent in a good repair shop, if the civility of the proprietor and the affability of the motorist can bring such about. More may be learnt in this way than will ensue during weeks of uneventful driving.

Chased by a Runaway.

THE unusual sight was witnessed the other afternoon of a motor-car making a supreme effort to escape from the too pressing attentions of a runaway horse. A policeman was on duty at the Market Hall Corner, Redhill, when he saw a motor-car coming towards him at an excessive speed up the High Street. When the constable motioned the driver to stop, he called out, "Get out, there's a runaway horse after me!" Upon looking in the direction from whence the automobile came the constable had ocular demonstration that the statement was correct. A horse attached to a milk cart was apparently in pursuit of the motor-car at full speed. The efforts which the constable made to stop the animal were futile, and the chase continued as far as Boulton's Corner, where the animal veered round into Wiggie Lane, and was eventually brought to a standstill at South Merstham. What protection would local authorities afford motorists from such runaways?

Motor-Cars for Cycle Clubs.

IN order to increase the popularity of cycle clubs, a firm in one of our London suburbs makes a suggestion that is worth the consideration of those interested in the motor-car industry. It is that cycle clubs should possess their own motor-cars for the purpose of accompanying club runs, and when not wanted for that purpose, for the use of individual members. By getting the members to each subscribe a proportion of the cost a car could be purchased, and the delights of motoring extended to a wide circle. It would be interesting to have some idea of the life of a car under such circumstances compared with that of one driven only by its actual owner.

Is Noiselessness Desirable?

MANY men who are accustomed to driving both steam and petrol cars profess to find a disadvantage at times in the noiselessness of the former. Working through ordinary traffic the motorist experiences a constant need of making careless and thoughtless people aware of his approach. On a petrol

car this is automatically accomplished, as the noise of the engine and gear, etc., is generally sufficient to convey the necessary warning. Being a continuous sound it comes to the car of the pedestrian or other driver without the shock of suddenness produced by the striking of an intermittent alarm. He is prepared for it in a manner, and has time to collect his wits. The steam car, however, approaches almost noiselessly, and if the driver is maladroit in sounding his gong or horn, the effect may be discomposing. A pedestrian or horse driver roused from his road-reverie by a strident alarm tends towards panic. To avoid producing these sudden shocks the motorist very often is constrained to keep sounding his gong or horn continuously, and it is not pleasant to his ears. The bicycle is the only other noiseless vehicle on the highway, and riders have frequently found this property productive of accident. Every other vehicle makes a certain kind of noise, and this may often vary with the speed, so that the pedestrian, without looking round, can approximately judge of the pace at which such vehicle is approaching. This automatic noise reaches up side streets and cross roads, and warns approaching objects of its proximity. The driver of the noiseless vehicle, on the contrary, must look out for such crossings and openings and sound his alarm, or something may crash into him. On the whole, perhaps, he is constrained to greater watchfulness. Far be it from our intention, however, to deprecate silence. Many petrol cars could do with considerably less noise; and no one who has enjoyed the silent-running car will be inclined to consider the quality undesirable, though he may have to admit that it is not without its minor disadvantages.

COL. CROMPTON IN THE WARS AT WELBECK PARK.
Photo by [Mr. J. A. Holder.]

Raiment [Again]

THE vagaries of motor-car attire are a perennial subject of comment in the newspapers, as well as of candid criticism from the man in the street who does not rush into print, but vents his views in startling and striking language. Here is the *Irish Field* describing the raiment of motorists as "inex-

pressively weird," "offensively ugly," and "peculiarly hideous," while the *Birmingham Gazette* quotes the saying of Mr. Barry Pain to the effect that the possession of a motor-car implies at least moderate wealth, but the possessors invariably look poor. Probably in this, as in other matters connected with garments, Royalty will have an important influence, and we note with interest that in many motor-cars owned by fashionable people coachmen are being transferred to the steering wheel in the same costumes in which they were wont to direct proceedings from the box seat of the brougham.

Club Discussions.

NEXT Wednesday the Right Hon. Sir J. H. A. Macdonald will read the chapter on "Reminiscences," at the Automobile Club, which he has prepared for the Badminton Book. Sir Francis Jeune will preside. On Wednesday last the Hon. C. S. Rolls read his chapter on the "Caprices (Other Than Ignition) of a Petrol Motor," Mr. J. Ernest Hutton being in the chair. Mr. Rolls has also written a series of articles for newspaper publication. These will appear during March and April.

MOTOR-CARS AT LIVERPOOL.

THE sixth annual Liverpool Cycle and Motor Show was opened under the happiest auspices on Tuesday, the formal ceremony being preceded by a luncheon, at which about seventy were present. The Hon. A. Stanley, M.P., took the chair for the first part of the proceedings, but having to attend to his parliamentary duties that position was subsequently occupied by Professor Hele-Shaw. The Hon. Arthur Stanley wished the show every success. They must all welcome, he said, the recent pronouncement of the President of the Local Government Board as being a step in the right direction. He (the speaker) had just come back from South America, and he was struck by the fact that in this country more than anywhere else restrictions were put upon our trade by the Local Government Board, the Board of Trade, and other bodies. If this country were to fight the rest of the world successfully it must not be compelled to do so with one hand tied behind. This was especially true of the motor industry, of which he was glad Liverpool was a pioneer, and he therefore all the more cordially wished success to the present show. He believed the time was not far distant when they would have a regular and available motor service around the district, and with such a system in operation much less would be heard of agricultural depression.

The formal opening of the show was performed by Mr. G. H. Cox. Professor Hele-Shaw presided, and said that the presence that day of so many admirable motor-cycles showed that nowadays the automobile was well-nigh within the reach of everybody. He had been connected with the show since motors had been introduced, and on the first occasion there was only one motor-bicycle and one motor-car in the exhibition. Since then there had, of course, been great improvements, and last year thirteen vehicles undertook the trial to Ormskirk and back without a single hitch. This year twenty-one had entered for the run to Blackburn and back, which would cover a route of eighty miles, and there was every prospect of a most successful run.

Mr. G. H. Cox, in declaring the show open, remarked that it was the best ever held in the district, and every credit was due to the promoters and others who had assisted in the development of self-propelled traffic. With regard to the question of tare, however, he was sorry to say that in spite of the sympathy of Mr. W. H. Long—expressed in Liverpool a few months ago—nothing had so far been done to amend the present law.

The exhibition is the largest of the series yet held, and is a tribute to the organising capacity of Mr. Price, the secretary. As might be expected, motor-bicycles are largely in evidence; there is also a fine show of automobiles. As in all motor matters taking place in Liverpool, Mr. Shrapnell Smith is well to the fore.

Taking the first stands on entering the hall, we notice that

of the British and Foreign Motor-Car Company, Limited, of 27, Islington, Liverpool. Here are to be seen specimens, well finished and handsome in appearance, of the 4½, 8, and 10 h.p. Rochet cars; a Cottereau; a 6 h.p. M.M.C.; and a 4 h.p. two-speed quad. Messrs. W. T. Pritchard, Limited, of Liverpool, exhibit specimens of the popular Stirling cars, including a dog-cart, phaeton, and a light delivery van. One of the latest products of the Humber Company, with a 6½-h.p. Aster motor and *tonneau* body, attracts much attention. Messrs. Marshall and Company, of the Belsize Works, Manchester, show a motor-van and one of their latest 12-h.p. cars, with the radiating coil travelling round the bottom of the bonnet and the front of the dash-board, certainly a distinctive arrangement. Messrs. Bennett and Carlisle, of Deansgate, Manchester, are present with an Argyll light van and two *tonneaux*, well worthy of the makers' reputation. The Imperial Autocar Company, of Manchester, have two cars—one a 6-h.p., and the other an 8-h.p. This company's vehicles have previously been described in the *Journal*. The Vulcan Motor and Engineering Company, of Southport, exhibit a two-seated phaeton, driven by a 3½-h.p. motor. The car is provided with two speeds—eight to twenty miles per hour—and the power is transmitted by a single belt, which is adjusted by a patent lever attachment by means of which it can be tightened or slackened by the driver from the seat. Mr. W. H. Buxton, of Bold Street, Liverpool, has a very fine show of Locomobiles, including a *dos-a-dos*, a dog-cart, a phaeton, and the usual popular two-seated vehicle so largely in evidence in the south. The public interest in steam-cars has been proved by the crowds surrounding this stand. This display also includes what is termed a carbon-silicon carburettor, a device for carrying petrol in a solid form, applicable to both steam and internal combustion engines, stated to give 100 per cent. more energy or heating power than petrol when used in the ordinary way. This ingenious arrangement will be on view at the Agricultural Hall in April.

On Wednesday a trial of light motor-vehicles took place in connection with the exhibition, the route being to Blackburn, *via* Wigan, Standish, Chorley, and Feniscowles; and back by way of Preston New Road, Samuelsbury, Preston, Rufford, and Ormskirk. Professor H. S. Hele-Shaw and Mr. E. Shrapnell Smith acted as judges, Mr. C. Herbert Bishop as hon. sec. to the judges, and Mr. H. F. Wheeler as principal hon. observer. The competition included fourteen motor-cars, three motor-cycles, and a quad, while a goodly number of non-competitors also took part in the eighty-mile run. Only one of the machines failed to reach Blackburn, and this mishap was due to unforeseen circumstances. The hon. secretary to the judges was on this car, but he was picked up by Mr. Shrapnell Smith, and was carried nearly twenty miles on the axle of the motor-tricycle. The trials were divided into three classes, and we hope to publish the awards in an early issue.

We understand that the London Autocar Company, Ltd., is prepared to quote for the conversion of the 4½ h.p. De Dion motor for voituresses into 6 and 8 h.p. motors by the supply of new cylinders, pistons, and specially-weighted fly-wheels.

THE Holborn Tyre Company, Ltd., are about to be joined by a well-known rubber firm, and will be registered as a limited liability company with a capital of £5,000, under the style of the Holborn Motor Tyre Company, Ltd. New premises are to be acquired to cope with the growing business.

MR. E. F. USBORNE gave a lecture on motor cars at the Lowfields Lecture Hall, Newark, last week. He said he had journeyed 5,000 miles during the last eighteen months on a De Dion voituress, and the vehicle was good for many thousands more.

THE Motor Cycling Club is organising a race meeting at the Crystal Palace on the 22nd inst. The motor-bicycle races (5 miles on the track) will be three in number, for machines with engines up to 1½ h.p., 2 h.p., and more than 2 h.p. respectively. Full particulars can be obtained from Mr. A. Lloyd Owen, the sports hon. secretary of the Club, 40, Oseney Crescent, N.W.

MOTOR-CAR REGULATIONS.

THE PROSPECT OF AN IMPROVEMENT.

IT was an influential deputation that waited upon Mr. Walter Long, the President of the Local Government Board, on Thursday, the 30th ult. Organised by the County Councils Association, it was introduced by Sir John Hibbert, who said the Association thought the limit of speed might be abolished if drivers of motor-cars were subjected to certain regulations, chief of which was that some clear principle of identification should be adopted, a course that was endorsed by the Automobile Club, the particular plan being left to the Local Government Board. The County Councils Association was also of opinion that the present penalty clauses of the Highway Acts were insufficient as applied to motorists—a suggestion that comes as somewhat of a surprise when the remunerative character of motor-car prosecutions to the county funds are considered.

Lord Thring made a very practical speech. He said as regarded speed they contended that the present regulations were equally bad for the trade and the public. The trade were subjected to keen competition from their Continental rivals, who had an advantage because motor-cars were allowed to go at a much higher speed than in England. It was well known that the present speed of motor-cars in England greatly exceeded twelve miles an hour, and his long experience with Acts of Parliament taught him that it was no use making penalties which would not be enforced, and therefore the limit of speed should be abolished. To name a limit of speed was really authorising a driver to go at that maximum, even when it was to the common danger. All they wanted was that the drivers should exercise due caution. As to adopting a number for identification, he did not know whether it was practicable, but the Local Government Board might devise something.

Mr. Long's reply was sympathetic. He concurred with what had been said as to the effect of the present regulations with regard to speed; but urged that allowance should be made for the fact that they were framed when automobiles were in their infancy in this country. The other points of his speech may be summarised as follows:—

1. At present it is impossible to contemplate any method of identification which would not apply equally to all kinds of motor-cars.
2. Numbering cars or painting names thereon does not seem altogether satisfactory, because it would hardly be possible to identify a car as it was passing at a great rate of speed.
3. Great security might be found in strengthening the law with regard to public safety.
4. Might not increased powers be given the police in rural districts to enable them to control the traffic of country roads as it was now controlled in towns.
5. There were many objections to licensing drivers.
6. The demand that there should be less limitations upon the use of heavy motor-cars for commercial purposes had been justified by the Liverpool trials.

We recognise that Mr. Long has a difficult task in framing regulations which will suit everyone, and the reports of Belgian and French experience that he has received have been too varied to give him much guidance from the Continent. One thing, however, is certain, viz., that he recognises the desire of the automobilists of this country to conform to any regulations which are based upon recent experience, and worded with some regard to common sense. His reference to the assistance rendered him by the Automobile Club was exceedingly welcome, for it is clear that the Local Government Board is considering the position in all its aspects, and that its decision will not be hastily given on partial evidence. It is very gratifying to find that county authorities are as keenly impressed as are automobilists with the fact that the present limitation as to speed is unsatisfactory and impossible. Having reached that point of agreement motorists

will await the plan of identification to be proposed by Mr. Walter Long with an easy resignation. For they are willing to fall in with any reasonable proposal that does not hamper the progress of the movement, and Mr. Long's reply to the deputation seems to indicate that a sympathetic attitude will be assumed by the Government, and that a less harassing time is in prospect for motorists and for the industry.

THE HUDLASS DOCTOR'S CAR.

THE accompanying illustration gives a general view of a motor-car that has lately been completed by Mr. F. W. Hudlass, of the Phoenix Motor Works, Southport, for the use of doctors. The vehicle is propelled by means of a 9 h.p. double-cylinder motor, the cylinders being $4\frac{1}{2}$ inches diameter by 6 inches stroke. The engine is fitted with electrical ignition, and both the cylinders and heads are water-cooled. Three speeds forward and reverse motion are provided, the power of the motor being transmitted to the counter-shaft by wide belts tightened or slackened as desired by means of a jockey pulley. From the counter shaft the usual duplicate pair of chains and chain wheels

convey the power to the rear road wheels. A feature of the car is the special body with which it is fitted. As will be seen, the driver sits inside and is entirely protected from the weather. The glass front and door can, however, be quickly detached. It will be noticed that, with the front in use, the hood at the rear is not extended to its full extent. Should the user of the car prefer to go out without the front portion of the body, the hood when fully extended gives a large measure of protection to the passengers. Complete, as illustrated, the vehicle weighs 18 cwts. We are informed that it is a good hill-climber, it having during recent tests taken all the hills in the neighbourhood of Mr. Hudlass's works on the high gear.

A 10 h.p. Wolseley car has just been delivered to Mr. Cecil Rhodes, who has taken it out with him to South Africa.

THE London Distributing Kitchens, Ltd., of 121, Victoria Street, Westminster, which make a speciality of delivering hot cooked meals at any desired time to one's office or flat, has recently acquired from the British and Foreign Electrical Vehicle Co., of 4, Bloomsbury Place, W.C., an electric delivery van, with a capacity for carrying one ton. The van has been running in a perfectly satisfactory manner for a month or two. It is fitted with Leitner batteries, and will run at a speed of about twelve miles an hour. The British and Foreign Co. attends to the charging of the batteries, and makes an inclusive charge for the services of a driver and maintenance of the vehicle and accumulators.

THE MEREDITH CARBURETTOR FOR SMALL PETROL MOTORS.

A SECTION of a new carburettor for use in connection with the small petrol motors of motor-bicycles is shown in the accompanying illustration. It is being introduced by Messrs. John Child Meredith, Limited, of Summer Lane, Birmingham, who state that their object has been to produce a carburettor which is simple, neat, light, and not expensive. The drawing is full size, so it will readily be seen that the device will not take up much room. One of the great features claimed for the carburettor is that it can be used in the coldest weather, and that, however rough the surface of the roads, it does not

A. Pulveriser.
BB. Inlet and Outlet for Exhaust
to heat Pulverising Chamber.
C. Petrol Supply Pipe.

J. Spring.

affect the working of the appliance. The petrol is admitted at the top, and the flow controlled by a regulating screw passing through a stuffing-box. The pulverising chamber is closed at the bottom by a valve of large diameter, carried upon a needle passing through a still lower chamber, whence the vapour enters the pipe to the motor. This lower chamber contains a spiral spring, which closes the flat valve except when the piston is making the induction stroke, when the suction opens the valve and compresses the spring. The pulverising chamber is warmed by a jacket through which a certain portion of the exhaust passes, being allowed to enter at one side and escape at the other. The top of the carbureting chamber is provided with holes closed by the usual form of revolving cap, by which the air-admission is easily controlled.

FLOTSAM AND JETSAM.

BY FLANEUR.

THE ways of the British Post Office are notoriously difficult to understand, and those of the Inland Revenue Department, if less extensive, are none the less peculiar. For the moment I have no old licences by me for purposes of comparison, but am considerably puzzled as to the right interpretation of the wording on the licence for 1902, which I obtained a few days ago at a suburban post office. The authorisation it confers is to "keep one carriage with four or more wheels, and fitted to be drawn by two or more horses or mules, or to be drawn or propelled by *mechanical power*, from the date hereof until the 31st day of December next following, the sum of two pounds and two shillings having been paid for this licence."

So far so good; but the third clause of a triple "notice" which figures at the foot of the document expressly states as follows:—"This licence is not applicable to a carriage which is a light locomotive as defined by the Locomotives on Highways Act, 1896." Curiously enough, moreover, the same contradiction in terms appears on the schedule which one is asked to fill up and sign when taking out a licence for a car. The problem which now presents itself is this: If the licence that has been officially vouchsafed to me be not applicable to "a carriage which is a light locomotive as defined by the Locomotives on Highways Act, 1896," what is the nature of the proper one which is to be obtained; and why, too, is it not obtainable? The post-mistress rejoined, when I pointed out the discrepancy, that that was the kind of licence she had always issued, and that she was not aware of the existence of any other; from which I infer that all the car-owners in my district are, like myself, the proud possessors of a car licence which is not applicable to a car!

ONE is moved to ask, moreover, what type of carriage it is that is "drawn or propelled by mechanical power," and is yet without the pale of the Locomotives on Highways Act of 1896. Traction engines we know, and there are tram-cars; but do these vehicles require a carriage licence of the ordinary kind, and is two guineas all they pay per annum, the one for cracking the road crust, and the other for enjoying a monopolist right of way? Never having kept a tame traction engine or an electric tram I am ignorant as to this point, but pending explanation I "hae ma doots." Perhaps—happy thought!—the Inland Revenue authorities were in league with Mr. Thomas Weeding Weeding when he essayed to eradicate the light steam car, and, fondly predicting the success of his campaign, they caused the form of licence to be printed for this present year of grace, 1902. But, joking apart, what will be my position if at any time I should be challenged by an Inland Revenue official to produce my licence? All that I can show him as a licence for my car, which is unquestionably a light locomotive as defined by the Act of 1896, is a document bearing clearly on its face the proviso that it is not applicable to a vehicle of that description. I have my own theory as to how the error has arisen, but will defer further comment until I have heard from the Commissioners of Inland Revenue.

MR. F. R. CARLING'S letter on "The Hertfordshire Police," which was published in the last issue of this journal, contains the welcome intimation that those persons have not, up to now, displayed the persecuting spirit of their Huntingdonshire confreres. I am right glad to hear it, and as Mr. Carling lives in Hitchin he ought to know the usual condition of things in Herts. But I am by no means able to acquiesce in the justice or the relevance of the major portion of his letter. I made no general charges against the Hertfordshire police, but addressed myself to two items of fact: (1) The serving of the Chief Constable's notice; (2) the terms of the notice itself.

WITH regard to the first. Mr. Carling in his first paragraph states he "cannot enter into the rights and wrongs of the incident," and contradicts himself in his second by saying "I have made enquiries, and am told that 'Flaneur' is mistaken in thinking the policeman who handed Colonel Daniell's recently issued notice did so in any other than a polite and well-meaning way." Now, the incident occurred in the early morning, when there was nobody about, and the only individual alive who could know anything about the affair besides myself was the policeman, whom Mr. Carling has apparently consulted. Police evidence may be sacrosanct in a Huntingdonshire court, but to the automobilist the word of a gentleman usually carries more weight, and it is surprising, to say the least, that Mr. Carling should uphold the doctrine of police infallibility at the very time when he is endeavouring to prove that Hertfordshire policemen are not as other men are.

policeman who needlessly addressed me, to the document he as needlessly gave me, and to certain facts, not opinions, which had come within my cognisance concerning the Chief Constable. There is far too much submission to this sort of thing all the country over, and protest from long-suffering automobilists is imperatively required. Let the notice be withdrawn, and then we can accept the whitewashing Mr. Carling has provided; but, meanwhile, one can only ejaculate, with Bernal Osborne—

"'Twas all very well to dissemble your love.

But—why did you kick me downstairs?"

It is scarcely safe to make mechanical deductions from the evidence of a photograph alone. *La France Automobile*, in its current issue, has an article on "English Voiturettes," and is consists of a reproduction of illustrations of the "Mabley" car, built by John Marston, Limited, of Wolverhampton, and the

MR. J. R. HARGREAVES ON HIS NEW 22 H.P. DAIMLER.

As for the Chief Constable's proclamation, I have nothing to withdraw, and nothing to add, concerning the merits of that document. I quoted it for all men to judge by, and anyone who feels disposed to defend its terms is welcome to do so. But I notice that Mr. Carling wisely shirks the task. If the constabulary intentions are so amiable in Herts, the logical course would be to refrain from issuing a superfluous and illegally worded manifesto. A man driving through the country can scarcely be expected to know the personal disposition of its officials, and would be loath enough to proffer any opinion whatsoever on the subject without evidence; but when a policeman flaunts a notice in his face with an "I could an' I would" sort of air, and the notice itself is found to be inherently indefensible, the stranger may reasonably draw conclusions from the facts, and state them. It is as absurd as it is palpably unfair for Mr. Carling to speak of my remarks on the "general bearing" of the police in his town or county. I confined my comments to the individual

Singer voiturette formed by placing a chair seat over the back axle of a Singer motor-tricycle. It is in respect of the vehicle first named that the French journal has fallen into error. Those who have seen the Mabley will remember that it is built on very original lines, the idea of its designer, a London gentleman, being, I understand, to make the body of the car as much like a boat as possible, though the stem and stern are necessarily truncated, and wheels placed there instead. Amidships are two large wheels, but only one of these is visible in a side elevation of the car. Hence *La France Automobile* has jumped to the conclusion that the vehicle is akin to the old country rotary tricycle, of blessed memory, a machine which was revived some time ago, in one solitary instance, for the use of the then Princess of Wales, our present Queen. The type was never conspicuous for stability, particularly at corners, and no wonder that our contemporary, in the light of its false deduction, should appear sceptical as to its merits when furnished with mechanical power.

A DAY AT LOWESTOFT.

MR. E. ESTCOURT is well known as an enthusiastic motorist who indulges in his favourite pastime in all weathers. When yachting claimed the hours now devoted to land voyaging he was delighted with rough weather, and hugely enjoyed the winds that sent fair-weather sailors to the nearest haven. Living now at Lowestoft in a delightfully situated house commanding the sea and the park, he delights in daily motor trips along the bleak east coast. All through the winter he has motored, his daily mileage never falling below thirty, and often advancing to fifty.

Last Friday we journeyed to Lowestoft for a few hours' re-invigoration on the breezy coast, and, in company with Mr. Estcourt and Mr. Mawdsley Brooke, whose new car will be on view at the forthcoming exhibition at the Agricultural Hall, we indulged in several short spins to Oulton Broads, and other

MR. ESTCOURT ON HIS WEATHER-PROOF CAR.

adjacent places—now deserted villages, but quickly to be re-animated after the coming of the spring.

The wind blew directly from the sea, and came upon the car with all the keenness and the boisterousness of a hurricane. But, comfortably ensconced on the front seat of Mr. Estcourt's well-known Daimler, we heeded not the biting welcome of the elements. In fact, we were as warm and cosy as though taking a trip in one of the new carriages of the northern railway lines. The wind blew, but we felt it not—and people gazed with wonderment as we glided along.

The secret of our comfort is apparent in the accompanying photograph. Mr. Estcourt has fitted his car with a striking carriage front—the most attractive and effective arrangement that we have yet investigated. When the passengers have mounted the car the glass doors at the right and the left are fastened to the top by means of spring clips, and thus those within are secured from the elements without. One day last week Mr. Estcourt drove in the face of a fall of snow which clung to the front window and obscured the vision, but through the rounded panels he was able to see his way without hindrance.

The top and front arrangement is removable—an operation that can be easily performed in ten minutes. It thus converts an open phaeton or car into a closed vehicle of a stylish and taking appearance. The way in which the idea has been worked out is certainly an important contribution to the automobile industry, for it renders a vehicle readily adaptable for wintry and wet weather. Thus the old story that the motor-car is only a fair weather vehicle is losing its point and accuracy.

In our little trip we had the opportunity of comparing the roads of North-east Suffolk with those of Norfolk. The latter county has splendid roads, but in Suffolk their surface is a varying quantity. Some of the minor roads are better than the main highways, and it is about time the authorities began a careful survey of the whole county, with a view to a general and uniform improvement being made. Automobilmism is going ahead around Lowestoft, where the consideration of motor-car drivers for those on the roadway is recognised by the police, who, in their turn, have shown a tolerant disposition. All that is now needed for its early development is that more attention should be paid to the condition of the main arteries of traffic, not only in the district, but throughout the county.

It is reported that a service of motor-cars between Bonchurch and St. Lawrence, Isle of Wight, will soon be inaugurated.

We learn that the Clarkson and Capel Steam Car Syndicate have taken the large works at Chelmsford until recently occupied by Messrs. Crompton and Company, and that they will shortly remove to them from Deverell Street, Great Dover Street, London, S.E.

THE Aeronautical Institute and Club is now being formed to encourage experiment in aeronautics and to diffuse a knowledge of the science thereof. Mr. O. C. Field, 20, Adelaide Road, Brockley, S.E., is the hon. secretary, *pro tem.*, and a meeting will be held at the Society of Arts, John Street, Adelphi, W.C., to-day (Saturday), for the confirmation of rules and election of officers.

A GREAT development in motor-car passenger traffic has taken place between Folkestone, Hythe, and Shorncliffe. For several years past horse conveyances have served the five-mile road between the two first-named towns. Now a rapid and frequent motor-car service has been established. As compared with horse-drawn vehicles, there is a saving of half an hour on the double journey, while the Sandgate Hill, which required the services of four horses to negotiate, is now taken by the motor-cars unaided.

THE Millford trailing car occupies considerable space in the latest catalogue issued by Messrs. Mills and Fulford, of the Crown Works, Coventry. This trailer is of neat and effective appearance, while the method of attachment is extremely simple—a clip encircling the seat pillar immediately above the frame. The joint is the makers' own patent, and the connection works well. Other trailers made by Messrs. Mills and Fulford include a juvenile car suitable for children up to ten years of age, and the "Millford Favourite." Specially made for use with motor-cycles is the Millford motor trailing car, which is of particular interest to our readers.

FROM the accounts given in the local taxation returns recently presented to Parliament it appears that the highest item of expenditure of the County Councils was the sum of £2,024,711 expended on main roads. The length of roads repaired by the County Councils themselves was 15,670 miles, and the amount spent on the maintenance, repairs, and improvements of these roads during the year was £931,263, being at the rate of £59 per mile. With regard to the main roads repaired by urban authorities under the Acts of 1888 and by Urban and Rural Councils it appeared that the mileage so repaired during the whole or some portion of the year was 10,928 miles. The payments of the County Councils in respect of the maintenance, repair, etc., of these roads amounted to £1,093,448, which was an average contribution of £100 per mile.

CONTINENTAL NOTES.

BY "AUTOMAN."

NICE-Abbazia-Nice has received the official sanction of the Italian authorities some ten days ago, and now there is feverish excitement and preparation for the great event, not only at the Automobile Club of Nice, but also in the machine shops specially engaged in the automobile industry. Entries are rolling in, and may reach the number of one hundred. It is going to be a great event. The reason for all the excitement is to be found in the absurd extreme to which the French Chamber of Deputies rushed, under the interpellation of M. Gautier de Clagny, during the Paris-Berlin race, and after the unfortunate accident to Brasier. It looks paradoxical to find the reason for the Nice-Abbazia-Nice race in this event, but it is nevertheless true, for had it not been for this absurd decision there would have been the usual short race in Nice. There would have been a little excitement about it, but it would still have remained a minor race, and attracted but little attention.

COMPARATIVELY few people in England have ever heard of Abbazia, which might be, judging by its name, a Turkish or Egyptian possession, or even some far-away oasis on the African

A MOST useful work is being quietly and unostentatiously undertaken by the *Chambre Syndicale de l'Automobile*, which is affiliated with the A.C.F., and has its headquarters at the *Place de la Concorde*. With every different make of motor-car special spanners are required to fit the various sizes of squares, for no two cars employ the same dimensions of nuts, bolts, and coach screws. Just in the same way, wheels vary in dimensions, and sometimes one make of tire will fit and another will not. Frames, too, vary as much as English weather, each one having its special dimension of body. The *Chambre Syndicale de l'Automobile* has set about to standardise all this work, and the advantages will be inestimable both to the user and also to the manufacturer; there will also result an economy in the price of manufacture.

FRENCH statistics, referring to exportation for the year 1900, have just been published, and in the category of complete motor-cars show a trade equal to nearly 950 tons, valued at about £380,000; more than 25 per cent. of this being for England. A comparison of the exportations since 1897 gives the following results:—1897, 62½ tons, value £25,000; 1898, 175, £70,000; 1899, 426, £170,000; 1900, 941½, £376,000. The trade has more than doubled itself every year; 1901 has more than made a

FIG. 1.—THE BROOKS LIGHT CAR. (See page 83.)

desert. Abbazia is a little watering-place on the Gulf of Fiume, in the Adriatic Sea, opposite Venice. It is about seventy-five miles from the Italian frontier, which joins the Adriatic Sea just by the Gulf of Trieste. It is nearly in the same latitude as Bordeaux and Turin, Milan and Venice, and considerably north of Nice. The route of the race will lie through Coni to Turin due north, then westward to Milan and to Mestre, near Venice, then north again to Oderzo, and west to Cervignano, the Austrian-Italian frontier town, and lastly south-west for seventy-five miles to Abbazia.

IN France, as well as in Austria, there will simply be touring because France has refused to allow racing and Austria has not been asked, but across Italy it will be a race, with nothing to limit the speed except the powers of endurance of the cars and the shockingly bad roads.

THE Emperor of Germany still continues to be a fervent *chauffeur*. His latest acquisition is a 16-h.p. Mercedes, which has just been turned out of the workshops of the German Daimler Company, at Cannstadt. The car is capable of reaching a speed of thirty-seven miles an hour on the level. The body is a *tonneau*, and the Imperial arms are painted on both sides of it. Needless to say it has all the latest improvements, including front and back glass screens to arrest the dust.

similar record, and I may be permitted to prophecy the following minimum figures for 1901, 1,900 tons, value £752,000; 1902, 3,800, £1,604,000. All this is for export only, the overflow, so to speak, of an industry which finds its great market at home. This export trade of France is directly due to the universal success of French makers in public competitions, and yet I only know of one English-made car in any French competition for 1902. It is to be noted that the average value of an automobile per cwt. is £20, and this value seems to have been pretty evenly maintained.

SANTOS DUMONT is out again, and his famous navigable balloon No. 6 has been "the" thing to see on the Riviera, sailing out over the Mediterranean, to and fro, with the usual grace and ease, and so far without the slightest mishap, and also, so it is said, without the objectionable pitching, which was one of the chief troubles in his experiments over Paris. In the meantime, M. Severo, the other Brazilian who is wooing fame by projected aerial flight, has completed his air-ship, and is busy inflating the air-vessel with coal-gas, in order to test it. The coal-gas will then be replaced by hydrogen, and M. Severo speaks of taking a preliminary canter round and above the fortifications of Paris. I have already briefly described this air-ship in these columns.

A MOTOR and cycle exhibition is to be held at Antwerp, from the 6th to the 14th of April next.

THE BROOKS LIGHT CAR.

OUR Midland representative, in company with Mr. H. Brooks, took a short spin of about twenty-five miles last week on a Brooks light motor-phæton. The car, which is being put on the market by the Brooks Motor Company, Limited, of Foleshill, Coventry, is designed to seat either two or four persons, is very comfortable when riding, and has a wheel base of some 6 feet, and is 3 feet 10 inches in width. The frame, which is of channel steel, is so constructed that either a pleasure or trade body can be fitted. The removal of either can be effected by simply releasing four balls. The engine is a Pinart, supplied by Messrs. Van Raden and Co., and all future Brooks cars will be fitted with either an 8 b.h.p. or a 12 b.h.p. engine of this type. Electrical ignition is adopted, while the water circulation around the cylinder is maintained by pump and radiators. The pump is operated by a 2 to 1 skew-reducing gear, which gives a positive and silent drive. A point of interest in connection with the double-cylinder motor (Fig. 2) is that very wide bearings are used. There is a $2\frac{1}{4}$ -inch centre bearing between the two cranks. The side bearings—two on each side—are $1\frac{1}{2}$ inch and $\frac{3}{4}$ inch respectively. A very heavy fly wheel, which forms part of the clutch, is fitted, and between the fly wheel and crank chamber is a ball thrust bearing, so that none of the friction from the clutch spring can come on the crank shaft. Another feature is

FIG. 2.—THE PINART TWO-CYLINDER MOTOR.

the ease with which both inlet and outlet valves can be taken out. The slackening of one bolt only is sufficient to get at the inlet valve, and a screw-driver is the only instrument required to take out the outlet valve. There is a wide water space for cooling the cylinders; two carburetors are used, and both are fitted with a throttle, so that each cylinder of the engine can be worked separately. The total weight of the 8 b.h.p. motor with heavy fly wheel is 146 lbs.

The power is transmitted through a clutch of special construction, the leather being made up in segments so that the edges do all the work, thus ensuring durability. The springs working this clutch are so arranged that they do not cause any and thrust either on the motor or gear, and can be easily adjusted to any tension desirable to avoid slipping. The clutch is fixed with sliding feathers to an improved type of Panhard gear, giving three speeds forward and reverse motion, designed by the Brooks Company. The pinions on the sliding sleeve can be removed separately, and so easily replaced in case of damage. The gear is controlled by one lever located immediately underneath the inclined steering wheel, and also works in the same plane, so that there is no necessity for the driver to stoop to effect a change in gear. From the gear-box the power is transmitted through an universally-jointed shaft to the rear live axle. Ample brake power is provided, one brake acting on the clutch, another on the countershaft, and one on drums connected to each of the rear road wheels.

SOME POINTS ABOUT MOTOR-BICYCLES.

AS the season is now approaching when a large number of people are contemplating the purchase of a motor-cycle, a few words from a maker of engines and coils for these machines may not be out of place.

The vital portion is of course the engine, as there are no other parts of the motive outfit that are subject to wear and tear, and bar accidents all other parts, such as carburettor, coil, accumulator, driving rim, etc., will last as long as the cycle itself. The belt, of course, wears out fairly quickly, but is not a large item in the upkeep. In designing an engine for the purpose, several makers have worked on the lines of extreme compactness and unduly light weight, especially cutting down the fly wheel weight, supposedly on the assumption that the momentum of the cycle will help the engine over its compression. With a belt-driven cycle this is pure fallacy, and though it sounds practicable with a chain-driven one it does not act in practice.

The cylinder, head, piston, etc., are most difficult to design to give good results, but they are generally well provided for in stroke, piston area, radiating surface, valve area, etc., by most up-to-date makers, and we may safely say that a $2\frac{1}{2}$ in. by $2\frac{3}{4}$ in. cylinder will give ample power for propelling a motor-cycle over average roads, and give fair hill-climbing capacity.

Two years ago I made my first engine for a motor-cycle. The cylinder was 2 in. by 2 in., with cast steel disc cranks weighted with lead on the rims. Of course a 2 in. by 2 in. cylinder sounds, and is, absurd, in the light of latter-day experience, and experience in cycle motor design and manufacture means expensive experiments and many disappointments. Those who are makers of engines can fully endorse this. The 2 in. by 2 in. soon gave place to $2\frac{1}{4}$ in. by $2\frac{1}{4}$ in., and that again to $2\frac{1}{2}$ in. by $2\frac{3}{4}$ in., every part being strengthened in proportion. Steel castings, with pins cast on, owing to the unreliability of the metal, were abandoned, and replaced by cast-iron disc cranks built in the usual De Dion practice. This class of crank is good and sound if accurately built, provided there is a fair length of surface for the cones, and to get this required length means a wide engine; otherwise the cranks will speedily rack themselves to pieces.

We have now to consider the diameter of the discs and fly wheel effect of same, as upon this greatly depends the steady running of the engine, and also the amount of power it is capable of giving out, especially in hill work. Weight for weight a 10 in. diameter wheel is far more effective than a 7 in. diameter one; but then arises the difficulty that if a 10-in. disc crank is to be used, a crank case 11 in. in diameter is required, which will be extremely awkward and cumbersome. If we abandon the disc crank and resort to a solid forged crank and outside fly wheel, we can then have a crank case about 6 in. diameter, and preferably made of phosphor bronze. With a solid forged crank, properly proportioned to its work, all fear of the cranks racking to pieces is avoided, and as this is the vital portion of the engine too much care cannot be spent on the design of this part of the motor.

As we now have the crank in one piece the connecting-rod must be divided to get it into place. This, I contend, is far better than having a crank capable of division, as it allows of wear on the big end being taken up, and can be easily secured so that there is no chance of its coming apart when running. In the light of past experience I have decided to adopt the forged crank, small crank case, and large fly wheel outside, as being the best job mechanically and making the most efficient engine. I am fully aware of the disadvantages of this method, but they can be overcome, and then the advantages far outweigh them.

First, the engine should be so arranged that the weight of engine counterbalances the weight of the fly wheel when attached to the frame. This naturally comes about, as the belt line, being required as close in as possible, the engine proper must be set over to give the narrow line required, and this also gives the required balance. Secondly, the fly wheel must have a light guard over it otherwise

in rainy weather the rider will have a rough time. Of course, a man may chance it without, the same as many do without mudguards, but the application is the same in both cases. Thirdly, the engine must have large and strong bearings. It should have with any form of crank, but very often has not with disc cranks, but it is essential on the driving side with an outside fly wheel. Fourthly, from personal experience, I have not found it any more prone to sideslip than any other form, neither can I find any difference, whatever position the engine is placed in. In fact, there seems little or no difference between such extreme positions as the Werner and Minerva.

Having summed up the pros and cons of the case, an account of two tests made with well-known makes

should have enough contained momentum in its fly wheels to run by itself without any external aid when started by hand. Insist on large bearing surfaces throughout. If you want an engine to go between the tread of a machine, do not cut down the engine to go in the tread, but widen the tread to suit the engine, as a 7 or 8 inch tread is rather an advantage than otherwise on a motor-bicycle. Get an engineering friend to examine the engine, and get his opinion as to what condition it will be in after a few million revolutions at 1,000 per minute. Do not attach an engine to an ordinary roadster bicycle. Have a machine built to take a motor. Do not have less than a 2½ in. by 2½ in. engine.

I have dealt at length with the engine, as it is the vital portion of the whole machine. Scarcely less vital is the coil, as no spark, no go. Do not be deceived by a coil giving a long pale blue spark. A ½ in. hot thick one is better than a 1 in. long thin one, and will overcome the compression of any internal-combustion engine likely to be used on a motor-bicycle. Much might be said about carburettor-spray or surface types, shape of belts, accumulators, etc., but these must be dealt with another time. There is one thing that will prove a boon to belt-driven bicycles, and that is a special-shaped pulley for the engine, which never slips to any appreciable extent, does not unduly wear the belt, and does not pinch the belt in and cause increased friction on bearing the pulley. I give the credit of the idea to my manager, Mr. Fleming, as he designed it himself without having seen anything of the sort before. Upon a search being made for the purposes of protection, it was found to have been "done before," as so many good ideas have been. The patent specification is No. 8235, 1893, and lapsed in 1897. This patent is a complete anticipation of Mr. Fleming's idea, and is open for anybody to use. I have decided, after exhaustive experiments, to adopt this type of pulley on all my motors.

G. CALVERT.

BURNHAM'S PULLEYS.—(Patent No. 8,235, 1893.)

of engines with inside disc cranks may be useful. To No. 1 engine an extra outside fly wheel, 10 ins. diameter and weighing 15 lbs., was attached. The result was that the engine gave an increase of 20 per cent. in hill-climbing capacity and 10 per cent. more speed on level. Of course, it could not be run for any length of time, as it would have speedily fallen to pieces, not having been designed for this extra weight and strain on the driving side bearing. No. 2 engine, of stronger build, was fitted with same fly wheel. Result, increase in hill-climbing capacity 25 per cent., and speed on level 12 per cent. The weather conditions were the same in both cases, and the same coil, carburettor, belt, etc., were used, and the tension on belt was the same in both cases.

In the light of these experiments, my advice to intending purchasers is this: Have an engine that will run and develop its full power by itself, i.e., if fixed on the bench or on bicycle it

THE President of the Board of Trade has received a deputation of members of the Council of the Roads Improvement Association, with reference to the proposed Light Railway Bill of the present Session. Among those present were the Hon. J. Scott-Montagu, M.P., Mr. Robert Todd, Dr. Cannan, M.A., Col. R. E. B. Crompton, C.B., R.E., and Mr. H. Howard Humphreys, M.I.M.E.

A NEW syndicate, known as the Kent Coast Motor Syndicate, has just been formed at Deal, where a line of cars will be established, running between there and a given point in Walmer, a route three miles long. In the season trips will be run to Dover, Canterbury, Margate, etc., at reasonable rates. The cars used will be of the Daimler type, there being six vehicles at present on order, four of them to be of wagonette build and the other two char-a-bancs. The syndicate expect to commence running the cars early this month, and when established, beside running cars they will undertake repairing in all its departments in motor-cars, motor cycles, etc.

WE have received a copy of an interesting little work, entitled "Light Motor-Cars and Voiturettes" (London: Iliffe and Sons, Limited), which has been written by Mr. John Henry Knight, mainly for the guidance of novices and intending motorists. As the title infers, the book deals with the smaller types of motor-vehicles, though attention is also given to motor quadricycles, tricycles, and bicycles. After a brief historical review, the author proceeds to describe in simple language the principle of working of an internal combustion engine. He then describes the main features of some well-known cars, among those dealt with being the Benz, New Orleans, Decauville, M.M.C. voiturette, Argyll voiturette, and De Dion voiturette and the Serpollet and Locomobile steam cars. There is a chapter on motor driving, another devoted to electrical firing, carburettors, and coolers, while the meaning of a horse-power and the method by which it is measured is clearly explained. The book throughout is well illustrated with drawings and reproductions of photographs, and its value is enhanced by a brief explanation of some of the most frequently used technical terms.

NEW WESTON STEAM CARS.

WE had an opportunity the other day, at the depot of the Weston Motors, 14, Mortimer Street, London, W., of inspecting a number of new types of Weston steam cars which are being introduced for the 1902 season. The illustration (Fig. 2) shows a light steam delivery van, which has been specially designed for tradesmen's purposes. Except as regards the body, which is of English construction, the vehicle is similar to the Weston pleasure cars. With the view of economy,

FIG. 1.—THE "WESTON" TAKING UP WATER AT WATFORD.

the boiler is fitted so as to use paraffin as fuel instead of the more expensive petrol, a Clarkson condenser being also provided. Of pleasure cars, we examined two new types—a 6 h.p. Victoria

FIG. 2.—THE "WESTON" DELIVERY VAN.

Stanhope and a 6 h.p. four-seated *dos-a-dos*. In both of these several improvements have been effected in connection with the mechanism and underframe, to which reference is made below, the remarks applying to both vehicles. The Victoria is furnished with an attractively-designed and comfortable two-seated body, painted in black and green, over which is a collapsible hood, provided with small side and rear windows. The body of the *dos-a-dos* is painted green and black, the footboard for the rear seats being made to fold up when not in use.

Coming now to the improvements in the running gear, as it is termed in America, it may first be mentioned that both the frame and springs have been considerably strengthened, and that the differential gear on the rear axle is now enclosed. The boilers are petrol-fired, while a new departure in connection with the two-cylinder double-acting engines is the provision of an automatic lubricator. This contains sufficient oil for a run of fifty miles, and is operated by the condensation of a small supply of steam allowed to pass into the lubricator. As the steam condenses into water the latter gradually rises, and forces oil slowly and in sufficient quantity to the cylinders. Probably, however, the most important new feature of the vehicle is the provision of what is known as a water lifter or sucker. One of the drawbacks to the use of steam cars is that very frequently a hose pipe is not available to refill the water tank, and when this has to be done by means of buckets it becomes somewhat of a sloppy and irksome task. By means of the new water lifter the operation can now be done automatically by means of the boiler. The lifter takes the form of a simple needle injector fixed in between a long length of rubber suction pipe with strainer at end, and the delivery pipe to the water tank at the rear, and having a connection to the boiler. With the gauge showing a steam pressure of not less than 50lbs., the end of the suction pipe can be immersed in a horse trough or rain-water butt, one or other of which is usually found in connection with country hostelrys, and the injector started. Not only can the water tank, which holds 26 gallons, be filled in a very few minutes, but the temperature of the water is also raised considerably during the operation. During a recent test of the apparatus the hose, with strainer, was placed in a tank of water of a temperature of 40deg. The tank was fully charged with 26 gallons in 5min. 1sec., the temperature of the water in the tank when full being 140deg. Thus the liquid, in passing through the injector or water lifter, gained 100deg. of temperature. The value and convenience of the device cannot be denied, as a glance at Fig. 1 proves.

A PRACTICAL LECTURE.

MESSRS. ARTHUR VERNON, J.P., and E. C. M. Instone gave the members of the High Wycombe Mutual Improvement Society an interesting evening last week, when the former discoursed on motor-vehicles, the latter gentleman showing a collection of photographs and explaining the technicalities of the motor. Mr. Vernon informed his hearers that roughly the cost of really first-rate cars was £60 per horse power. Roads were very costly for maintenance. Wycombe main roads cost about £400 per mile, Eton £450, and the general roads throughout the country nearly £54 per mile. Of this cost (about £50,000 in Bucks), it must be remembered that 66 per cent. was occasioned by the wear and tear of horses' feet, and probably 24 more per cent. by iron wheels and manure droppings, so that Mr. Vernon calculated only 10 per cent. arose from weather and evaporation. Motors had no feet, no cutting drags, no dropping of manure, and their elastic pneumatic or solid tires probably caused something under 10 per cent. of the present wear. If motor-cars were used, then, instead of £50,000, the roads in Buckinghamshire would cost £10,000. With regard to the cost of maintaining motor-cars, Mr. Vernon said that several owners of vehicles put the cost of cars of moderate power at 2d. to 4d. per mile, including all expenses. Up to 7 h.p., for petrol and oil, taking, say, a pint of petrol every three or four miles, at 1s. 4d. per gallon, it worked out to about 1d. or 1½d. per mile for petrol, and perhaps an equal sum for oil, or 1d. per mile running cost. To this must be added cleaning and attendance, and occasional mechanic's time in lubrication, adjustments, and small repairs and renewals.

THE first meeting of the Motor-cycle Section of the Metropolitan District Association of the Cyclists' Touring Club will be held on Tuesday next at the Society of Arts, Adelphi, W.C., when several motor-bicycles will be on view, including the Phoenix, Werner, Holden, Chapelle, Derby, Brown, Enfield, and the Excelsior.

HERE AND THERE.

MR. S. S. DORSETT, a well-known Birmingham barrister, is the latest addition to the ranks of local motorists.

MR. W. H. KINGSBURY, of 61, Bath Street, Glasgow, has again concluded arrangements for the sole representation of De Dion-Bouton vehicles in Scotland.

At the last meeting of the Glossop Town Council it was suggested that the Council should purchase a motor-car, as the horses belonging to the Corporation have been frequently ill of late.

SIR ALEXANDER BINNIE says that wear and tear of the roadways is caused more by the hoofs of horses than by the wheels of the vehicles. The motor-car has a beneficial effect rather than otherwise upon the roadway.

WITH regard to the projected motor parcels post service between Manchester and Liverpool, and *vice versa*, we hear that it will be fully two months yet before the service commences. The start is to be made with three vans.

THE scheme for the five minutes' service of motor-omnibuses between Edgbaston and Harborne (Birmingham) is still under consideration. It had been hoped to have been able to inaugurate the service at the beginning of the present year.

DR. HICKMAN has ordered a M.M.C. voiturette, having been decided in his choice by a trip in Mr. F. Guy Lewin's voiturette up Netherall Gardens, Hampstead. This thoroughfare has a gradient of one in five, and the car had four passengers.

THE Paragon Motor-tricycle is described and illustrated in the new catalogue issued by Messrs. Fitzsimons Brothers, of 44, Westminster Bridge Road, S.E. The firm have also brought out the Imperial Paragon Motor-bicycle, which is claimed to be extremely easy to manipulate.

THE Martin Pneumatic Tyre Syndicate, Limited, has been registered with a capital of £10,000 to acquire certain patents granted to G. W. Pitt and E. Martin (British rights only), relating to improvements in pneumatic tires, and to carry on business as manufacturers of pneumatic tires, etc.

MESSRS. STRICKLAND AND COMPANY have acquired the works at Teddington, hitherto occupied by Messrs. Strickland and Company, Ltd. as their Thames branch, and will carry on the business of oil motor manufacturers, both for launch and car work, and motor-car builders. The management of the yard will remain in the hands of Mr. Strickland.

THE Caledonian Motor-Car and Cycle Co., Ltd., of Aberdeen, have issued a new price list of the Peugeot motor-carriages, for which they are the sole agents in Scotland. Illustrations are given of the 10 h.p. car with double phaeton body, the 8 h.p. light carriage, and other types of the Peugeot car. A special page is devoted to the 5 h.p. light parcel car designed to carry six cwt. of goods.

AN exhibition of arts and crafts trades and industries is to be held at King's Lynn next week under the patronage of the King and Queen. Messrs. W. H. Johnson and Son, of that town, intend making a good display of motor-cars and motor-bicycles, the latter being a department which the firm have added to their business within the last twelve months. Messrs. W. H. Johnson and Son are agents for De Dion-Bouton, Limited, and also Werner Motors, Limited.

THE James Cycle Company, Ltd., of Birmingham, are introducing two varieties of motor-bicycles. One is fitted with the ordinary type of Minerva engine, transmitting the power by belt to a special rim on the back wheel. The other is fitted with the Derby engine, in which the power is transmitted by means of a chain-driven friction wheel acting on the tire of the rear wheel. The frame of the machine is, of course, specially strengthened to stand the extra strain, and the total weight runs from 70 to 80 lbs.

TO-DAY (Saturday) an informal meet of motorists will take place at the Star and Garter, Richmond, at twelve noon. An ascent will then be made of Petersham Hill, each car carrying its full complement of passengers. After lunch, the Test Hill in Richmond Park will be negotiated. Probably some of the results will be utilised in the forthcoming Badminton book, in connection with which certain hills near London are being specially surveyed.

J. T. JAMES, Birmingham Rim Works, Loveday Street, Birmingham, has devised a means whereby a pneumatic tire cover of either the thickened edge or wired-on type can be secured to the wheels of any ordinary carriage fitted with wooden wheels. The method consists in simply using two circular flanges corresponding in diameter to the wheel; each of these flanges has a little groove around it, and so grips the wire or thickened edge of the cover against the wooden wheel. The flanges are secured to the wheel by a series of bolts and nuts, and in case of puncture by removing these nuts the flanges can be taken off and the inner tube immediately exposed. It is claimed to be impossible for the tires to creep when they are securely fastened to the wheel, and even when deflation takes place they are still held in place.

THE accompanying illustration shows the "J.D." motor-bicycle, now being put on the market by Messrs. Dickinson and Sons, of 4, Forest Hill Road, East Dulwich. As will be seen, the motor is of the De Dion pattern, 1½ h.p., fitted with variable electrical ignition. The motor is placed vertically between the bracket and the back wheel, in which position it is claimed to reduce the tendency to side-slip. The accumulators are placed

in compartments made in the tank, which has a capacity of 2½ gallons of spirit. The machine is fitted with an atomising carburettor of Messrs. Dickinson's own design. The motor transmits the power to the rear wheel by a chain; pedals and chain gear for starting the motor being also provided. The makers state that the engine requires no assistance uphill, easily mounting the steepest grades at a good round speed; the machine being geared to 30 miles an hour.

FOR some months past Mr. Van Hooydonk, the maker of the Phoenix motor-bicycle, has been experimenting in the direction of two-speed gears for motor-bicycles, and has devised a simple and ingenious arrangement. The method adopted is to fit on the right-hand side of the rear wheel hub an ordinary free-wheel clutch for the pedal driving. On the opposite side, the usual form of belt pulley, instead of being attached to the spokes, is carried on a drum, which is fitted to a sleeve which rotates inside the hub proper. On the inner periphery of the larger end of this sleeve, or internal hub, are cut teeth which mesh with four small pinions brought in or out of mesh by means of a suitable cord projecting through the hollow axle end, and connected up to a lever on the top tube, or handle-bar, as desired. The change from high to low gear and *vice versa* is perfectly smooth by the simple movement of the actuating lever, or, if desired, both gears can be thrown out of mesh, and the engine run free entirely.

CORRESPONDENCE.

THE GORDON-BENNETT CUP.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—“Even Homer nods,” and your contributor “Automan” must have been dreaming when he wrote that “Fournier has been chosen as one of the defenders of the Gordon-Bennett Cup, and he will drive a new Mors car with ‘Continental’ tires.” As recently as in your issue of January 11th he wrote that “Switzerland could not compete owing to the lack of Swiss-made tires,” and one of the regulations of the contest, I believe, is that everything connected with the cars of the respective countries must have had its origin in the particular country. Where did “Automan” obtain his information as to a French car fitted with Hanoverian tires being allowed to compete? Perhaps he will tell us.

—Yours truly,
A POSSIBLE ENTRANT.

A QUERY RE STEAM CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As I am, like “Naval Engineer,” an intending purchaser of a car as soon as I am suited, I was in hopes of seeing more about steam cars from those that have them in use. Steam vehicles seem to me to be more reliable, and there is evidently less noise, rattle and vibration; but as to the exhaust, could not this trouble be got over, when employing a flash boiler, by using the exhaust to heat the feed water, then causing it to pass through condenser (using again what was condensed) and then, in case any should be visible on hills, etc., have a superheating coil in the boiler so as to make it invisible? Will an expert reader tell us how this method and this kind of boiler would act, and will those that have steamers in use tell us the faults of different makes? Hoping this will start a lively correspondence similar to that we have had on motor-bicycles.

—Yours truly,
WILLIAM LEE.

BRAKES.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to Mr. P. N. Hooper's letter on this subject in your issue of the 18th ult., I send you a sketch of the new brake which Messrs. Charron, Girardot, and Voigt have introduced. It was shown fitted to the new car they exhibited at the recent motor-car show in Paris, and, as will be seen, consists of two opposing segments which expand inside a drum attached to the hub of the rear wheel. The characteristic features of this brake, according to the inventors, are:—The force on the adjustable tension rod *m* is in a plane very near to the plane of the chain tension. The axle may thus be reduced in size without

danger of it being thrown out of alignment by the brake action. When the brake is applied the chain adjusting rod *n* works under tension, the brake tension rod *m* under compression, and the shaft to which both are joined at their forward end under a shearing strain. The supports of the pinions are therefore only subjected to the difference of the two opposing efforts, which is negligible. In most other arrangements, it is claimed, the effort on the countershaft supports is equal to the sum of the brake and chain rod stresses. Moreover, the axle, the chains, the brakes, and even the tension cables act around the same centre line—the axis of the chain pinion shaft—so that passing over a *canté eau*, or deep rut in the road, will not cause any binding. One advantage of the arrangement is that the wheels may be taken from the axle without affecting the brake. I may add that the action is absolutely the same for both directions of motion.—Yours truly,

DOUBLE ACTION.

QUERIES RE DE DION MOTORS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to Mr. G. H. Hardy's query in your issue of the 18th ult. with reference to his 2½ h.p. De Dion tricycle, the exhaust pipe of which, and all round the exhaust box, gets completely red hot after going a very little distance; he does not say whether the same thing

occurred before he fitted a stronger spring to the exhaust valve. I take it, however, that such would be the case. Perhaps he is unaware that all internal combustion engines will heat in this manner when run “light” with a full charge of gas, and I can only surmise that he is in the habit of driving with his mixture valve open wider than is necessary. Better results would be obtained and heating considerably reduced by using as little vapour as possible and increasing or decreasing the speed up to a limit by means of the ignition lever.—Yours faithfully,

J. W. STOCKS.

STARTING A MOTOR-TRICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Can any of your readers assist me in the following? I have fitted a Longuemare carburettor to my 2½ h.p. trike, and have inserted sizes 22 and 10. I have great difficulty in starting. Immediately on the explosion taking place, I have to advance spark; it then runs about one mile at about three-quarters the speed it used to do with the surface carburettor, then slows down to about half, and in going up hill gradually slows down and stops. If I stop a minute at bottom of hill, it will go up to the top all right. Compression is good, but the explosion sound weak.

—Yours faithfully,
W. AULD.

FIRST IMPRESSIONS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—By describing a run on my first motor-car, from London to Leeds, I may remind intending purchasers of small pleasure motor-cars to hurry up and get all the pleasure out of the coming summer days that is possible.

Having purchased a M.M.C. 6 h.p. car, I was provided by the makers with a competent driver, and started out with four persons on board on Monday morning about 11.30, going over very heavy and greasy roads, through Finsbury, Highbury, and Barnet on to Hatfield (about twenty-seven miles), where we had a short stay. On again through Baldock and Biggleswade to Hitchin, where we put up for lunch.

After leaving Hitchin it took us all our time watching the roads, which were covered right across with flints roughly laid down, not rolled or having any covering whatever. One would think the owners of the horses which have to travel over these roads day after day would make an outcry to save their animals from being lamed, apart from the motorists, cyclists, and other users of the road. Mile after mile we travelled over this disgraceful road, which extended, I should think, fifteen to twenty miles.

We met a few cyclists walking their machines along the pathway rather than have their tires spoilt. They evidently had come out for a cycle run, but it turned out to be a walking tour. Two or three were chancing it by riding on the footpath.

At last, when within half a mile of Norman Cross, we had one tire cut clean through, causing a puncture. Our driver soon had it put right again, but it now being dusk and having some seventy-six miles we put up for the night at Norman Cross.

Off again by 8 o'clock next morning, we made good headway, the roads now being fairly good and getting better as we went along. The ride on through Grantham and Newark to Retford is a grand one. This being our first motor-car run of more than two or three miles, we can now proclaim it to be one of the most appetising sports or pastimes. If anyone troubled with insomnia will try a ride like this they will want to sleep overtime to make up for previous loss. We arrived in Leeds about four o'clock in the afternoon, having come 130 miles since 8.0 a.m., including stoppages for meals.

After getting home I took the car in hand, and after some hours' tuition was able to drive. I have since driven nearly 100 miles, including the streets of Leeds, Bradford, and York.—Yours truly,

F. BEKVERS.

MOTOR-BICYCLES FOR 1902.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Like many others I have been very interested in reading the correspondence on the merits and demerits of the motor-bicycle for 1902. I was rather disappointed and surprised that the “Singer” was not once mentioned. As a visitor to the last cycle show, I inspected and rode, amongst others, a Singer, and, although a non-motor-cyclist, I could not help being forced to the conclusion that this machine was far ahead of all others. Easy to manipulate, compact, low gravity, not liable to be smashed in a fall, powerful, though perhaps not able to break speed records. In fact, with the exception of a high price and a little extra vibration, I could see nothing against the Singer as a motor-bicycle or rather bicycle-motor. While this machine is on the market I cannot see ground for such a statement as “The motor-cyclist either has not or cannot” emancipate himself from the disabilities of the belt.—Yours truly,

MEDICUS.

FRANCE COPYING ENGLAND.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In Mr. Edge's reply to my query under above title, and also as to who were really first in the points discussed, he states that plans were made in 1898, so that the Napier engine could be fitted with an

aluminium jacket. I believe that it was in the year 1900 that the first 8 h.p. car of that name appeared in the 1,000 miles trial in a very unfinished condition, and I was not aware that the Napier was on the market before that date.

In the summer of the same year I saw the Napier 16 h.p. on one of its first appearances at a hill-climbing competition. This machine was not fitted with an aluminium jacket, according to my recollection; nor was Mr. Mark Mayhew's, which was the next 16 h.p. turned out.

It was in the autumn of 1900 I had reliable information of the plans for the new 50 h.p., and in connection therewith the aluminium jacket was mentioned to me as a new idea, although I was aware that this had been used in France already; but I did not mention that. As we all know, this 50 h.p. machine did not materialise publicly till the Paris-Bordeaux 1901.

Mr. Edge suggests that a 16 h.p. machine on which he competed in France in 1900 had an aluminium jacketed engine; but does he mean that it could have been so fitted? Because, to quote his own letter, he writes, "I find, on referring to dates, that the Napier was designed so that an aluminium jacket could be fitted in 1898" (two years before its first appearance!); why, then, were the first Napiers not made so?

Many practical engineers will recollect that numbers of the early gas and petrol engines were made with detachable water-jackets. There was nothing to hinder aluminium being used, or brass, or gold in these cases, if one chose, and I presume that this is the real measure of what Mr. Edge suggests.

Now as to the Mors cars, these were on the French market actually fitted with an aluminium jacket to the engine in the very beginning of 1900, whilst at that time the first Napier was still on its trial trip. I have letters from Mors to prove this, and they also tell me that they designed these a very long time before that date. I think this settles the question as to which firm were the first to place this improvement on the market in a practical form.

As to straight exhaust valve stems, if Mr. Edge will refer to the "Automotor and Horseless Vehicle Handbook," published at the commencement of 1900, he will find on page 164 a very fair diagram of the first 10 h.p. Mors engine, produced in 1898-99; this embodies the straight valve stems, and also governing on the induction, as he will find mentioned. Though this has been claimed as introduced by the Wolseley, Mors had also a most ingenious exhaust valve lifter in connection with it, which he soon found unnecessary. This engine was distinctly a modern type. But the old Mors dog-cart engine also had straight exhaust valve stems, and this was produced in 1896-97, according to my recollection.

As to power for weight, I am in communication with Mons. Mors, and expect all figures at an early date. I shall feel obliged if Mr. Edge will kindly send the weight of his 50 h.p. car, when it started for the Paris-Berlin race, and its brake h.p.

From what I hear, our friends the French will be again in front with new improvements for this year (as they were in 1900), which I hope we will not copy and claim next year.—Yours truly,

ANTHONY WESTLAKE.

TIRES FOR IRISH ROADS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I am the owner of a 6½ h.p. Daimler, which I purchased new last season, and have since driven about 1,000 miles. The back tires on the wheels are ordinary 2½ in. solid rubber, and are now worn and cut up so much that they are practically done for. This will give an idea of how hard our Irish roads are on motor tires. I should like to have the opinion of your readers on this question as to the best type of tires to fit.—Yours truly,

DUBLIN.

MESSRS. STUBBS AND ROGERSON, of Winsford, Cheshire, write:—"We have a car and cannot find out why the carburettor floods. The valve is tight, the float is tight, also the ball on top. Flooding takes place when running only. We shall be much obliged if any readers can explain the cause.

MR. WILFRED BANNER, the President of the Breisgau Automobile Club of Freiburg (Baden), writes:—"I wonder if some of your numerous readers would be good enough to let me know, through the medium of the *Journal*, the best way to handicap cars of different h.p. and weight in a hill-climbing competition over a measured kilometre.

FROM Messrs. L. Loewe and Company, 35, Farringdon Street, E.C., we have received a catalogue of the many machine tools made by the Bullard Machine Tool Company, of Bridgeport, Conn., U.S.A. Included in the list are a number of tools which should be of interest to all motor-car builders.

THE Firefly Motor and Engineering Company are opening commodious premises on the Brighton Road, at 72, High Street, Croydon, where they will keep a large stock of spare parts for all leading systems of motor-cars. A garage for twenty-five cars with a large inspection pit is being erected, which will be open day and night, and will be fitted with the latest machine tools for repairs. Mr. William Glass, whose name is well known in the automobile world, is the manager of the new concern.

FURIOUS DRIVING CASES.

At the Norwich Shirehall, Mr. J. R. Hargreaves has been summoned for driving a motor-car at a greater speed than 12 miles an hour, at Horsford, on January 10th. The Chairman of the Bench (Mr. E. S. Trafford), said motor-cars had come to stay, and they had as much right to the road as any other vehicle as long as they conformed to the bye-laws. Everyone knew Mr. Hargreaves was one of the most experienced amateur drivers, certainly, in the county, and if Mr. Reeve put defendant into the box and he said he was not going more than 12 miles an hour, they would accept his statement, and thus save the time of the Court. That was the opinion of himself and colleagues. Mr. Reeve (for Mr. Hargreaves) said he was not in a position to do that, and the case must take its course. Ultimately a fine of £10 and costs was imposed.

JOHN OVERTON, of 5, Mortimer-street, Great Portland-street, London, was summoned by the police at the Marylebone Police Court, for driving a motor-car furiously on January 21st. Police-constable White, said that the defendant was driving round the inner circle of Regent's Park at the rate of something over 18 miles an hour. Mr. Staplee Firth, for the defence, submitted that the policeman's watch could not be taken as evidence in the case, as its accuracy had not been proved. Furious driving had not been proved, for no case had been decided defining what number of miles per hour was to be deemed furious driving. Mr. Curtis-Bennett said he should accept the constable's watch as good evidence, and should rule that going at 18 miles an hour was furious driving. He fined the defendant 40s., with 2s. costs, or one month.

HARRY GEORGE LEE, The Hollies, Acton Lane, Chiswick, pleaded not guilty, before the Eastbourne Borough Bench, to the charge of furiously driving a motor-car. Police-constable Braynell stated that at 10.30 a.m., on the 13th ult., he saw defendant drive a motor-car round the corner of Cavendish-place and Seaside-road, Eastbourne, at a speed of about twelve miles an hour. The car, which was on the wrong side of the road, frightened a horse, causing it to jump on to the pavement. John Davey said that if the horse had not sprung across the road, the motor-car would have dashed into a carriage. Frederick King said the pace was between fifteen or sixteen miles an hour. Defendant said he was only driving at eight miles an hour, and he went on the wrong side of the road in order not to further frighten the horse and cause an accident. In answer to the Chairman, he explained that he was a motor car driver in the employ of Mr. Harmsworth. The Chairman said the Magistrates were determined not to allow motor-cars to be driven in Eastbourne to the danger of the public; he would have to pay a fine of £5 and costs, £1 1s. 6d.

At Braintree Petty Sessions, Henry Cooper, of Halstead, was charged with driving a motor-car at a pace exceeding 12 miles an hour at Braintree, on January 12th. Police-constable Watson deposed that he saw the defendant come round the corner from Landpit Road on a motor-tricycle. Noticing that he was travelling very fast, he at once looked up at the town clock, and saw that it was exactly nine minutes past eleven. Having held up his hand, he watched him down London Road and over the railway bridge, and looking up at the clock again, found that it had taken about thirty-six seconds for him to get out of his sight. The Clerk: Could you tell as fine as that on the town clock? Witness: Oh, yes. I have since measured the distance I saw him cover, and find it just a quarter of a mile, which would give a rate of 25 miles an hour. He was travelling like the wind. Superintendent Terry said the defendant was fined six months ago for furiously driving a motor-car in Bank Street, Braintree. He was now fined £1 and 12s. 6d. costs.

THE PURCHASE OF A MOTOR-CAR.

IN the High Court of Justice, on Monday, before Mr. Justice Bigham and a common jury, the case of Docking v. the Sports Motor-Car Company was heard. The plaintiff entered into an agreement with the defendants for the delivery and acceptance of a motor-car at £183 11s. It was stipulated that it should be delivered within four weeks in perfect working condition. He paid £61 3s. 8d. on deposit. It was not delivered to time. He contended that the motor-car when it was alleged to be ready was in a most defective condition. He therefore sued for the return of the deposit. For the defence it was submitted that the car was in perfect running condition at the date of trial, except that the chain broke. That was replaced at once, and the machine was ready for work. Mr. Montague Lush appeared for the plaintiff, and Mr. Wallace, K.C., and Mr. Ellis Hill represented the defendant. Mr. F. R. Docking said that on or about May 9th of last year he ordered a motor-car from the defendants, the agreed price being £183 11s. He paid £61 3s. 8d. as a deposit, and stipulated that the car should be delivered within four weeks. He had been prepared to accept delivery of the car within the stipulated time. When it was delivered on the trial trip the chain broke. The car was unworkable, and could not be run at all. Finally he extended the time to June 24th, but even then the car was not in working order. As a matter of fact, he and his friend had tried for four hours to make the car start, but all to no purpose. After some further evidence, the case for the plaintiff concluded. Mr. M. Capellen, the manager of the defendant company, said that except for the faulty chain the car was in a perfect condition on June 11th, when it was delivered. On the trial trip, after about three or four miles, the chain did break. Mr. Salisbury, an engineer in the defendant's employ, admitted in cross-examination that a few days ago the car in question was towed

through the streets by another car. Mr. Seyd, motor car manufacturer, deposed to examining the car on two occasions. The first time—June 12th—it started very regularly, and behaved very well indeed. He and the defendant tried it in Hyde Park, and then went up Primrose Hill, where it ran admirably. On the previous day he went some sixty or seventy miles in a gale of wind in this particular car, and it again ran without a hitch. The jury found for the plaintiff, and judgment with costs was entered accordingly.

A BREAKDOWN.

At the West Riding Police-court, before Sir Alexander Wilson and Mr. E. Willoughby Firth, there were two charges against Wilfrid Ridout Wills, engineer, Sheffield, the first of causing an obstruction by leaving a motor-car on the highway, and the other with leaving the car without a light. The car, an experimental one, of 5 h.p., by a local maker, belonged to Mr. A. W. Dixon, of Hillsbro' Hall, and on the Sunday before last was being driven by Wills. Just after noon the car broke down at Middlewood Cottages, just opposite the policeman's house. The engineer removed the car, as far as possible, to the side of the road, and went in search of a horse. This form of tractive power was not to be had at once, and the car remained in the road until 7.30, being all the while under the observation of the constable, who lit the lamp himself after dark. Mr. A. Howe, who defended, urged that no harm was done, and suggested that it would be a fit ending to an unfortunate incident if the summons was withdrawn on payment of costs. This course was adopted.

STANDS AT THE MOTOR-CAR EXHIBITION.

ROBERT EDDIE AND Co., builders, 17, Tynedale Place, Upper Street, Islington, have sued the Sirdar Rubber Company, 36, Duke Street, E.C., for £7 1s. 3d. for fitting up a stand at the Agricultural Hall. Defendants filed a counter claim for one half week's rent of space at the Agricultural Hall, the use of which was lost to them by the negligence of plaintiffs in not completing the stand in time, also for one half week's loss of time of defendant's traveller in consequence of this negligence, and further for a half week's loss of time of defendant's managing director, owing to the same cause. After hearing both sides, the Judge held that the work was carried out according to instructions given by defendants, and found in favour of plaintiffs on the claim for £7 1s. 3d. He thought the counter claim had not been made out, so he also found in favour of plaintiff, with costs in both instances.

DRIVING WITHOUT A LIGHT.

At Warwick Police Court, Lindsey Frost, Leek Wootton, Warwick, was summoned for driving a motor-car in Jury Street, Warwick, on January 15th, without a light. Defendant had to pay 15s.

THE AUTOMOBILE MANUFACTURING COMPANY.

THE petition of the Clipper Pneumatic Tyre Company for the compulsory winding up of this company came before Mr. Justice Byrne last week. Mr. Ramer, in support of the petition, stated that it was opposed by certain debenture-holders on the ground that their debentures covered the whole of the assets of the petition, and, a receiver and manager having been appointed, no useful purpose would be served by a winding-up order. The petitioners were creditors of the company for goods supplied, and their contention was that the debentures referred to were bad by reason of non-registration, and, further, that they were a fraudulent preference. Counsel for the debenture-holders and the company said that an action had been instituted to test the validity of the debentures, and he undertook that if the petitioners made an unsuccessful application to be represented in these proceedings his clients would pay the costs. Under these circumstances, his Lordship directed the petition to stand over for a week, saying he would consult Mr. Justice Wright, who had previously had the petition before him.

DAMAGE TO A MOTOR-CAR.

THE Cambridge Auto-Car Company sued, at the local County Court, Mr. Arthur F. Gibbs, late of Cambridge, but now living in London, for £8 13s. 6d., the amount of damage done by him on one of their motor-cars. In opening his case Mr. Miller said that the car was hired by the defendant on September 22nd and 23rd of last year. The hire money was to be £1 11s. 6d., which was to be written off the price—£85—if the defendant decided to purchase. The defendant signed an agreement, holding himself responsible for all damages. When the machine went out of the workshop it was in splendid condition. Geo. Charles Bedwell stated that when the car was returned it was in a disgraceful condition. The front mud-guard was smashed, the rubber off the back tires was missing, the engine was broken away from the frame of the machine, part of the exhaust box was smashed, the lamp had gone, and part of the pump was missing. Witness spoke to the defendant on the matter, and he said, "Someone ran into me." He further said that he would pay, and asked witness to send in the bill. The defendant stated that they had had trouble with the machine. The vibration simply shook it to pieces. On

the outward journey to London the motor broke down at Bishop's Stortford, but he ultimately got it to its destination. It took him from 10 o'clock in the morning to 4 o'clock in the afternoon to return home. Josiah Wheeler, a partner in the firm of Wheeler and Co., motor manufacturers, also gave evidence. Mr. Wootton suggested contributory negligence on the part of the plaintiffs in sending out the machine in a faulty condition. His Honour gave judgment for £5 12s. 6d.

THE Thornycroft steam watering cart, No. 89, belongs to the Corporation of the City of London, and may generally be seen receiving supplies from a standpipe at the City end of London Bridge about 11 p.m., prior to its work of cleansing the streets.

MR. F. J. B. MITCHELL, of the Inland Revenue Office, Market Drayton, has been writing to the local papers pointing out that motor-cars are taxed. Evidently the spirit of enterprise has reached the official mind.

THOMAS BRAMLEY, 6, Lincoln Street, Coventry, was summoned at Coventry for riding a motor-bicycle without having a lighted lamp attached. Defendant pleaded guilty, stating that he was merely trying a motor-cycle for a few yards. A fine of 2s. 6d. and costs was imposed.

OUR attention has been drawn to a silly paragraph in the *Globe* describing a farewell to horses which is alleged to have been celebrated in Vienna recently. "The last horse-drawn car paraded the streets, driven by the oldest driver, and accompanied by a band of music." The horses were wreathed with flowers, and the people are described as cheering "the last of a dying race."

A SAD misfortune has befallen Mr. F. Buchanan, of Cosham, Hants, the inventor of an air-ship designed to travel against the wind. The air-ship was fully described in our issue of August 31st last, and was almost ready for a trial trip. But on Sunday it was completely destroyed by fire, and a tramp is now under remand on the charge of setting fire to the shed in which it was stored.

AMONGST the steam-cars now being introduced from the United States is the Overman, which Mr. Overman has located at the Motor Mart depot in the Euston Road, N.W. The main features of the vehicle have previously been made known. An important improvement has, however, been effected lately, by means of which the driver can start the independent air and water pumps from the seat, thus securing, when desired, higher pressures than are ordinarily allowed by the automatic regulation.

THE Kensington Motor Company, Ltd., have opened new offices and showrooms at 64, Hammersmith Road, W., as an annexe to their works in the Sinclair Road, Addison Road, W. These will be found useful by motorists in the locality for the storage of cars as well as the supply of petrol and for repair work. The works in the Sinclair Road are open night and day throughout the week, and will remain under the direct supervision of the company's managing director.

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, FEBRUARY 15, 1902.

[No. 154.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

MR. W. E. ROWCLIFFE presided at the third annual meeting of the Manchester Automobile Club last week. The Club has now eighty-two members, and the funds in hand are substantial. Mr. Rowcliffe reviewed the general progress of automobilism during the past year, and referred to the recent deputation of the County Councils Association to the Local Government Board. The decision of the Association to recommend the abolition of the speed-limit was heartily endorsed, and the report of the Committee was unanimously adopted.

A Stubborn Bench.

MR. PERKINS, of Gainsborough, has been summoned under the Locomotives Act of 1865 for not rendering assistance to passing vehicles, although he was driving a light locomotive at the time of the alleged offence. His solicitor urged that the Act under which he was charged did not apply, but the police were of the contrary view, and the Chairman of the Bench spent some time in arguing in support of their contention. Ultimately it was discovered that the earlier Act was repealed, so far as light motor-cars are concerned, by the Act of 1896; and even then the Bench admitted the point with an ill grace. This amateur administration of justice is not always characterised by wisdom—often it is marked by lack of knowledge on minor legal points—and only the tenacity of the solicitor seems to have saved Mr. Perkins on this particular occasion. Even then he was fined—for not drawing to one side of the road, in order to give approaching vehicles their proper proportion of the metalled portion.

Protection from Animals.

AUTOMOBILISTS will have to add another organisation to those that have already been formed, and a Society for the Protection of Motorists from Offensive Beasts would not be an inappropriate title for a new combination. Last week we recorded the chase of a motor-car by a runaway horse at Reigate, and at Liverpool a fierce bull has made a most unwarrantable attack upon a Rochet car. Journeying outside the city, the driver of the vehicle noticed the animal intently gazing at the red colour of the car. The bull lowered his head and rushed as though "going for" the car in true bovine fashion. But when he got to close quarters the whizzing of the motor undecided him, and instead of indulging in a reckless charge, he grabbed one of the pneumatic tires with his teeth and tried to shake it. The car was badly damaged in consequence, and the occupants hardly appreciated the situation. Still it ended without physical hurt to motorists or bull; but the lesson will probably not be lost upon owners of bright red cars. It adds a new terror to the perils of the road.

New Works at Burton.

WE understand that arrangements are nearly complete for the establishment of a motor-car factory at Burton-on-Trent. A private company has been formed to make light cars and steam waggons, and Mr. E. E. Bagulay, the present manager of Bagnall's Locomotive Works at Stafford, will be the manager. Among the directors are Mr. A. J. Clay, a director of Messrs. Bass and Co., and Mr. W. W. Worthington. An 8 h.p. four-seated steam car will be introduced by the new company. This development will be regarded with interest. Motor-vehicles are already used by brewing and distilling firms in various parts of England and Ireland, and the establishment of a motor-car works in the centre of the brewing industry should give an impetus to the more general adoption of the automobile by brewers throughout the country.

Imports and Exports.

THAT the Board of Trade should deem the imports and exports of motor-cars, motor-cycles, and parts thereof worthy of separate headings in their monthly returns is another tribute to the growing importance of the automobile movement and industry. The new departure makes its *debut* in the January returns, and it is with much satisfaction that we note that an export trade in British-built automobiles has already been created. The shipment of motor-cars and cycles of home manufacture during the past month attaining twenty-seven vehicles of a value of £7,301. Of parts, the exports amounted to £3,691, making a combined total of over £10,000 in one month. As regards the imports of foreign cars and cycles, these of course show larger figures, and for a year or so, at least, are likely to do so. In all, 173 cars and cycles were imported into this country last month, the value of the same being returned at £35,330. The value of the "parts thereof" is given as £8,525, so that we get a combined total of £43,855. Some of these imports were only of a temporary character, being re-shipped to foreign destinations. Thus last month the re-shipments comprised eleven vehicles amounting in value to £2,268, and £397 of parts. In the monthly returns only the aggregate total of imports is given, and while we hasten to publish this, we may add that *The Motor-Car Journal's* special classified table will make its appearance as soon as the official figures are available.

Watch Local Bills.

MOTORISTS should carefully watch the proceedings of local corporations promoting Parliamentary Bills, for these apparently innocent measures often contain clauses calculated to harass peaceful people like the drivers of motor-cars. An instance of the necessity for this watchfulness comes from Manchester. If the Omnibus Bill of the Manchester City Council, now before Parliament, passes into law, it may be anticipated that the number of motor-car prosecutions will vastly increase. By that Bill it is sought not only to absolutely exclude vehicles,

carts, and slow-going traffic, in which may be included motor-cars for heavy haulage, from certain thoroughfares, but to fix varying maximum speeds in different places. If the Corporation sees fit to press these clauses, there is no doubt strong opposition will be offered from many quarters. But we are glad to be assured by the President of the Manchester Automobile Club that the Corporation, owing to the threatened opposition, is already seriously considering the withdrawal of these clauses entirely from the Bill. Should they, however, be retained, motoring M.P.'s will probably have a word to say when the measure is before the House.

Motor-Cars at Portsmouth.

MOTOR matters are looking cheerful in the Portsmouth district, and the interest shown on the occasion of the last two runs to Southsea has by no means evaporated. As already announced, a Southsea motor-car club is in course of formation, and at the preliminary meeting testimony was paid to the fairness of the borough constabulary and the local bench towards automobilists. Not only is there activity with regard to the social side of motoring, but the commercial aspect of the industry is being recognised in Portsmouth. The statutory meeting of the Portsmouth and Gosport Motors, Limited, has been held at the Masonic Club, Commercial Road, Portsmouth. Mr. J. Taylor presided, and gave an account of the working of the Cambria cars, which, he said, had run practically without any serious detention upwards of 2,600 miles, their two vehicles having carried upwards of 17,000 passengers. The receipts from all sources for the past four weeks amounted to £103. There were three cars on order for early delivery, and it would appear as though success is already within view.

A LOCOMOBILE IN A SNOW STORM.

Lincolnshire Automobile Club.

THE annual general meeting of the Club has been held at the headquarters, the Saracen's Head, Lincoln. The report, showing a great deal of good work done for automobilism, was, with the balance-sheet which revealed a deficit of £2, adopted. Mr. W. D. Wansborough, Col. J. M. Warrenner, and Mr. A. W. Forster were elected members. Sir Hickman B. Bacon, Bart., was re-elected President, and Lord Willoughby de Eresby, M.P., Sir G. Whichcote, and Mr. J. D. Sandars were added to the list of Vice-Presidents, viz.: the Marquis of

Exeter, Hon. S. Ormsby-Gore, M.P., Right Hon. H. Chaplin, M.P., Mr. W. B. Jevons, Capt. J. A. Cole, and Capt. J. F. Laycock, D.S.O. Mr. C. W. Pennell was re-elected Chairman, and thanked for his valuable services during the year. Mr. C. Nelson was elected Hon. Solicitor. Mr. E. Cragg, M.D., was, on the resignation of Mr. Wilkinson, Secretary, and Mr. C. Nelson, the Hon. Sec., elected as Hon. Sec. The Chairman and Hon. Sec. were elected to represent the Club on the A.C. of Great Britain and on the Motor Union. Capt. J. A. Cole was thanked for his hospitality on the occasion of the visit to Roseholme Hall, and he promised to give a lecture on "Electric Ignition" at an early date in Lincoln. It was decided to hold the annual dinner on Saturday, April 5th.

Waterproof Cars.

THE question of how best to protect the occupants of a car from the elements has received little attention from manufacturers, who may perhaps excusably plead that they have been employed in more important work. Coachmakers, too, from whom something might have been expected, have been unable to divorce luxury from weight. Hence it is that most of the best attempts at solution have been due to the ingenuity of private owners. The mere addition of a brougham body to a car produces, as a rule, an intolerable horseless effect, and even worse is the adaptation of a hansom cab top—about as inappropriate a combination as could well be imagined. The solution is not so difficult if passengers alone are to be protected, leaving the driver exposed; but as most owners drive themselves, the real problem is to satisfactorily cover the front seats. The chief desiderata are: first a hood, capable of being half raised (to protect the back of the head in dusty weather, a point much appreciated by ladies), and when raised, to be able to carry an open canopy as well as an entire covering (both being on the lightest possible framework), and a front glass. Here another point comes in: it must be of such a form as not to be easily obscured by snow and rain, and not too far from the driver's face. Mr. Estcourt, as shown last week, secures this by curved side panels, but a correspondent suggests that a V-shaped glazed frame, forming a "prow," would be far less liable to obscuration than a flat front glass, and could be more firmly attached. And if glass could be replaced by some lighter and less fragile substitute it would be all the better. Celluloid would probably be unsafe, but the non-inflammable material used in some substitutes for goggles, possibly an insoluble gelatine, would be just the thing. It would need, however, to be very cheap and easily replaced, as the surface would not be very durable.

Roads.

AUTOMOBILISM is already having an important and salutary effect upon the highways of the country, and as motor-car services are extended county surveyors will have to give increased attention to the roads under their care. Once properly laid, the main thoroughfares will be less worn with motor-car traffic than by horse-drawn vehicles—an assurance that is given with all the authority that is attached to the views of Sir A. R. Binnie. Hence the advisability of County Councils encouraging the perfecting of road surfaces so that no obstacle shall be placed in the way of the automobile.

Wideawake Lancashire.

ALREADY some of the leading councils are considering the matter, and in his report to the Lancashire County Council last week the County Surveyor of that great Northern area remarked that "the number of motor-cars and light motor-wagons requiring some different road surface to the old boulder or worn-out rough set pavement which still obtains on many of the highways is greatly increasing, and as examples I only need to point to the regular running of motor-wagons between Preston, Blackburn, and other large towns to Manchester and Liverpool.

The fact that a contract has been entered into by the postal authorities with the British Electric Traction Company for the conveyance of parcels daily by motor-wagons between Liverpool and Manchester, commencing on March 1st next, shows that this traffic will have to be reckoned with in the near future, and, from a commercial point of view at any rate, it is advisable that every effort should be made at once to place all roads carrying through traffic into good and sufficient repair." Such an attitude will be appreciated by automobilists throughout the country.

Dover's Latest.

A FORTNIGHT ago we referred to the suggestion made by a Dover Town Councillor that a measured mile in the town should have a policeman at each end in order to time unwary and non-suspicious motorists passing that way. At the meeting of the Council, when that proposal was made, no decision was arrived at, but since we last wrote on the subject it has been resolved to station policemen at various points in the town and arm them with stop-watches in order to time the speed of the drivers of automobiles. The Corporation of Dover is also suggesting that the local authorities should advise each other by telephone of automobiles travelling furiously—according to the police idea of "furiously"—in the direction of their respective districts. Surely such a scheme will prove rather cumbersome and uncertain in its operation; why not train the police in the art of lassoing motorists, and so save the trouble of telephoning to other places?

Motor-Car Maintenance.

FROM Bradford, Lowestoft, and elsewhere we have received letters enclosing cuttings from *Pearson's Weekly*, in which the annual cost of a motor-car is set down at £480. Really, Mr. Pearson will have to keep his eye on the young men who contribute to his journals, for such a statement is ridiculous, and calculated to do harm to his paper and to the automobile movement. It would be interesting to obtain detailed information as to the cost of maintenance of motor-cars, and in our Correspondence columns, this week, is a useful letter on the subject. We shall gladly welcome others.

Hints to Horse Drivers.

OVER the signature "Compression" motor-car notes are appearing in the *Golden Penny*. They bear evidence of the practical character of their writer, who recently gave some useful advice to the driver of horses. The latter is warned, should he leave his seat, not to go to the near side of the horse, but to get between the horse and the car. The horse will then be less likely to shy. "Compression" says he makes it a rule when motoring to stop—should the driver of an approaching horse be inclined to dismount—until the driver reaches the off side of the horse. The danger of the near side is that the driver may get between the horse and the wall, bank, or ditch at the side of the road and not be able to keep clear of his own wheels. Although he will be left-handed on the off side, he will be quite safe, as horses invariably shy away from the car.

Motors v. Tramways Again.

A FRENCHMAN, who knows the West Riding of Yorkshire pretty well, has been confiding to a newspaper correspondent that millions of English money are being frittered away on light railway and tramway schemes. More than that, the high-ways are being spoiled by a network of rails and wires, which will all be out of date in a decade, when automobiles will be the universal vehicle in the country districts, and tramways only seen in large towns. We hope this observant Frenchman is as accurate as he is sanguine.

Authors, Artists, and Autos.

It can hardly be said that the motor-car has taken its rightful place in fiction as yet—if we leave police-court records out of the question. It has appeared casually in a recent novel or two, and has, of course, inspired much of what passes in these days for humour in the comic papers. In the attempts at motor fiction, however, which have occasionally graced the magazines no inconvenient realism has hindered either author or illustrator for the most part. The latest addition to these, appearing in the *Windsor Magazine*, turns on the running of a new and phenomenal electrical car, and the artist has, with a touching if mistaken fidelity, shown the hero and heroine on as good a copy of a Panhard as could be produced in this country, starting handle and all! One possibly useful hint lies buried in the tale—at least for these pre-numbering days—namely, the provision of reversible panels of varied colours for the car body, to be used after passing a police ambush, to avoid inconvenient identification by telegram. It is hardly to be expected that our pastime will attract the attentions of artists, except for such illustrations; but its exponent in fiction will surely arise before long. As yet, however, while automobilism has not lacked its historians and prophets, both major and minor, its novelist—the Surtees of the sport—has yet to appear among us.

MR. E. MIDGLEY ON HIS 16 H.P. NAPIER.

The Transition Stage.

IN the *Contemporary Review* for February Mr. Joseph Pennell has an article on "Motors and Cycles: the Transition Stage," in which he complains that "it is almost hopeless for the person of average means to get a fast and reliable car, because the very few makers who can make such cars will not do so. The hoped-for millionaire rather than the certain purchaser of moderate means is catered for." This is becoming less and less accurate, for makers are recognising that the future of the motor-car industry in this country depends not upon the few buyers of racing cars, but upon the many likely purchasers of cars for business and for touring purposes. With regard to motor-bicycles, for which Mr. Pennell has a penchant, he sadly confesses that he does not know where to find one that will carry him as reliably as an ordinary bicycle, although there are plenty good enough for a day's run. In a foot-note to the article—which is worth reading by those who did not hear the author's paper at the Automobile Club some time ago—we are told that Mr. Pennell has tried the Holden, Phoenix, and Shaw motor-bicycles since he wrote the article, and that he regards the latter type as the most comfortable machine he has ever ridden.

Motor Bicycles at the Society of Arts.

ON Tuesday evening last, at the Society of Arts, Adelphi, W.C., the first meeting of the motor-cycle section of the Metropolitan District Association of the G.T.C. was held under the chairmanship of Mr. W. Rees Jeffreys, the evening being devoted to a discussion on matters connected with motor-bicycles. The debate was opened by Mr. Joseph Pennell, who, in his peculiar style, related his experiences with the Werner, Phoenix, and Shaw motor-bicycles. Afterwards there was a lengthy discussion, in which, in addition to several amateurs, quite a number of members of the trade took part. It was the general feeling that the ordinary safety bicycle was not sufficiently strong to be converted into a motor-bicycle by the addition of a motor and its accessories. In this connection, Mr. Albone pointed out that only quite recently a converted bicycle of this kind came under his notice in which the front forks were on the point of giving way. As regards the location of the motor opinions varied considerably, some speakers advocating a high position and others a low position for the motor. The questions of ignition, lubrication, carburation, transmission of power, tires, etc., were all gone into, a variety of opinions being expressed. It was generally considered that unless some means could be devised of keeping up the speed of motors when the machines were ascending hills a motor of greater h.p. than $1\frac{1}{2}$ is really necessary. On the question of side-slip, the discussion brought out as great a divergence of opinion as the other points raised. Finally, the meeting passed to the lines upon which the new motor-cycle section of the Metropolitan District Association should be carried on, and it was left in the hands of the committee to devise a policy. In connection with the meeting an exhibition of motor-bicycles had been got together on the lower floor at the Society of Arts, among the machines shown being the Singer, Holden, Derby, Bradbury, Enfield, Excelsior, Humber, Albone, Phoenix, Shaw, Werner (1901), Bowden, Martini, and Trent.

More Persecution in Surrey.

THE animus of the Surrey County Council against motorists is being evidenced regardless of expense. Mr. Trevor Williams has just been summoned at Chertsey on two counts under the Locomotives Act of 1865. With the help of two expert witnesses and Mr. Staplee Firth he secured the dismissal of both cases, although his costs were disallowed. This is the fourth case of the kind which the Surrey Council County has brought against motorists, and, although each has been dismissed, the police do not seem satisfied. In one case they took out three summonses, and in two others two each—all with the same result. Surely the ratepayers of Surrey will shortly begin to recognise that this wasteful expenditure of their money should cease. It does not secure its object; it prevents motorists touring in Surrey, and it generally indicates such a wanton disregard of the public interest that should not be forgotten at the next council elections. A combination of motorists, hotel proprietors, and kindred spirits that effectively used its influence at the proper season might secure the return of councillors who would keep the police in their place.

Reminiscences.

ONE of the most delightful evenings enjoyed by the members of the Automobile Club was that on Wednesday last, when the Right Hon. Sir J. H. A. Macdonald, K.C.B., Lord Chief Justice Clerk of Scotland, read the chapter on "Automobile Reminiscences" he has written for the Badminton book. Sir Francis Jeune presided, and gave an enthusiastic address on the "Pleasures of Motoring" in introducing Sir John to the meeting. The Lord Chief Justice Clerk of Scotland delighted the company for more than an hour as he told stories of early motor-car adventures in a most humorous way. The Hon. C. S. Rolls, Messrs. R. H. Fuller and Thynne took part in the discussion, and votes of thanks to the chairman

and reader of the paper were carried by acclamation on the motion of Mr. Roger W. Wallace, seconded by Mr. Harrington Moore. Sir John Macdonald was heartily received on rising to respond, the members of the Club joining in singing "For he's a jolly good fellow" with a heartiness that left no doubt of the sincerity of the regard in which the Lord Chief Justice Clerk of Scotland is held by English, or rather, British automobilists. Next week the house dinner of the Club will be followed by a paper on "Motor-cycles" by the editor of the *Journal*.

MR. BERNARD ROTHERHAM, of the New Coventry Eagle Cycle Company, Lincoln Works, Coventry, has for some time been experimenting with a trailer specially adapted for motor-bicycles and tricycles. To the inexperienced the negotiating of corners appears a little unsafe, but after a few trial runs this apparent danger vanishes entirely from one's mind, as the trailer follows the machine with marked steadiness and precision, owing to the special joint and clip employed.

AN announcement on the placards of the London evening journals, on Tuesday, to the effect that Niagara had been sold, sent the thoughts of many people to the great Niagara Falls. But it actually referred to the purchase of Niagara in London by Mr. Paris Singer, of the City and Suburban Electric Vehicle Company. The great hall, with its various offices, will be utilised as a garage and for the cleaning and charging of electric vehicles, as well as a sales department of the company, in addition to their existing large establishment in Denman Street, Piccadilly, W.

AT the last quarterly 100-mile trial of the Automobile Club two vehicles were presented, a 5 h.p. voiturette by the Hozier Engineering Company, Limited, and a 8 h.p. Dennis car by Messrs. Dennis Bros. The Argyll made the outward journey at a speed up to the legal limit, and the return trip at an average of 8.7 miles per hour, 4 gallons 3 quarts of petrol and 1 pint of water being used. The steep portion of Dashwood Hill was ascended, with four persons on board, at 5.7 miles per hour. On the return journey three stops were made—(1) After forty-third milestone, owing to two punctures on rear tires. (2) Of about $\frac{1}{4}$ minute's duration, due solely to the road being blocked by a wagon and team; and (3) To attend to one of the brakes. The Dennis car did not proceed beyond Dashwood Hill owing to tire troubles.

THE second general meeting of the Aeronautical Institute and Club was held on Saturday last at the Society of Arts, Adelphi, W.C., the chair being taken by Mr. C. H. M. A. Alderson. The provisional rules were read and adopted with certain amendments made chiefly in the interests of members desirous of obtaining the Institute's assistance in the perfection of their designs. Mr. P. L. Senecal and Mr. H. Middleton were elected vice-presidents. At the conclusion of the meeting the chairman made a few remarks dealing with the scope of the Society.

No small amount of interest attaches to litigation which has just been started in America. Suit has been brought by the Whitney Motor-Waggon Company, of Boston, against Messrs. F. E. and F. O. Stanley, of Newton, Mass., in which the former seeks to enjoin the Stanleys from making their present steam carriage, and also seeks an accounting for damages. To the Stanleys is usually accorded the honour of being the pioneers in the light steam automobile industry, their vehicle being the forerunner of the present well-known "Locomobile." Lately the Messrs. Stanley have turned their attention anew to steam vehicles. In so doing they have incurred the hostility of the Whitney Company, who also dispute the claim of the Stanleys to being the first in the steam field. In the litigation now inaugurated the contention is that the Stanley vehicle is an infringement of the original Whitney vehicle, which was first manufactured in September, 1896; that it possesses the same number of tubes to the boiler, has virtually the same boiler, and is in fact practically a duplicate of the Whitney vehicle. The application for an injunction is returnable to the United States Circuit Court in Boston early in March.

A RICHMOND MEET.

TESTING AUTOMOBILES ON THE HILLS.

BYRON'S "ambrosial Richmond" is a charming place in the springtime and when autumn's bright tints have given it a kaleidoscopic effect. But in the days between winter and spring its enchantment is less keen, and its beauty lies below the surface. Should the day be wet and the air have a biting keenness reminiscent of chill October, the prospect is even less delightful; and if to these two irritants you add a puncture, the unhappiness of man is nearly complete. We refer to the average man. The motorist, however, is more than the average man, and braves the elements, daring rough stones with seeming indifference, although there may be a touch of bravado in his public demonstrations of how automobiles go boldly over metalled roads.

When Mr. C. Johnson suggested that a few pleasant and useful hours could be spent on the hills of Richmond on Saturday last, several motorists rejoiced, for did not such an occasion give

but the roads less greasy than the Putney road. Nearing the destination, Mr. S. F. Edge came along on his 16-h.p. Napier car. The horses in a passing 'bus evinced some astonishment, and made as though to converse with us, but our driver skilfully eluded the fractious creatures, and we left them to gyrate in equine fashion, to the alarm of a nervous old lady who had incautiously taken a seat near the driver on the top of the 'bus. "Oh! the wretched motor," she exclaimed, failing to recognise that the attitude of the horses was more threatening than our own. By that time the 16-h.p. Napier had turned the corner, and we followed along to the "Star and Garter," where the photographer looked disconsolate, and Mr. Johnson, notebook in hand, presented a picture of cheerful indifference to the atmospheric conditions that would have depressed anybody but motorists, whose defiance of hail, wind, and snow is even more pronounced than their virtuous and commendable efforts to keep within their legal rights on the public highway.

The first ascent of the day was up Petersham Hill, the distance from the Dysart Arms to the Star and Garter Hotel, Rich-

SOME OF THE CARS AT THE STAR AND GARTER HOTEL, RICHMOND.

[Arg'n Archer.

another opportunity for petrol talk and reminiscences? Besides, there was the opportunity of doing doughty deeds by taking loaded vehicles up ascents that few cars could have conquered three or four years ago. And no motorist declines the chance of proving the reliability of the modern automobile, and his power of control over the wheel. Thus it was that Mr. Johnson's suggestion proved a popular one, for although the Weather Controller proved refractory, the meet suffered no reverse in consequence. Quite a score of cars presented themselves at noon before the "Star and Garter," and in the roomy stables of that famous hotel they sheltered awhile till the time-keepers were prepared to play the part of recording angels. There was no procession from town, all going as they pleased to the rendezvous. Mr. C. Cordingley's 10-h.p. Napier left the Club shortly after eleven o'clock, with Lord Kingsburgh, Mr. Cordingley, and the writer aboard, these, with the driver, making up a full load. With the rain pelting in our faces we passed through Clubland, and, taking a glance at the proposed new headquarters of the Automobile Club, went along at a steady rate that was evidently well within the legal limit, or the police would have called our attention to the fact. Over Hammersmith Bridge the way was long,

mond, being 600 yards. The average gradient of the hill is 1 in 15.1, that at its steepest part being 1 in 9.5. Several of the vehicles made two ascents, and the trial was a good test of the capacity of the cars, for the condition of the road was about as bad as it could be, the mud lying thick upon the surface. The fastest time was made by Mr. H. G. Burford on his 20-h.p. Milnes car, which travelled the distance in 1 minute 10 seconds on the first attempt, and in 1 minute 6 seconds on the second effort. Mr. S. F. Edge's 16-h.p. Napier finished the journey in 1 minute 13 seconds. A Locomobile made the ascent in 1 minute 14 seconds, its course being well defined by a clearly expressed protest against the cold damp day. Mr. W. D. Astell did well on his 12-h.p. New Orleans. All the cars carried their full complement of passengers, and the mileage per hour worked out as follows:—

	First Ascent.	Second Ascent.
	m.p.h.	m.p.h.
Mr. Harvey Du Cros, jun's. 16-h.p. Panhard	14.7	—
Mr. S. F. Edge's 16-h.p. Napier	16.8	—
Mr. C. Jarrott's 16-h.p. Panhard	14.4	15.5
Mr. H. G. Burford's 20-h.p. Milnes ..	17.5	18.5

Car.	First Ascent. m.p.h.	Second Ascent. m.p.h.
Mr. E. M. G. Instone's 12-h.p. M. M. Co. ..	3.7	7.7
Mr. Charles Cordingley's 10-h.p. Napier ..	8.7	8.6
Mr. Rowland Browne's 10-h.p. Lanchester.	9.2	—
Mr. W. D. Astell's 12-h.p. New Orleans ..	15.7	14.4
Capt. E. A. Locock's 10-h.p. Wolseley ..	10.8	10.6
Mr. P. Dodson's 7-h.p. Durkopp ..	—	—

MR. ASTELL'S "NEW ORLEANS" ASCENDING THE TEST HILL,
RICHMOND PARK.

Mr. J. W. Stocks's 8-h.p. De Dion ..	9.8	9.7
Mr. J. M. Gorham's 4½-h.p. De Dion ..	6.5	9.0
7 h.p. New Orleans ..	5.5	7.8
Mr. Roger H. Fuller's 4½-h.p. De Dion ..	8.8	—
4½-h.p. Locomobile ..	14.4	6.5

From Petersham Hill to the luncheon room was a pleasant transition. Among the common requirements of Men and Motors lubrication is pre-eminent, and that having been attended to, we set off through the principal entrance of the Park to the scene of the next trial, viz., the Test Hill. Our car had a fourth passenger (making five of us in all) in Mr. W. J. Peall, who had come as an observer, having forsaken his car for the day. The Test Hill lies between the Robin Hood Gate and Kingston Gate. It includes a bend, so that a full view of the ascents was possible, and that the top of the hill proved a coign of vantage was demonstrated by the interested little group that watched the cars come gaily upon their way. In fact, the view was so attractive that many passengers left their cars, and only those of Messrs. Astell, Burford, Cordingley, and Edge carried their full number. Here again the Milnes car did well, going up the hill in 31 seconds with one passenger on the second attempt, and in 39 seconds on the first attempt, when it carried four passengers. The 16-h.p. Napier made one journey, doing it in 38 seconds, and the Locomobile made two good trips. On both occasions the 12-h.p. New Orleans made the ascent in 40 seconds, being the only car to make the two efforts in similar time. Curiously enough, its rate of speed (14.4 miles per hour) was the same as in the second Petersham Hill climb.

This second test was a very severe one, the road being extremely loose and heavy. The distance covered was 850 yards, the average gradient being 1 in 11.3, and the steepest 1 in 7.8. As at Petersham Hill, Messrs. F. T. Bidlake and H. J. Swindley acted as hon. timekeepers. Below are the miles per hour made by the cars.

Car.	First Ascent. m.p.h.	Second Ascent. m.p.h.
Mr. Harvey Du Cros, jun., 16-h.p. Panhard ..	13.1	—
Mr. S. F. Edge's 16-h.p. Napier ..	15.2	—

Car.	First Ascent. m.p.h.	Second Ascent. m.p.h.
Mr. C. Jarrott's 16-h.p. Panhard ..	14.4	13.7
Mr. H. G. Burford's 20-h.p. Milnes ..	14.8	18.6
Mr. E. M. C. Instone's 12-h.p. M.M. Co. ..	—	7.5
Mr. C. Cordingley's 10-h.p. Napier ..	7.1	—

Just before the dispersal took place, one of the park-keepers came along and suggested that the trial was somewhat of a liberty. Probably he thought to see the road cut up, as would have been the case had any other form of locomotion been employed. But motor-cars roll the road, and do not disturb its surface, hence the trials had really been of advantage rather than detriment. In a few minutes the cars began to return to town in the same go-as-you-please style as they had arrived. Scuttling along there were few incidents as we crossed the park, and even the deer looked nonchalant, while the only person who held up his hands was a belated motorist who had had trouble after lunch, and only arrived to see us leave. But our happiness was of short duration, for, descending the hill leading to the town of Richmond, something hissed. It was an ominous sound, and sadly did we dismount half-way down the hill to investigate the cause. There was no doubt as to the trouble, and while a new inner tube was being put in, horsemen passed with glad smiles—pictures of cheery temper we could not display. After the usual delay we set forth again. Mr. Peall remarked that very often a puncture was closely followed by a second similar mishap. We had demonstration of the truth of his remark when nearing Mortlake. For we had another puncture; and another delay. The delay was this time occasioned in the wait for a train to town. And thus ended our experience of last Saturday's informal hill climbing trials at Richmond.

MESSRS. BENNETT AND CARLISLE, LIMITED, Deansgate, Manchester, have issued a new list for the season, in which they announce that they will open a new department in Renshaw Street, Liverpool, early in March. The firm have the exclusive Manchester and Liverpool agencies for the Argyll and Progress light cars, together with that of the Locomobile for Manchester. Messrs. Bennett and Carlisle undertake repairs and keep a large stock of accessories.

THE Brecht Automobile Company, 1207, Cass Avenue, St. Louis, U.S.A., have issued a neat catalogue of their automobiles, gears and parts. They stock several standard styles of gearing. In one that is illustrated the front axle has swivels pivoted as near as possible over the point of tread. These are attached to the steering device direct, thus ensuring a positive guide for the vehicle at all times. A special point in connection with the hind or driving axle is that it is made in one solid piece of steel.

MR. A. HEARD, of the Century Engineering and Motor Company, Limited, informs us that, having experimented with several varieties of radiators, particularly in connection with their Century tandems, they are now using the Begbie-Audin for cooling Aster engines from 4 to 12 h.p., and that although Mr. S. D. Begbie recommended them to allow twenty inches per h.p., they found that they can obtain satisfactory results with even less. The Century Company are just now engaged in testing a new four-seated car fitted with 9 h.p. Aster engine, and they find that with a Begbie-Audin radiator of 12 feet the cooling is all that they can wish. They have sent us a section of the radiator in question, an inspection of which shows that only pure copper is used for the piping—oval in section—and that the gills are neatly and securely fitted.

Mechanical Flight Up-to-Date.

[All rights reserved.]

By SIDNEY H. HOLLANDS.

CHAPTER IV.—GRAVITY AND PASSIVE FLIGHT.

SINCE first perusing the very interesting remarks of Mr. Lancaster, of Chicago, in his communications to the British Aeronautical Society—now a good many years ago—on the evolutions and habits of the large soaring and sailing birds, it has become clear to the present writer that the flight of these great birds—the largest that command the atmosphere—is an operation quite distinct and different from that of small birds and insects. With the latter two classes it is undoubtedly a matter of almost incessant exertion of power during flight—with

Fig. 1.—Aviator of "Wave-action" type (Brearey's), with original motor (designed by the writer), together with twin compressed air reservoirs and "Pectoral Cords."

insects absolutely so; but with the former remarkable class, on the contrary, there may be, and frequently is, a long-protracted intermission of power-output from the bird, with continuance of flight and sustentation, which for the time become passive.

Several keen and credible observers of Nature, including the late Charles Darwin, testify to having seen these birds perform their graceful evolutions in the air: rising in a spiral path, soaring, swooping, wheeling about, and sailing straight away, for half an hour and upwards at a time, on extended stationary wings, and without a single flap.

The foregoing facts shadow forth the astounding possibilities in store for artificial passive or sailing flight. Among birds, the efficient flyers have long, narrow, and pointed wings; these features in the "swift" are very remarkably displayed. Con-

Fig. 2.—Type of Motor adapted for Wing and "Wave-action" aviators (the writer's original design).

sistently with this formation, the extraordinary velocity of this bird in flight, when carefully noted and timed by at least two naturalists working independently, was found by one to be 270 miles per hour, and by the other 273 miles per hour.

Still another writer on bird-flight alludes to the purple swift as doing its five miles per minute. This writer, however, has indulged in a slight touch of "brilliant exaggeration." The arrow-like flight of this bird is achieved with only an occasional sharp wing-flap. The conjoint action of gravity and wind-pressure in its bearing on flight—both natural and artificial—is well worthy deep and careful thought; it probably contains a startling revelation. Mr. R. O. Davidson, an American, in his book, "A New Theory of Flight," published in 1858, says: "I find, after twenty years' contemplation of this theme, natural flight to be dependent upon gravitation, muscular power, accelera-

Typical Inclined Aeroplane, at a positive angle.

tion, and force of winds," and holds the first-named of these factors to be the all-important one.

At one time the present writer sought, in his experimental flying models, to counteract gravitation (notably by means of vertically (acting ascensional screws) and wind pressure, considering them as adverse forces only; whereas with certain types of aviator they are positively as valuable auxiliaries as they are to birds' flight. By virtue of these, a bird's own weight is an indispensable source of power to it; and we are warranted in saying that if a sailing bird's weight were materially reduced, without reducing its bulk, and its muscular power remained constant, it could not fly at all.

The poet Cowper truly wrote—

The bird that flutters least
Is longest on the wing.

Did our respected poet know why this was thus? As King Solomon, in all his glory and wisdom, confessed that he knew not "the way of an eagle in the air," we trow it could not be expected in a mere poet. We now know that "the bird that flutters

Section of "Aspirating" Aero-curve of very efficient form, set at zero.

This Aero-curve at zero is far more efficient than an Aeroplane at a positive angle.

least" utilizes the natural air-currents and his own gravity, inertia (transversely), and momentum (longitudinally), thus obviating the necessity for much laborious fluttering. Finding early in life that Nature was prepared to do nearly all his hard work for him, the bird probably thought it a very neat and satisfactory arrangement; and so, having very little to fatigue him, he can remain longest in the air. These favoured members—the giants of ornithology—comprise the condor, the albatross, the frigate bird, the pelican, the gull, etc.; although all birds use the extraneous natural forces in a lesser degree.

Now it is by so designing an aerial machine as to make use of these forces as auxiliaries that a comparatively evanescent source of power, such as stored compressed air, can be used effectively. (See Fig. 1.) Compressed air could only be used with any degree of practical success for flight by stages, or for short cruises, and where the apparatus is of such design, and the comparatively small motor power provided is so supplemented by the auxiliary forces that the motor need not work continuously, but could have comparatively long spells of inaction, or of greatly reduced exertion of power, while the aforesaid auxiliaries were putting in their joint work and producing passive flight, as in the case of the birds mentioned. The weight of compressed air and reservoir may be taken as 300 lbs. per horse-power hour.

The chief medium through which this great gain is achieved is the elastic pectoral muscles in birds. The late veteran authority and experimenter, F. W. Brearey, B.Sc., introduced and applied successfully to his flapping "wave-action" models an efficient artificial equivalent for this, and called it the "pectoral cord," which provided about 50 per cent. of the power from gravity. (See Fig. 2.) This appliance, attached to the underside of the wings or "wave-arms," and to a central fixed point or strut (corresponding to the "keel" bone of birds) below the car or the main frame, really forms a reservoir of power, "charged," so to speak—i.e., kept in tension—by the weight of the machine, thus enabling its own gravity, with the air as a medium, to sustain it against gravitation, and to assist propulsion as a consequence, paradoxical as it may seem at first. The amount of power gained from this is the product of the total weight of the machine, and the *virtual* amount of fall in feet per minute. The writer will endeavour to make clear what he means by "virtual" fall. As soon as inclined wings, aeroplanes or aerocurves, have horizontal motion imparted to them, or, which is the same thing,

EXPERIMENTS BY MR. L. HARGRAVE, MAY, 1890.

Winged Aeroplane Machine, driven by rubber cord in tension.

Weight of Model 33½ ozs.
Power 470 ft. lbs.
Surface 14.77 sq. ft.

Stated to have flown 270 feet.

Centre of effort was 14.6 in. ahead of C. of Gravity.

receive the impact of a wind or horizontal air-current while held stationary, they are practically or "virtually" falling *relatively to the surrounding atmosphere*, although, relatively to the earth, they (together with the machine or the bird) may be rising. It is thus that the conversion of horizontal into nearly vertical motion of the air is effected by wedge-action on the inclined surfaces, the conjoint action of gravity, inertia, and acceleration holding the machine or the bird down to its work, as a kite is so

held by its string, which string is there the equivalent of gravity and inertia.

The writer hopes and believes that this explanation and simile will sufficiently illustrate how gravity can act continuously in aiding flight, without causing the body to approach the earth, and why gravity is indispensable to flight. The late Dr. Lilienthal had a high degree of success, for over two years of experimenting before he met with his sad fate, with his apparatus for passive

with a horizontal resistance of .87 oz (27 miles per hour).

Maximum Efficiency was obtained at 15° with this form of Aerocurve.

or sailing man-flight; and the results of his trials have afforded us some further useful data for the designing of aerial machines generally. Dr. Lilienthal gave the *adequate* sailing-wing surface as 0.49 to 0.61 square foot per pound, and the best depth of flexure or concavity on the underside of such surfaces as one-twelfth of the width; the curve to be parabolic in cross section of wings, with the greatest curvature on the leading side. These conditions agree generally with the natural wings, as well as with the results of some previous experimenters.

The maximum velocity of natural wind in which the apparatus was found to be manageable was about 16 miles an hour, which, being supplemented by the operator running forward against the wind at 7 miles an hour, gave 23 miles an hour as the greatest relative velocity found to be practicable; but the maintenance of anything like stable equilibrium was then very difficult. The wings had a spread of 23 feet, and a width of 8.2 feet, the area being 151 square feet, and the total weight of apparatus was 25 lbs. Dr. Lilienthal made some further experiments in the application of a steam motor to one of his machines. This motor was of 2 i.h.p. (for a duration of half an hour), and weighed 44 lbs.

It is rather amusing to advert to the results and conclusions arrived at by the ultra-mathematical gentry on the subject of flight, natural as well as artificial. A distinguished French mathematician gave a formula showing that the power necessary must increase so rapidly with speed of flight that for a swallow to attain the speed it does it must have the muscular power of a man. Another distinguished mathematician—an Italian this time—"proved" that a goose in order to fly must develop 300 h.p., and defied the goose to do it on anything less. It must be conceded that this man was the more "distinguished" of the two. His exploit will doubtless "live" in aeronautical circles. The very first thing that the intending experimenter in flight has to do is to discard all rules that lead to such extravagant results.

(To be continued.)

MR. G. CALVERT, of 12, Woodville Road, Mildmay Road, London, N., has sent us a sample of a special grooved pulley he is now making, for use on belt-driven motor-bicycles, and for the driving of water-circulating pumps of motor-cars. A feature of the pulley, which is made in sizes from three inches upwards, is the formation of projections at regular intervals on the inner faces, the projections on one side being so set that they do not come opposite those on the other. It is claimed for the new pulley that it considerably reduces the chance of the belt slipping, the latter being tightly gripped without being pinched into the groove when leaving the pulley.

The Argyll Light Car.

GENERAL VIEW OF 8 H.P. DOUBLE PHAETON.

WE are this week able to publish an illustration and description of the new 8 h.p. light car which the Hozier Engineering Co., Ltd., are introducing for the 1902 season, and to which reference was made in a recent issue. Two types of engines are being fitted, either of which may be had to order—namely, the Simms, fitted with Simms-Bosch ignition, or the latest De Dion pattern made by the Motor Manufacturing Co., Ltd., the dimensions of the cylinder being 100 mm. bore and 130 mm. stroke, both types giving over 8-brake horse power at 1,500 revolutions per minute. The M.M.C. engine is now fitted with trembler on the induction coil and positive contact on the motor, so that the trouble of oil finding its way from the crank case to the contact water is obviated. The motor is surrounded by a double row of vertical water-cooling tubes, which are joined at both the top and bottom to aluminium water tanks. When the water becomes heated in the engine it rises into the top tank, and, of course, the cold water from the bottom follows it into the cylinder; thus the hot water must pass through the cooling tubes and become cooled on its way back into the engine jacket again. This arrangement of cooling pipe and aluminium tanks is neatly designed, and forms a very attractive and distinctive bonnet. It contains in all 40 feet of cooling tubes, and as they are right in the front of the car, they are in an effective position for cooling purposes. This system is found to work perfectly satisfactorily and greatly simplifies the mechanism of the car, no pump being needed. The makers state that after a run of 200 miles they have only found it necessary to add about two pints of water to the tank.

In designing the new 8 h.p. car the Hozier Company have retained all the good features which distinguished the 6 h.p. Argyll voiturette. Among these may be mentioned the transmission gearing, which secures a direct drive from the motor to the rear axle on the top speed. The power is transmitted from the engine to the gear-box by means of a friction clutch, which is claimed to be entirely free from end thrust when the car is running. The internal part of the clutch is mounted on the engine shaft, which renders it impossible to get out of line with the external part. The clutch is of large diameter, and a sliding universal joint is

introduced between it and the gear-box to prevent any strains arising, should the engine get slightly out of line with the gear when going over very rough roads. The change speed gear is contained in an aluminium box. The change of speed is obtained by using strong square-jaw hardened steel clutches, while in the case of the first and second speeds the reduction of the gearing is obtained by using two pairs of gear wheels. This has the effect of distributing the strain, and, while increasing the life of the gear, it also considerably reduces the noise. The reverse motion is obtained by introducing an intermediate pinion—which is mounted on an eccentric shaft—between the slow-speed pinions when they are out of gear. All the speeds are actuated by one lever, and a cam is used which renders it impossible for any one gear to get into mesh before the other is released. A universally-jointed shaft transmits the power from the gear-box to the back live axle, which is rigidly supported on four sets of roller bearings, while the end thrust from the bevel drive is taken by a ball-bearing on either side of the differential case.

Efficient brake power is provided. Large diameter drums are fixed to the driving wheels, around which are placed wood blocks mounted on wire ropes actuated by a side lever. There is a large drum on the central driving-shaft which is fitted with a double-acting brake attachment actuated by a pedal, the depression of which also releases the friction clutch. Both sets of brake work will stop the car when running in either a forward or backward direction. The frame of the vehicle is tubular, the rods running along the whole length to make it perfectly rigid. The road wheels are of the artillery type, and may be fitted either with solid rubber or pneumatic tires. The steering gear is on the irreversible principle, and is actuated by a screw and nut. The illustration shows a double phaeton, a type for which there is a growing demand. The still popular *tonneau* can, however, be fitted, the frame being adapted to take any style of carriage body.

It is reported that more stop-watches are being supplied to the Huntingdonshire police for the purpose of gauging the pace of motorists.

CONTINENTAL NOTES.

By "AUTOMAN."

"A POSSIBLE ENTRANT" for the Gordon-Bennett Cup calls in question my statement in the *Journal* of the 1st inst. with regard to the probability of "Fournier running a Mors car with Continental tires" in this international event, and brings up as witness against me my own writing of January 11th. "Automan" was wide awake, and "A Possible Entrant" can rely on what the French call "*le tuyau*." For his private information the explanation is *bien simple*. The Hanoverian firm are striving to make arrangements to manufacture their tires in France specially for this contest. One word more. I heartily wish "A Possible Entrant" more success in the Cup race than in his criticism of my news.

TALKING of tires, changes that may affect Great Britain are in the air. I was one of a party of automobilists at dinner at the Café Riche à Paris a few days ago, and learned that the last day of February may possibly be the last day on which Michelin tires will be licensed for England. This is quite possible, though as yet I believe a final decision has not been arrived at by the monopolists.

THE first important automobile event of the year took place on Wednesday last week in the neighbourhood of Paris, and under the organisation of the *Auto-Velo*. It consisted in a trial of the amount of carburant consumed on a journey of 100 kilometres (62½ miles) from Suresnes to Corbeil and back. Petrol, or alcohol and petrol, were used. There were altogether 74 starters, and out of this number 9 used a mixture of half alcohol and half petrol, and the remaining 65 used petrol. A speed not exceeding 30 kilometres per hour was the order of the day. The weather was dismal in the extreme, foggy, cloudy, and generally damp. The only redeeming feature from this point of view was that it neither snowed nor rained. It was, however, bitterly cold, and the roads were covered with mud, slush, and thawing snow.

THERE were altogether seven classes, and the winners were as follows:—1st class, bicycles without pedals and not more than 50 kilos. (110 lbs.) weight—Clement, 0.860 litre; 2nd class, motor-cycles without pedals, and not more than 25 kilos. (56 lbs.) weight—De Dion and Bouton, 2.325 litres; 3rd class, voiturettes not more than 400 kilos. (880 lbs.) weight—Peugeot, 5.800 litres; 4th class, light cars not more than 650 kilos (1,430 lbs.) weight—Georges Richard, 6.165 litres; 5th class, cars not more than 1,000 kilos. (1 ton) weight—Chenard-Walker, 6.470 litres; 6th class, heavy cars more than 1,000 kilos (1 ton) weight—Delahaye, 13.330 litres; 7th class, heavy traction cars over a course of 60 kilometres or 37½ miles—Société des Telephones Ader, 3.850 litres. Classed per kilometric ton, the following are the results:—1st class, Clement, 0.078 litre per kilometric ton; 2nd class, De Dion and Bouton, 0.132 litre; 3rd class, Peugeot, 0.105 litre; 4th class, Gladiator, 0.1027 litre; 5th class, Chenard-Walker, 0.0599 litre; 6th class, Amedée Bollée fils, 0.1076 litre; 7th class, Société des Telephones Ader, 0.0661 litres. Arranged in the order of the kilometric ton, which is the true test of efficiency, and irrespective of class, the class winners were as follows:—1, Chenard-Walker; 2, Société des Telephones Ader; 3, Clement; 4, Peugeot; 5, Amedée Bollée fils; 6, Gladiator; 7, De Dion and Bouton. Undoubtedly the great successes of the trial were Chenard-Walker with a car weighing, loaded, over 1 ton, and the Société des Telephones Ader with a delivery wagon weighing 1½ tons. The light car class had by far the largest number of entries (28), showing once more that this vehicle is considered the automobile of the present if not of the future. Three Bardon cars in Class 5 ran very well and secured three out of the first five places, the consumption being 8.300 litre, 8.360 litre, and 8.950 litres respectively.

BELGIUM is still in the throes of exhibition rivalries. The readers of the *Journal* will remember that I have already told them of the two exhibitions which are to be held in Brussels in March—the one at the Cinquantenaire Parc, under the patronage of the A.C.B. and of the Chambre Syndicale de l'Automobile, and the other at the Pole Nord, under the auspices of the Société Royale Union Auto-Veloce de Belgique. The last-named society has held annual bicycle shows for the last ten years, and during the last three years these shows have developed almost exclusively into automobile displays. The automobile trade were, however, not allowed to have a voice in the matter; hence the split. Matters have been now aggravated by the question of Royal patronage, and at the meeting of the A.C.B. last week it was decided to ask the King of Belgium to become patron of the show held under its auspices. There was only one dissident—the president, Count Van der Straten-Ponthoz,—who insisted that if he asked the King to patronise one show he should also ask his Majesty to patronise the other. Finding himself, however, in a minority of one, the Count decided to resign his position of president, and so the A.C.B. is in search of a new president.

THE correspondence at present going on in the *Journal* between Messrs. Edge and Westlake should be carefully studied by those who are interested in British trade in motor-cars. I can substantiate from my own knowledge the last paragraph of Mr. Westlake's letter in the last week's issue. Remarkable improvements will appear at the time of the big races, and until English manufacturers wake up and learn what is being done in France they will continue to be behindhand and to have only a very small proportion of the English trade.

FOURNIER has gone back to America. He sailed last week from Cherbourg on the "Kaiser Wilhelm der Grosse," and will be in New York before these lines appear in print. I shall be very much surprised, however, if he is not back again in sunny France before many weeks are over. It will take a big inducement to make him break away from his cosy flat which overlooks the Bois de Boulogne, and is only a few minutes from the Avenue de la Grande Armée, which is the "hub of the universe" to French automobilists. His Searchmont friends will have to forge a golden (read cash) chain and not a paper (read shares) one to induce him to cast anchor on their side of the herring-pond. Fournier is a remarkably smart and daring driver, and if any reader of the *Journal* wants to prove it let him (if he can and dare) take a drive with the Paris-Berlin champion in the crowded streets of Paris and be whipped round corners at twenty-five miles an hour and dodged in and out of traffic in a manner fit to make the boldest shiver, finishing up at the destination with, not a slow down, but a dead stop with all the brakes hard on, and then a merry twinkle in Fournier's blue eyes whilst he looks round to see if anybody has fallen off.

THE Durham County Council has approved the proposals of the Gloucestershire Council.

MR. G. M. Franklin, Rupert Street, Bristol, offers to take his car to the residence or stable of any horse owner in Bristol with a view to the education of horses.

THE Auto-Lubrine Company, of Fairfield, near Manchester, have sent us a sample of their motor-cylinder oil, Auto-Lubrine. It is claimed that the oil is a pure hydro-carbon, having a high flash and medium viscosity, retains its lubricating properties at abnormally high temperature, and will remain liquid when subject to a temperature even below freezing point. We intend to submit the oil to test and to report further.

EXTENSIVE premises in the Limes Road, Croydon, have been opened by the Anti-Vibrator, Ltd., where they are prepared to repair, or supply parts for, motor-cars. The company has ample storage accommodation and will enter into contracts to store, clean, and maintain cars for any period. Plant has also been laid down for charging the accumulators of electric vehicles.

MOTOR-CARS AT LIVERPOOL.

LAST week we referred to the automobile trials which took place at Liverpool in connection with the Cycle and Motor Show in that city. The report of the judges, Professor H. S. Hele-Shaw and Mr. E. Shrapnell Smith, has been issued and records the satisfactory growth of the light motor-car industry in this country. It is pointed out that the light motor-car industry of this country, as indicated on the trial run, has made great progress so far as reliability is concerned. The journey took place over the worst roads in the district, being hilly and covered with loose stones. Rough roads like those between Rainford and Blackburn and Preston and Ormskirk, traversed at a high rate of speed, and hills, many of which were as steep as 1 in 10, afforded severe tests as to trustworthiness and efficiency. Although four of the cars out of the twenty which took part in the trial did not complete the run within the time allotted by the judges, their breakdowns admitted of remedy within a few hours.

Another important feature which the judges point out is the remarkable development of the motor-bicycle. This motor may be said to be within reach of a very large proportion of those who at present use the ordinary bicycle; but whereas it would have been impossible for anyone except a powerful and trained rider to have traversed these roads and completed the eight-two miles without fatigue and physical strain, those who rode these machines travelled the distance without the slightest inconvenience or fatigue. The judges conclude their report by giving the hill-climbing speeds and the fuel and water consumption on the trials as follows:—

Motor.	Speed up		Consumption.	
	Cemetery	Brow.	Petrol.	Water.
	Miles		Galls.	Galls.
	per hour.			
Mr. Jackson's Daimler ..	10.5	..	4.0	0.25

* Speeds above twelve miles an hour not recognised.

† Traversed an extra twelve miles.

The awards in connection with the show were made as follows:—

AMATEUR SECTION.—Class A, Carriages: Silver medals, Mr. H. Jackson, Bradford, 10-h.p. Daimler; Mr. Leonard Williamson, Southport, 12-h.p. Daimler. Class B: No entries. Class C, Bicycles: Silver medal, Mr. M. Strang, R. and P. 1½-h.p. cycle.

MANUFACTURERS' SECTION.—Class A, Carriages: Gold medal, Rochet 8-h.p. car, the British and Foreign Motor Co., Ltd., Islington, Liverpool. Silver medal, Locomobile steam car (Mr. W. H. Buxton, Liverpool). Bronze medal, 8-h.p. Imperial car, the Imperial Autocar Manufacturing Co., Manchester.

VOITURETTES.—Gold medal, the Mabley, Hitchings, Ltd., Liverpool. Silver medal, the Stirling voiturette phaeton, Mr. W. T. Pritchard, Ltd., Liverpool. Class B: Gold medal, Rochet 4 h.p. quadricycle. Class C: Gold medal, Robinson and Price, 1½-h.p. bicycle. Silver medal, Humber, Ltd., Liverpool, 1½-h.p. bicycle.

Bronze medals awarded for special features: Marshall and Co., Clayton, Manchester, and Humber, Ltd., Liverpool, for general design; Robinson and Price, for 2½-h.p. petrol engine, specially designed for Liverpool Technical School for demonstration purposes; Bennett and Carlisle, for Govan change-speed gear.

On Saturday the show was concluded, when the Lord Mayor presented the medals, etc., won by the exhibitors. Sir Alfred

L. Jones (president of the Liverpool Self-Propelled Traffic Association) presided. He remarked that he would like to see Liverpool right at the front in establishing industries for the production of all classes of motor-vehicles. What they wanted in Liverpool was a commercial article, and that was the heavy wagon. It was hardly possible to over-estimate the importance and utility of such a wagon for commercial purposes in Liverpool. He was looking forward to a great industry rising in the city in the manufacture of motors that would be useful to the citizens as wage-earners and profitable to merchants and purchasers. It had been said that the development of motor-traffic would injure our railways. But Sir Alfred did not think that motor-wagons would be in the least detrimental to our railways. The Lord Mayor, in rising to present the medals, said he believed that motor-vehicles in the near future would come to the front. Just as progress had been made in bicycles from the days of the old "bone-shakers," so we should see a similar advance with respect to motor-wagons. He hoped that Liverpool would not be behind in this industry and would like to see great factories in the city for the manufacture of motor-vehicles.

Mr. J. C. Robinson (chairman and director of the show) moved a vote of thanks to the Lord Mayor, who, in responding, proposed a vote of thanks to Sir Alfred A. L. Jones. The Liverpool Self-Propelled Traffic Association, he said, was one of great importance, and with the assistance of the excellent secretary, Mr. Shrapnell Smith, he believed it was one of the best associations in the country.

THE Long Island Automobile Club will hold a 100-mile non-stop endurance run and hill-climbing contest on April 26th.

By a recent decision of the New Zealand Customs Authorities, mineral naphtha, including petrol, is to be admitted into the colony free of import duty.

AT last the writer of the short story has centred a tale around a husband's infatuation for the motor-car, an infatuation that caused him to leave his wife too often alone. It was inevitable, and the *Free Lance* is responsible for the publication.

THE Overman Automobile Company state that there is no truth in the report that their company has been absorbed by the Locomobile Company of America. They have simply entered into an agreement to make certain parts at their factory for the Locomobile concern.

MR. LESLIE BUCKNALL, the well-known motorist, has just made a series of balloon ascents from Sevenoaks. On Saturday, at one o'clock, he set out on a plucky aerial voyage during a severe snowstorm. He was accompanied by his two brothers and Mr. Stanley Spencer, the latter in charge of the balloon, the City of York. The ascent was successfully accomplished, and the balloon travelled in a north-easterly direction.

At the last meeting of the Denbigh County Council Mr. J. E. Humphreys moved that the Council make arrangements for controlling the speed of motor-cars, and said the police should be in a position to have control of the cars, and each car should have a distinguishing figure on the front and back. On the suggestion of the vice-chairman, the matter was referred to the Locomotives Committee.

A NEW internal combustion motor using ordinary heavy oil with, it is claimed, an absolutely invisible exhaust under all conditions of load and speed, is being introduced by the Allsop Smokeless Petroleum Engine Syndicate, of 37, Norfolk Street, Strand, W.C. The engine has two cylinders—a small pump cylinder which draws in and delivers in a regular manner the petroleum vapour into the second, or larger cylinder, which is the motor cylinder proper. An essential feature of the arrangement is the compression of the hydro-carbon without ignition in the small, or pump cylinder, with, as a result, development of greater power and the perfect combustion of the fuel in the motor cylinder. When thoroughly warm, the burner heating the ignition tube may be turned out, the engine firing the charge itself by the heat of the combustion chamber walls.

FLOTSAM AND JETSAM.

BY FLANEUR.

BY a fortuitous combination of circumstances I found myself a day or two ago in more or less amicable converse with a chief constable of police. The county over which he has jurisdiction shall be nameless; in view of the fact that I wish to refer to one or two of his observations it would be unfair that he should be identified, though I may add that he well knew that I was a journalist, and from the way in which he himself opened the conversation, and the extreme frankness with which he volunteered his opinions, I had no reason for supposing that he had any aversion whatsoever to the publication of his views.

I do not propose to dwell upon these at any length, but merely to quote two of the most significant of his remarks, because they show clearly enough what we automobilists have to face in certain portions of the country, and they help to an elucidation of the question I have previously asked in these columns—namely, “Who are our enemies?” The chief constable in question disclaimed any personal antagonism to motor-vehicles or their users, but stated that he was bound to put the law in motion, because of pressure brought to bear upon him by the magistrates themselves! The importance of this declaration may be appreciated when it is borne in mind that these magistrates come into court to hear charges against automobilists, against whom they have thus waged a secret warfare, and against whom, therefore, they entertain a degree of bias which renders a fair trial impossible.

FROM another source I have also heard that the farmers in this same county have likewise been influencing the chief constable by working up an agitation against automobilists. It is a melancholy reflection on the weakness of human nature, that motives of self-interest should be so nakedly displayed. “The motor-car does not eat fodder; if motor-cars become general we shall have fewer oats to sell. We shall also have fewer horses to breed, and lower prices even for those that we do happen to dispose of. Let us, therefore, hinder the growth of this new movement by every means in our power, fair or foul. The public interest, or the law of progress, is nothing to us; we are frankly and blatantly selfish.” This, in effect, is the mental attitude of the farmer in certain districts; in Kent, perhaps, another tale could be told. It is not too much to say, moreover, that farmers of the hostile type welcome with avidity the heavy fines imposed on automobile drivers, for these large and cheaply-earned accretions to the county funds have the obvious effect of reducing the rates of that particular locality.

BUT to return to the chief constable. “You must get the law altered,” he said with emphasis, when I had obtained from him a virtual admission that the twelve-miles-an-hour regulation was tyrannical and absurd. It was a palpable surprise to him when I pointed out that it was quite feasible to summon for “furious driving so as to endanger the life and limb of any passenger, or to the common danger,” under the Highway Act. He appeared up to that moment to regard himself as wholly without option in the matter, and to consider that the Local Government Board regulations were the only ones under which he could proceed against automobilists. In all probability, however, the hostile forces at his back would not be content with anything but summonses under the twelve-miles-an-hour rule; they want their pound of flesh, and mean to have it, if the letter of the law will let them.

THE moral is obvious. So long as the “ridiculous” regulation—to use Mr. Walter Long’s own description—is in force, so long will it be possible for automobilists to be harassed in an absolutely unjustifiable way, when travelling at over twelve miles an hour on the open highway, or, for that matter, when proceeding at a slower pace, but timed by the usual police methods.

It is strange that this lesson should still need to be enforced, but when there are automobilists—as was shown in one conspicuous instance at a recent Club discussion—who actually talk of “letting well alone” because they themselves have not yet been summoned, it is meet that the point should be hammered home. It is all very well for men living in a county where persecution is not rife, and whose ideas of automobile travelling are so parochial that they do not drive far afield, to contend that matters may well remain as they are; but those whose journeyings expose them to indefensible aggression, or who actually reside in a hostile county, are constrained to pipe to a different tune. In one way it would be better if the strict letter of the law were enforced in every county, for automobilists generally would be up in arms instead of lukewarm, as too many of them are.

APROPPOS of the warming of motor-houses, reference was made in this journal last week to the danger of using lamps for the purpose “unless a safety-stove, somewhat on the Davy principle, could be supplied for the purpose.” Such a stove is not on the market, I believe, but an ingenious friend of mine devised one lately for his own use, and it works most satisfactorily. He has surrounded a gas jet with a huge environment of gauze, about the size and shape of a railway-carriage foot-warmer, and this he claims to constitute the largest Davy lamp in existence. Though the building in which the car is housed is out in the open—at the bottom of a garden—the owner has had nothing to fear from the various frosts we have been visited with this winter.

SOMEWHAT curious was the way in which the *Daily Mail* and *Daily Express* threw themselves into a state of considerable excitement in last Monday’s issues concerning two new motor-cars which the King was stated to have ordered. One looked to see if still further Royal patronage had been accorded to the automobile industry, but in each journal alike the lengthy disquisition which met one’s eyes was nothing more nor less than a belated extract from the *Court Journal*—of all papers! Well, the *Court Journal* is scarcely the same thing as the *Court Circular*, and so far from the “information” being new and authoritative alike, it embodied nothing that was not already known, or that had not been published weeks ago in many journals, including, if I recollect aright, the above-named dailies themselves. Possibly, however, there may have been people who saw one or other of the paragraphs on Monday, but had not previously been made aware of the King’s abiding interest in automobilism; in which case we may be glad that that fact has been emphasised anew.

“MOTOR Race in Lancashire” is the title of an article in the *Manchester Dispatch* on the recent Liverpool trials. How some journalists allow their imagination to run away with them!

THE official list of members of the Automobile Club of America has been issued in a neat little volume, which also gives the by-laws of the Club, and a directory of the automobile clubs in Europe and America. The total membership of the Automobile Club of America is now 353, 291 of whom are active members.

MR. W. J. MILLS, of High Road, Clapton, sends us a short account of a trip on his Werner motor-bicycle from Clapton to Frinton-on-Sea. On the journey “something went wrong with the works,” but Mr. Mills discovered in Mr. Fisher, a Tollesbury motor-car agent, an excellent friend, who, after two hours’ work, sent the motorist on his way rejoicing.

WE learn that the title of the British and Foreign Electrical Company, Ltd., is being changed to the British Electromobile Company, Ltd. The managing director of the company, Mr. Theodore Chambers, has informed us that in the future the electric carriages made by his company will be entirely of British manufacture. By an arrangement with Accumulator Industries, Ltd., of Woking, all the carriages will be equipped with “Leitner” batteries. On its part the Woking company has decided that all car bodies required for the batteries which it supplies shall be manufactured by the British Electromobile Company.

HERE AND THERE.

THE Daimler Motor Company have just completed a handsome 12-h.p. car for Lord Brassey.

LORD SUFFIELD has intimated that he will allow speed trials to be held on his estate at Cromer.

THE Talbot Cycle Company, of Wolverhampton, are introducing a motor-bicycle on the Minerva system.

A BRIGHTON motor-car firm is contemplating the establishment of a motor-wagonette service in Rugby in the spring.

In our article on the Brooks light car, published last week, we should have stated that the removal of the body can be effected by simply releasing four bolts.

THE Birmingham Theatrical Charity Sports Committee is organising a race meeting on the track at Aston for March 12th next. Included in the events is a motor-bicycle handicap.

THE competition of the Lincoln Motor 'Bus Company during part of the year and the high price of horse fodder are the two reasons ascribed by the Lincoln Tramways Company, Limited, for a lessened profit.

BY vulcanising fresh rubber to the old covers of motor-cars the "Imperial" Tyre and Rubber Company, Limited, 27, Brooke Street, Holborn, E.C., are claiming to render old tires practically as serviceable as new ones.

THE future generation should know something of automobilism, for the *Boy's Own Paper* is publishing a series of articles on "How to Build a Model Steam-car." Importers of American cars will have to look to their laurels.

THE Motor-Cycling Club, Limited, has been registered as a company limited by guarantee, with a membership of 500, each of whom is liable for the sum of 5s. in the event of winding up. The registered office is at 13, Colville Mansions, Talbot Road, Bayswater.

FOUR or five public-service cars are still running between the Post Office and Haymarket, Edinburgh. Two of the cars belong to the New Rossleigh Cycle and Motor Company, Limited, who in their few weeks' experience have done a satisfactory business.

In the recent Liverpool trials the R. and P. motor-bicycle accomplished the run of eighty-one miles over a rough hilly course on nine-sixteenths of a gallon of petrol. Professor Hele-Shaw and Mr. E. Shrapnell Smith have since ordered R. and P. machines for their own use.

THE Motor Mart Limited report the sale, during the ten days preceding the 4th inst., of eighteen motor-cars and five motor-tricycles. The cars included a public-service vehicle, four De Dion voiturettes, five Benz cars, two Daimlers, two Star cars, one Panhard, and three Clement-Panhards.

A NEW motor-tire price list has been issued by the Clipper Pneumatic Tyre Company, Limited. It comprises particulars of tires for heavy cars, voiturettes, and motor-cycles. Prices are also given of old types of light car tires for replacement by motorists. These, however, are only sold for replacement purposes.

MOTOR-CARS are now being made in New York for the children of the rich. The millionaire's baby who has passed beyond the perambulator stage can enjoy its daily outing in a miniature electric Victoria. The wheels of these baby Victorias are not more than 1 ft. in diameter, while the seat is about 8 in. or 9 in. square.

A DESCRIPTION of the Chapelle motor-bicycle has been published by the United Motor Industries Limited. The features of this machine are well known. It can be supplied with or without a speed-changing gear, and the motor is placed in the axis of the frame. A full explanation of the two-speed changing gear is provided, and a series of useful hints on how to start and stop the bicycle concludes an interesting little pamphlet.

MR. LEONARD WILLIAMSON, Southport, drove from Southport to Liverpool, via Ormskirk, on Saturday, in order to take the Lord Mayor and Lady Mayoress to West Kirby and back, prior to the distribution of medals, in connection with the

Liverpool Cycle and Motor Show. Mr. Williamson drove through a blizzard and several inches of snow, with 5-inch pneumatic tires frequently completely buried in the snow, in the short time of one hour and twenty minutes.

WHEN the application for the renewal of the licence for motor-cars to ply between Gravesend and Northfleet comes before the District Council, attention will be drawn to the alleged persistency with which the cars are driven in the middle of the road.

GARAGES, LIMITED, has been registered with a capital of £10,000, to acquire the business of the Club Garage, Limited, and certain assets connected therewith, and to carry on the business of, or connected with, the storage of motor-cars, repairers, hirers, etc. The registered office is at 19, Princess Street, Westminster.

THE Albany Manufacturing Company, Ltd., has been registered with a capital of £2,000, to adopt an agreement with T. Threlfall, T. B. C. Hardman, and H. Lamplough, and to acquire any real, personal, or other property in any part of the world, and to develop, deal with, work, and turn to account the same in such manner as the company shall see fit.

A COMBINED volt and ampere-meter, designed especially for use on electric motor-carriages, has recently been introduced by Messrs. Nalder Bros. and Thompson, Limited, of 34, Queen Street, E.C. It consists practically of two instruments having a common magnet, thus possessing the advantages of two scales and pointers, with little more than the weight of a single instrument.

THE Speedwell Motor Company, of Reading, has just introduced a handy little combination tool for the use of motorists. As will be seen from the accompanying illustration, the tool comprises not only a tire lever, screw-driver and spanner

for De Dion sparking plugs, but also can openers for the spirit cans of either the Anglo-American Oil Company or Messrs. Carless, Capel and Leonard. The tool is about twelve inches in length and is strongly made, and, being nickel plated, is of neat appearance. Altogether it forms a useful addition to the motorist's tool kit.

THE illustration on page 904 shows a motor delivery van that has lately been supplied by the Motor Manufacturing Company, Limited, to Messrs. W. Whiteley, Limited. The van is similar in all respects to the one that went through the Glasgow trials last autumn so successfully. It is fitted with a double-cylinder engine of 7 h.p. and has a carrying capacity of one ton. We understand that the car has given great satisfaction to Messrs. Whiteley, making an average of no less than ninety calls daily. During the Christmas holidays it was frequently called upon to convey loads weighing nearly thirty cwt., although really only intended to carry one ton.

MESSRS. PETO AND RADFORD, LIMITED, have sent us particulars of a new accumulator they have just introduced, and which has been specially designed for motor-car use so as to withstand vibration. The plates are composed of three distinct parts: 1 the case, 2 the grid, and 3 the separator or insulator. The case consists of an outer shell of lead, which gives strength and mechanical support to the grid. The plate consists of a very light grid filled with a maximum amount of active material, while the separators are formed of two pieces of perforated ebonite or celluloid, which prevent the paste from falling out or causing a short circuit by bridging across the plates. The accumulators, which are known as "Armoured," are made in a variety of sizes, ranging from ten up to eighty ampere-hour capacity at four volts, and from twenty to eighty ampere-hour at two volts.

MOTOR-BICYCLES.

At a meeting of the Cycle Engineers' Institute, at Birmingham, on Thursday last week, Mr. A. Craig read an interesting paper on Motor-bicycles. The first part consisted of a brief description of all the leading types of motor-bicycles, including the Werner front-driver, the Werner rear-driver, the Minerva, the Derby, the Brown, the Mitchell, the Enfield, the Progress, the Chapelle, the Humber, the Singer, and the Holden. Figs. 1 and 2 show the Accles-De Veuille-Starley motor-bicycle. This is an interesting machine which is just about to emerge from the experimental stage. Worm gear is adopted, so proportioned that the worm will drive the worm wheel, or *vice versa*, and an oil bath is provided to ensure proper lubrication. Only a single chain is used.

Mr. Craig next devoted his attention to some general considerations of motor-bicycles. An abstract of his remarks is appended:—

Stability.—The general belief which prevailed some time ago that a motor-bicycle was less safe than the ordinary machine and more liable to side-slip, no doubt had a considerable effect in retarding its development. That the danger was much exaggerated has since been practically demonstrated, and the machine has been proved to be at least as stable as the pedal-driven bicycle, though when a fall does take place the effects may be in some cases more serious. The fact remains, however, that side-slip does occur on motor-bicycles, and anything which would minimise it would

while he, or rather his centre of gravity, will come down vertically. In passing from the original position to the final one, the movement of the rider and machine as a whole has been twofold—namely, a fall vertically and a rotation about a horizontal axis of a quarter of a circle, which is explained by the fact that the final position is at ninety degrees to the original position. These movements we may consider separately. If the motor is in the high position, with its weight near the horizontal line of the centre of gravity of the machine and rider, a given disturbing force will rotate the whole through the quarter of the circle in less time than will be the case if the motor is located far away from the centre of gravity, that is to say, near the ground. The comparison is the same as when two fly-wheels of equal weight but different diameter are considered. To look at it in another way, the quickest fall that the rider can have is when he comes down exactly in a vertical line by the machine skidding freely from under him. If, as would be the case when a weight such as the motor is placed low down in the frame, the side movement is more sluggish, then the rider will be constrained to move some distance laterally in the other direction, away from the vertical line also, and therefore his fall must be retarded. The author is, consequently, of opinion that the lower the motor is placed in the frame the less sudden will be the side-slip, but he does not regard it as a question of vital importance, since practice has demonstrated that satisfactory machines of both types can be made. Other considerations have a bearing on the question, and one of these is convenience of handling when the rider is off the machine. From this point of view the low position

THE BELLE 6 H.P. TONNEAU (MESSRS. E. J. COLES AND CO.).

[For Description see issue December 7th last.]

be welcomed by all users of the machine. A point that has been greatly debated in this connection is whether the motor should be placed in a high or low position in the frame.

Side-slip may arise either from excessive speed round corners, in which case the height of the centre of gravity does not influence the angle to which the rider has to lean inwards, or it may arise from irregularities of a greasy road, such as tram-lines, etc. If side-slip occur in going too fast round the corner, one would be inclined to put it down to carelessness on the part of the rider. The side-slip arising from the second cause, however, is more common, and also more difficult to guard against. If a rider loses his equilibrium and falls sideways on a dry road, his centre of gravity will move approximately in a circular path round the line of contact of the wheels and the road. In this case, the higher his centre of gravity the more time would he have to recover himself in the first part of his fall, as it is practically a case of the inverted pendulum, the length of which is the height of the centre of gravity from the ground, and it is a well known fact that a long pendulum is slower in its movements than a short one. In the case of a side-slip the conditions are reversed. The lower part of the machine does the lateral movement, and the centre of gravity of the rider comes down approximately in a vertical line. Neglecting the forward movement of the bicycle, let us imagine the rider sitting on the machine, which is being held up for him on a greasy road. If the support be withdrawn he will commence to fall sideways, and so soon as he gets to a slight angle the machine will skid laterally from under him,

of motor is certainly the best. Gyroscopic action of the fly-wheels has some effect on the stability of the motor-bicycle, although nothing like so much as is commonly supposed. The rule is as follows: "When a fly-wheel rotating about its axis is turned about another axis, the fly-wheel axis tends to set itself parallel to the other axis, with the fly-wheel rotating in the same sense as the movement about the said other axis." As a matter of fact, the gyroscopic effect is so small with the light fly-wheels at present in use that it may be neglected, but, where possible, it is advisable to arrange the direction of rotation so that the gyroscopic action increases the stability of the machine.

Engines.—Small air-cooled engines have been brought to a high state of efficiency by the manufacturers of motor-tricycles, and the experience gained provides ample data for the design of motor-bicycle engines. These latter, of course, are smaller and lighter in every way, the most notable reduction being in the size and weight of the fly-wheel. Air-cooling is almost exclusively used, but the Holden machine forms the exception, as this is water-jacketed. Of course, water-jacketing was used in the earlier days on the Wolfmuller bicycle, and it is not at all unlikely that it may come into favour for bicycles fitted with high-powered engines, and especially for tandems.

Weight of Engine.—The reduction in weight and size of the fly-wheels still form the chief element in the weight of the engine. Suppose the machine to be geared so that it runs twenty-four miles an hour when the engine is making 1,800 revolutions a minute, probably the motor-bicyclist

would be satisfied if his engine commenced to work as soon as he got up a speed of two miles an hour by pedalling to start it. This would mean 150 revolutions per minute of the engine, and the weight of the fly-wheels should be such that their momentum at 150 revolutions, together with the energy of the first explosion, would just carry the engine over the next compression. As a matter of fact, existing engines can be started at a much slower speed than this. It thus appears that the present weight of the fly-wheel might be considerably reduced without impairing the starting power of the engine at low speeds. Of course, the fly-wheels have another function to perform in evening up the irregular impulses of the single-cylinder engine, but these are not very noticeable when the machine has attained even a moderate speed. If a motor-bicycle were fitted with an engine having extremely light fly-wheels and a disengaging clutch, the machine might be started by pedalling and the engine thrown into gear with very little shock indeed. The cylinder might be reduced in weight by making it of drawn steel; the radiators could be of sheet copper and threaded on as in the Aster, which arrangement is quite satisfactory.

FIG. 1.—THE ACCLES-DE VEULLE-STARLEY MOTOR-BICYCLE.

Carburettors.—Although the surface carburettor is more common at the present time, it will probably in the near future be replaced by some form of spray carburettor which would be more uniform in its working. Of course, a level-regulating apparatus may be fitted to a surface carburettor, as in the Singer machine, which would make its working quite uniform, but that would have no advantage in the way of simplicity or efficiency over the ordinary spray carburettors. Of the spray or jet carburettors the ordinary float feed is best known, and this can be easily made up in a small size suitable for motor-bicycles. There are others on the market in which the spray nozzle is normally closed by a small conical valve held lightly down by a spring. The suction on each charging stroke of the engine causes this valve to open, and a spray of petrol emanates from the nozzle. When properly regulated these carburettors are quite effective, and can be very small and compact.

Ignition.—The ignition apparatus of a motor-bicycle, in common with that of other motor-vehicles, is the part which most frequently gives trouble. Electrical ignition is now, of course, universal, but the current may be supplied either by primary battery, secondary battery, or magneto. In the last case, it is a low-tension current, while the former two are employed in connection with the induction coil to produce a high-tension current giving a jump spark in the cylinder. Generally speaking, the contact-breakers, induction coils, and other apparatus employed in connection with the high-tension ignition gear for motor-bicycles have been of the very cheapest variety, and this has naturally caused a good deal of trouble to the user. With about one exception the induction coils used on motor-bicycles have no trembler, the interruption to the current in the primary circuit being made by the contact-breaker, which is generally of the Aster type, producing one spark only instead of a stream of sparks such as the trembler coil gives on the large cars. Probably the small space available has accounted for the inefficient contact-breakers that have been fitted in the past; and the necessity having been seen for something better, these troubles will soon be eliminated. Accumulators seem to find favour with motor-bicycle users in preference to dry batteries, but neither can be considered an ideal source of current for the purpose. Magneto-ignition has proved successful on the Singer bicycle, and its general adoption, not necessarily in the low-tension form, would at any rate remove one source of anxiety from the mind of the rider.

Transmission.—The method of connecting the engine to the driving-wheel has an important effect on the efficiency of the mechanism as a whole, and also materially influences the general arrangement of the bicycle. The simplest form of transmission is that in which the connecting rods of the engine drive directly on to cranks on the back wheel axle. This is exemplified in the Holden bicycle, and was also used on the Pennington and Wolfmuller machines of earlier date. The arrangement is open to many objections, unless it be made in the four-cylinder form like the Holden, and the tires of the back wheel soon become badly worn. The method of transmission which comes next in the way of simplicity is the belt-drive,

which is so largely used at the present time. A twisted leather belt is generally employed, running in V-grooved pulleys. This drive has the merit of being very smooth in its action, and by admitting of a little slip between the belt and the pulley prevents any irregular working of the engine having effect on the rider. It is also conveniently detachable in case the engine fails and has to be disconnected. It has been a matter of surprise, however, to many who have had experience in motor-car construction that the belt should have survived so long as a means of transmission in motor-bicycles, since the conditions are more unsuitable than in the case of larger cars, where it has been superseded by chain or gear drive. The use of higher-powered engines this year has certainly revealed the inadequacy of the round belt in many cases, and some manufacturers have adopted a flat belt in preference. Probably the belt-drive will eventually lose favour except for low-powered machines, and some form of chain or gear drive, with a spring or slipping clutch in one of the wheels, take its place. The gear-drive is best exemplified in the Singer motor-bicycle, where the pinion on the engine shaft drives directly the internal gear-ring on the road-wheel. It forms a very efficient method of transmission, and one that has already been proved practicable on motor-tricycles. However, there is no doubt that it would be considerably improved if it were made more elastic, so that the shocks of the engine should not be imparted to the rest of the machine. Chain transmission will probably become the most popular in all cases except for low-powered machines, and some form of chain or gear drive, with a spring or slipping clutch in one of the wheels, take its place. The gear-drive is best exemplified in the Singer motor-bicycle, where the pinion on the engine shaft drives directly the internal gear-ring on the road-wheel. Its efficiency is undoubtedly higher than that of the belt, and it can be made as smooth in its action. If the reduction from the engine to the road-wheel be attempted in one step, a very large and unsightly sprocket-wheel or belt-pulley must be fixed to the driving-wheel. With the high efficiency obtainable on a chain-drive it may be worth while to make the reduction in two steps, in which case the drive would appear less clumsy, and a suitable gear-case could be easily fitted. The worm-drive is exemplified in the motor-bicycle illustrated in Figs. 1 and 2. By the use of worm-gear the necessary reduction between the engine and road-wheel can be effected in a very small space, and although the worm is certainly less efficient than spur-gearing, yet if well designed and properly made it is doubtless more efficient than the belt-drive commonly used. Two-speed gears have been fitted in some few cases, but this seems an unnecessary complication except for very hilly country. It is also convenient when the engine is not working up to its normal power, but it frequently happens, in cases where a low-speed gear is fitted to a vehicle propelled by an air-cooled engine, that the driver, in his endeavour to get up hills quickly, will race his engine on the low gear, and this, of course, leads to overheating and loss of power.

Disengaging Clutches.—It is useful to have some means of disconnecting the engine from the road-wheel without dismounting from the machine. If such an arrangement be fitted the rider can mount the machine with the engine disconnected, and put the latter into gear after he has started. The momentum of the machine and rider will then carry the engine over its compression, and start it without excessive exertion on the part of the rider.

FIG. 2.—DRIVING GEAR OF ACCLES-DE VEULLE-STARLEY MOTOR-BICYCLE.

General Arrangement.—It has already been remarked that the system of transmission used largely governs the design of the machine as a whole, but in cases where a belt or chain is used there are several positions in which the motor can be fitted. The ordinary bicycle, even when suitably strengthened, is not particularly adapted for the attachment of a motor, and a better result can be obtained by designing a special frame for the purpose. In such a design the motor is not the only thing to be considered, as provision must also be made for a petrol tank, battery case, etc. There is a very wide field for the designer of motor-bicycles, as tandems and spring frames have yet to be dealt with. If water-cooling be adopted, there should be no difficulty in enclosing the motor and accessories in one portion of the frame and concealing it with a panel on each side. By this means a very neat result could be obtained. Details cannot have too much attention, as the efficiency of the machine as a whole largely depends upon them. A weak rod to the compression tap or contact-breaker, for instance, would

be an endless source of annoyance, and the lubricating arrangements must have very careful attention. The motor-bicycle is the simplest, and consequently the least expensive, form of motor-vehicle which can be made. The fact that it has proved practicable in actual use ensures its popularity in the future; indeed, the trade has already assumed much greater proportions than is generally known. The subject is, therefore, worthy of the most careful consideration on the part of cycle engineers, and they will find that it is not lacking in interest.

CORRESPONDENCE.

MOTOR-BICYCLES FOR 1902.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I note W. M. W.'s reply to my letter in your issue of the 25th ult. As I surmised, his fly-wheel for the new machine he has made is of somewhat exceptional diameter. Its weight multiplied by velocity at 2,000 revolutions would be about 1 h.p., actual. I think this would agree well with the dimensions of the cylinder as given. I am glad to see W. M. W. places his fly-wheel externally. I believe this is one of the best ways of keeping the weight down in these machines; I am doing the same, and I may also mention that I have reduced the weight of my engine by 30 lbs. for a 3 h.p. motor. As he surmises, I am using a more or less rigid system of transmission.—Yours faithfully,

ANTHONY WESTLAKE.

STARTING A MOTOR-TRICYCLE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—If your correspondent who signs himself W. Auld will make an air hole in his petrol tank, or force petrol in carburettor with a force-pump on tank, I think he will get over his difficulty. I had the same experience, and found that the tank was air-bound, and that the engine would not run many minutes unless I opened petrol tank plug and let air in.—Yours truly,

AIR-BOUND.

THE RECENT HILL-CLIMBING TRIALS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—May I suggest that a very good climb is that of Hazellville Hill, leading from St. John's Road into Hornsey Lane, Highgate? This hill is long, very wide, and of good sandstone surface. It is situated amid very quiet surroundings, and is only four miles from Charing Cross. Another gradient that seems to have been forgotten since the early cycling days is Muswell Hill. Either of these I consider a far better test than Petersham Hill, and one great advantage on the above-mentioned hills is that a clear view can be had of the entire course from any part of the rise.—Yours truly,

E. J. COLES.

MECHANICAL FLIGHT UP TO DATE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to the letter of Mr. A. C. E. Whittard in your issue of February 1st, re the function of the tail in soaring birds, the equivalent of the bird's tail in an aeroplane system is the horizontal rubber or Penaud "planophore" (invented by the Frenchman Penaud in 1871), which, by the action of the impinging air, corrects any deviation of the aeroplane from its normal line of flight. Mr. Sidney H. Hollands will probably deal with this in the course of his interesting articles. A full explanation of this device will be found in Chanute's work "Progress in Flying Machines," on page 118. Although it appears to act more or less satisfactorily in models, yet most aviators hold that it consumes too much power in the constant readjustment of the stability, does not, in a full-sized machine, act quickly enough to prevent disaster, and therefore does not solve the problem of automatic equilibrium. Lateral stability, as Mr. Hollands has often pointed out, can be secured by placing the supporting surfaces at a diedral angle, but longitudinal stability appears to be still an unsolved problem.—Yours truly,

HERBERT F. LLOYD.

THE STIRLING CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will some of your readers who have had experience of above cars kindly let me have, through your columns, their opinions as to their hill-climbing abilities, and also the brake power? I will be much obliged for any information from those who have used the Stirling cars.—Yours faithfully,

J. T.

FRANCE COPYING ENGLAND.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Replying to the letter from Mr. Anthony Westlake, in your last issue, it is very evident that for some reason this gentleman does not wish it to be clearly proved that England has been in advance of France in at least some few directions. My answer in your issue of the 1st inst. was a clear statement of fact, and as Mr. Westlake tries to somewhat obscure the truth I will answer his points categorically, and also suggest that a competent person should be appointed to examine my documentary

proofs. My information is all first-hand and of my own knowledge; Mr. Westlake's is only something that he has heard of. His own powers of observation are evidently not good in the direction of distinguishing aluminium-jacketed engines, when he says that he admits having seen one of my cars, but did not notice that it had aluminium jackets. I can easily prove that it was never fitted in any other way. Firstly: The year 1900 saw the first appearance of the Napier motor-carriage, but Mr. Westlake, if he peruses the automobile papers, knows perfectly well that the Napier engine was made and was in use on the road eighteen months prior to this, and as the only point under discussion was the engine, why should he drag in the car, which has nothing to do with the case? Secondly: He admits having seen a 16-h.p. Napier, and does not recollect that it had an aluminium jacket. We have never made a four-cylinder engine without an aluminium jacket, and both mine and Mr. Mayhew's, which I believe were the two first 16-h.p. Napier cars made, were fitted with an aluminium jacket. The statement that Mr. Mayhew's was not so fitted is incorrect. With regard to my suggesting that the car on which I competed in France in 1900 had an aluminium jacket, certainly I mean exactly what I said, and that is, that it was fitted with an aluminium jacket, and never was made or fitted in any other way. In regard to the straight valve stems on the modern vertical engine, these were embodied in the Napier in 1898.

This defeats the various statements of Mr. Westlake's, except on the question of power for weight in reference to what we term our 50-h.p. engine. I notice even on this point Mr. Westlake has begun to weaken, and now wants to compare the Napier car complete which competed in the Paris-Bordeaux race. Even on this point I am willing to compare if it is of interest, providing he will produce a certified copy of the weight of the Mors car and a certified copy of the horse power. It seems to me that he is rather inclined to hold a brief for our French friends, and I hope he will agree to an unbiased person holding the scales in the matter, and publishing to the world the actual truth. My facts are ready as soon as he has some.—Yours truly,

S. F. EDGE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I notice in the discussion re "France copying England," in your issue of last week, that Mr. Anthony Westlake states that according to his recollection my 16-h.p. Napier had not an aluminium jacketed engine. This, of course, is quite incorrect, as anyone knows who saw the car and can recognise aluminium when they see it. It had an aluminium jacket, and I have never owned or seen a Napier engine without it.—Yours faithfully,

MARK MAYHEW.

COST OF MAINTENANCE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—The following extract from a weekly paper has just been shown me:—"A 5 to 12 h.p. motor-car will cost its owner £480 to keep. The sum has been put at £200, but the former is more reliable. You must allow £100 for tires, £100 for the conductor, £30 per year for lubricating oil, and the rest for paraffin, insurance, sinking fund, taxes, rates, and so on."

Now, I do think it is a pity that editors, however ignorant they be of motor matters, should allow such utter nonsense to appear in their papers, for not only is it prejudicial to the industry, but at the same time it brings their paper into ridicule. £30 for lubricating oil, forsooth! £250 for paraffin (!), insurance, etc. £50 per year should be a liberal allowance for tires, another £50 for the man, £3 for lubricating oil, and £20 would certainly cover insurance and taxes. This brings us to a total of £123, leaving a balance of £357, out of which petrol must be taken, which, of course, is a variable quantity, governed only by the distance run. Possibly the editor had a vague idea of police persecution, and put on the odd £300 to cover the same.—Yours truly,

MAWDSLEY BROOKS.

THE WYDT'S ALLUMEUR ELECTRO-CATALYTIQUE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Your Paris correspondent, "Automan," recently described a new sparking plug, "Wydt's Allumeur," and as this is now on sale in England, it would be interesting if any of your readers who have tried it would send their experiences. If it does all that is claimed for it, it is nothing short of a revolution. It sounds incredible that the coil, accumulator, make and brake devices, can be abolished at one stroke. A recent letter from one of your correspondents suggested that there was no means of advancing and retarding the ignition, but I find that the English agents claim that this has been accomplished.—Yours faithfully,

ARTHUR GUEST.

AN INTERESTING QUERY RE LOSS OF POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Seeing the recent letters about the York Boyer cars, I should like to add a few comments myself, as the owner of one of them. The car (or rather voiturette) is well designed as a whole, and would be a very satisfactory one also in work if the makers were more careful in certain matters of detail. It is, however, in connection with the ignition that I propose to trouble you, as that has been the subject previously referred to. The contact-spring being a very stiff one requires considerable force to bend it, even when the whole length is free, and this force is greatly increased as soon as its elastic length is (about) halved by the meeting of the contact

points. Of course the adjustment may be supposed to be so exact that the moment of contact coincides with the extreme push of the cam, but such mathematical nicety cannot usually be obtained. The practical result is that the force applied to the spring causes the nib against which the cam acts to be rather rapidly worn away, which in turn involves annoyingly frequent attention to the contact screw. This screw itself, also, has to bear great strain when the spring is forced against it, and has therefore a natural tendency to get loose.

I always consider that the motor should start, all cold, at the second or third turn of the handle, and at the first or second turn after running for a time, and I give great attention to the adjustments in order to secure this, but notwithstanding all my care, the ignition is very apt to fail quite suddenly, without apparent cause, and always in the most public place of the town I may be passing through. Mr. Wolstencroft's reply to a former correspondent does not appear to help in such a case as mine. I should add that the dry battery originally supplied with the car turned out almost useless, and had to be promptly replaced by another make. The compression tap, too, did not long remain tight. I do not wish, however, merely to find fault, but should like to suggest a possible remedy. Why could not a simple commutator be used instead of the present arrangement, but made to work in an oil-tight (and therefore oil-free) case, so as to avoid the trouble met with in this style of contact-breaker by the surfaces becoming fouled and greasy?—Yours truly, C. L. C.

MR. SIDNEY HOLLANDS writes:—"With regard to Mr. A. C. E. Whittard's letter with reference to there being no mention in my aeronautical contributions of the tail of a bird being used for soaring purposes, it is still early in the series, and I promise him that I shall have more to say about birds in later chapters. I may say now, however, that as far as we can determine by observation and experiment, the chief end and aim of the bird's tail is to impart longitudinal stability to its owner and to preserve the same in all vicissitudes, among which latter are those evolutions described by Mr. Whittard."

THE AUTOMOBILE MANUFACTURING COMPANY.

THE petition of the Clipper Pneumatic Tyre Company, Limited, for the compulsory winding-up of the Automobile Manufacturing Company, Limited, came before Mr. Justice Byrne last week. Counsel for the petitioners submitted that he was entitled to a compulsory order. The order was opposed by the debenture holders on the ground that they had a charge over all the assets of the company and that no useful purpose would be served. The petitioners submitted that the claim of the debenture holders was, under the circumstances, a fraudulent preference. After some discussion it was admitted that the first debenture issue was void by reason of non-registration within fourteen days, and his Lordship then went into the question whether there was sufficient ground for making a *prima facie* case of fraudulent preference. In support of the petition counsel said that the Clipper Pneumatic Tyre Company, Limited, was a judgment creditor of the Automobile Manufacturing Company, Limited, for £257 for goods supplied in June, 1901. On August 24th following, after having from time to time pressed for payment, they issued a writ and obtained judgment on September 19th. The first debenture was given to the directors of the Automobile Company on August 12th, at which time the petitioners were pressing for payment. It was given in favour of four of the directors of the company, but nothing was done with it as required under the Companies Act, 1900. On September 20th a second debenture was substituted for the first and duly registered, and this was the debenture under which the assets of the company were claimed against the petitioners' judgment. As a matter of fact, Jordon did sell the company's goodwill for £100, and it was said that there was an action pending to set aside that sale and redeem Jordon's loan. He submitted that the transaction of the directors was one that should be investigated in the interest of the shareholders.

For the Automobile Company, counsel submitted that the debenture, having been given in accordance with a resolution passed to secure an overdraft at a time when the company was flourishing, could not be challenged on the ground of being a fraudulent preference.

Mr. Justice Byrne, in giving judgment, said there was no doubt that the company were in that condition of solvency which did not enable them to meet their judgment debts. An order would have been a matter of course but for the contention on behalf of the debenture holders that the amount due to them was such as to exhaust all the available assets of the company. To that the creditors replied that these debentures were bad, as being a fraudulent preference. He could not say that this contention was one that might not have a fair chance of success, and he was of opinion that there were circumstances connected with the company which required investigation. Considering all the circumstances of the case, he was not satisfied that a winding-up order would be injurious, or, if injurious, so injurious as to induce him to say that the plaintiffs had lost the rights which they otherwise would have had. He therefore made an order for the compulsory winding up of the company, with the usual order as to costs.

FURIOUS DRIVING CASES.

At Barnet Petty Sessions, Sir C. B. Lawes, of Rothamsted, Harpenden, Herts, was summoned for furiously driving a motor-car in the parish of Ridge on January 10th. Mr. Lewis Stroud, solicitor, pleaded "Not Guilty" on behalf of defendant. The evidence of two roadmen in the

employ of the Hertfordshire County Council was to the effect that on the afternoon in question they saw a motor-car, driven by Sir Charles Lawes, coming down the St. Albans side of Ridge Hill at the rate of about thirty or thirty-five miles an hour. When it got to the bottom it met a trap, the horse attached to which shied, but though there was plenty of room for the car to pass, it came into collision with the trap and badly damaged it. Police-constable Shorter stated that when he was on duty in London Colney on January 10th, he was stopped by Sir Charles Lawes, who informed him that he had had an accident while driving down Ridge Hill. He handed witness his card, and asked him to tell the gentleman whose trap he had damaged that he was very sorry, and would pay all expenses. When witness first saw Sir Charles he was driving at the rate of about ten or twelve miles an hour. Sir Charles Lawes gave evidence, and said that when he was driving down Ridge Hill he saw the pony and trap coming towards him; but the animal seemed perfectly quiet, and to take no notice of the car. When, however, he got close to it, the animal shied, and backed right across the road. Witness immediately let the brakes go—his only means of avoiding a collision—and in about the tenth part of a second he would have done so, but his splash-board, unfortunately, caught the wheel of the trap. Witness did not stop then, because on such occasions one did not know what sort of people one was going to meet, and they might want to fight; but when he met the police-constable he informed him what had occurred. On the following day the owner of the trap called on witness, and witness suggested to him that he might have avoided the accident if he had whipped the mare up, and he replied that he did not think of that. The magistrate fined Sir Charles Lawes 40s., with 8s. 6d. costs, the maximum penalty under the section under which the summons was taken.

EDWARD ARNOTT, of Northampton, was summoned for furiously driving a motor-cycle along Waterloo (Northampton), and also for not having a lighted lamp attached to the vehicle. Police-constable Tarlton deposed to seeing defendant at 9.40 p.m. on the 31st January riding a motor-cycle at a furious pace. There was no lighted lamp attached to the cycle. After going 260 yards defendant got off the cycle and lighted the lamp, and went over the ground again, but the lamp went out immediately after he started on the second journey. Defendant went a distance of 260 yards in 15 seconds, and witness told him he had been riding at 20 miles an hour, but the rate worked out at about 35 miles an hour. Defendant was fined £1 and costs in each case, and the Bench intimated that furious driving could not be allowed. If the offences were repeated heavier penalties would be inflicted.

At Hythe, Herbert Charles Burton, of Hill Street, Berkeley Square, W., has been fined £10 and costs for driving a motor-car at the alleged rate of 45 miles an hour on the 19th ult.

THE Norman Cross magistrates have fined Mr. Claude Johnson £5 and costs for furiously driving a motor-car. A constable swore that he timed the defendant, and found that he was going twenty-two miles an hour.

A MOTOR-CAR ON THE PATH.

C. J. SCARRISBRICK, of the Royal County Theatre, Reading, was summoned for driving a motor-car on the footpath at Earley on January 13th. Police-constable Harris proved seeing the defendant drive his motor-car on the footpath for a distance of 400 yards. Fined 20s. and 14s. 4d. costs.

THE NEW WESTON VICTORIA STANHOPE (see last issue).

A NOVEL POINT.

CHARLES PERKINS, of the Aegir Cycle and Motor Works, Gainsborough, has been summoned under the Locomotives Act, 1865, that he, being the driver of a locomotive on the Corringham Road, did not give as much space as possible to approaching vehicles, and neglected to render assistance. Mr. Tweed, who defended, urged that the locomotive in question, a steam lorry, could not be dealt with under the 1865 Act, inasmuch as, being under four tons in weight, it was a light locomotive. The chairman said it was hardly reasonable that because there had been a Light Locomotives Act, which laid down new regulations, the Act of 1865, which applied to all kinds of locomotives, should not apply to the proper using of the highway. The 1896 Act was passed for the purpose of relaxing restrictions, but the obligation to use the highway properly still existed. If it was a question of using the highway with due consideration for other people it applied equally to light and heavy locomotives. Until Mr. Tweed could show that the Act of 1865 was repealed in that sense his contention would not hold good. Mr. Tweed maintained that there was direct repeal of the earlier Act; and on reference this was found to be the fact. Consequently the summons for neglecting to render assistance to passing vehicles fell to the ground, and the case was confined to the second charge—neglecting to draw to one side, in order to give approaching vehicles their due proportion of the metalled part of the road. The defence was that due allowance

engineers and builders of motors and every description of machinery. The directors are Messrs. H. S. Gledhill and W. E. Netherwood, and the registered office is at Temple Street, Lindley, Huddersfield.

THERE will be a gathering of motorists at Bexhill-on-Sea on Saturday, the 1st prox., when a private road will be examined, which, it is thought, will be suitable for a kilometre speed trial during the summer. The Sackville Hotel will be the headquarters of the Automobile Club on the occasion, and some of the members will start from Whitehall at noon, taking lunch on the way down to Bexhill.

THE Glasgow Cycle and Motor Show was opened on Friday last week by Mr. J. B. Dunlop. A large part of the exhibits consists of motor-cars and cycles, among the former being the Albion, Argyll, Humber, Daimler, De Dion, Panhard, Wolseley, Progress, Gladiator, etc. The Sixth Annual Cycle and Motor Show at Manchester was also opened on Thursday, the 13th inst. Here,

THE MOTOR MANUFACTURING CO.'S ONE-TON DELIVERY VAN. (See page 899.)

was made for the passage of the vehicles, but several farmers gave contrary evidence, all stating that they had to turn on to the grass. The Chairman said these locomotives would have to be adapted to do the same, and a fine of 40s., with £1 14s. 6d. costs, was imposed.

AN American motor-car designer considers that it may be taken as a safe rule that the wheel base in inches shall be double the speed in miles per hour.

"UNLIMITED, LIMITED," is the title of a new company registered with a capital of £10,000 to carry on business as "a land development company, as motor-car builders, as dentists, and general store keepers."

It will be remembered that the A.C.G.B.I. recently offered a prize of £5 for the best design of a Club plaque to be fixed to hotels, etc. The selected design is that of Mr. Berne Nadall, to whom the prize has been awarded.

THE Vulcan Motor and Engineering Company, Ltd., has been registered with a capital of £1,000 to carry on business as

too, a large number of motor-cars and cycles are to be seen. Of cars, specimens of the Marshall, Argyll, Progress, Locomobile, etc., are on view, while among the motor-bicycles are the Humber, Quadrant, Bradbury, Werner, Royal, Riley, and others.

THE Motor-Car Journal.

Vol. III.]

LONDON, SATURDAY, FEBRUARY 22, 1902.

[No. 155.]

Published Weekly by CORDINGLEY & CO., 39 & 40, Shoe Lane, London, E.C.

COMMENTS.

POLITICIANS are becoming increasingly interested in the automobile. On Saturday last we saw Mr. Arthur J. Balfour, the Leader of the House of Commons, in a great fur-edged leather coat gravely contemplating the mechanism of a higher-powered car than that he has previously driven, and there is reason to believe his automobile education will soon be completed by the study of a Napier car of nine horsepower. Lord Rosebery, too, is interested in motor-vehicles, and in the course of his peripatetic oratorical feat at Liverpool on Saturday made merry over the Derby. Addressing the members of the Stock Exchange there he said "if one is to win the Derby again it must be done soon, because no one can shut their eyes to the encroachment of the motor-car and motor principles. The horse is gradually being superseded, and it may not be long before you see the great Olympian gathering on Epsom Downs confined to chariots on electric principles. It will not then be my destiny to win that race, because I should remain faithful to the horse." We congratulate Lord Rosebery on his faithfulness to the horse, and would assure him that such faithfulness is not inconsistent with the favour which he has shown to the automobile as a pleasure vehicle. Baron de Zuylen is one of the keenest automobilists, and has also the finest racing stables in France. In this country, too, men combine a love of horses and a pride in automobiles. So Lord Rosebery need have no fear.

Resignation of the Hon. Sec. of L.S.P.T.A.

THE Council of the Liverpool Self-Propelled Traffic Association have received, (with a regret that will be expressed throughout the whole automobile movement) the resignation of Mr. E. Shrapnell Smith from the office of hon. secretary, which he has filled with credit to himself and advantage to automobilism for the last six years. "During that time," he writes to the Council, "my business connections have been in connection with the alkali industry, and this independence of commercial interest in the motor industry has, in my opinion, contributed largely to my acceptance by all who have at heart the progress and development of heavy motor traffic." Then Mr. Smith goes on to refer to the fact that he has become manager and secretary of the Road Carrying Company, Limited, which he has formed himself by private subscriptions—£18,000 having been already subscribed, mainly by Liverpool gentlemen.

Success to Mr. Shrapnell Smith.

"UNDER these circumstances," he writes, "I regard it as a point of honour that I should resign a position which places in my hands much important correspondence and various powers which rightly belong to the office of hon. secretary of a centre of the Automobile Club." Everyone will respect Mr. Shrapnell Smith's scruples, but, although his interest in the

work will be as active as heretofore, the loss of his organising power and the devotion with which he carried out the work of hon. secretary will be felt, not only in the North of England, but throughout the country, so far as heavy motor traffic is concerned. While expressing the regret that will be generally felt we would add a word of encouragement to him in his new undertaking, to which every automobilist will wish well.

Motoring as a Health Restorer.

AT a time when open-air sanatoria are attracting attention in medical circles we may be pardoned for urging the value of the automobile as a health restorer. The subject is certainly worthy of medical study, and may be expected ere long to occupy a place in the programmes of the medical congresses. Several French doctors have been very enthusiastic in their advocacy of the health-giving virtues of automobilism, and Dr. Marion, of the Paris Faculty of Medicine, reports the case of a patient suffering from an attack of asthma who gained relief by a ride upon a motor-car. Two patients who had lately recovered from congestion of the lungs and were still suffering from a feeling of oppression in breathing found great benefit in the same way. In his own case a troublesome cough, the legacy of a former attack of dry pleurisy, was relieved by motoring. It would be interesting if our readers would give the results of their own observations as to the effect of motoring on the health of their friends and themselves.

One Sidedness.

MANY motorists have been troubled by the refusal of chains to stretch equally on each side, an annoying state of affairs that is made worse by any attempt at adjustment that throws the countershaft and back axle out of parallelism with each other. The difficulty has generally been attributed to a natural impossibility in turning out a pair of chains of exactly equal ability to resist wear. But it will generally be found that the right-hand chain stretches most, and some light on the subject may be given by the somewhat similar behaviour of springs. It has been our experience, corroborated by that of other drivers, that springs more frequently break on the right side than the left, and a simple and probable explanation offers itself: the real *fons et origo mali* is, the hay-motor! The centre of a road is usually in a much worse state than the sides, owing to the destructive effect of horses' hoofs, and the rule of the road causes us to drive habitually somewhat towards the left; thus the right-hand chain is apt to get more dust and dirt thrown on it, while, owing to the greater roughness of the surface on that side, it is doing more work in pulling its wheel; the differential, though equalising the total effort, not compensating for the jolts and sudden strains. Moreover, when going over stones, the right wheels get the worst of it as a rule. Tires also give some confirmatory evidence of this view, which, if correct, should hold good in the opposite sense on the Continent, where the rule of the road is reversed. Perhaps

some who have had Continental experience could throw additional light on the matter.

Unbalanced Strains.

IN more or less connection with this, it may be observed that a very appreciable one-sided strain comes on the frame of any car of the usual type with a longitudinal engine shaft, obviously tending to twist the front of the frame in a sense the reverse of the direction in which the engine rotates, and the countershaft, or back axle, if a direct-geared live one, in the same direction. This would throw a greater strain on the off-front and near back springs than on the other two, and while perhaps negligible in solidly-built cars, may prove by no means so as the progressive lightening of the light car increases along with the power of its engine.

An Amateur's Car.

IN our issue of the 8th inst. we reported a curious case at Sheffield, where a local motorist was summoned first for causing an obstruction, and secondly for leaving a car without a light. It appeared from the evidence that the car had broken down, and was simply left while the motorist went in search of assistance. Mr. W. R. Wills, the motorist in question, writes us

as follows:—"I enclose a photo of the particular car, which was designed and made by myself at Messrs. Vickers, Sons, and Maxim's works, though not in connection with that firm. The stoppage was due to an inlet valve-stem giving way, and as I had not got a spare one, it entirely stopped the engine working. The car is a very good hill climber, and has gone up a gradient of one in six. It may be of interest to mention that it was finished before I was twenty-one years old, and is entirely of amateur construction." The photo reproduced herewith shows the builder at the wheel. The engine is of the horizontal slow-speed type, and of $5\frac{1}{2}$ h.p. Two speeds are provided, the power of the motor being transmitted to the countershaft by means of chains and clutches. The motor is located in the rear of the frame, the petrol and water tanks being located under the front bonnet.

American (?) Humour.

IN the financial columns of a New York journal we have just read one of the most humorous accounts of the "scientific and perfect solution of the automobile problem" that has yet come to our notice. It deals with a company that is to bring the Tractobile to the notice of an astounded world, and already "an offer of 2,500,000 dols. for the English patents has been practical demonstration that the market for the machine is world-wide." The Tractobile is being sold to the trade, after deducting all discounts, so as to realise 450 dols. for the company on each machine. The maximum cost of manufacture will be

150 dols., and as the capacity of the works is 2,500 machines per annum, the profits will be 750,000 dols. Hence the offer of 100,000 shares at 6 dols. each should be quickly taken up by wide-awake American investors.

The Tractobile.

BUT the demand will be for more than 2,500 machines per year, and so additional plant has been ordered for April 1st—a most appropriate date. The Tractobile is a wonderful affair—the eighth Wonder of the World. It can be attached to any carriage or wagon, and will draw it without the help of horses or mules—although the assistance of monied donkeys will be welcomed to help the construction of 2,500 Tractobiles a year. The business is under the direction of the president of a dry goods company, but the writing of the prospectus savours of the tone and style of one who is well acquainted with that section of the public that delights in speculating in uncertainties. It has, in fact, a Penningtonian flavour.

Motor-Cars for Hotel Work.

SOME enterprising hotel proprietors are proposing to engage one or two cars, with drivers, for the summer and tourist seasons. This is interesting, as forestalling a time when the motor-car will be as necessary a feature of hotel equipment as is the lumbering station 'bus that has done service for so many years. The value of the motor-car in this connection must be a substantial one, and we shall be pleased to record any developments of the kind that may come to the notice of readers.

The Poetry of Motion and the Art of Expression.

SOME writers of advertisements in the United States combine a keen appreciation of the automobile with a florid style of expression. The following is a fair sample:—"The exhilaration of bubbling along buoyantly upon a little sprite, at will, flying fast enough for the most daring, or creeping slow enough for the most cautious, the steady and regular momentum, the wonderful ease of control, the enchantment of distance without muscular effort, the ever-changing view, the rush of keen air—begets new sensations of pleasure and excitement not possible from any other source. The motor itself is an interesting study; it has a language of its own, soon interpreted by the thoughtful rider. It will cry and labour for more oil, it will snap and snarl if you foul its sparking plug with too much oil, it will thunder at you, and finally refuse to work if you stuff it with too much petrol or oil. But when you have learned to feed and groom it properly, which can soon be done, it will bound merrily along, singing its song of joy in unmistakable language, up hill and down dale, like a thing of life, the very poetry of motion."

Good Roads to Prosperity.

As a general rule we believe the County and Borough Surveyors of the country are anxious to maintain the roads in the best possible condition; but their efforts are often sadly hampered by the fits of economy to which public bodies are subject. And yet the maintenance of a good highway is becoming of increasing importance to the people of rural districts. If the roads are good, motorists will be found thereon; if they are bad, drivers of automobiles will shun them as they do the country lanes of Surrey, to the sorrow and regret of the innkeepers of that delightful county.

Retarding the Industry.

ONE has only to watch the development of the motor-car to recognise that the laws of this country have been framed with an extraordinary capacity for strangling new industries. We practically forbade the use of the motor-car until Continental countries had thoroughly installed themselves as leaders in its manufacture, and then we thwarted progress by

allowing rules and regulations which their author has now declared to be antiquated and unnecessary, But the spirit of restriction has not stopped with the central authorities; it has permeated all local rulers, with the result that prejudice is permitted to place every obstacle in the way of the new idea. The fact that so many members of the Government are automobilists should be sufficient to demonstrate that the automobile is no mere plaything of the hour. Why cannot the *fiat* go forth that the ways of the motorist are to be made easy by the perfecting of the roads and the general agreement that riding to the public danger is an offence—without any regard to speed limits, which in that case would be quite unnecessary.

Motor-Cars for Industrial Purposes.

ousted by automobiles, just as they were ousted from the mail service by the railways long before the railroad service was as

THE comparison between horses and motor-cars is never one that can be dealt with in exact terms. Horses have been used, for example, for many branches of work for which they are very poorly adapted, and from these they may be

forward a bill making speed above the limits prescribed by the present law of New York State an offence punishable by imprisonment, and so serious is the support which he has obtained that emergency meetings of the Automobile Club of America, the Clubs of Buffalo, Syracuse and Long Island, and the National Association of Automobile Manufacturers, have been held to discuss as to the action to be taken. Evidently the situation is somewhat strained, and angry discussions in the Senate will be the least serious result of the agitation.

Delivery Vans.

SURELY it is nearly time that makers of automobiles began to seriously cater for the tradesmen and business firms interested in the delivery of goods. There is a fascination about the pleasure car which has diverted many makers from all thought of such commonplace matters as delivery vans. Talking to a manufacturer lately, we were told that he entered the industry with the idea of developing a trade in light vans for commercial purposes; but he found the immediate demand was for

Photo by] EN ROUTE TO THE WELBECK BRAKE TRIALS—TIRE TROUBLES AT REDBOURNE.

[Mr. C. Frisw. O.]

perfect as it is to-day. Automobilism will naturally attack its utility work first at the points where horse service is weakest. Then, by slow degrees, it will enlarge its sphere, growing gradually to greater perfection by adaptation to the more and more severe tasks imposed upon it. Understanding of automobile mechanism will spread at the same time among the public; men fitted to take care of motor-cars will become more numerous and less exacting; and after a decade or two it will be found that automobiles may be substituted for horses without subsequent disappointment, even if no other factors are considered by the purchasers than reliability and economy of the machines as machines.

The Prison for Speedy Motorists.

So far the antipathy expressed towards automobilism in this country has come from pettifogging local authorities and rural councillors of slow movement and near-sighted view. In the United States, however, it would seem that more powerful influence is about to make an attack on the motor-car, and in several of the State Legislatures bills of a very reactionary character are about to be introduced. Senator Cocks proposes to bring

touring and pleasure cars. Consequently he paid attention to that branch, and soon forgot the idea with which he set out. Of course, in the present transition stage, such changes of ideas are pardonable, and possibly warrantable, but it must not be forgotten that in catering for commercial vans makers will find a wide and remunerative field of employment in the future.

Motor-Cars for Fire Brigades.

Of the practicability of the automobile in connection with fire brigade work the chief of the New York fire department has no shadow of a doubt. He often has alarms of fire at night, and can then cover the distance at a rate of thirty miles an hour when the streets are clear. In the daytime there is also a great saving of time. He has just ordered a specially-built car from the Locomobile Company, which will embody one or two new ideas. It will have a heavier frame than is usual in steam-cars, a long wheel base, and heavy wheels fitted with 3 in. tires, these latter being regarded as better for block and other rough pavements than the smaller tires. The engine will be of 16 h.p., with a 36 in. boiler, carrying a steam pressure of about 300 lbs. per square inch. Steam is to be kept up at night by a

similar attachment to that of the steam fire-engine; that is, an automatic pipe connection which comes from a large boiler in the basement of the engine-house up through the floor into an upright position, and is placed in such a manner that when the carriage is backed into position the pipes interlock, giving a tight connection. When an alarm is sounded all that is necessary in order to start is to turn on the petrol, which will be lighted by an electric spark. As the machine starts the pipes from the large boiler disconnect automatically and close the cocks, preventing nearly all escape of steam from either the machine or the large boiler in the basement.

Motor Omnibuses for London.

AFTER several vague references to mechanical traction at meetings of the London omnibus companies, it is satisfactory to learn from the speech of the chairman (Mr. J. H. Moore, J.P.), of the London Road Car Company, that experiments are about to be undertaken with a view to the general adoption of motor omnibuses, should they prove cheaper than horse traction. The cost of feeding a horse is now 9s. 3½d. a week, as compared with 7s. 10½d. in February, 1896. Interviewed after the meeting, Mr. Moore said that experiments were in active progress, and that a steam 'bus is shortly to be tried on the Hammersmith to Oxford Circus route. There was no question as to the ability of motor 'buses to do the work required, but the point in doubt was whether they would not be subject to greater depreciation than the present system.

Another Victory.

THE Surrey campaign against steam cars has received another set-back by the dismissal of a case—similar in character to the previous ones—by the Guildford Bench on Saturday last. The severe and well-deserved comments of Mr. Staplee Firth on the methods adopted by the prosecution—which included the introduction of alleged occasions of offence not mentioned in the summons—produced an evident effect, while their disgust at their inability to burke a reference to the eight cases already decided in favour of automobilists was amusing to witness. It is sincerely to be hoped that the final *coup de grace* has been given to the ill-advised and malicious persecution of steam-car owners, which has done much to keep them off the Surrey roads, to the detriment alike of the motorists and those who benefit by their custom.

Motor-Cycles.

THE increased interest now being taken in motor-cycles is most encouraging to makers of this type of automobile. In the forthcoming Badminton book on Motoring a chapter will be devoted to this branch of the subject. This has been written by the Editor of the *Journal*, and was read on Wednesday at a meeting of the Automobile Club. The space allotted for the chapter on motor-cycles is rather restricted, but the paper not only gives some useful hints to motor-cyclists, but presents a lucid view of the distinguishing features of most of the motor-bicycles now upon the market. The chair was taken by Professor C. Vernon Boys, F.R.S., and, in the unavoidable absence of Mr. Cordingley, the paper was read by the Club Secretary. An interesting discussion ensued, in which Messrs. Campbell Swinton, Pennell, Edge, Jarrott, Phillips, and others took part. Mr. Pennell strongly advocated the use of high-powered motors on bicycles, but the general feeling of the members present was that engines of 1½ h.p. would be found to give the best results to ordinary motor cyclists. Professor Boys, in responding to the vote of thanks for his occupation of the chair, pointed out that the motor-cycle had an important future from an automobile educational point of view, and considered that the A.C.G.B.I. should do all in its power to encourage motor-cycling. After the House Dinner of the Club on Wednesday, the 26th

inst., a paper on "Electrical Vehicles" will be read by the Editor of the *Automotor*.

Licensing Motor-car Drivers.

MR. HENNIKER HEATON, M.P., has given notice that he will, in the House of Commons next week, ask the Home Secretary, "whether his attention has been called to the danger of incompetent persons driving motor-cars in this country; whether he is aware that in America motor-car drivers have to obtain a certificate under examination as to competency, and whether the Home Secretary will introduce a similar law in England."

M. Santos Dumont.

SANTOS DUMONT'S experiments in his No. 6 navigable balloon have come to a sudden standstill in a manner which might have been anticipated. The story of his accident resembles faithfully the stories of the series of mishaps which the plucky young man has gone through. The air vessel was not properly filled, plunging took place, the rudder got entangled in the rigging, the valve had to be opened, the envelope burst, and down came the ship. The only variation in the story is that the sea received the *débris* instead of the housetops of Paris or Baron Rothschild's trees. As usual, rescue was at hand, and M. Santos Dumont, imperturbable as ever, and up to his neck in the Mediterranean, calmly gave orders for the salvage of himself and his air-ship. An imprudence in staying too long in his wet clothes, directing operations from the bows of a friendly yacht, has sent him to bed with a severe cold; but, as usual, No. 6 is already being repaired for new ventures. We believe that M. Santos Dumont will now wisely confine his attentions for the present to overland flight, and leave the ocean alone until he is more sure of being able to avoid these recurring disasters.

THE Niagara building in London, which, as we have already announced, has been acquired by Mr. Paris Singer, will accommodate about 800 electrical carriages.

A SUM of £15,000 is included in the German Budget for 1902 for the continuation of the experiments with motor-vehicles for military purposes.

M. JENATZY, on the 14th instant, covered a kilometre, with flying start, on his combination petrol electric car in 34.25 seconds, being at the rate of 105½ kilometres, or over 65½ miles per hour.

AT the Coronation exhibition held at King's Lynn Messrs. W. Bath and Son exhibited two of the M. M. Co.'s cars—one a 12-h.p. car with tonneau body to carry six. Messrs. W. H. Johnson and Sons made a good show of De Dion vehicles.

M. S. DUPONT, of Plessis-Trevisé, near Paris, advises us that the East Riding Cycle and Motor Company of Hull are no longer agents for the Liberia cars in England, and that all inquiries regarding the same should be sent to the works in France.

THE Chemische Fabrik Helfenberg Gesellschaft, of Helfenberg, near Dresden, have sent us a sample of a spool of solutioned tape that they have introduced for the repair of small cuts in tires. The spool contains about eight feet of tape, and, as it occupies a very small space and is sold at a reasonable price, should be found a very useful addition to the toolbags of motor-cyclists.

MOTORISTS are warned that it is understood that the Inland Revenue intend to bring a test case against the first motorist they can detect who may make an error in stating what is the weight of his motor vehicle for the purposes of Inland Revenue. Owners of motor vehicles weighing under one ton, unladen, pay only the ordinary carriage licence of £2 2s., but if the vehicles weigh over one ton, £2 2s. extra has to be paid. If the Inland Revenue Office can discover a case in which the weight is given as just under one ton, whereas really the car weighs over one ton, they intend to prosecute.

THE DAIMLER 1902 CARS.

FOR the 1902 season the Daimler Motor Company, Limited, will make three standard types of cars—viz., 9 b.h.p., 12 b.h.p., and 22 b.h.p.—of which we are now able to give some particulars. Fig. 1 gives a view of the 12-b.h.p. tonneau, from which it will be seen that the frame—of wood, strengthened with steel fish-plates—is built lower than formerly. The motive power is supplied by a four-cylinder engine, running at a normal speed of 900 revolutions per minute. The cylinders and heads are cast in one piece, so that there is now no troublesome joint at the top. Both electrical and incandescent tube ignition are

FIG. 1.—THE DAIMLER 1902-TYPE 12 B.H.P. CAR.

provided. As regards the former, the commutator is fitted in a dust-proof transparent case on the dashboard, while in connection with the latter only the pressure-feed system is now being employed. The sparking plugs are fitted in special firing boxes, so placed that the chances of the points of the plug becoming fouled by carbon deposit are considerably reduced. A gravity type of spray carburettor is employed, while the automatic governor is now arranged to act on the mixture supply, increasing or cutting off as desired the admission of gas to all four cylinders, which can thus be kept running quietly on a small charge of explosive mixture. The power is transmitted through a single leather-faced clutch to the gear-box, which is adapted to give three speeds forward and a reverse motion, all controlled by a single lever at the side of the car. A change has been made in the reverse motion. In the old types this was obtained by having two sliding bevel pinions on the cross-shaft, either of which, to give forward or reverse motion, could be brought into gear with the bevel wheel on the end of the countershaft. In the new arrangement there is only one fixed bevel pinion on the cross-shaft, and this is continuously in mesh with that on the end of the countershaft, the reverse motion being obtained by the interposition of a pinion between the pair of spur wheels giving the low gear. The clutch-shaft no longer slides to and fro with the clutch, but the latter moves forward and backward on its shaft. Furthermore, the two shafts in the gear-box are now located not

only parallel, but also in the same horizontal plane, instead of being one above the other, as in the former method. Special attention has been paid to the question of rendering all bearings dust-proof, and also to that of lubrication, a self-oiling arrangement being fitted to the bearings of the cross-shaft and change-speed gear-box, so that they only require attention about every three weeks. All four road-wheels are of equal size—32in. diameter, and adapted for 3½in. tires. Double-acting band-brakes are fitted to the countershaft and to drums connected with the chain-wheels on each of the rear road-wheels. Ample mud-guards are being fitted, and those to the front wheels are arranged so that they can be readily detached, to give access to all parts of the motor, when necessary. Another departure, small in itself, but

which adds much to the comfort of the driver and front passenger, are the rounded extended ends—somewhat on the lines of Mr. Estcourt's arrangement—given to the dashboard. Two sizes of this car are being built, one having a wheel base of 6ft. 6in. by 4ft. 1in., intended for four passengers, and one 7ft. 6in. by 4ft. 1in., for six passengers, the weight coming out at about 14 cwt. and 15 cwt., without bodies, respectively.

The new 9-b.h.p. cars follow exactly the same lines, and comprise the same features, as the 12-b.h.p. vehicles, the only difference being that instead of having a four-cylinder engine the motive power is supplied by a 9-b.h.p. two-cylinder engine, fitted with throttle governor and running at a normal speed of 900 revolutions per minute.

Fig. 2 shows the new high-powered Daimler car, which is fitted with a four-cylinder motor, developing 22 b.h.p. at a normal speed of only 750 revolutions per minute. This engine is fitted with automatic governor, acting on the exhaust valves, and a hand-controlled throttle on the gas supply. One lever controls the four forward speeds, while the reverse is actuated by a second handle. The road-wheels are all 36in. in diameter, while the

FIG. 2.—THE DAIMLER 1902-TYPE 22 B.H.P. CAR.

frames are made in three sizes—6ft. 6in., 7ft. 6in., and 8ft. wheel base respectively, by 4ft. 7½in. wheel gauge—for four, six, or eight passengers, the weight ranging from 21 to 23 cwt. In all other particulars the 22-b.h.p. cars comprise all the new features we have described above in connection with the 12-b.h.p. vehicles. Naturally, all can be fitted with various types of bodies as desired.

E

THE "BROOKE" CAR.

IN entering the motor-car business the possession of a well-organised and self-contained establishment is a considerable factor in the ultimate success of the venture. And that being so, Messrs. J. W. Brooke and Company, Limited, are introducing themselves to the automobile industry with many advantages. At the Adrian Iron Works, Lowestoft, they have a modern and model works covering a ground area of 11,000 square feet, where 100 men are usually employed. The foundry is fitted with the latest appliances, while the two large machine shops with their galleries have a selection of modern machinery. The smithy contains six fires. The assembling shop is a building 113 feet long by 30 feet wide, and the utmost completeness characterises its arrangement.

Conveniently located and facing the Alexandra Road is another shop which is reserved exclusively for overhauling motor-cars, and during last summer five or six cars were frequently

cylinders are in one casting with a solid head. The engine is fitted with throttle governors and electrical ignition, and the Estcourt patent induction valves. The cranks are equally spaced and equal explosions are obtained in the two revolutions, so that the perfect balancing of the motor is ensured. Even at its normal speed of 700 revolutions per minute the running of the motor can hardly be detected when the car is stationary. In the first car made the motor is placed transversely on the frame, but it is the intention to turn it round to the front in the later cars. Power is transmitted to the gear-box by a Renold silent chain. In the gear-box an important advance has been made, gearing being done away with, except in the case of the reverse, which is actuated by spur wheels. The change speed gear is arranged by means of chains, thus reducing friction and, as was demonstrated on our trial trip, silencing the car to an exceptional extent. The absence of vibration is indeed a notable feature of the vehicle.

Three speeds have been fitted, these and the reverse being worked from one lever. Double acting brakes have been provided, and the steering is of the worm and quadrant type fitted

FIG. 1.—MR. MAWDSLEY BROOKE ON THE BROOKE CAR.

seen in the place at one time. At one end is a long pit for the examination of cars, and at the other is a main switchboard which contains a charging apparatus for accumulators. In the centre are large entrance gates, which are convenient for the entry and exit of cars.

With such facilities for the rapid production of any new notions as they occurred to him, Mr. Mawdsley Brooke has had many advantages in the production of a new motor-car, upon which we recently had an enjoyable spin to Yarmouth. The car had previously had only one trip, and on its second venture it did splendidly, coming back in remarkably good time and without a stop. Since then longer journeys have been made and the car has fully maintained the original good impressions.

The frame of the Brooke car—for that is the name by which the new vehicle is identified—is fitted to take either a phaeton or *tonneau* body, and although the car, as illustrated, may appear somewhat high, it is the intention of the makers to have a frame about four inches lower and eight or ten inches longer in subsequent cars. A special feature of the car is the three-cylindered motor of 10 h.p., developing 11 h.p. without difficulty. The

with a Brooke patent wheel with the receptacle below the circumference of the wheel. The electric ignition and the governor are controlled from the steering pillar. An accelerator pedal is also part of the fittings in the front of the driver. A special point has been made of the lubrication, and in the front of the driver is an arrangement showing eight glasses, each conveying oil to different parts of the mechanism—thus ensuring efficient lubrication all round. Mr. Estcourt's cooler is fitted to the car, being modified to such an extent that it forms a slightly addition to the vehicle. The weight of the car is about 16 cwt., and the wheels are all of one size, viz., 36 in.

Messrs. J. W. Brooke and Company intend to standardise the various parts so that replacements can readily be obtained. They will be able to add to the utility of the car by adopting the front-cover arrangement devised by Mr. Estcourt. On heavy roads the car has already demonstrated its capacity to maintain a speed of over twenty-five miles an hour, and with an absence of noise and vibration that should make the vehicle the object of inquiry by many visitors to the exhibition at the Agricultural Hall in April.

FLOTSAM AND JETSAM.

BY FLANEUR.

A BIG revolution will have to come about ere long in the methods of the suburban builder. Already he has had to consider the housing of the cycle; my own house, for example, has a nice cycle-room built into it, with cemented floor and everything as it should be, although totally superfluous in this case, as I long ago had built an outhouse that holds my car and sundry bicycles as well. With regard to cars, however, I am not suggesting that the builder should include a *garage* in his plans, though in due time that may be done in the case of mansions, for there is no need to plant a car as far away as possible, like a horse, lest the odour of the stable reek should be wafted through the windows.

slope of one in eight! To get up it with a run the driver must needs slip through his garden gates at fair speed, with only inches of clearance on either side. The ascent is thus difficult enough, but coming back is worse, and by no means a case of *facilis descensus Avernus*. The car has to be wheeled out, and allowed to drop by gravity, with a tight hand on the side brake; and steering a car backwards in a confined space, and graduating the power of the brake application at the same time, are not the simplest of operations.

This difficulty of manœuvring a car in and out of his own domain, though it vexes the soul of the suburban automobilist, serves at first one useful purpose. The one in eight gradient may be the exception, but the narrow space and awkward corners are probably the rule, and the result is that the owner, on acquiring his first car, soon of necessity learns how to use his reverse.

FIGS. 2 AND 3.—PLAN AND ELEVATION OF THE BROOKE CAR. (See opposite page).

THE consideration I have in view is that of the approach to one's back garden. If one looks round "villadom" generally, one finds innumerable houses behind which there is room to keep a car, and from the appearance of the dwellings themselves it may also be assumed that the means exist to acquire and maintain a horseless vehicle; but of room to drive it in and out there is often none whatever. In many cases this is not unavoidable; houses, it is true, are often built too closely together to permit of a motor-carriage being driven between the intervening spaces, but in the numerous examples I have in mind there might have been left ample room for the purpose if the growth of automobilism had been foreseen. But it had not.

ANOTHER difficulty which may frequently be found, even where there is just width enough to drive a car in and out, is the extreme awkwardness of the approach. I can recall three cases in which, to reach the motor-shed, the car has to be driven up a

and how to shave between gate-posts without a splitting of his splash-guards. These accomplishments being learned at home, and at the very outset of his driving career, reduce the possibility of trouble in actual traffic; but once he has become dexterous he will naturally continue to lament the inconvenience he suffers every time he takes the car out of its shed. And this brings me back to the text from which I started on this topic; the suburban builder, in his future operations, may reasonably be invited to consider the requirements of that rapidly growing class, the owners of motor-cars, for they are by no means going to be merely the men who live in mansions, nor even those who keep a carriage. Of existing automobilists, even, to say nothing of the future, the number of those who are not plutocrats is far from unimposing.

ONE of the most praiseworthy examples, by the way, which I have ever encountered of triumphing over difficulties occurred the other day in connection with one of the aforesaid gradients

of one in eight. The owner of the house has several cars, and one of these he lent to a friend to experiment upon; it has a *tonneau* body, and probably weighs about twelve hundredweights. It was not in first-class order, and its temporary owner had sundry difficulties with it on the road, with all of which, however, he coped successfully, and eventually brought it back to the foot of the stiff slope ascending to the stable. At this point the car had just taken another sulky fit; the hour was late, and the driver was loth to disturb the household. To push the car up that precipice was impossible; to leave it out-of-doors all night he disclaimed.

"WHAT would you have done?" is a question I feel tempted to propound to all and sundry, and leave the answer to next week! What the ingenious automobilist actually did resort to, however, is deserving of immediate record: I must confess that I, for one, should never have dreamed of anything so clever, and, though there may be precedents, I have met no one who ever heard of such an expedient being used before. He opened the compression tap of the motor, put in the bottom speed, applied the starting-handle, and—slowly wound the car up the hill. I may add that he is very strong!

THAT a sprag is not always the security that fancy may paint is fairly well known. If a man has any doubts about his ability to ascend a given hill on his car, he will prudently let down his sprag beforehand, and probably all will be well. But the trouble happens when he has had no cause to entertain any previous doubt, and owing to some quite exceptional failure of his engine, or miscalculation of the gradient and consequent missing of his gear, he finds the car running backwards ere he has given the sprag a thought, and it may be too late to let it down effectively when he does give it his attention. If his car be not too heavy, and his brakes in good condition, he ought, of course, to be able, even then, to obviate an untoward backsliding.

THESE facts, however, are tolerably well known, but I heard this week of a curious thing which happened to a driver on a steep hill on a main road near London, along which tram-lines are laid. He had occasion to let down his sprag, and did so amply soon enough; yet, strange to say, the car went sliding backwards. As luck would have it, the sprag had dropped in the tram groove itself, and got no grip whatever. Realising what had happened the driver raised the sprag, swerved the car a little aside, and with the aid of the brakes was able to get the sprag down again, this time with an effectual hold. The moral is, however, "Don't get too near a tram-line when you are likely to need a sprag."

THERE is another sprag story which that admirable *raconteur*, the Lord Justice Clerk, might well have included in his "Reminiscences" at the Automobile Club house-dinner last week, but so rich was the fund of anecdotes at his disposal that naturally he had to eliminate the less important. At the same time the incident which I may justifiably relate here might easily have caused a serious accident, and would have been by no means an unimportant matter, when the safety of so distinguished a friend to the automobile movement was intimately concerned. It was after one of the hill-climbing and consumption trials on Dashwood Hill; Lord Kingsburgh had been an interested spectator, and returned to town on a 6-h.p. car. Not until the conclusion of the journey was the alarming fact discovered that the sprag had become detached at one end, but that, singularly enough, instead of falling on to the road, the free end had caught on some portion of the under frame, and had rested there probably throughout the greater portion of the journey of thirty miles. The last ten, of course, were through tolerably thick traffic, and, if that sprag had dropped from its temporary lodgment, the car must inevitably have overridden it. Most likely the rod would have snapped like a carrot, but if not the car would have risen in the air. In any case the mishap would probably have had a disturbing influence upon the steering, and on a greasy surface that is not the most pleasurable of *contretemps*.

THE PHILISTINE AMONG THE MOTORS.

IT was too bad. Someone might have told me. If I had been warned beforehand I could have refused the invitation. But I was let in for it unawares. I had heard that Uncle Joseph had bought a motor-car, but did not know that he had become a motorosity, or rather what I call a monstrosity. First of all, when I arrived at Dippington by the afternoon

train a most surprisingly absent feature was Cousin Ted in the dog-cart to meet me! Not a soul to be seen. This looked queer. So I had to walk. Nearly a mile and such a dainty country road. And my best shoes, too. Most annoying!

When I reached the house I walked up the pathway. Still no one in sight. Very queer! Then, lo and behold, Cousin Ted emerged from the coach-house, and came across. Well, I have seen Ted in quite a variety of costumes, but never in anything just like this one. He wore a worried look, a sort of leather dressing-gown, and an overgrown yachting cap—and this fifty miles from the sea. "Well," I said, "what's the matter?" He held out a dirty hand, which, on behalf of my gloves, I declined. In the other he held what seemed to be an oily floor-cloth. "Oh, so sorry!" said he, "I was coming to meet you, but my throttle's out of order, I think, and it delayed me." ("That's a good old English word for his throat," thought I, "but I'd rather have the modern name.") "What's the matter with your throttle?" I asked to humour him. "Have you got a cold? Then you shouldn't take your collar off." Then he began giggling like an insane person. "Oh, that's so that I can bend easier. But it's not mine, it's 'Tom-tit's' throttle. I was getting her ready to come to the station, but there's something wrong with her throttle or a connection loose, but come and I'll show you." "Did you give her the whip?" I said, "and where are Stormaway and Ben?" Then it turned out that Uncle had sold the horses and now drives about in horrid motor-cars! I don't like them, and they don't like me; you see even this one wouldn't come to meet me, refused to budge an inch, Ted said. Uncle goes to town and back on one that looks like a gas-stove with a sofa behind it. There is a governess-cart arrangement at the back which they call something like a Watteau bodice.

I shall not stay long here. Everything smells paraffin-oily. I do declare that there was some of it in the soup this evening, and even the coffee had an oil-stove sort of flavour. The cushions in the drawing-room smell like kid gloves that have been cleaned with benzine. They have dispensed with the oil-paintings in the dining-room, and keep a regular art-gallery of portraits of famous "chauffeurs," as they call them; motor-faces sticking out of the top-front of heaps of fur and stuff. The earnest concentration depicted on their features is simply heroic. I imagine they are all trying to find the North Pole.

One evening Ted put his arm round my waist (just in fun, you know; he is so silly), and left five finger-marks of black grease on my new grey voile. He said it was only lubricating and would work off, but when it does I'm not going to have it re-lubricated! Cousin Amy has gone silly over what she calls "motor style," and wears nothing but motor costumes (which are terribly serviceable), motor gloves (like hop-pickers'), and motor hats (or rather deformed caps, which are decidedly not pretty). She thinks it smart, but I think she's ten times worse looking now than when she had the golf craze. I believe she will have her next white satin evening frock trimmed with leather. Auntie has a "motor coat" exactly like the library rug, only without a head and tail. The first day I saw it in the car I put it on the floor and my feet on top, and oh, my, she *was* mad! Well, how could I tell?

Uncle does nothing but talk of exhaust plugs and sparking valves, and inductions and driving-belts (reins, I suppose he means), and Ted is betting frightfully on racing motors. I only saw Sidney once. He spends all his time in the saddle-room trying to make an engine work with champagne. Of course he never will, because the thing will get drunk. We tried it on a horse once. We all went to a motor meet one afternoon. Of course, I wore my blue velvet toque and a dress to match. I wasn't going to be a guy to match Aunt, Flo, and Amy. Oh, they looked awful! Amy had an entire suit of terra-cotta football-leather, and Aunt Flo wore her bear-skin, and a sort of turtle-back plateau on her head, warranted to resist the rain. They both wore blue-bottle gauze curtains round their faces. Uncle looked like a partially-inflated balloon in yellow oilskins, and Ted wore seaman's boots and a sou'-wester. Instead of veils their eyes were carefully guarded by navy-blue glass plates. I don't see why the people all stared so, but I was the only decently-dressed person there.

You can't hear yourself speak on board a big motor when its going, so I asked Uncle to lend me the silver ear-trumpet he has on the handle of the rudder affair he steers with, but I had to give up asking, because he couldn't hear! Why didn't he use the ear-trumpet? It was Saturday, and they said they *must* have a little run on the Barleygate Road. So we did. They carried on so queerly. First they'd fly along, and then suddenly pull up (I mean slow down), and then they'd stop dead, and someone would get out to look behind every milestone! It appears there are policemen behind these little kopjes ready to pot at them. So what's the good of a motor-car? They make me quite nervous. I was introduced to a nice gentleman who gave me a ride on his motor, a sort of bath-chair like those at Brighton, only with a seat behind for the bath-chair man. But, dear me, I really thought at the end that they'd have to dig me out of the bank of dust that was all over the front of me. And he was quite cosy and neat at the back. This machine had conversational drawbacks. He could talk quite nicely to the back of my head. He said:—"So you are a devotee of the art of motoring, Miss So-and-So?" and I yelled "No!" but he couldn't hear, and when I turned my head round to put my answer more plainly the brim of my hat almost took off his nose. Under these circumstances our acquaintanceship did not thrive. One day Cousin Ted took me out in the "Swallow" with the gas-stove frontage, and about ten miles away the horrid thing began to shoot like a gun. I wasn't going to stay and be murdered, so I jumped off while we were going up a hill, and I sat on a fence to wait for a cart or something safe to go home in. Nothing came that way, so what with cold and hunger and Cousin Ted sitting by persuading me I *had* to go back in it. I'm sure it will explode or do something terrible some day. When we got home it was rather dark, and Ted was—er—talking to me and not looking what the car was doing. It ran into the gate-post, stood on end, and then fell over on its back. I fell right out, and the cushions and rugs and Cousin Ted and everything fell on top of me. I was awfully squashed. I have the foot-mark, I am sure, of the air-cooled cylinder thing on my back yet, only it's too far round to see. Ted says the car will have to have its bonnet done up. Well, I know mine is ruined, but I don't see how a motor-car can wear a bonnet. I'm going home to-morrow!

ANITA.

BUILDERS of heavy steam vehicles in this country have, we understand, just been asked to quote for six wagons adapted to use liquid fuel firing for the Russian Government.

MESSRS. W. KING AND COMPANY, Bridge Street, Cambridge, who have been taking an interest in motor-vehicles for the past four years, inform us that they have taken large central premises in the town, which will be opened early in March. The establishment will have storage accommodation for about sixteen cars, with large workshops and inspection pits. They will be able to undertake repair work of all kinds, and will keep a large stock of petrol and motor accessories.

MOTOR-BICYCLES FOR LADIES.

ONE of the latest departures in connection with motor-bicycles is the adaptation of these machines for use by ladies. Fig. 1 shows the Ivel machine, which has been introduced by Mr. Dan. Albone, of Biggleswade. As will be seen, the machine follows the general outline of an ordinary lady's bicycle; the motor is a $1\frac{1}{2}$ -h.p. Minerva, driving the rear wheel by a belt, which is efficiently guarded, so that it is impossible for the dress to become entangled. The motor is fitted with a float-

FIG. 1.—THE IVEL.

feed carburettor and automatic oiling apparatus. The levers are all conveniently arranged, while the petrol tank, which is fitted in the rear frame, has a capacity sufficient for a run of fifty miles.

Fig. 2 shows the Excelsior machine, made by Messrs. Bayliss, Thomas and Co., of Coventry. It will be seen that the frame is of special design. The motive power is supplied by a $1\frac{1}{2}$ -h.p. Minerva engine, fixed below the bottom tube. The combined

FIG. 2.—THE EXCELSIOR.

carburettor and petrol tank is located between the top and bottom tubes behind the head, while the coil and accumulator are fixed to the seat tube behind the saddle. As in the Ivel, the motor and driving arrangement are efficiently guarded. Mr. Van Hooydonk, of Holloway, is also introducing a motor-bicycle specially adapted for ladies' use.

THE works, plant, and business of the Kingsburgh Motor Construction Company, Limited, Granton, were again offered for sale by auction as a going concern in Dowell's Rooms, Edinburgh, on Wednesday last. "To induce competition," the lot was put up at the "greatly reduced upset price of £10,000," but up to the time of going to press we have not heard whether a sale was effected.

AN ELECTRIC IGNITION INDICATOR.

UNDER the name "Ignicator," a new and ingenious device for instantly ascertaining whether the electrical ignition in petrol, oil, gas, or any other internal combustion engine is active or not, is being introduced by Mr. V. Douglas de Wet (representing the Ignicator Syndicate), of 12, Regent Street, London, S.W. The device provides those in charge of cars with a simple means of localising, without leaving the seat, any failure in the vehicle such as (1) batteries run down; (2) damage to sparking plug; (3) short circuit or leakage; (4) unsuitable carburation; (5) faulty contact-breaker or trembler. Also in the case of more than one cylinder being employed, as in the Panhard, Daimler, Mors, and Peugeot cars, this device shows at a glance, in addition to the foregoing, what each and every cylinder is doing. Thus, without getting down the driver can see that No. 3 cylinder, for instance, is idle and consequently throwing all the work on the others, instead of, as at

present, having to stop, descend, and examine all the cylinders to find the offending one.

When duplex ignition (*i.e.*, hot tube and electric spark) is used simultaneously it is almost impossible to tell whilst travelling whether one or both methods are performing their duty, but with the new instrument this is at once made manifest, as if, on switching off the electric current by means of the switch usually provided in the cars, the cylinders are still in action it is evident that the hot tube is firing the charge, the only means at present of ascertaining if the electric ignition is doing its work being to get down and turn off the burners of the hot tube ignition. Another useful and important point about the Ignicator is that it can also be used as a "cut-out," thereby securing a double purpose: firstly, to enable the driver, without leaving his seat, to test each and every cylinder of a motor of two or more cylinders separately; and, secondly, to economise power by cutting off any cylinder or cylinders that may not be required for working purposes, such as when going down hills or when a less speed is required. This is effected by simply turning the vulcanite handle (D) until the points of the rods (represented by

the dotted lines) are too far apart for the spark to jump across. It should be mentioned that an Ignicator is required for each cylinder, suitable clips to hold one, two, or more, as required, being provided. The instruments are small and neat, one being only four inches long, so that very little space is taken up; and, moreover, they are easily attached to the car, as, after having screwed the clip or clips on to the dashboard or other convenient part, where it can be easily seen by the driver, the insulated wire usually employed to convey the secondary or high tension current from the coil to the sparking plug is to be connected instead from the coil to one terminal (A or B) of the Ignicator; then, by means of an extra length of similar insulated wire, the other terminal of the Ignicator (B or A) is attached to the sparking plug. In other words, the Ignicator is connected in series with the high tension circuit, and it should be pointed out that it does not use up any of the current of the accumulators or batteries. Referring to the illustration, which shows the actual size of the Ignicator, D is the vulcanite or insulated handle for regulating the width of the spark gap or electric bridge, and it is by turning this handle sufficiently, so as to widen the gap, that "cutting out" any cylinder can be effected; A and B are the terminals connected, one to the coil, the other to the engine sparking plug; C, the observation slot through which the spark and condition thereof is observed; E, the clip in which the Ignicator is held (the one in the illustration being for a single Ignicator). The dotted lines represent the rod inside the tube from the points of which the spark passes, and F is the gap, or electric bridge across which the spark passes.

To ascertain where a fault, if any, lies, the following conditions have by repeated observations been summarised:—

(1) Batteries run down.—The spark at the gap in the Ignicator will be intermittent and probably cease altogether until the points are brought a little closer, upon which the spark will commence again. This is due to a "drop" in the E.M.F. (electro-motive force), a sure indication that the batteries are nearly "discharged," and therefore the pressure of the induced current is not sufficient to jump the gap. (2) In the event of the porcelain of a plug cracking, and thereby causing a short circuit in the body of the plug, this can at once be ascertained by "cutting out" the good cylinder or cylinders, and the one that is failing to explode (although indicating a good spark in the Ignicator) is the one that is short circuiting. (3) Short circuit or leakage.—In this case there would be no spark shown in the Ignicator. (4) Unsuitable carburation is shown by there being no explosion in the cylinder or cylinders although a good spark is shown in the Ignicator. (5) Faulty contact in contact breaker or trembler would be indicated by a complete absence of any spark, whether the points are close together or not, or even in contact.

It will thus be seen that although the Ignicator is an extremely useful little device for the purpose of testing even single-cylinder cars, it becomes far more useful in cars having motors of two or more cylinders, and also in such cars where duplex ignition is used.

In addition to their tire-driven motor-bicycle, Messrs. Edward de Poorter and Company, Limited, of 9 and 10, Great Tower Street, London, E.C., have now introduced a belt-driven machine. The general arrangement follows the old type of "Derby," but instead of the friction drum acting on the tire, a small pulley, carrying the belt, is used to convey the power to a light metal pulley on the rear wheel. A lever is provided, by means of which the belt can, without dismounting, be tightened or slackened at any time, so as to give practically a free engine.

The East Riding Cycle and Motor Company, of Grosvenor Street, Hull, has just introduced a new motor-bicycle, in which several novel features are comprised. The frame of the machine is of special construction, the motor being carried in a vertical position, just forward of the bottom bracket. It is of the air-cooled type, developing $1\frac{1}{2}$ h.p., the power being conveyed to a light pulley on the rear wheel by means of a leather band. A single lever operates the exhaust-valve lifter and advance sparking arrangement. A spray type of carburettor is used, while particular attention has been paid to the question of lubrication.

CONTINENTAL NOTES

BY "AUTOMAN."

THE Paris-Vienna motor-car race is now a certainty, all doubt having been put to an end by the official sanction of Austria being accorded. From Paris to the frontier there will be no racing, but just a promenade—unless the French governmental authorities should relent, which seems at present very unlikely, and allow full speed ahead. From the French frontier there are several proposed routes, and, very naturally, Mr. Ernest Cuenod, who is the vice-president of the Swiss Automobile Club (although his headquarters are in Paris), is most anxious that the route should be through Switzerland. In a conversation I had with Mr. Cuenod the other day he expressed the opinion that he would succeed in obtaining the sanction, but I fear "the wish is very much the father to the thought" with him, and I should feel inclined to doubt the possibility of such a result, because of the peculiar state of the laws of the little mountain Republic. There each Canton seems to have its own complete control of the roads. I should be inclined to prophesy that very little, if any, Swiss soil will be disturbed by the rubber tires of the competitors in the Paris-Vienna race. The route will more likely be through the Bavarian Alps.

THE rules for the competition in the touring section have just been printed, and are briefly as follows:—Any vehicles are admitted which have a system of mechanical propulsion, providing they are entered by a member of the A.C.F. or one of the affiliated clubs, and that they are driven under the direct responsibility to this person. The competing cars must have comfortable sitting room for the number of passengers which they propose to carry, and must be vehicles similar in type to those delivered ordinarily to the customers of the manufacturer. The power of the motor must be declared, and must be in proportion to the kind of cars and the weight of the vehicle fully loaded. Every car must be photographed before the start by an official photographer. Entrance fees are 200 francs, or £8, up to May 31st, and 400 francs, or £16, after that date and up to June 10th. The entrance fees will be forfeited if the car is not started. Every car must carry a ticket with Paris-Vienna printed on it, and with the crests of the French, Swiss, and Austrian automobile clubs, and the number of the entry. No advertisements are allowed, but the driver must have a distinguishing band on his arm. The tour will take place between June 17th and 28th. The driver of each car must carry the documents showing his permission and capacity to drive. In France and Switzerland drivers keep to the right when meeting other cars, and pass other cars going in the same direction on the left, whereas in Austria the opposite rule holds good, as in England. Spare parts can be carried, and any repairs are allowed either on the road or in the garage.

WHILST on the subject of racing, I must mention the peculiar situation in which the matter is placed at the present moment in France. Since the unfortunate hasty action of the Chamber of Deputies on the motion of M. Gautier de Clagny, who was scared by the lamentable accident on the road between Epernay and Reims in the Paris-Berlin motor-car race, no other race has been authorised in France. But now the Government is so interested in the alcohol question that it has a project on hand for a great race between Paris and Calais. The A.C.F., which has already asked for sanction for several races and received a flat refusal, does not see why the monopoly of organising races should fall into the hands of the Government, whom it considers an improper authority in these matters. The question, therefore, is whether or no the A.C.F. shall authorise the Government race from Paris to Calais; and the automobilists of France may find themselves in a peculiar dilemma. If they enter for the Government race they may be disqualified by the A.C.F., and if they do not enter for the Government race, the Government will not let them race under the auspices of the A.C.F.

TALKING of the A.C.F., a meeting was held the other day to

organise the Société d'Encouragement as a branch of the Club, as explained in the *Journal* some few weeks back. There were a great many present, and the discussion on the subject got into such a state of confusion that M. Forestier, who was the author of the project, proposed that the proposition should be put off until a later date. This was agreed to.

THE defenders of the Gordon-Bennett Cup are to be Fournier, Girardot, and René de Knyff, who, in the case of sickness or other accident, will be replaced by Huillier (commonly known in the racing world as Gilles Hougières), Giraud, and Maurice Farman. Three cars that are likely to compete will be a Mors, driven by Fournier; a Charron-Girardot-Voigt, driven by Girardot; and a Panhard-Levassor, driven by René de Knyff. The race will be doubly interesting from the fact that in addition to the international struggle, there will also be the purely national contest between the two great French houses, as well as with the new competitor.

THE JAMES AND BROWNE DOUBLE-ACTING BRAKE.

IN connection with the recent correspondence in our columns on brakes, and more especially in regard to the letter from "Double Action" in our issue of the 8th inst., describing the brakes on the new Charron cars, Messrs. James and Browne

FIGS. 1 AND 2.—SECTION THROUGH CENTRE, AND ELEVATION ON INSIDE OF CHAIN RING

- | | |
|--------------------------|------------------|
| AA. Chain thrust rod. | E. Chain ring. |
| BB. Brake blocks. | FF. Axle. |
| CC. Brake tension rod. | H. Hub of wheel. |
| D. Back member of frame. | J. Brake cord. |

of Hammersmith, have sent us drawings of the brake which they are fitting to their new cars, for which they claim all the advantages of the "Charron" brake, such as removing wheels without affecting the brake, etc. As will be seen, the brakes take the form of two slippers acting on the inside faces of the chain sprockets attached to the rear road wheels of the car. The slippers are brought into contact with the braking surface by means of ingenious toggle arrangements actuated by the pull on the brake cord. The thrust rod runs to the back of the frame instead of to the sprocket bearing, so that no strain is put on the latter when the brakes are used; it is made a fixed length and consists of a plain tube. As the chains can be adjusted without in any way interfering with its action, the work of chain adjusting is rendered a very simple matter.

THE Motor-Cycle Manufacturing Company, of Brockton, Mass., U.S.A., have lately built what is claimed to be the most powerful motor bicycle in existence. It is a 6 h.p. racer, in which the motor is supported parallel with, and in front of, the main down tube of the frame, and drives the rear wheel by a belt. The frame is of specially strong construction, a noticeable feature being the use of duplicate front forks. In an official trial the machine has, it is stated, covered a mile in 1 min. 23.5 sec.

THE "KING" MOTOR-BICYCLE.

"STILL they come!" is the cry with regard to motor-bicycles, one of the latest to come under our notice being the "King," made by Messrs. W. King and Company, of Bridge Street, Cambridge, and of which an illustration is given herewith. It is probably one of the most powerful machines of the kind in the country, being fitted with a $2\frac{1}{2}$ h.p. De Dion engine. The wheel base of the bicycle is longer than usual, to enable the engine to be fixed between the seat tube and the rear wheel, which is driven by means of a small twisted belt working on a light metal pulley. The motor is provided with a jet-feed carburettor, which is claimed to work satisfactorily in the coldest of weather; an exhaust-valve lifter, controlled by Bowden wire, is also fitted. To render the machine as quiet as possible a large exhaust box is made use of, while as regards lubrication of the crank case, this is so arranged that it can be effected whilst riding, sufficient oil being carried for a run of 300 miles. The petrol tank, which is fitted in the frame, has a capacity of two gallons. The frame of the machine is of specially strong construction; the wheels are twenty-six inches in diameter and are

shod with 2-in. or $2\frac{1}{2}$ -in. pneumatic tires. Messrs. King inform us that, employing a $2\frac{1}{2}$ -h.p. engine, the machine is an excellent hill climber, a statement we can readily believe; in fact, they claim that it will pull a trailer up most hills without any pedal assistance on the part of the driver.

WE hear that the British Power, Traction and Lighting Company, Limited, of York, will shortly open a dépôt in London for the sale of Gardner-Serpollet steam vehicles.

MESSRS. TRENT, of Wells Road, Shepherd's Bush, W., have just introduced a new motor-bicycle. It is somewhat on the lines of the old Werner, a $1\frac{1}{2}$ h.p. air-cooled motor being fixed in front of the head, and driving the front wheel by a leather band.

THE Thomson Motor Company, of Melbourne, Victoria, have just completed a 5 h.p. steam motor-van for the Dixon Tobacco Company. The van will run nearly 70 miles without recharging water or kerosene, the latter being used as fuel.

THE P. and R. Storage Battery Company, Limited, has been registered, with a capital of £6,000, to adopt an agreement made by this company with Allan and Adamson, Limited, and W. Peto (the liquidator thereof), and to carry on business as electricians, electrical engineers, etc.

THE capital of the company formed for the carriage of goods between Liverpool, Blackburn, and Manchester by motor-wagons has now been fully subscribed and the directorate completed. It is not at present proposed to include Manchester in the daily service, but first to work up and consolidate the Liverpool to Blackburn service for the carriage of goods, the principal advantage being that the cotton will be carried at 1s. 6d. per ton cheaper than by rail, and delivered the same day as collected.

LUBRICATION.

THIS is a subject which appeals forcibly to every motorist, and one on which, perhaps, more than on any other single matter affecting an automobile, satisfactory running depends. The necessities of explosion motors, more particularly those of the smallest type, have evoked much scientific and manufacturing skill in the production of suitable oils for their lubrication, and beyond the recommendation that a good and well-known brand should be selected little need be said here on the subject, except to remark that there is never any objection to using a thick oil where a thinner one will do, unless, of course, it will not flow easily through the type of lubricator employed, though the reverse is by no means the case. The general lubricating arrangements of cars, however, invite more comments than space will permit. Few drivers will fail to properly oil their engine, which is quite capable of calling attention to the omission; but the same care is not always given to the numerous other points about the vehicle where lubricants are needed, and where much unnoticed deterioration may be caused by their absence.

Mechanical feeds of the "oleopompe," or similar types, are not largely used on account of their complication and expense, and the usual methods vary between lubricators grouped on the dashboard, and the same distributed in proximity to the parts they supply. The former arrangement, though convenient, is perhaps less advisable in some ways, as the long and tortuous pipes needful are possible sources of trouble, especially in cold weather, and additionally so where grease is employed; while the general inspection that distributed lubricators demand is by no means an undesirable formality. Semi-solid lubricants have, in the writer's opinion, many advantages in automobile work; they offer greater resistance to the entrance of road dust and grit into bearings, are cleaner, and more economical, while the increase of friction due to a more consistent lubricant is infinitesimal, and for ball bearings practically they are much to be preferred.

And here it may be remarked that the virtues of graphite as a lubricant are hardly as much appreciated as they might be. True, it is dirty, and somewhat difficult to distribute, being, when mixed with oil, not altogether an ideal liquid for drip-lubricators; but in such cases as a piston or bearing slightly injured through insufficient lubrication a short course of graphite will often get the surfaces back into good working condition—a fact worth noting, particularly with steam-cars. For valve-stems, too, graphite is useful, being indeed the only admissible lubricant, and it is equally beneficial to that bugbear, the pump. It is somewhat odd, by the way, that lignum-vitæ bearings have not been employed in the latter, being the only material on which metal will run with water lubrication. Graphite for such purposes should, it is needless to say, be of the best, the ordinary black-leads, though good enough for smearing packings with to prevent adhesion, being by no means suitable for anything else except blacking stoves. Finally, for such small moving parts as are not deemed worthy of special oiling devices, and usually have to depend on a casual—sometimes very casual—oil-can, a grease syringe, best employed with some graphite grease, is far preferable.

R. W. BUTTNER.

WE learn that Lord Edward Spencer Churchill has just placed an order for a 12 h.p. Daimler car of the new type.

THE Clarkson and Capel Steam Car Syndicate, Limited, have made a donation of £5 5s. to the funds of the Motor Union.

AT a recent meeting of the Maidstone Urban District Council the recommendation of the Electric Lighting Committee in reference to the charging of the storage batteries of electric motor carriages was adopted. In future, ignition batteries and main cells will be charged at the municipal electricity works at the rate of 8d. per unit. A yard is provided at the station, where the motor-cars may stand while the charging is carried out.

DOUBLE-ACTING BAND BRAKES.

THE term double-acting as applied to brakes is somewhat ambiguous. If it is interpreted to mean that the brake effects a retarding action on the vehicle for each direction of motion, then all the brakes which have come to our notice, and probably all that have ever been made, are double acting. If, on the other hand, it is interpreted as meaning that the retarding effect is exactly equal, with equal operating pressures, for both directions of motion, then the class of so-called double-acting brakes most commonly used only deserve their name when certain conditions as to dimensions are fulfilled. The class of brakes we refer to, remarks the *Horseless Age*, is the band brake in which both ends of the band are movable and are fastened to the opposite arms of a double-armed lever.

By varying the design of this brake, that is, by changing

THE NAPIER 24 H.P. BAROUCHE.

HEREWITH we reproduce a photograph of Mr. Wilfrid Ashley's 24 h.p. Napier car, fitted with a type of body which is known in France as a "Limousine," but which originated in this country some twenty years ago, it being made for the Duke of Beaufort, and called a Beaufort barouche. The Motor Power Company, Ltd., state that they believe it is absolutely the first body of this description built in this country, and was constructed to their own design and specification. Although it looks very large it is really very light, as, wherever possible, aluminium is used. All of the top portion is of glass, readily removed, the whole making a fine double phaeton. All the fittings, etc., are the very finest cabinet work. The photograph hardly does the car justice, as, owing to the fine mahogany and rosewood fittings, it looks very much lighter in

THE NAPIER 24 H.P. BAROUCHE.

the distance between the centre of brake drum and centre of brake lever, the length of the lever arms and the length of the band, it may be made either a perfectly double-acting brake, with equal effect for both directions of motion, a brake exactly similar in action to the so-called single-acting band brake with one end of the band fixed, or it may occupy any position between these two extremes. In practice the brakes of this class usually belong to the last category; that is to say, they are not quite as powerful for reverse motion as for forward motion. There is, of course, no reason why we should insist upon the theoretical condition of equal power for both directions being complied with, especially as, on account of the higher forward speeds of vehicles, the greatest braking effort is always required to arrest forward motion; but, at the same time, if judicious design permits us to increase the brake power for reverse motion without seriously affecting the power for forward motion, we might as well take advantage of it. It is, at any rate, well to know what are the theoretical conditions underlying the equality or inequality of brake action for the opposite directions of rotation of the brake drum. In the ordinary band brake, in which one end of the band is fixed, the tension in the band varies from end to end. For forward motion it is greatest at the fixed and least at the opposite end. Similarly in a band with both ends movable the tension varies from point to point, but the point of least tension is never at one end.

In order that the braking effect may be the same for both directions the tension applied to each end of the band must be the same. To ensure this the length of the band must be so adjusted that when the band is drawn tight the effective lever arms, through which the operating power is applied to the ends of the band brake, are the same.

real life than it does in the photograph. We may add that Mr. Ashley has now driven the car some thousands of miles.

MR. E. H. MICKLEWOOD gave a lecture on "Motor-cars and Traction" at the Plymouth Athenæum last week.

SEVERAL local authorities have deferred the consideration of the question of the law affecting light locomotives until the result of the recent conference between the Local Government Board and the County Councils' Association is made known.

"THE proposed motor-cars" is the heading of a paragraph in a Devonshire paper, which, on reading, proves to be a refusal of the Local Government Board to allow the Electric Lighting Committee of the Taunton Town Council to spend £2,000 for motors for power purposes to be let out on hire.

MESSRS. STROM AND SON, Paris, who are represented in this country by the Grapholine Manufacturing Company, Ltd., have issued a most effective catalogue of their special clothing for motorists. There we have splendid illustrations of motor raiment for ladies and gentlemen, ranging from the simplest leather garments to most elaborate motor robes for ladies' evening wear. It reveals a picturesqueness in motor costume that is sadly lacking in our ordinary attire.

THE Peak district of Derbyshire has resembled Canada during the last few weeks, and the snow and ice have given joy to all who love winter sports. Mr. Bradbury, the well-known writer on Derbyshire, has been touring through the district on Mr. A. Beatson's Locomobile. He writes graphically of the ascent of Topley Pike and the journey to Taddington, a village which lays counter-claim to its neighbour, Chelmorton, for the distinction of being the highest village in England. Snow and ice have no terrors for a well-driven motor-car.

AUTOMOBILES AND THE RAILWAY COMPANIES

OFTEN have we urged in these columns that motor vehicles might be usefully and profitably employed to act as feeders to outlying districts and also in facilitating the conveyance of passengers from the railway station to their homes. But hitherto the railway companies have not been very enterprising in the matter, and have shown an aloofness which has at length been broken down by the Northern Counties Railway Company of Ireland. As we have already announced, the company recently decided to supersede the horse bus plying between the Whiteabbey and Greenisland railway stations, Belfast, by a motor-omnibus. During the last few days this vehicle—the first of its kind introduced into Ireland—has been plying in the streets of the northern city, attracting considerable attention. The omnibus is one of Messrs. Thornycroft's steam cars, and should it prove satisfactory the railway company will adopt similar machines in other towns on their system.

There are several ways in which the adoption of automobiles by the railway companies should be of advantage, and their use in large towns will be preparatory to a development in rural districts, which will be of considerable utility to the country. Many large villages are miles away from the railway station. By providing motor-vehicles at such stations a regular service could be maintained to run in conjunction with the trains, thus securing a through time-table system. With horse traction no really reliable time-table can be issued, but with the provision of motor-cars running from villages to stations it will be possible to meet the trains and avoid the uncertain running incidental to horse-drawn vehicles.

This is but one department in which automobiles will be serviceable to railway companies. Probably it will be in the supersession of motor lorries for ordinary vans in dealing with heavy traffic and parcels delivery that the greatest economy will be effected. By such means it would be possible to work the goods department with the same exactness in time that the passenger service is now run. That this is recognised by some of the leading railway managers is evident from the fact that the Lancashire and Yorkshire Railway Company are building motor-wagons for their own use, such enterprise having been warranted by previous experience with a vehicle in actual use.

There is no doubt that railway directors will find in the automobile a most valuable ally, one that is more adaptable to varying circumstances than light railways. Even in localities where light railways will have eventually to be developed, motor-car services might well be established with a view of obtaining data as to probable traffic and other information of service when considering the financial aspects of the question. Thus, in every way, the matter is one of interest to railway companies, and we gladly recognise the Lancashire and Yorkshire Railway Company and the Northern Counties Railway Company of Ireland as pioneers in this respect. Which will be the next company to utilise the automobile?

MR. W. M. LETTS has returned from a visit to the United States, and has brought with him some excellent specimens of the cheaper form of Locomobile which is being made specially for the British market. These cars have the same power and capacity as those already familiar in most of our towns, but in some minor points economies have been effected, with the result that a reduction in cost has been obtained. Three hundred of these cars are now being made.

A NEAT little catalogue, illustrating their specialities of motor clothing, has been brought out by Messrs. Holding and Son, of Maddox Street, W., and King Street, E.C. The firm is favourably known in connection with Auto-cloth, and has five other kinds of cloth in non-dust-showing shades. These are made up with lining to suit the individual preferences of customers. A special coat for lady motorists has a prominent place in the list, and attention may well be drawn to the kangaroo-leather vest, which is really a combination of kangaroo leather, chamois leather and flannel with slipping sleeves.

THE CLYDE MOTOR-BICYCLE.

IT was announced in these columns some time ago that the Clyde Cycle and Motor-Car Company, Ltd., of Shenstone Street, Leicester, were at work on the construction of a new motor-bicycle. The machine is now on the market, and from the accompanying illustration it will be seen to comprise several novel features. In the first place, it will be noticed that the frame is of special design. The motive power is supplied by a Simms air-cooled engine of 2 h.p. The placing of the motor in a vertical position is claimed to ensure equal wear on the piston and valves, and perfect lubrication and cooling of the cylinder. The mixture is formed by a spray carburettor, while a Simms-Bosch magneto-electric machine furnishes the electrical spark for the ignition of the charge. An exhaust valve lifter is provided, and this is actuated by a Bowden wire so arranged that before the exhaust valve is held closed the ignition is retarded

CLYDE MOTOR BICYCLE

to its slowest point. From the motor the power is conveyed by a belt to a light pulley connected to the rear wheel. The petrol tank has a capacity sufficient for 100 miles, and if necessary an extra tank can be fitted behind the saddle. A pump is provided for the automatic lubrication of the crank case. The road wheels are 28 inches in diameter, and are shod with 2-inch pneumatic tires. Each wheel is provided with a brake, so that although the motor-bicycle can attain a speed of thirty-five miles per hour on good roads it is always well under control, the various levers being grouped together within easy reach of the rider's hands.

It has been decided to have a badge prepared for members of the Motor Union.

The annual general meeting of the Automobile Club will be held at Whitehall Court, S.W., on the 27th inst.

AMONG the recent shipments of Stirling cars were, one to Holland, another to Malta, and two to Johannesburg, South Africa.

THE statutory meeting of Portsmouth and Gosport Motors, Limited, was held at Portsmouth last week. Only formal business was transacted. The chairman gave an interesting account of the working of the cars, more especially the Cambria, which, he said, had run practically without any serious detention upwards of 2,600 miles, the two vehicles having carried upwards of 17,000 passengers, which spoke well for the popularity of the car of the future. The receipts from all sources for the past four weeks amounted to £103. There were three cars on order for early delivery.

L'ALLUMEUR ELECTRO-CATALYTIQUE.

IN our issue of December 28th last "Automan," in his account of the report of the Paris Automobile Exhibition, gave a brief description of what may be termed the "metallic" ignition of M. Wydts. We are now able to publish a further illustration showing a section of the new ignition plug, and the arrangement of connecting up the small battery with it. As previously stated M. Wydts uses a special alloy of osmium, iridium, and ruthenium, which is extremely porous, inoxydizable, and able to withstand very high temperatures. He discovered at the same time that the faintest electric current through this alloy had the effect of purging the metal of all impurities and keeping it permanently in perfect condition for ignition purposes. The device which he has produced, and which is guaranteed to do all the work now done by incandescent tubes or the electric spark, is described as follows:—A plug *K*, made of brass, is screwed into the head of the motor, and contains a piston *D*, which may be pushed back and forth by means of a lever or other device. Through the piston *D* runs an insulated wire. At its inner end the piston *D* carries a piece of the alloy *C*, which is fastened on one side to the inner, insulated wire, and on the other side to the end of piston *D*. The latter, being in contact with the body of the plug, receives the current transmitted through the terminal *B*. An electric current passing from *B* to *P* will consequently pass through *C*. The commutator *I* by which the current may be interrupted when no longer necessary is seen in Fig. 2. It is to be noted that the electric current may be extremely weak, and serves only to heat the alloy when the motor is cold. A few seconds after starting the motor, even this weak current, for which any small battery is sufficient, may be cut out and the alloy will take care of all subsequent explosions without assistance, by its mere presence in the combustion chamber. The ignition may be advanced or retarded at will by the movements of a lever acting on the piston *D*, and may be interrupted entirely by drawing the alloy *C* back to the aperture *E* in the plug. The free admission of the oxygen of the atmosphere will then immediately cool the incandescent mass, and disturb the explosive properties of the gas mixture in the combustion chamber. From the correspondence we have received on the subject it is evident that considerable interest is being taken in the new ignition. Curiously

enough, too, we learn that experiments have been in hand in this country for some time past with a somewhat similar form of "metallic" ignition. We may add that Messrs. Ed. de Poorter and Company, Ltd., 9, Gt. Tower Street, London, E.C., have acquired the sole agency in this country for the "Allumeur Electro Catalytique."

MR. F. T. MERSELES, of the American Bicycle Company, New York, is, we learn, at present over in this country looking into the possibilities of opening up a trade in motor-cars.

THE PRICE PETROLEUM SPIRIT MOTOR.

A VERTICAL two-cylinder petroleum-spirit motor made by Mr. R. Price, of Willow Grove, Plaistow, E., is shown in the accompanying illustration. The cylinders have a bore of $3\frac{1}{2}$ in. by $5\frac{1}{2}$ in. stroke, and at a normal speed of 800 revolutions per minute develop 8 b.h.p. The crank case is provided with detachable openings sufficiently large to enable the connecting rods to be adjusted without having to dismantle the engine, while the valves are also so

arranged that they can be withdrawn without breaking any of the joints. A centrifugal governor, in connection with which is an accelerator, is provided. This can be made to act in three different ways, viz., one cylinder to cut out at a speed of 700 revolutions per minute, and the other at 900 revolutions, or both together, or the governing can be done by throttling the vapour valve. Electric ignition is employed, care having been taken to so arrange the contact-breaker that no oil or dust can reach it. All the parts are well balanced, and special attention has been paid to the details, the gear-wheels being provided with shields. The 8 b.h.p. motor weighs, excluding the 90 lb. flywheel, 110 lbs. Mr. Price is also making motors with one, three, or four cylinders, for both motor-car and launch purposes, ranging from 4 h.p. to 24 b.h.p.

THE Syracuse Automobile Club, of Syracuse, U.S.A., has decided to call the place where motor-cars are stabled an "autogorium."

THE Automobile Club of America has succeeded in obtaining certain touring privileges in Canada, a letter having been received from the Acting Collector of Customs at Ottawa, announcing the willingness of the Canadian authorities to extend to American touring automobilists the same privileges accorded sportsmen entering the border ports. If requested, his department will issue orders that touring motor-vehicles be regarded as sporting outfits, on the same footing as guns, fishing rods, and other paraphernalia of sport. These pay 25 per cent. duty, but their temporary importers receive receipts for the duty paid, which is refunded when they recross the border. The tourist is required to make an affidavit and fill a descriptive blank, so that the article entered may be readily identified. The Automobile Club of America will now endeavour to induce the United States authorities, who now demand the full 45 per cent. duty from touring Canadians, without refunding, to reciprocate by issuing similar orders, or carry the matter a step further and ask for the same privileges as cyclists, who do not even have to make deposits on crossing the border.

HERE AND THERE.

MR. A. LORENZO BARBER, president of the Locomobile Company of America, is at present in England.

MR. G. FOSTER PEDLEY informs us that he has recently resigned his position as manager of the Daimler Motor Company.

MR. R. N. WHALEY'S auction sale at Lincoln on the 1st prox. will include a few motor-tricycles and quadricycles.

THE Caledonian Motor-Car and Cycle Company, of Aberdeen Scottish agents for the Peugeot motor-vehicles, are introducing a light motor parcel delivery van made by the Peugeot Company, and of which an illustration is given herewith. The vehicle, which is intended to carry a load of six cwt., is propelled by means of a 5-h.p. two-cylinder horizontal motor, having electric

ignition. Three forward speeds and a reverse motion are provided. The road wheels are of the artillery type, shod with solid rubber tires. The illustration shows a car fitted with tiller steering, but in the latest types wheel steering is provided, the throttle and ignition levers being mounted on the inclined steering post.

THE Locomobile Company are bringing out a new steam air and a steam water pump. By fitting one of these pumps and simply turning on the steam cock, the air is pumped up to 80 lbs. within two minutes—thus obviating the long and irksome process of pumping up air pressure by hand. We hope to refer to this improvement in our next issue.

IN reference to the importation of automobiles, the director of an automobile company writes that it must not be overlooked that this country is making enormous strides. The output of his company is now five times what it was two years ago, and there would be no trouble in increasing this tenfold; but wise manufacturers have to be careful that every vehicle turned out is a credit to Great Britain. The greatest barrier to increasing the output rapidly is the difficulty of securing good mechanics, only about one in ten, it is said, being good enough for the work.

WITH reference to the action brought by the Whitney Company against Messrs. Stanley, mentioned in last week's *Journal*, it transpires that the Locomobile Company of America, who own a controlling interest in the Whitney Company, is behind the suit. The patent in dispute covers forty-six details in steam vehicle construction, relating for the most part to the running gear, the power transmission, engine and boiler. We understand that the Locomobile Company intends to take action with regard to all infringements of its patents, and that a number of steam-car makers have expressed their readiness to take out licences from the Locomobile Company, in order to protect themselves.

THE Road Carrying Company, Limited, of 7, Victoria Street, Liverpool, has been registered with a capital of £20,000. The directors are Mr. G. H. Cox, deputy chairman of the Salt Union, Limited (chairman); the Hon. A. Stanley, M.P.; Messrs. R. O. Burland, J.P., Wigan; F. R. Dixon-Nuttall, St. Helens; T. Thornycroft Vernon, Liverpool; Max Muspratt, Liverpool; and G. W. Paton, Liverpool. The offices are at 7, Victoria

Street, Liverpool, and the company will establish a garage as well as carry out road-carrying operations.

THE *Surveyor* returns again to the suggestion for a new road from London to Windsor which was outlined in its columns by Mr. W. Rees Jeffreys in November last.

HORSES are learning to jump safely from out of the way of the motor-car. Mr. Estcourt was driving his motor-car in Yarmouth the other day when he passed a horse, which became frightened, swerved on to the path, and dashed over the palisading fronting Sefton Terrace. The animal was extricated from the garden, and found not to have sustained any serious hurt. Evidently the horse had had a good automobile education.

VERY comprehensive is the new catalogue of the British Electromobile Company, Limited, of 4, Bloomsbury Place, W.C. A useful article on the equipment of the company's electrical cars precedes a series of illustrations of landaulettes, voiturettes, wagonettes, pleasure brakes, delivery vans, etc., in all of which the Leitner battery is employed. The company possesses facilities for the housing, cleaning, and maintenance of electrical vehicles, and will shortly stock a number of cars for hire.

MESSRS. J. ROTHSCHILD and Son, Ltd., 1, Endell Street, London, W.C., is the title of a company formed, with the Earl of Shrewsbury and Talbot as chairman, to develop the English business of Clement Rothschild and Messrs. J. Rothschild and Son, both well-known in France, as makers of motor-car bodies, the former dealing with the business in a wholesale way. The company will be among the exhibitors at the forthcoming automobile show.

THE Garrard Manufacturing Company, Limited, Magneto Works, Ryland Street, Birmingham, are placing on the market complete motor sets suitable for fitting to existing strong roadster bicycles. Although the complete motor set only weighs from 25 lbs. to 30 lbs., bringing the entire weight of the machine well under 65 lbs. all told, the power given out by the "Clément" motor is claimed to be sufficient to take a rider up any ordinary hill without assistance. It will be noticed in the illustration that there are two tubes that run almost parallel with the front forks, these serving the double purpose of strengthening the front forks and supporting the petrol reservoir. The motor weighs 15½ lbs.,

and develops 1 h.p. at 1,900 revolutions. Its features are an external flywheel, the method of opening the exhaust valve, similar to the Buchet; a compression cock attached to the cylinder, and the contact-maker, composed of a cam with notches and of a trembler. The contact is obtained, not by the sudden fall of the trembler on a platinum screw, but by the pressure on that screw on the back of the trembler.

THE British Automobile Commercial Syndicate, Limited, have taken the premises at 1, Endell Street, W.C., adjoining their present dépôt in Long Acre. The ground floor will be used as show-rooms, the first floor as offices; the second floor will be devoted to accessories and will also be the home of the "Maison Talbot" for the supply of Talbot tires; and the third floor will be given up to automobile clothing. With regard to the Talbot tires, we are informed that Lord Ingestre has used them on a De Dion voiturette on journeys aggregating 4,800 miles, and that they were then in a sound condition. The Hon. C. S. Rolls has fitted his 20 h.p. Panhard with these tires.

CORRESPONDENCE.

THE CENTURY MOTOR-TANDEM.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—You are good enough to allow your journal to be used as a medium for inquiry and reply respecting matters relating to motoring. Will you kindly permit me to ask any reader who has used the Century motor-tandem to favour me with his opinion upon its merits, stating whether it is adapted for a hilly district and whether its brake power is effective? An opinion, based on a fair experience, as to its suitability as a touring motor vehicle will be most acceptable.—Yours truly,

A READER.

MOTOR-BICYCLE CONSUMPTION.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your last issue you mention, under "Here and There," the fact that at the recent Liverpool trials the R. and P. motor-bicycle ran 81 miles on nine half-pints of petrol. I should like to remark that my 1900 pattern Werner, with surface carburettor, has on several long runs been found to use exactly one quart for 35 miles; nine half-pints would therefore run it 78½ miles, and but for a leak in the top of the tank, which is now soldered up, the efficiency would have been better still. It would be interesting to know the amount consumed by other types.—Yours truly,

T. FREDK. HUNT.

LICENCES FOR MOTOR-CARS.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—If "Planeur" applies to his district Inland Revenue officer for Form 132 B, he will find that the Inland Revenue Department only demand the duty under the "Light Locomotives on Highways Act" (59 and 60 Vict., c. 36), 1896, on and for mechanically driven or drawn carriages over one and under three tons in weight, this duty being for locomotives between one and two tons weight £2 2s. and for locomotives exceeding two tons £3 3s.; plus ordinary carriage duty.

A footnote on this form reads as follows:—"For a locomotive not exceeding one ton in weight, or of the weight of three tons or upwards, which is liable to duty as a carriage or a hackney carriage, an ordinary carriage licence should be obtained." The Act under which cars under one ton weight pay duty is not the "Light Locomotives on Highways Act" of 1896, but the "Customs and Inland Revenue Act" (51 and 52 Vict., c. 8), 1888. Motor-cars under one ton (and over three) in weight, and motor-cycles are locomotives under the 1896 Act as far as speed is concerned, but are not locomotives as regards duty. Anomalous, but most motorists thereby save at least two guineas, so there is a grain of comfort to be got out of the absurdity.—Yours faithfully,

ARTHUR J. CARY.

FRANCE COPYING ENGLAND.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—We have noticed with some amusement the correspondence continuing from week to week upon the subject of "France copying England." The two points most dwelt upon have been "separate liner and water jacket" and "a straight exhaust-valve spindle." With regard to the first, a separate liner has been the constant gas engine practice for a great many years in this country; the mere substitution of one metal for another in a water jacket is, we think, not worth talking about.

With reference to the second point, "the straight exhaust-valve spindle," we should like to inquire what this means. For if it be taken literally, surely it has been the usual gas and oil engine practice for many years past and to the present time to have these valve spindles straight. We should like to know what is meant by "straight exhaust-valve stems." Surely Mr. Edge should be the last person to claim special originality, particularly as against French designs, when the whole design from one end to the other of the Napier car is the Panhard or French construction, with some slight modifications made by Messrs. Napier.—Yours faithfully,

ROOTS AND VENABLES.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—I have read Mr. Edge's letter on this subject in your current issue, and I take grave exception to a certain element he introduces, namely the personal one. In the first place he states definitely that I have some evident reason for not wishing to see it clearly proved that England has been in advance of France in some directions. May I point out that I have never questioned that; indeed, in many constructional parts the Napier is in my opinion superior. But the question was—had the French copied the English; and I have demonstrated that such was not the case. I must ask Mr. Edge not to credit ulterior motives to me, in face of a statement I made in my first letter, which was that, apart from many of my relations being French, I have no personal bias or other interest in the subject. However, to place the matter clearly before you. Some letters and advertisements appeared some weeks back stating, among other things:—(1) The aluminium water jacket was copied from the Napier by the big French makers. (2) Also straight exhaust stems. (3) The exclusive use of electric ignition. (4) Enclosed valve gearing and cam shafts. Now I enclose a letter from Messrs. Mors. In it they state that

the aluminium jacket was fitted to their first machines turned out in 1900. The aluminium-jacketed Napier engine did not appear in public till later. I presume the case is that both Mors and Napier designed the same thing at the same time without knowledge of the other's doings, but certainly Mors appeared first on the market.

With regard to the second statement I beg to say that in all his big car engines Mors has always used straight exhaust valve stems, and Mors first built motors in the very early nineties before the Act of 1896 was passed allowing automobiles in England. How then can Mr. Edge state that Mors has copied Napier? Thirdly and fourthly: In all his engines Mors has always enclosed his valve gear. In the 1900 engine referred to he placed his 2 to 1 pinions on the outside for the first time. The original arrangement of his vertical engine of '98 is shown on page 164 of the "Automotor and Horseless Vehicle Handbook" published in January, 1900. Moreover, Mors has always used electric ignition, and as I have before stated, he was making petrol cars long before any English firm.

It is also stated that Mr. Edge's information is all first hand, etc., and that mine is "only something I have heard of." To show the truth of this statement as regards the Napier, I went through Mr. Napier's workshops on more than one occasion in 1900, and I have since taken great interest in this machine. As to the Mors car, I have ridden, driven, and assisted in taking to pieces most types during the last two years. Again I must ask Mr. Edge to refrain from introducing matter not at all "pertinent" to the title of his letter, as I am sure my personal acquirements and qualifications have no more to do with the subject under discussion than Mr. Edge's own.

I trust you will allow me to apologise to Mr. Mark Mayhew for my error of memory regarding the metal used for the jacket of engine of his 1900 16 h.p. Napier. Permit me to point out that if an engine be painted all over with aluminium paint, it is only possible to ascertain the real material by scratching it off. Needless to say I do not indulge in these little liberties. As to my capabilities of distinguishing aluminium when I see it—and I have had much work done in it—I may say that I was experimenting with alloys of this metal in '89 and '90 when it was very expensive, nevertheless I still experience a difficulty in distinguishing an aluminium-painted article from an aluminium casting when at a short distance from the object. I may point out that the fact of Mr. Mark Mayhew's engine having or not having an aluminium jacket does not affect my argument that Mors produced the same thing as early, if not earlier than Napier, and Mors therefore could not have copied it.—Your truly,

ANTHONY WESTLAKE.

HILL CLIMBING AT RICHMOND.

To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will you kindly permit us to air a grievance *re* above. We see that fifteen cars were timed and twelve of these were driven by members of the trade; to all intents and purposes it was a trade function. Your report states that the meeting was unofficial and informal; but the names of the two timekeepers are sufficient to vouch for the absolute accuracy of the tests and every person reading your report would accept such timing as official. We think that the whole trade should be invited to compete in such tests, or if their presence is not desired such meetings must be treated as private.

We are provincial makers and do not belong to the Club, and cannot therefore have notice of such events which our trade competitors who are members of the Club are able to obtain. There is a growing feeling amongst provincial manufacturers that some events held by the Automobile Club, whether official or otherwise, are largely participated in by members who are also prominently engaged in the sale of cars.—Yours faithfully,

PROVINCIAL.

QUERIES *RE* STEAM CARS.To THE EDITOR OF *The Motor-Car Journal*.

SIR,—Like your correspondents "Naval Engineer" and Mr. W. Lee, I am an intending purchaser of a steam car, and have wondered how the difficulty of the exhaust steam could be overcome. Messrs. Clarkson, Capel and Company, I understand, have brought out a condenser and oil separator by which the exhaust steam can be used over again, and which, they say, enables a car to run for seventy miles instead of twenty, on twenty gallons of water. I shall be glad to hear from any of your readers how it works in practice. I now have one or two queries of my own to make. Can one use very hard water in these cars without the trouble of furring? With regard to hill-climbing, I shall be grateful for information as to the gradient and length of some suitable hills in the immediate neighbourhood of London for testing a car, the steeper and longer the better. As I live in a very hilly district, I wish to satisfy myself that they really will "climb any hill" as advertised. All the makers decline to send even a second-hand car into the country for trial.—Yours truly,

RUSTICS.

MESSRS. EDWARD DE POORTER AND COMPANY, LIMITED, the British agents for Wydts Allumeur Electro Catalytique, write:—"Before we make any definite statement as to reliability and working of this device we wish to give it a longer test. However, we may say that so far it acts wonderfully. The sensation of seeing a petrol motor working without lamp, coil, accumulator, or trembler for the first time, we must confess, was somewhat peculiar."

ALLEGED OBSTRUCTION.

At Buckingham Borough Petty Sessions, Frank Whitworth, of Biddlesden House, Bucks, was charged with causing obstruction on the highway by leaving his motor-car unattended. The police stated that the car was left outside the Swan and Castle Hotel from 7.15 to 10.10 p.m. without any light attached. The road at that spot was very narrow, and there was insufficient room for two vehicles to pass. A fine of £1 18s. inclusive was imposed. Counsel for the defence said the money would be paid, but notice of appeal was given.

NOTICE REQUIRED FROM DRIVERS.

Before Judge Lush Wilson at the Plymouth County Court, Mr. John F. Selmon, trading as the Plymouth Motor-Car Company, sought to recover £1 10s. from W. J. Willey, at one time a driver in his employ, a week's wages in lieu of notice. Mr. J. Shelley, who represented plaintiff, said that defendant was paid 30s. a week for driving a motor-car, and on a Saturday night he left without giving notice. This necessitated plaintiff's foreman being taken from another task, and one of the cars remained idle for some time, resulting in a loss to plaintiff. Mr. Shelley's statement was corroborated by Walter Smith, manager for the plaintiff. Defendant averred that he had given verbal notice eight days before, but this was denied. His Honour held that no notice had been given, and judgment was given for plaintiff.

REPAIRING A MOTOR-CAR.

CAPTAIN AUGUSTUS KENT, R.N., of Billericay, Essex, sued Messrs. Davenport Vernon and Company, Limited, of High Wycombe, at the Wycombe County Court, for the sum of £13 15s. 8d., damages sustained by the plaintiff by reason of injuries to his motor-car in consequence of the negligence of the defendants or their servants. The particulars of claim included the sum of £7 10s. in respect of the five days during which the car was useless, undergoing repair. Mr. Frank Dodd, who is himself a motorist, appeared for the plaintiff, and the defendants were represented by Mr. J. Bliss. Captain Kent stated that on September 18th he was going to Wycombe on a De Dion 3½ h.p. motor-car. It was moving very well indeed. He heard a scraping noise near Amersham, and found it was necessary to put up the car at Upper Temple Farm. He drove the car to the farm-yard and left it there, and he and his friend went to High Wycombe. Next morning he called on the defendants and asked for a man to see to the clutch gear, as he imagined the scraping noise he had heard on the journey was in that part of the machinery. The man helped him to take off the clutch gear, but no fault was found there. Witness took train to London, calling on the defendants and giving orders that the car was not to be brought down. Later he returned and was surprised to find the car at the works, and a bill was presented to him for £3 2s. 6d. He tried to start the engine but it would not go. Ultimately they got it to start, but it went so badly he had to wire to Mr. R. E. Knights, of Chelmsford, to examine the car. Mr. Knights also gave evidence, and said the car had been in a collision and was quite unfit for use. Evidence for the defence having been given, His Honour the judge, Sir Alfred G. Marten, said the evidence was not such as to justify him in coming to the conclusion, unless he had further evidence, that plaintiff was entitled to the return of the money which he had paid defendants. As to the other sums which had been incurred by him in consequence, as he held, of the non-execution of the work by the defendants, he had no doubt that Mr. Knights was paid for his services £1 13s. 2d., and for the repairs to the machine £1 17s. 6d., and that plaintiff was entitled for the five days in which he was unable to use the vehicle and his expenses of 15s. He thought the plaintiff was entitled to judgment for £11 15s. 8d. He was satisfied that the defendants, through their servant, were guilty of negligence in regard to the repairs. It appeared that plaintiff while driving the car found there was a scraping inside, which he desired to have rectified. He also gave instructions that the car was not to be removed from the farm. Defendants, contrary to these instructions, moved it down from the farm to their works, and while running it met with a collision which was not communicated to the manager until the damage was pointed out by the plaintiff and Mr. Knights. There was undoubtedly negligence, and plaintiff had made out his case entitling him to judgment for £11 15s. 8d. and costs.

AN IRISH CASE.

COLONEL JOHN R. MAGRATH, Baun-Aboo, Wexford, sued the National Telephone Company, at the Wexford Quarter Sessions, for having wrongfully and negligently placed wires upon a public highway between New Ross and Waterford, whereby plaintiff's motor-car was obstructed, broken, and damaged, and plaintiff suffered a loss of £50. After hearing witnesses and counsel, his Honour said that the parties on both sides gave their evidence very fairly, though it was contradictory. Colonel Magrath, who at the time of the accident did not appear to be any way flustered, had stated only what he believed to be perfectly true. He said that there were no wires on the pole broken at all by the accident. Where, then, did the wires on the ground come from? Colonel Magrath said they must have been lying along by the side of the road. He (the judge) was asked to jump to the conclusion that these wires belonged to the Telephone Company, but there was no evidence to that effect given, only the Colonel stated the wires looked like telephone wires. There had been no neglect proven on the part of the defendants, and he was bound, therefore, to dismiss the case. He allowed £2 expenses.

EXPERIMENTING ON A MOTOR-TRICYCLE.

At the Derby County Court, before Judge Smyly, David Roberts, electrical engineer, of Derby, sought to recover £27 from Edward Goldstraw for work done to a motor-tricycle. The plaintiff's case was that he did certain work to defendant's motor-tricycle at his request, and carried out various experiments in connection with fixing a free wheel and a Weston clutch to the tricycle and transferring the petrol on to a particular valve. He asserted that Goldstraw, against his advice, would have these things, but the defendant denied this and said he told plaintiff he should be responsible for any experiment he tried. He was willing to pay for the work that he had ordered.—In the end his Honour said he considered the £22s. paid into court was sufficient to satisfy the plaintiff's claim, and gave judgment accordingly.

THE DETENTION OF A MOTOR-CAR.

SOME litigation has arisen out of a hire purchase agreement in regard to a Daimler motor-wagonette, Mr. Ernest W. Hart, of Luton, claiming that Mr. George Senior, of Hull, should deliver up to him the vehicle or its value. He also claimed damages for detention. It appeared that in November, 1900, Mr. Hart owned the car, and sent it to a firm of manufacturers to have it done up. Ultimately, after trials, one of which included a trip up Primrose Hill with seven or eight persons on the car, the defendant entered into the agreement in question. Under that the price was fixed at £265, and defendant paid £125 down, the remainder to be paid by monthly instalments of £11 13s. 4d. Plaintiff's witnesses said the car was sent down to Hull in December in perfect condition, but after about three months the defendant made default in his payments, and as the plaintiff also alleged that he did not keep the wagonette in proper repair, as he undertook to do, plaintiff claimed its return or its value, as he said he was entitled to do under the agreement. For the defence, however, it was said that the car when it arrived was not in good condition, and when started would only go one hundred, or at most one hundred and fifty yards, and then stopped suddenly. In consequence the defendant had had to incur considerable expense to get it in order, and had lost profits which he placed at £7 a week, because it appeared he used the wagonette for the purpose of conveying passengers about Hull. Another suggestion for the defence was that the car sent to the defendant was not the car he agreed to take on hire. The defendant accordingly counter-claimed for the return of the money he had paid, £32 for repairs, and £75 for loss of profits. The jury found for the plaintiff with £35 damages. They also found for the plaintiff on the counter-claim. His Lordship entered judgment for the plaintiff for £265, to be reduced to 1s. on the return of the motor-car, with £35 damages for its detention.

WE notice that one of our cycling contemporaries has discovered a new form of motor-bicycle, Mr. B. Rotherham, of Coventry, having been found "riding a machine fitted with a 2½ engine on the brake." Probably the next advance will be to put the engine in the inner tube of the tire!

THE Forman Motor Manufacturing Company, Day's Lane, Coventry, are now making a four-cylinder throttle-governor engine with enclosed valve gear which is automatically lubricated, and fitted with solid heads to cylinders. Cylinders and heads are cast in one piece. The engine runs at a normal speed of 900 revolutions per minute, and develops 16 h.p.

COMMENTS.

DAIMLER MOTOR BICYCLE (1885)

ON Tuesday evening, Mr. Henniker Heaton asked the Home Secretary whether his attention had been called to the danger of incompetent persons driving motor-cars in this country; and whether he would take steps to issue licences to competent drivers only, on the plan adopted in America. Mr. Grant Lawson, in reply, said this question should have been addressed to the President of the Local Government Board. His right hon. friend had received representations on the subject, but on his present information it did not appear to him that danger from motor-cars arose from want of skill on the part of the drivers. He was afraid there would be much difficulty in giving effect to the suggestion of the hon. member.

Motor-Cars and Manœuvres.

ALTHOUGH motor-cars have had to suffer from the lack of knowledge of military men with regard to their utility in warfare, their value in manœuvring at home is being amply demonstrated. On Sunday the South London Volunteer Brigade, consisting of nine battalions, held a tactical night march around Wimbledon. Some of the commanding officers walked, but others covered the ground in motor-cars. The Brigadier, Colonel Fludyer, of the Scots Guards, travelled by automobile, making a thorough inspection of the various outposts. So far as we can hear, all were well satisfied with the behaviour of the various cars engaged in connection with the march.

Activity at Lincoln.

AUTOMOBILISM has many good friends in Lincolnshire, and the Automobile Club of that county is evidently prepared to do all that is possible for the furtherance of social intercourse and automobile knowledge amongst its members. The annual dinner is to be held at Lincoln on the 22nd inst., and invitations will be extended to the Nottingham and Yorkshire Clubs, as well as to members of the A.C.G.B.I. To-day (Saturday) Captain J. A. Cole will give a lecture on "Ignition" at the Club headquarters, the Saracen's Head Hotel, Lincoln.

Lawyers and Automobiles.

THE dreariness of the law courts is often relieved by judicial attempts at humour, and our judges evidently regard the motor-car as a fit subject for merriment. There was an amusing case before Mr. Justice Bigham the other day, when a coal-dealer and wagonette proprietor confessed to a desire to make £7 a week profit out of a motor-car which "he had run on one wheel." The driver of the car said the vehicle jibbed every hundred yards, and to get it to start again he "had to knock a lot of wind into her." The particular car in question was said to have been kept in an open shed, and formed a roosting-place for hens—a foul use, indeed. In opening the defence, Mr. Witt, K.C., said there was some consolation in this case, so far as members

of his profession were concerned. He had feared that motor-cars would oust the horse from his long and honourable career, and that there would, in consequence, be less litigation. After what he had heard about automobiles, there was a magnificent prospect of many law suits in the future. If such is the case, we would advise lawyers to become motorists—if only to realise that there is a serious side to the subject.

The Carriage of Goods by Motor Vehicles

CONSIDERABLE interest is being taken throughout the North of England in the Road Carrying Company, Limited, the main lines of which have already been described in the *Journal*. We now learn that Mr. Ernest A. Rosenheim, B.Sc., A.I.E.E., has been appointed engineer to the company—an appointment upon which both may be congratulated. Mr. Rosenheim took his engineering degree with Professor Hele-Shaw, F.R.S., and served a pupilage with Crompton's, Limited. Latterly he has been with the General Electric Company, Limited, from which concern he has resigned in order to take up a position with the Road Carrying Company, Limited. Mr. Rosenheim was assistant hon. sec. to Mr. Shrapnell Smith at the 1901 Liverpool trials, and will be active in connection with the forthcoming exhibition at the Agricultural Hall. In this connection we may add that the resignation of Mr. Shrapnell Smith from the hon. secretaryship of the Liverpool Self-Propelled Traffic Association will take effect as from April next, when a meeting will be held and plans for the future of the Association decided upon.

The Calculus of Probability.

IT speaks well for the capacity of modern actuarial methods that insurance is to be obtained not only against accidents and claims for damages from car-owners, but against legal expenses for speed prosecutions. The chances of occupying the martyr's dock offer an interesting, if painful, subject of calculation, which would, we should imagine, have puzzled Laplace, whose reported last words, "*L'homme ne poursuit que des chimères*" now need a corrigendum. For *homme* read *gendarme*. The factors include the size and noisiness of the car quite as much as its speed, while important variables are the driver (by no means directly as *his* speed proclivities), and, largest of all the county. It is odd how the vagaries of ill-luck in this direction pursue some men rather than others, apart from any obvious reasons. The one thing omitted specifically from the insurance (in one prospectus sent to us) is the amount of the fine. This is presumably supposed to depend on the magistrates' digestions, and to be, therefore, incalculable.

The Bicycle Boom.

THE unwisdom of prophecy is being very much illustrated by the distinct signs that, in spite of all that has been said against it, the motor-bicycle has "come to stay." The objections to it are, as experience has proved, largely imaginary, and, for the rest, are more than counterbalanced by its convenience and cheapness; while among the marvellous variety of designs that are now available some at least are sufficiently near

perfection for practical purposes. The amount of interest shown in them by the hitherto non-motoring section of the public, as vouched for by cycle and motor agents in all parts of the kingdom, show that this is becoming generally appreciated. The value of motor-cycles has hitherto been largely educational, the man who had one seldom being content till he got a car; but it is not at all unlikely now that a good proportion of the devotees of four wheels will not be satisfied without including a two-wheeler in their stud.

As regards the Ladies.

It cannot be said that the lady's machine lends itself to a motor gracefully, but then, even in its non-motor state, it is at best a somewhat unmechanical concession to fashion, in which the admirable design of the diamond frame has to be sacrificed.

The motor-tricycle would be more easily adapted for ladies' use, but for some reason the attempts to create a demand for a lady's machine of this kind seem to have fallen flat so far. It must not be forgotten, however, that nearly seven years elapsed after the introduction of the ordinary lady's bicycle before it attained a wide popularity, and the rate of progress is, as a rule, much greater than the rate of public acceptance of it. That ladies are becoming interested in the subject is generally recognised, and the article by Miss Kennard in this week's issue shows that that keen motorist recognises the advantages that are associated with the two-wheeled machine.

Mr. W. J. Peall's Car.

COMMENCING his automobile career on a 6-h.p. Daimler, Mr. W. J. Peall has advanced a stage and is now the owner of a 12-h.p. car, upon which he has already run nearly a thousand miles. The new vehicle is so arranged that it is not necessary to have

the usual assortment of petrol tins, oil cans, dirty rags, etc., sur-

MR. W. J. PEALL ON HIS 12 H.P. DAIMLER.

rounding the driver's feet, while the body is of a comfortable tonneau type, with accommodation for three passengers on the rear seats. The underworks and the wheels of the car are painted primrose and lined with black, the body being painted dark green. All the fittings are of rolled silver, giving the automobile a remarkably fine appearance. Wherever the car goes it will be a credit to the British industry, for Mr. Peall has his motor-vehicles kept in as smart a condition as any fashionable horse-drawn carriage. In fact, instead of employing a mechanic, he engaged a coachman whose earlier training has well fitted him for the work of sending the car out in the smartest possible fashion. Doubtless other owners of automobiles may be inclined to take the "cue" from Mr. Peall.

Some Grievances.

MOTORISTS have always regretted the fact that so many drivers of horse-drawn vehicles leave their animals unattended when delivering goods, seeking refreshment, etc. These unattended horses are always a source of trouble, not only so far as automobilists are concerned, but also with regard to owners of traction engines, and tram-car drivers and others; for the absence of anyone to watch any sudden change of disposition may lead to accident and is, moreover, contrary to the law. Akin to this matter is the regulation of traffic in the London streets. It is gratifying to know that these matters are being submitted to the Home Secretary and to the Commissioner of Police, with a view to action being taken to minimise the dangers and difficulties now attaching to both inconveniences of the road.

Good Business.

UNDER the authority of the Automobile Club the statement has gone forth that at least a thousand automobiles will be sold in London alone during the present year—a very modest estimate indeed. There is no doubt that the present activity of the motor-car industry will receive a great impetus from the forthcoming exhibition at the Agricultural Hall, and that the motor-car business is now rapidly advancing to a season of prosperity. This is particularly gratifying to those who pioneered the automobile in the days when the public were ill-favoured towards it and the prejudice of rustic people and those of narrow ideas was keener than it is in the present year of grace.

Exeter.

COMMERCIAL men throughout the country are watching developments in the automobile industry, and several local Chambers of Commerce are considering the suitability of their towns for the location of motor-car works. The Exeter Chamber of Commerce, which takes an active interest in the welfare of the city, has decided to have a special meeting to consider the prospects of success for the automobile industry there—should such be established—and to invite the Traction Committee of the City Council to be present.

Motor-Car Imports.

THE official list of imports published in another column will be regarded with interest. They show that the imports from France alone during the first month of 1902 were nearly equal to the whole of our imports in the last month of 1901, more than sixty cars having been sent here *via* Boulogne and Dieppe. On the other hand, the receipts from Belgium were scarcely half the value of the imports in December, and the most conspicuous feature of the Belgian exports to England was the presence of about a dozen motor-cycles in the returns. The value of the German shipments showed a slight increase, while an export of nine cars has quintupled the Dutch exports to Great Britain. A slight falling-off is reported from the United States, but looking at the total figures they show a larger import than in either of the last two months of the year. In our issue of the 15th ult. we published the Board of Trade figures, which recorded an importation valued at £43,000—the difference is probably due to the inclusion of some "motor-trucks" for tramcar work in the latter figures.

Motor-Buses for London

As announced last week the London Road Car Company has decided to make a series of practical experiments with a view to the adoption, if popular and economical, of mechanical traction. We are now able to give an illustration, on page 929, of the coke-fired steam omnibus made for the company by the Thornycroft Steam Wagon Company. This vehicle, which seats

thirty-six people, has been approved by the authorities at Scotland Yard, and is intended to ply in regular service between Hammer-smith Broadway and Oxford Circus. The mechanism is of the Thornycroft patent chainless type, but the road wheels are of rather larger diameter than the firm usually fit to their steam lorries. The carrying body is bedded on rubber, and there are special provisions to reduce noise and vibration, while powerful brakes and reversing gear give the driver absolute control of the vehicle. The new omnibus is capable of an easy eight miles an hour, at which pace it will be able to overtake all the ordinary horse-drawn omnibuses on the road.

A Wall from Reading.

REALLY the local authorities about Reading will have to look after the dogs of the town. From a letter by Mr. F. G. Rowcroft to one of the Reading journals it would appear that the people there have a most canine fancy. "On Sunday last," writes Mr. Rowcroft, "a party of us, with five dogs, were walking on the Oxford Road, and down the hill between Purley Post Office and Purley Hall a motor-car containing two men and one person in female dress appeared and dashed past us through the midst of our dogs like an express train. It was going as near forty miles an hour as a motor-car can go. One dog we gave up as lost, and it escaped by a hair's breadth." This is a sad case; but the escape of one dog by a hair's breadth is splendid testimony to the cleverness of the motor-car driver or the cuteness of the dog. It must have been an interesting scene, for "in my futile rage," says Mr. Rowcroft, "I so far forgot myself as to shake my fist at the man in the back seat. Good-bye to pleasant peaceful country walks, rides, and drives, with these infernal machines monopolising the even most countrified roads. But for the sake of one's life and limbs there ought to be police on bicycles, or mounted men, to patrol certain roads, particularly the Bath and Oxford roads." Why be satisfied with police on bicycles or horses? The better way would be to mount the police on motor-cars and let them arrest all dogs wandering on the roadway. They might also have power to warn persons shaking their fists at other people.

Horses in Paris.

AT a time when the London omnibus companies are experimenting with mechanical traction, some figures just published in Paris have considerable interest. There are 90,796 horses still employed for various purposes in the French capital, but the number of steeds available for requisition in the case of mobilisation by the Ministry of War is 5,900 less than was shown in the corresponding figures of last year. The omnibus company had nearly 2,000 more horses in its stables a twelvemonth ago than it has now. The chief hackney-carriage owner has reduced his stud of animals by 750, and the remainder of the diminution is mostly accounted for by private persons having discarded horse-drawn vehicles for motor-cars. In superseding cab and omnibus horses by mechanical traction a great humane work is being done in Paris.

What might have been.

THERE were all the elements of a tragedy, without the sad conclusion, in an incident which occurred in a London thoroughfare the other day. A small girl of about ten years of age was wheeling a perambulator along the roadway when a motor-car came speeding along. Losing her head the girl rushed to the pavement for safety, leaving the perambulator in the middle of the road. A young mechanic who attempted to drag the baby carriage out of danger was just too late, for it was overturned and partially revealed a small white bundle—which all present thought was a baby. This was hauled out. When the excitement had subsided it was discovered that the bundle was—"washing"!

Automobiles and Railways.

LAST week we referred to some interesting developments in connection with motor-vehicles which were being undertaken under the auspices of some Irish and English railway companies. Already Belgian and Italian railway companies have adopted the automobile for service in conjunction with main lines, where it is often difficult to secure convenient secondary trains, and on branch lines where passengers are few. In view of the motor-omnibus experiments now being carried on in London, railway managers are showing increased interest in the automobile movement, and some practical developments are likely to take place before the end of the year.

A Kentish Enterprise.

UNDER the presidency of Dr. Oldfield, the statutory meeting of the Bromley Autocar Company, Limited, has been held, when it was said that the company had five sources of profit—viz., (1) the service of 'buses, (2) the hiring of motor-cars by private residents of Bromley, (3) the sale and exchange of vehicles, (4) repairs of all sorts to motor-cars and motor-cycles, and (5) advertisements in 'buses. The Chairman spoke at some length on the prospects of motor-omnibuses which would run rigidly to time and thus prove admirable feeders to the railway companies. He hoped, too, that the enterprise would be able to find well-paid employment for a number of local lads who were more fitted for mechanical than for office work. Mr. W. Prebble, Mr. Kenyon, and Mr. Draper also spoke, being unanimously of opinion that automobilism would have a good effect on Bromley and the surrounding district.

OSMONT ON HIS RECORD-BREAKING DE DION TRICYCLE.

Axles for Motor-Cars.

A BROKEN axle is capable of such serious results to life and limb that too much stress cannot be placed upon the question of its stability, and it is unfortunate that the design of a front or rear axle is as yet impracticable upon mathematical lines, but must be the result of expensive and even dangerous experimentation. The stress imposed upon these members of a motor-car are so complicated and so nearly incalculable that theory can offer little assistance to the designer with the data at hand, and, further, the qualities of the material employed are far from being perfectly understood. Like most parts of a motor-car, remarks Mr. A. L. Clough in the *Horseless Age*, the axles are generally proportioned empirically as the results of experiments. The great basic difficulty which prevents the actual design of all the structural parts of automobiles is the utter impossibility of predicting the stresses which may be expected to arise from imperfections in the road surface. This is the only difficulty in axle design. When one knows what are the maximum stresses arising

from this source no further difficulty is apparent, although the problem is rather a complicated one. If a vehicle were fitted up with carefully calibrated springs and means were provided to automatically record the extent of the maximum deflection of the vehicle springs due to running at full speed over rough roads, quite a good idea of the axle stresses due to road irregularities for a particular type of carriage could be obtained, which might lead to intelligent proportioning. Much is said about the failure of axles through crystallization, but no such phenomenon seems possible when resilient tires are used, indeed its occurrence at all is scouted by the best authorities. What really happens in the case of an axle which breaks after considerable use, is that it fails through the fatigue due to repeated application of what would be a safe stress if applied as a quiet load. Fortunately, a working formula which may yet be turned to account is at hand for taking into account the effect of repeated stresses.

Electrical Vehicles.

THIS was the subject of the chapter for the Badminton Book on Motoring which was read at the Automobile Club on Wednesday evening by the Editor of the *Automotor*. The paper was a very extensive one and attracted a notable gathering of electromobile experts. Mr. Jas. Swinburne occupied the chair, and among those who joined in the discussion were Messrs. Oppermann, Joel, Northey, Leitner, and Chambers. Dr. Lyon Playfair asked some very pointed questions with regard to the actual cost of electrical vehicles in practical use, and mentioned that, as a result of his inquiries, he found that the annual cost of an electric landau was at present fully £100 a year more than that of a carriage and pair.

"TRAILING CARS FOR CYCLISTS" is the title of a booklet explanatory of the "Royal Eagle" trailing car, which has been brought out by the New Coventry Eagle Cycle Company, Limited.

THE Empress Eugenie is one of the latest converts to automobilism, she having, according to report, placed an order for a 12 h.p. vehicle.

AN electrical omnibus, similar to those which have been in use for some time in Berlin, will be seen on the London streets shortly. This will hold twenty-six passengers, and Messrs. Zadig & Co., who are introducing the vehicle, are sanguine as to its efficient running when tried on the route from Hammersmith to the Caledonian Road.

IN the pouring rain, and on a road lying several inches in mud, Osmont, the well-known motor-tricyclist, has just established a record for the machine ridden by him. He covered 100 kilometres (sixty-two miles) in 1 hour 16 minutes and 55 seconds. The last thirty-one miles were done in thirty-six minutes.

WHILE driving from her house in Tedworth Square, W., to the Imperial Theatre, in her electric motor brougham, on Tuesday, Mrs. Langtry met with an alarming accident, owing to one of the wheels suddenly collapsing. The driver kept his seat and righted the automobile. Although considerably shaken, Mrs. Langtry was fortunate enough to escape serious injury.

THE East Riding Cycle and Motor Company, of Grosvenor Street, Hull, have just brought out a new light car fitted with a 9-h.p. Aster motor under a bonnet in the forepart of a tubular frame. Three speeds forward and reverse motion are provided, the power being transmitted to the gear-box through the medium of a friction clutch, and from the differential cross-shaft to the rear road wheels by a duplicate set of chain and chain wheels.

A NEW undertaking at Coventry is the Maudsley Motor Company, who a few months ago secured a large portion of the old Beeston cycle factory. The plant and machinery is being laid down under the supervision of Mr. A. Craig, the consulting engineer to the company. At first attention is to be devoted to the construction of high-powered pleasure cars. A department for the repair of all types of cars is also being established.

MOTOR-BICYCLES FOR LADIES.

I DARESAY that a good many ladies are anxious, like myself, to purchase a motor-bicycle which can be ridden in an ordinary cycling skirt. Already, makers of these handy little machines are bestirring themselves on our behalf, and we owe them a debt of thanks for their energy and enterprise. But in their gallant endeavours to shield the feminine dress from oil and grease, they are in danger of losing sight of a most essential item—namely, accessibility. Safety and cleanliness are admirable things, but their value ceases from the moment they are not coupled with "getatability." Last week I closely inspected the Phoenix, Excelsior, and Ivel lady's machines.

The Phoenix was a finely-constructed, and, in the main, a well-designed machine, but in several important particulars it failed to realise the ideals of the practical female rider. The exhaust-pipe was placed so close to the exhaust-valve that to remove the cotter-pin and spring was almost impossible, quite apart from the difficulty of doing so without burning the fingers. The tread was too narrow to permit of sufficient clearance, and instead of a proper gear-case, a celluloid chain-case was fitted, which effectually prevented the owner from cleaning the chain, whilst admitting dust and dirt in any quantity from the inside. The exhaust-valve lifter was placed too far away from the hand, and it struck me as questionable whether it were an advantage dispensing with the switch. I make these criticisms with all deference, and fully recognising the general excellence of the machine. As for the Excelsior, it had a specially-built frame of clumsy design, and its lines were not pleasing to the eye. The engine and belt were completely encased by an extremely ingenious birdcage arrangement, and were doubtless calculated to afford satisfaction to a person supremely indifferent to the condition of her engine. It was veiled in mystery—I mean wire—and made one shudder when one contemplated roadside repairs. Let us hope the Excelsior does not require them from feminine riders. Few ladies are mechanics, or, indeed, possess the smallest mechanical knowledge. The use of the spanner is a terrible puzzle to the majority. Everything must be easily got at. That is the first problem requiring solution. It is hard on a woman for valves to be placed in such a position that she has no possible chance of removing them in case of any mishap arising. neither should she run the risk of burning her fingers against an exhaust-pipe.

What we want is this: an engine, preferably hung in a vertical position, when any oil exuding from the crank-case will fall upon the ground. It should be freed at will through traffic, so as to permit of ordinary pedalling when desired. Simplicity and accessibility of all parts; a detachable dress-guard, not hooked to the mud-guards, but capable of being undone by a thumb-screw or butterfly nut; a belt protector that will readily unhinge; plenty of clearance, even if it be obtained at some sacrifice of appearance, for many of us take pride in grooming our own machines, or else are forced to tend them through circumstances. In any case, plenty of room is wanted, as also are wide mud-guards, firmly attached so as not to rattle, and placed a couple of inches from the tires; puncture-proof inner tubes; all levers and brake handles within reach of the hand; a duplex petrol-tank, sufficient for a run of over a hundred miles; a visible feed-lubricator, and space behind the saddle to carry a luggage carrier. These are just a few of the points likely to appeal to the practical lady rider.

I was pleased to find the majority of them embodied in Mr. Dan Albone's Ivel motor-bicycle. That gentleman has evidently grasped our requirements more clearly and comprehensively than most of his competitors.

MARY E. KENNARD.

AN International Exhibition of Sports is to be held in St. Petersburg, from the 1st May to 1st July next. The first section is devoted to automobiles and motor accessories. It is hoped that English firms will take part in the exhibition with the view of giving an impetus to the automobile movement in Russia.

The Chatel-Jeannin Petrol Car.

FIG. 1.—GENERAL VIEW OF TWO-SEATED CAR.

WE are enabled this week to give an illustration and a brief description of a new petrol car which has lately been introduced into this country, and which appears to comprise several novel features. The manufacturers, La Compagnie de Construction d'Automobiles Chatel-Jeannin, Mulhouse, Alsace, have for some years been experimenting with the object of bringing out a motor-car with such a simple and effective mechanism that the average man, having no knowledge of mechanics, may readily understand it. This they now claim to have done, and English motorists will have the opportunity of seeing at the Agricultural Hall next month, three or four cars of the new type, petrol or alcohol driven, with *tonneau*, phaeton, and two-seated bodies. Two different powered cars

driver's seat, so it is not necessary to stop in order to oil up. One feature especially is unique, i.e., the sparking or electric ignition, which works in oil. The bore of the cylinder is 105 mm. and the stroke 108 mm., the maximum speed of the engine being 1,500 revolutions per minute.

The 12 h.p. car is built on the same lines as the 6½ h.p., with the difference that the engine is double cylindered, and is located under the centre of the car, the power being transmitted to the back axle by means of two special chains. Any speed from one mile up to fifty miles per hour can, it is claimed, be attained, and on the low gear any hill may be mounted. There are three speeds and reverse, all of which are manipulated by one lever. The change gear is worked on the friction clutch principle.

FIG. 2.

are principally being made—6½ h.p. single cylinder and 12 h.p. double cylinder. The sketch (Fig. 2) shows the whole mechanism of the 6½ h.p. vehicle. The motor is fixed on the back axle, the crank shaft being enclosed in an aluminium case, the top of which may be removed in less than a minute, so exposing the entire engine and working parts. It is also possible to detach any wheel or part of the motor without disturbing the remainder. The lubrication is worked automatically by a pump from the

FIG. 3.

Among the advantages claimed by the makers for the new car are: firstly, there is no vibration whatever, even when the motor is running full speed, and car stationary; secondly, there is no trouble with sparking, as this works in oil. Arrangements are in hand for the introduction of the new car on the English market. In the meantime, anyone requiring further particulars would do well to communicate with Mr. Sydney S. Dixon, Gale House, Bradford, who has a car which may be seen by appointment. — L.

THE CENTURY 1902 TANDEM VOITURETTE.

THE Century tandem voiturette, which is already well known to our readers, has undergone a number of modifications since its first introduction, and in its latest form is capable not only of attaining high speeds on ordinary roads, but is possessed of exceptional hill-climbing qualities. The Century Engineering and Motor Company, Limited, inform us that for the 1902 season they will fit Aster engines only, either 4 h.p., 5 h.p., 6½ h.p., not governed, or 6½ h.p. governed, to order, with gearing in proportion to the engine power.

The water-circulating pump, which is of the company's own construction, is stronger and larger, and is now driven direct off the engine by chain gearing, instead of by a strap from the countershaft. The latter, although the same in principle, has been considerably strengthened in its dimensions throughout; while, in view of the extra horse power which can now be provided, the strength of the high gear chain has been practically doubled in order to have an ample margin of strength, the chains used being the Renold silent solid block chains.

The brakes have been improved, and are now more powerful than ever. The front seat springs have been altered somewhat in the angle, so as to render the seat more comfortable; while the back seat springs are more flexible than hitherto, and in addition the back seat itself is upholstered with good springs, so

that the driver may be said to be almost equally as well off in point of view of comfort as the front passenger.

There are many other small improvements in the way of finish and detail in the 1902 car, which add considerably to the efficiency of the vehicle, the makers themselves considering it from 20 to 25 per cent. better than the 1901 pattern.

A LECTURE on "Cycling in the Alps" will be given by Mr. Rees Jeffreys at the Samuel Morley Memorial College, Waterloo Road, S.E., on this (Saturday, March 1st) evening.

THE 6-h.p. Daimler car, on which the Lord Justice Clerk for Scotland journeyed in the 1,000-miles trial, has travelled 43,000 miles since it left the factory, and is still fitted with the original gear wheels and motor.

MR. ERNEST M. C. INSTONE has resigned his position with the Motor Manufacturing Company, Limited, and is now entering the service of the Daimler Company as manager. Mr. Instone went to Paris about three years ago, and stayed for a considerable time in the French capital acquiring a first-hand acquaintance with the most modern developments of French automobilism. As Paris correspondent of this journal he kept our readers well informed as to the progress of events. In his new capacity he will doubtless be able to add to the credit of the British automobile industry.

CONTINENTAL NOTES.

By "AUTOMAN."

YEAR after year it has been prophesied in France that a slump in motor-cars was coming, and year after year events have exposed the false prophets. The boom still exists, and the really up-to-date makers have their year's production sold ahead. Large numbers of these cars have, of course, been sold to English agents, but there is now a new *debouche* for the ever expanding French trade, and one likely to take a lot of filling. I allude to the American market, which has suddenly developed a demand for French petrol automobiles. The serious demand began last autumn, when several French agents, including Charron, commenced operations on a large scale across the Atlantic. Charley, the French agent of the Mercedes, followed suit, and sold in an incredibly short space of time £20,000 worth of cars, and brought home orders for nearly twice that amount. Every Atlantic steamer from Cherbourg or Havre is now transporting French cars and Frenchmen with vehicles to sell or contracts to place. Clement is now on his way to the United States, and amongst the passengers on the "Savoie" on Saturday last from Havre was Mr. Ernest Cuenod, the vice-president of the Swiss Auto Club and a very prominent member of the A.G.F. M. Cuenod, though of a Swiss family, is, I think, a Frenchman by nationality and certainly by adoption. He is now visiting America with the intention of forming a large automobile undertaking on French lines. Amongst other contracts he has one in hand for the manufacturing rights of the new light cars made by the Société des Établissements Georges Richard. Over two hundred of these cars are, it is said, the subject of an American contract, and I understand that the whole output of the works for the season has been sold ahead. Mors' late manager, Brasier, is now superintending the works of Georges Richard, and building, in addition to the 10 and 20 h.p. light cars, a racing car which is to compete in the Paris-Vienna contest.

THE Nice week and the Nice-Abbazia race, forming, as they do, the practical opening of the racing season so far as automobiles are concerned, deserve a little special attention. In the first place there are two distinct "caravans," which will leave Paris towards the end of March with the "littoral" as their destination, and timed to arrive during the first week in April. One of these "caravans" is the "heavy weights" organised by *La France Automobile*, and includes omnibuses, lorries, and delivery wagons; and the other, organised by the *Auto-Velo*, comprises carriages of all sorts and descriptions. The Nice races include the Turbie hill-climbing competition, the mile race on the level, and the Nice-Abbazia-Nice race. It is well to be noted that no car will be available for classification or prizes which has not completed by its own mechanical means the whole course of each competition.

AT the time of the Paris Automobile Exhibition I gave a short explanation of the term "limousine" in connection with car bodies. It may be useful to give the various names for the different kinds of bodies now employed. Everyone by this time knows the phaeton and the tonneau, and the limousine is more or less a tonneau with a covered-in back seat and a roof extending over the driver's seat. There is, of course, the double phaeton, which has two seats parallel facing the wind, and in which the back seat is reached either by steps between the wheels or by a lifting or hinged front seat. There is, however, now the phaeton tonneau, which differs from the ordinary tonneau in that the back seat is reached through the lifting or hinging of the front seat, but the sides of the back part are high and arranged as a tonneau. There is also the berline, which is a limousine with the back part rounded and with no door at the back. This car generally carries four or more passengers in the back part in addition to those on the front seat. It is a very roomy covered body and good for a family travelling car.

I saw one at Rothschild's the other day being fitted for the Duke of Marlborough on a Mors 15 h.p. frame.

LAST week I gave the readers of the *Journal* an abstract of the rules for the tourist section of the Paris-Vienna motor-car race. The rules for the racing section include the following points. There are to be five classes of vehicles, viz. (1) bicycles weighing less than 50 kilos.; (2) motor-cycles weighing less than 250 kilos.; (3) voitures between 250 and 400 kilos.; (4) light cars between 400 and 650 kilos.; (5) heavy cars between 650 and 1,000 kilos. The last two classes must carry two passengers side by side, and one of them must be a member of the A.C.F. or of an affiliated club. The cars will be weighed empty, that is without passengers, petrol, oil, water, accumulators, tools, or luggage. On the first day the cars will start in the order of entry with an interval of two minutes between each.

fourth class, 300 francs; fifth class, 400 francs. After the end of April the entrance fees will be doubled, and the last day for entrance will be June 15, at 6 p.m.

MESSRS. ROWLAND HILL, King Street, Coventry, have recently extended the size of one of their foundries by taking in a portion of the open yard.

SOME interest has lately been aroused in Belfast by the presence of a motor-lorry on the premises of the Northern Motor Company in Montgomery Street. The vehicle is one of the productions of the Lancashire Steam Motor Company.

ON returning to London from Burton-on-Trent the King journeyed from Euston to Marlborough House in a closed carriage. Some members of the party, including Lord Westbury and Mr. and Mrs. George Keppel, left Euston in motor-cars.

LONDON'S NEW MOTOR OMNIBUS. (See page 924).

The following days they will start in their order of arrival on the preceding day. On the last day they will start in the order of a provisional classification, so that as nearly as possible the car arriving first at Vienna will be the real winner of the contest. On arrival at the "parc" or enclosure at the end of a day's run the cars must be left at once and nothing whatever done to them save stopping the engine, turning off the petrol and flooding the cylinders. No refilling, renewing, or repairs of any kind can be done inside the "parc," but the car must remain there until the time for starting in the morning, and must then be driven outside, where all refilling, etc., must take place, for which no allowance of time is made. Should it be found impossible for any reason to drive a car out of the "parc" it must be pushed out by hand. The entrance fees are as follows:—First class, 50 francs; second class, 100 francs; third class, 200 francs;

THE Holborn motor-tire will, in future, be manufactured by the St. Helen's Cable and Rubber Company, Limited, of Warrington, St. Helen's and London. A new company is about to be registered and larger premises taken to cope with the demands for this tire.

THE Club Garage which has been established opposite the Art Gallery in Edmund Street, Birmingham, for the storage, cleaning and repairing of motor-cars, cycles, is now open. An electrical plant has been installed with facilities for charging the accumulators of cars.

MR. G. CALVERT, 12, Woodville Road, Mildmay Road, N., and 8, Kingsland Passage, Dalston, N.E., has issued his 1902 list of bicycle motor parts, etc. The list has some interesting notes on motor-cycle fittings, and will be found serviceable to all interested in motor-bicycles.

THE McCURD PORTABLE SUPPORT FOR MOTOR-BICYCLES.

It is always well, when starting out for a ride on one's motor-bicycle, to give the engine a preliminary trial to see that all is in proper order. To do this, without necessitating mounting the machine and pedalling it on the road, some sort of convenient stand must be used. The motor, too, may from one cause or another occasionally have a "fit of the sulks" when out travelling, to discover the cause of which would be greatly facilitated if some means of jacking up the rear wheel and holding the machine firmly in an upright position were at hand. Mr. W. A. McCurd, of 21, Clapton Square, London, N.E., whose ingenious portable stand for motor-tricycles we illustrated some time ago, has now introduced a somewhat similar arrangement for motor-bicycles, which seems to meet all requirements. From the accompanying illustration, which shows the support in and out of use, it will be seen that to the bottom stays near the rear axle, on either side, duplicate pairs of telescopic tubes are permanently and rigidly

THE McCURD PORTABLE SUPPORT FOR MOTOR-BICYCLES.

attached. Within the two tubes nearest to the wheels are inner tubes held in position by a catch or bolt; when the support is required for use the catch is withdrawn and the inner tube by means of a spring is forced out to the ground. The machine is then slightly raised, when the inner tube extends a little further, and the bolt catches in place, supporting the rear wheel clear of the ground. To give ample base so that the machine can be held up in position, the outer tubular supports of each pair are brought into use. These are suitably attached to the inside supports by connecting links, so that when not in use they are held firmly in position parallel to them, and when required to support the machine can be rapidly extended as illustrated. The supports weigh only about $3\frac{1}{2}$ lbs. per pair, so that they are not a cumbersome addition to the machine. They can be quickly brought into use, and when extended the machine is supported from five points, i.e., the front wheel and the four tubes, the width between the extreme outer ones of the latter being 16 ins. So firm is the arrangement that the machine can be jacked up to permit the rider mounting and trying the motor at any time by pedalling.

FLOTSAM AND JETSAM.

BY FLANEUR.

ALMOST is it easier to drive a camel through a needle's eye than to induce the average daily paper journalist to write sensibly on automobile topics. The pity of it is that the prejudices of the unthinking are thereby confirmed. No harm is done in cases where a man has begun to reflect seriously upon the advantages of automobilism; he resolves to inquire into the facts, and, once he is on the right tack, the facts will soon speak for themselves. But the essence of prejudice is a refusal to consider facts, conclusions being formed from false premises, or, oftener than not, no premises at all, but mere fantastic insubstantialities. The responsibility of an editorial writer on any leading organ is therefore great indeed, for its readers, for the most part, have votes, and the occasion may conceivably arise, in the near future, when a large mass of uninstructed opinion will be thrown in the scale against the actual knowledge of the automobile user, who may be overborne by sheer weight of numbers.

A TYPICAL example of editorial misdirection is that of the *Daily News* in commenting on Mr. Henniker Heaton's proposal to license the drivers of motor-cars. So far as that suggestion is concerned, I am not proposing to discuss it here; there are plenty of automobilists in favour of such a scheme, which has even been promulgated by the Automobile Club itself. What it is that calls for comment is the airy inconclusiveness of the *Daily News'* arguments and the consummate worthlessness of its "facts."

TAKE, for example, this statement, which is virtually the foundation of the editorial superstructure:—"The tale of motor-accidents and of prosecutions for dangerous speed is already long enough to warrant some such action by the Home Secretary." Parenthetically, I may remark that the Home Secretary has no jurisdiction in the matter, but that is a detail—a detail, however, which illustrates the characteristic slipshodness of the editorial methods. As regards the "tale of motor accidents," however, I can only flatly deny that it is in any sense a lengthy one, and I have followed the happenings in the automobile world since its earliest days. If there is one thing more surprising than another about the history of the movement it is the comparative immunity from catastrophe which it has displayed, despite the considerable element of experimentalism that has necessarily been part and parcel of its progress.

So far as the public are concerned, the number of victims of unskillfulness or mischance can be counted on one hand, while the ranks of automobilists themselves have by no means been decimated. Not a single pioneer automobilist in this country has been immolated on the altar of his devotion to the cause, and I can only recall two cases of injury, one of which happened during a trial journey on an experimental car, and the other to a French racing vehicle, the user of which, of course, drove at his own risk on English roads. The well-known Harrow Hill fatality, of several years ago, and two other cases on Edge Hill, were individual instances of imprudence on the part of professional drivers, and can scarcely be regarded as typical of the usual behaviour of the average automobilist. On the other hand, accidents with horses are of everyday occurrence, and so commonplace as to escape tabulation in this country. In France another tale could be told, and if the *Daily News* would obtain and ponder over the monthly figures of *Le Velo*, which show the horse to be responsible for about eighty deaths per month in that country, the Bouverie Street organ might be induced to amend its views.

It is not more fortunate in its reference to magisterial proceedings. "Prosecutions for dangerous speed" are almost unknown; automobilists could wish that the charge was more often made. The prosecutions that do take place are for technical

infractions of the twelve-miles limit, a very different thing from furious driving. It is not once in twenty times that any attempt is made to prove furious driving to the danger of the public; the police know better. They also know, what the *Daily News* presumably does not, that a conviction for furious driving is not only much harder to obtain, but brings into the court coffers a maximum penalty of only forty shillings, while with the aid of a Waterbury, or even without, a policeman has simply to "prove" an automobilist to have been driving at 12½ miles an hour, and he may be fined £10 by a vindictive and possibly horse-breeding Bench. This is no hypothesis, but a hard fact which may be commended to the most serious attention of the journal named.

THE discussion on motor-bicycles at the Automobile Club the other evening can hardly be described as satisfactory, for the good and sufficient reason that the experience of the majority of those present was either limited or a minus quantity. Personally, I was profoundly sorry that the Chairman, Mr. Vernon Boys, had not found time, as yet, to make practical investigations into the subject, for if there is any man alive whose opinions thereon would be worth listening to it is the erstwhile professor. As it was, he could only bring his profound analytical capacity to bear upon certain theoretical aspects of the problem of how to build a motor-bicycle, at the same time being the first to admit that his remarks were more academical than otherwise.

FOR the rest, it was equally unfortunate that the only person present who had made trial of almost every type of motor-safety on the market was unable to carry conviction to his hearers, the value of his personal experiences being discounted again and again by the immoderation of his rhetoric. Whatever was undesirable, according to Mr. Pennell's experience, was hopelessly bad, and what was good was the finest thing in the world. He spoke of "millions" when he meant hundreds, and destroyed at almost every point the effectiveness of what, with more sedateness of diction, would have been valid argument. There was special cause for regretting this in connection with his plea for a more powerful motor than the 1½ h.p. to 2 h.p., which, in the majority of cases, is fitted to a motor-safety.

Now herein Mr. Pennell spoke as a tourist of unusually extensive experience, and I, as an old tourist myself, was just as much in favour of his views as I was perturbed by the mode of their expression. Nine-tenths of the people who have produced road vehicles, whether bicycles, motor-cycles, or even cars, until the period of the 1,000-miles Trial, have had but the most rudimentary idea of what touring really involves, and the same may be said even to-day of people whose sole idea of travelling is a Saturday or Sunday run on one type of vehicle or another. Touring conditions are as different from week-end jaunts as chalk from cheese, for in the latter case one may count on a probability of nothing going wrong during a short journey, or of finding a good repairer on the route.

A LONG, genuine touring journey, however, is quite another matter, for the chances are that one may meet with road con-

ditions not only immeasurably more trying as to gradient and surface than anything previously encountered within the radius of a day or two from one's own home, but also one wants to be guaranteed the minimum possibilities of breakdown, lest such may occur at the most inconvenient time. From my own touring experiences by road, extending over ten countries, I can most emphatically endorse the contention that something reliable and powerful alike is imperative when a real tour is embarked upon. As one who has been eastwards by many routes, even as far as Venice, I am bound to say that, where motor-safeties are concerned, I should decline to start on anything less than a 2½-h.p. machine. Its fittings throughout, moreover, would have to be emphatically less flimsy than the average motor-bicycle displays. If one appears insistent in these matters, the manufacturer, at least, has small ground of complaint. The tourist is really paying the highest form of compliment to a machine, whatever it be, when he proposes to put it to the serious purpose of a long journey instead of Saturday flutters on well-known roads.

THE "HORBICK" CAR.

MESSRS. HORSFALL AND BICKHAM, of Pendleton, near

Manchester, have lately introduced the light four-seated car of which a general view is given herewith. The 6 h.p. engine which provides the motive power has been supplied by the Motor Manufacturing Company, but otherwise the makers have mostly fallen back on their own resources. There are three speeds forward and one reverse, the engine, which is located in the fore part of the frame, transmitting its power through a friction-clutch, gear-box, and a universally-jointed shaft to the rear live axle. The *cardan* shaft is made telescopic with the object of obviating undue strain. The change-speed lever is attached to the steering post, on which are also conveniently placed the actuating handles for the

THE "HORBICK" CAR.

sparkling advance, accelerator, and mixture regulator. The car is wheel steered, and there are three band brakes, one on the gear-box shaft, and compensating brakes, acting backwards or forwards, attached to the rear wheels. Michelin tires are fitted to the artillery-type road wheels. The *tonneau* body will seat four, and is upholstered in maroon morocco, the panels being painted royal blue, relieved with a thin red line. The total weight of the car is 10 cwt.

JOHN CHILD MEREDITH, LIMITED, Birmingham, have sent us an illustrated sheet showing a number of specialties they are making for motor-bicycles. Amongst these we notice accumulators, coils, contact breakers, carburettors, sparking plugs, and some special tanks for carrying an extra supply of petrol and lubricating oil. They have also sent us a price list of their motor-cycle parts for the trade, and a sheet of working drawings of parts of bicycle motors of 1½-h.p. and 2-h.p., showing also the arrangement of wiring for the electrical ignition, and a sectional view of the carburettor. This sheet, for which a small charge is made, should be of great use to those small concerns taking up the manufacture of bicycle motors.

THE "CITY AND SUBURBAN" ELECTRICAL VEHICLES.

THOSE who have not had an opportunity of going over the depôt of the City and Suburban Electric Carriage Company, at Denman Street, Piccadilly Circus, London, W., can have no idea of the extent of the building. We ourselves were astonished at its size when we were taken over the establishment the other day. Not only is there ample accommodation for the storage, cleaning, washing, recharging, etc., of customers' cars, but several floors are used as sale and stock rooms, offices, etc. The variety of vehicles from which a choice can

FIG. 1.—THE "CITY AND SUBURBAN" ELECTRIC SURREY.

be made may be gauged from the fact that we inspected no less than ten different types. Space prevents us from referring to all these at length, and while it may be mentioned that the landaulette appears to be the favourite type in the West-end, we have selected for illustration the Surrey phaeton to seat four (Fig. 1), and the hooded victoria (Fig. 2). The under frame of both vehicles is of tubular construction, with special flexible joints to allow for uneven roads. Supported on this at the rear are two small electric motors, one at each side, pinions on the motor shafts gearing with internally-toothed wheels rigidly attached to the rear road wheels. The battery used as a standard consists of 44 E.P.S. accumulators contained in a receptacle formed

2.—THE "CITY AND SUBURBAN" ELECTRIC VICTORIA.

in the rear portion of the body. The distance that can be covered on one charge of the battery ranges from thirty-five to forty miles, according to the character and condition of the roads traversed. In the Surrey phaeton the controller is adapted to give three forward and three reverse speeds, while that of the victoria is arranged to give three speeds ahead and two backward, the maximum speed in each case being twelve miles per hour. Steering is controlled by a tiller, while the driver has both

foot and hand double-acting brakes under his command. The road wheels are of the artillery type shod with solid rubber tires, the company finding these quite satisfactory, having regard to the ample springs introduced between the carriage body and frame.

For the benefit of London users of their cars who are not equipped with battery charging appliances, the City and Suburban Company have arranged for the storage, cleaning, and recharging of cars, at inclusive monthly, quarterly, or yearly rates. The normal time occupied in recharging the accumulators is 4½ hours, but where a spare battery is kept on hand this can be substituted for the discharged one in about five minutes. We have in a previous issue referred to the many well-known personages, ranging from H.M. the Queen downwards, who are using "City and Suburban" electric carriages.

IMPORTS OF MOTOR-CARS, CYCLES, AND PARTS.

BELOW we publish our monthly official list of the imports of motor-cars, motor-cycles, and the parts thereof into the United Kingdom during the month of January, 1902. Compared with the three preceding months, the total imports as officially recorded were as follows:—

January, 1902	£37,988
December, 1901	£25,233.
November, 1901	£34,574.
October, 1901	£45,441.

By SIDNEY H. HOLLANDS.

CHAPTER V.—AERIAL MOTORS.

IT has been remarked—and the remark is a true one within certain limits—that the modified success attendant on the motor-ballooning demonstration in Paris (for the Henri Deutch prize) was “entirely due to the motor-car,” as that “airship” was provided with an engine much lighter for its power than could have been obtained had not automobile engineers been engaged for some years in studying the problem of weight reduc-

FIG. 1.—HARGRAVE'S STEAM AERIAL MOTOR (1892).

5 lb. 11 oz. Steam Engine No. 18.
Cylinder, 2 in. diameter. Surface of Wings, 281 sq. in.
Stroke, 2.52 in. Boiler, 21 ft. of copper pipe, .18 in. bore.
Feed Pump Ram, .266 in. diameter.
Piston Valves, .3 in. diameter.

tion. Now, without detracting from the obligation under which would-be aerial navigators certainly lie to our friends the automobile engineers (and the writer is one of that fraternity), it must be said that the degree of success attained was due to the motor-car because M. Santos Dumont elected to use the petrol motor of the

for use in aviation. Moreover, this extremely light steam motor bears favourable comparison with the lightest petrol motor (for a given power) yet produced; in fact, is considerably lighter.

For the very light steam motor, which, by the way, is considerably lighter than the latest and lightest of marine types, our thanks are due to certain workers in the field of aviation exclusively. It is only a measure of justice to the successful labours of the ingenious and persevering producers of the specially light steam motor, as adapted for aviation, to claim due recognition of them. Alluding to light marine types of engines, it would at

FIG. 2.—HOLLANDS' RECIPROCATING STEAM TRUNK MOTOR (for Winged Aviators),

first sight appear that the comparatively new departure, the marine steam turbine, would be admirably adapted for aerial propulsion. Being so impressed I went to the fountain-head, and communicated with the Hon. Charles A. Parsons, asking him to kindly state his views on that question, and to let me know the

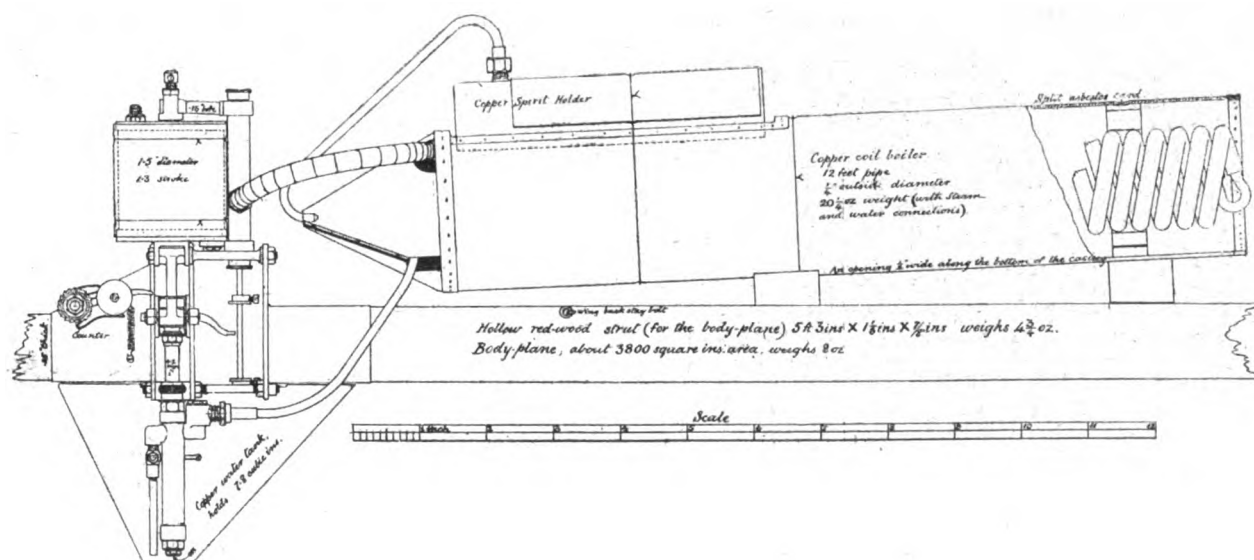

FIG. 3.—HARGRAVE'S STEAM AERIAL MOTOR (1892). Length of Flight, 1,640 yards.

automobile rather than a specially light steam motor. Such a motor as the latter is available—there is even a choice of types—and it has been developed, independently of the motor-car industry, specially for aeronautical purposes, or, more correctly, mainly

lightest steam turbine he could produce for a given power. That gentleman duly responded, but the purport of his reply was surprising and disappointing. It certainly surprised me, for it stated his opinion that the steam turbine is not so well adapted

for aeronautical uses as one would think, and went on to give the minimum weight of it for a given power as *one ton for 100 horse-power*, which works out at 22.4 lbs. per h.p. This certainly will not do for aeronautical uses.

Professor Langley's steam motor, as designed for and applied to his famous "Aërodrome," weighed $4\frac{1}{2}$ lbs. per h.p. (engine and generator)—it developed $1\frac{1}{2}$ h.p. and weighed 7 lbs. That is the "record" light steam motor—a motor that has flown three-quarters of a mile and sustained 22 lbs. besides its own weight. We certainly do not need to break that record of powerful lightness—less than one-fourth the weight of the steam turbine! As showing a course of development, and the great advance made by one experimenter on a previous production of his own, it may be mentioned that Professor Langley's first steam motor weighed no less than 25 lbs. per h.p.—the engine (double oscillating) weighed $3\frac{1}{2}$ lbs., and the boilers (four) collectively $21\frac{1}{4}$ lbs. It developed just 1 h.p. The numerous steam motors designed and made by Mr. Lawrence Hargrave are really admirable productions. Until recently these have all been small—i.e., working models—but nevertheless are very efficient, and fairly indicate what may be effected in large motors of similar types. One of Mr. Hargrave's lightest, simplest, and most efficient motors is of the reciprocating, non-rotative type, specially designed for winged types of aviator, and acting directly on to the wing-arms (see Figs. 1 and 3). It is a curious and noteworthy coincidence that Mr. Hargrave

FIG. 4.—HOLLANDS' BALANCED HIGH-SPEED LIGHT STEAM MOTOR (1892).

and myself—living and working in the field of experimental aeronautics (with models) at opposite sides of the world—Mr. Hargrave residing in Australia—quite independently produced model non-rotative motors of striking similarity of design, stored compressed air, too, being used in both cases. The main point of difference was that mine had a trunk piston (see Fig. 2) to economise power on the return or up-stroke of the wings (when less power is needed), which it effectually did. Both Mr. Hargrave and myself have since used steam pressure with these little motors. The weight of these for a given power, using a very light coil type of flashing generator, is less than 6 lbs. per h.p. While on this point, I will, with the reader's indulgence, allude to another type of light steam motor of my own—a rotative engine this time—in designing which a perfect balance was aimed at, both as to momentum of moving parts and of turning effort, without introducing balance weights; lightness, of course, is understood. This was effected—and successfully, as far as a very high-speed working model was concerned—by the means shown in Fig. 4. The arrangement formed a perfect "couple," was remarkably free from vibration, and was extremely light and compact. The weight of an engine of this type (engine alone) is 2 lbs. per h.p.

(To be continued.)

At the Plymouth Institute, Mr. E. H. Micklewood has been lecturing on motor-cars and traction. An interesting discussion followed, in which Major Drummond and the Rev. G. Scholey took part.

THE bronze medal awarded the Imperial Autocar Company, Limited, at the Liverpool Show, was for a 5 h.p. car. The company write to inform us that the observer on their car during the trial was unaware of the place at which the concluding time was taken—a point to be considered when comparing the time of their car with that of the others.

PROGRESS IN THE UNITED STATES.

AMID a crowd of steam-cars I found Mr. W. M. Letts, the other day, at Sussex Place, South Kensington. He was full of enthusiasm for the Locomobile and all its works—I mean its factory—and a pile of photographs had to be glanced through before we settled down to business. These photos he had brought with him from America. They included views of the wonderful factory at Bridgeport, with a capacity for turning out twenty-five cars a day, and actually producing sixty a week—scenes in the southern States, with the Locomobile dodging round almost impassable curves and ascending marvellous gradients, and views calculated to impress the stranger with a great sense of the steam car's adaptability and reliability.

"Now, Mr. Letts," I went on, "you were in America two years ago, I believe, so that your recent visit has given you a chance for comparing the advance of automobilism in at least one city of the States."

"Yes," he said, "I will compare. Two years ago the De Dion and the Winton petrol cars were familiar in the streets of New York. So, too, were electric and steam vehicles. But the former appear to have fallen into the rear, while the more silent vehicles have forged ahead. Standing at a corner of Fifth Avenue one afternoon I counted ten steam carriages and five electrical vehicles for every gasoline car that passed."

"But gasoline cars are not being ignored," I suggested.

"No; in fact, the visit of Fournier has given an impetus to the demand for petrol cars that will last a good time yet. Americans, too, are experimenting, but they have not yet produced anything like a gasoline car that would be really serviceable in a country like England. I must confess I had expected to find more gasoline cars than I actually saw. There were, of course, machines of every make, and Keene, Bostwick, Vanderbilt, and others had splendid vehicles; but, speaking generally, steam and electric automobiles are in common use. The hotels in New York have such cars for ordinary work. One incident occurred during my stay that gives some idea of the progress that has been made in America. While I was there a great dynamite explosion occurred, in which six people were killed and many scores injured. Within a few minutes of the sad event four electrical ambulances had arrived. I saw them perform their work with an expedition and ease that was lacking in the case of the horse-drawn vehicles."

"Then, I suppose, garages are plentiful in New York?"

"Plentiful and extensive. The storage departments are a feature of the city—to automobilists. There you can find every type of vehicle stored during bad seasons. Of course, in America there is not the home life that is found in England, and consequently many owners of motor-vehicles send their cars to the storage department, where they are cleaned, kept in repair, and generally looked after—a development that is hardly ever likely to attain such gigantic dimensions in this country, owing to the facilities for keeping cars that are provided near every country, and a good many town, houses."

"Is the presence of so many practically silent vehicles in the streets of New York regarded as a source of danger," was a question that naturally occurred in view of recent Press strictures on noiseless vehicles.

"A lot of nonsense is talked about noise and silence with regard to automobilism," said Mr. Letts. "Look here"—and he produced a newspaper cutting with which he apparently maintains a high state of feeling—"here is a man declaring in a London paper only last week that had noiseless steam and electric vehicles preceded petrol cars in England the Day of Emancipation would still be afar off. He actually argues in favour of noisy cars, and yet every maker of petrol cars is trying all he knows, and much that he doesn't know, to reduce the noisy clatter that prejudiced people against automobilism a few years ago. Society folks are favourable to electric and steam vehicles because of their silent running, and to praise noisy cars to the detriment of noiseless ones is absurd."

Tacking about, for the subject is evidently a burning one with the London manager of the Locomobile Company, I asked if he believed the steam car was adaptable to every purpose.

"Let me tell you of some of the applications in which it has succeeded. We have delivery vans running about New York, Locomobile cars for fire brigade purposes, and in some American cities the postal collections from pillar-boxes are made by a special type of car, with a large box at the rear—effecting a saving of time and economy in expense. While I was in New York an Englishman, Mr. Giles, of San Juan, Cuba, came into the office there and ordered twelve cars, each of which was required to run sixty-eight miles per day. In one place a river had to be forded, and in another a hill eight miles in length had to be traversed. These cars were to carry the mails and four passengers in addition to the driver. The company will also shortly bring out an opera 'bus, and other types of vehicles for different purposes. It is not only in designing new types, but also in additional improvements to the existing cars, that our company is maintaining a position in America. For instance, I brought back with me a new steam air-pump, and also a water pump, which are being fitted to our cars in the States. By fitting one of these pumps, it is possible to simply turn on the steam cock and have the air pumped up to 80lbs. inside of a couple of minutes—thus doing away with the necessity of pumping by hand."

A brief study of these pumps concluded my chat with Mr. Letts. Herewith are illustrations of the air pump, Fig. 1 showing the connections, Fig. 2 a section of the steam cylinder and air pump which it drives, and Fig. 3 a section of the valves at right angles to Fig. 3. The air pump can be used for inflating the tires as well as pumping up the air tank. It has a weight of $4\frac{1}{2}$ lbs., the steam and air pistons are $1\frac{1}{2}$ inches diameter by 2-inch stroke, and the space occupied when placed in the carriage is only 9 inches long by 8 inches in diameter. The piston valves 665 and 673 (Figs. 2 and 3), control the live steam entering the cylinder, and the space surrounding the stem of plunger 665, is always filled with live steam. The cross section of the upper piston is larger than that of the lower one, and consequently the plunger is forced in the direction of the upper head and valve 673, the stem of which, resting upon the upper piston of 665, is also raised by the motion of plunger 665. The lower end of the steam cylinder is then in communication with the atmosphere through the lower part, the steam exhausting from it. At the same time live steam enters

FIG. 1.

the clearance space on the opposite side of the piston through the steam port on the end of the cylinder controlled by the upper head of piston valve 665. The piston 648 is thus forced downward, and communication between the two lower parts controlled by the slide valve 658 ceases. Then, when the valve is at its

lowest position, live steam enters valve 673, and as the area of the latter is larger than that of valve 665, all the control valves are forced downward until the plunger strikes the bottom. The clearance space below piston 648 then communicates with the live steam chamber, and the motion of the piston is reversed.

FIG. 2.

FIG. 3.

When nut 636 strikes and raises valve 658 the steam is cut off from the space above 673, and the plunger is raised again. After the steam has done its work it rushes out to the atmosphere in the same way as it does in ordinary steam-engines. The air pump is also double acting, and has poppet valves, but no piston rings. There are two sets of identical valves—one for each end of the cylinder. On the suction stroke the inwardly opening valve admits air to its end of the cylinder, and as soon as the compression stroke begins this valve closes. When the compression in the cylinder slightly exceeds the tank pressure, the delivery valve opens, and the air flows past it and the check valve in the piping, into the air pressure tanks. LOLLIS.

SIR THOMAS LIPTON has lately shown an interest in automobilism.

SKIDDING on the tram-line at South Croydon last week, a motor-car was overturned, and the passengers, Messrs. H. H. Spalding and G. Morrison, were much shaken.

"NOTES on the Management of the Gardner-Serpollet Steam Motor-car" have been written by Mr. G. H. Olliver, and published by Iliffe and Sons, Ltd., for the benefit of those commencing to drive this particular type of car. A careful study of the hints contained in these twenty-four pages will enable the novice to avoid many difficulties, and although it will not enable him to entirely dispense with the services of an instructor, it should save him from breakdowns. At the end of the little book is a chapter of questions suggestive of the varied knowledge required to successfully operate the Gardner-Serpollet steam car. Boiler, pumps, motor, relief valve, brakes, lubrication, the fire and the water are all lucidly considered.

HERE AND THERE.

THE Marquis of Anglesey has purchased a Locomobile.

THE Brighton Motor and Cycle Club held its third annual ball last week.

CROWDS assemble nightly outside the Imperial Theatre to witness Mrs. Langtry's arrival and departure on her new automobile.

MESSRS. BREWER AND SON, of 33, Chancery Lane, W.C., have issued a useful manual on "Property in Trade Marks." The book is intended to give users and the prospective users of trade marks a practical knowledge of the law on the subject.

THERE has been a marked improvement of late in the roads of North Wales, and we are informed that from Chester to Bettws-y-Coed, or to Barmouth, there is scarcely a bad patch to be found.

THE Yorkshire Motor Company have opened premises in Delph Street, King's Cross Lane, Halifax, under the management of Mr. J. W. Brown, late works manager of the Yorkshire Motor-Car Manufacturing Company, Limited.

REALLY the editor of the *Express* ought to read his *Motor-Car Journal* before making statements about American motor-vehicles; for he has just declared the "Tractobile" to be capable of converting an ordinary vehicle into an "up-to-date automobile."

A CORRESPONDENT writes asking for information as to the size of water tank necessary to use for the cooling of a 3½-h.p. De Dion motor. He also asks whether he should use a radiating coil, provided he employed a three to four gallon tank.

OWING to the increase of business the Collier Twin Tyre Company, Limited, are shortly removing to more convenient and extensive premises at King Edward's Mansions, Shaftesbury Avenue, W.C.

COPIES of the Judges' Report on the 1901 Liverpool trials can still be obtained from the Liverpool Self-Propelled Traffic Association at 10s. 6d. per copy, post free. The price will probably be advanced to a sovereign at no distant date.

COMMENTING on the healthy effects of motoring a doctor writes, "May I suggest to those in charge of sanatoria the advisability of combining a daily run on a good motor-car at a pace fully up to the legal limit with the ordinary open-air treatment."

THE next quarterly 100-mile trial of the Automobile Club will be held on the 25th inst., the route being *via* Uxbridge, Beaconsfield, and High Wycombe to the fifty-second milestone from London, and back again without stopping. Entries should be made before the 22nd inst.

MAYFAIR GARAGES, LIMITED, has been registered with a capital of £7. Object, to carry on the businesses of or connected with storage of motor-cars, as repairers, instructors, hirers, manufacturers of, and dealers in, component parts, and petroleum spirit, and lubricating oils.

THE Automobile Club will have a run to Bexhill on Saturday. Some of the members will start from the Club-house at noon, but there is no recognised programme either as to the

start or the route to be taken. The Sackville Hotel will be the headquarters of the Club in connection with the trip.

THE Manchester Motor Transport Company, Limited, has been registered with a capital of £20,000 to adopt two agreements and to carry on business as carriers, carters, railway and forwarding agents, collectors, agricultural produce dealers and merchants. The registered office is at 10, Deansgate, Manchester.

A CORRESPONDENT suggests that the reason the police prefer to prosecute under the old "furious driving" Act and not under the Act specially dealing with motor-vehicles, is that under the former the fine goes to the police, while under the later Act it goes to the county funds. The *Daily News* asks whether this explanation is not too cynical?

THE legislators of New York are still considering the bill aimed at the liberties of automobilists, and much amusement has been caused by the presence of several toy motor-cars in the Senate House. These have been sent on their wild careers by enthusiastic motorists determined to defend the larger kinds against the suggested restrictions.

THE Primus Motor Works, of Rathgar Road, Loughborough Junction, S.E., have just brought out a new 1½-h.p. bicycle motor. The engine is neatly made, and comprises a cast cylinder with copper radiators. The oil tank case is of aluminium.

Special attention has been paid to the question both of the bearings and of the lubrication.

IN our issue of August 3 last we briefly described the novel electric racing machine built by Mr. A. H. Riker, of the Riker Motor Vehicle Company, Elizabethsport, U.S.A. We are now able to give an illustration of the machine as it appeared in the recent Long Island Automobile Club's speed trials, when it covered a mile in 63 sec., or at the rate of over 57 miles per hour.

THE RIKER ELECTRICAL RACING CAR.

[The Horseless Age.]

A NEW bicycle motor, to which the name "Unique" has been given, has lately been put on the market by the Midland Motor Company, of Ladywood Road, Birmingham. The engine, which develops 1½ h.p., has large cooling ribs cast around the valve chambers as well as the cylinders. A positive form of contact breaker is used on the motor, the trembler being fitted on the induction coil.

SOME time ago the *Bristol Times and Mirror* reported the case of a motor-car accident which had subsequently to be explained as less serious than originally reported. Our attention has been called to another instance of similar exaggeration by the same journal, and a Bristol automobilist feelingly suggests that newspapers should be more careful in mirroring the occurrences of the day.

BEWARE OF RAILWAY CROSSINGS.—At Colomars, near Nice, on the Chemin de Fer du Sud, Mdle. Schiff, with several friends, was returning from an excursion in her motor-car when she came to the railway track. The gates were open, and she attempted to cross. Just at that moment a train dashed round the curve, and the locomotive struck the front of the motor-car, throwing the occupants out on the line. By a miracle no one was fatally hurt, but the occurrence was not pleasing. Had the train gone off the metals it would have been heralded as "another accident caused by the motor-car."

CORRESPONDENCE.

MAINTENANCE OF MOTOR-CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I noticed in a recent issue a letter from a correspondent on the cost of maintenance of motor-cars, in which he stated that £50 a year was a liberal allowance for a man. I wonder what sort of a man he wants?—Yours truly,
H. J. D.

GARDNER-SERPOLLET CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to your correspondent "Rusticus" I have had five years' experience of Gardner-Serpollet cars, which are all fitted with a condenser and oil separator by which the exhaust steam can be used over again, and which I have found to give every satisfaction. These cars are now built to run 100 miles on twenty gallons of water (perhaps a little more). I have found no difficulty as regards kind of water used. As a hill-climber this particular car has no equal that I have seen.

I hope soon to be in possession of a steam car of 50 h.p., on which I intend to make the run from London to York without a stop.—Yours faithfully,
F. H. HUNT.

MOTORING AND HEALTH.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of last Saturday you refer to the beneficial effects of motoring on health. To this I can most cordially and gratefully bear testimony. About eight months ago I was taken ill, suffering from an acute local affection which rendered horse riding and even walking impossible. The doctor recommended outdoor air as indispensable to my recovery. Having a strong car, with hood—a most valuable adjunct in winter—and good engineer and driver, I resolved upon using them when the weather permitted and I was able to move, or rather, which was often the case, to be moved, the result being that my general health was well maintained, even during the winter, well wrapped as I was in furs, etc. Gradually the local mischief is being effectively exorcised, and it is felt that all this is mainly attributable to the open, airy, and pleasant spins I was able to enjoy. I may mention that during the time the car, a 10-h.p. Rochet-Schneider, has travelled between 3,000 and 4,000 miles or more with scarcely any hitch or mishap, not even any tire troubles.—Yours faithfully,
H. OWEN.

THE STIRLING CARS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In answer to the inquiry of J. T. in your issue of the 15th ult., regarding the hill-climbing abilities of the above cars, I can give him, briefly, the experience of a friend and myself on a Stirling Parisian phaeton. In September of last year we made a journey from Glasgow through the Lake district, the Potteries, the region of the Peak, and the district around Harrogate, returning by Edinburgh. The car was able to climb the hills with ease, notwithstanding the exceptionally hilly nature of the country through which we passed. In the Potteries, where, in addition to the hills, or "banks" as they are locally named, the roads were bad, the car did splendidly; the brake power was ample. The journey extended to over 1,200 miles, and the only hitch (one of short duration) was due to our ignorance of electrical ignition, being unable to recognise a faulty connection.—Yours truly,
ALEX. ROBB, M.B.

AN INTERESTING EXPERIMENT.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Referring to the very interesting experiments being carried out by an American railroad company, mentioned in your issue of February 8th, I hope to very shortly run a Napier car 200 miles a day for some considerable time, and I should be most pleased to carry out the suggestion mooted in your paper if you think it of sufficient public interest to appoint somebody to do the necessary certifying as to weight, etc. The trial will consist of a run of 200 miles per day for a month or two on a 9-h.p. Napier. I should very much like to see one or two other manufacturers enter for this test.—Yours truly,
S. F. EDGE.

TIRES FOR IRISH ROADS.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In your issue of the 8th Feb. I notice a letter from a Dublin motorist, who drives a 6½-h.p. Daimler, and complains that after a thousand miles the 2½-in. solid tires with which the wheels are shod are practically cut to pieces. I, too, drive a Daimler car, but mine gives 9½ h.p. on the brake, and weighs about 23 cwt. I have Michelin pneumatic tires on the front wheels. They have run over 2,500 miles, and are still in excellent condition. The back tires were in bad condition after about 2,000 miles, and I had new treads put on. Meanwhile, I fitted 2½-in. solid Buffer tires, made by the Sirdar Tyre Company, as I thought they would stand better during the winter. These have up to date run over a thousand miles, and are still in excellent order. They show hardly any signs of cutting, due, I fancy, to the quality of the rubber, and to the fact that it is under

compression. I might mention that the pneumatic tires on the front wheels were repaired after they had run about 2,000 miles. They have traversed a distance of nearly 2,000 miles without meeting with a puncture. From my experience, I am inclined to think that the soft metal with which Irish roads are repaired is not as injurious as the English flints.—Yours faithfully,
R. J. MCCREDDY.

HORSE v. MOTOR.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—I should be glad to learn from your readers the respective merits of horse and trap *versus* motor-car, from the point of view of convenience and also expense, the latter to be exclusive of first cost. Can anyone give me the cost of a motor-car to go to and from the station (two miles each way) twice daily, and occasional drives with four passengers? The above information will be of service.—Yours faithfully,
MOBILE.

CORRECT HORSE-POWER.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—Will someone be good enough to tell me definitely what brake horse-power is given off from the M.M.C.'s De Dion engine? It is 100 mm. bore and 130 mm. stroke, and is stated by the Hozier Engineering Company, Limited, to give 8 brake horse-power at 1,500 revolutions. The makers, however, term it their 5 or 5½ h.p. A correspondent to your journal recently, in describing his journey home from London on his new M.M.C. voiturette, calls it a 6 h.p. I am expecting delivery of my M.M.C. voiturette any time now, but am waiting for better weather, and should like to know definitely what horse-power to call the engine. Surely the makers would not call it 5½ if it is capable of developing 8 h.p.?—Yours truly,
UNCERTAIN HORSE-POWER.

MOTOR-BICYCLES FOR 1902.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—You have already inserted in your journal one or two letters I wrote on motor-bicycles. I look upon these machines as about the most valuable of all automobiles. I have purchased two of them, but have only found them perfect torments, as I could neither make them go nor discover anyone who had the skill to make them work. I have read many letters in your paper by riders of motor-bicycles, who have extolled their machines, but I am impelled to the conclusion that such letters must be dictated by mistaken enthusiasts. I can see no motor-bike about that looks to me more promising than those I have been glad to get rid of, and I desire to solicit some impartial rider of a motor-bicycle, who may have met with a satisfactory machine, to be so good as to apprise your readers where they may meet with one of the same merit. I will only add that I cannot believe that a machine can be of much service to a tourist on a motor-bicycle which is over a gross weight of 60 lbs., and which will not travel at least fifty miles on average roads at twelve miles per hour without coming to an involuntary stop.—Yours truly,
J. A.

FRANCE COPYING ENGLAND.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—In reference to the letter of your correspondent who is trying to prove that the Napier car was not original in a number of various points, I do not propose to correspond any further until some documentary proof is produced by him. He merely reiterates in a different form his original statements, but I am sorry I cannot accept these unconfirmed.

My claims for the Napier are simple and clear. First, that Napier was the first modern constructor to use aluminium water-jackets. Second, the first to use straight valve stems on modern automobile vertical engines. Third, with this same type of engine to boldly say that electric ignition only would be fitted. Fourth, on the same type of engine to use enclosed valve gear and cam shafts. Fifth, that the nominal 50-h.p. Napier engine was the lightest engine of this type to be produced, for its actual h.p.

When your correspondent has documents to disprove these statements I shall be pleased to meet him. Until then I prefer not to correspond any further, as it is waste of time, and must become wearying to your readers.—Yours truly,
S. F. EDGE.

TO THE EDITOR OF *The Motor-Car Journal*.

SIR,—As an Englishman and one who has tried to support the English industry by purchasing English cars—and I am glad to say with fair satisfaction, certainly with equal satisfaction to friends of mine who have French cars—it seems rather strange to me that the gentleman who writes "Continental Notes" in your paper should continually try and throw discredit on English manufacturers. Why should he imagine, because he is a foreigner, or lives abroad, that English manufacturers are not awake? When one has tried the latest 20 h.p. Wolseley or 16 h.p. Napier, I would like "Automan" to say what French car is superior; and in what way? By all means do not let us shut our eyes to foreign perfection, but at the same time give the struggling English industry a chance.—Yours sincerely,
H. A. HECTOR.

"A Reader's" question with reference to the Century tandem has brought commendatory letters from Mr. C. A. P. Truman, Mr. Arthur Brown, and E. F. S.; the latter mentioning the fact that he has covered about 1,000 miles in Kent, Surrey, and Sussex, without finding a hill on any main road that it was unable to mount.

MOTOR-BICYCLE RACES.

THE first race meeting confined to motor-bicycles was held by the Motor Cycling Club at the Crystal Palace on Saturday last. There were six events on the programme, but only five were carried through. The first was a five miles open scratch race on the track for machines having motors catalogued as 1½ h.p. or over. Fifteen entries were received, so that it was somewhat disappointing that only half a dozen competitors came up to the scratch. The race was divided into two heats, the riders in the first one being E. Dries and T. B. Lindre on 1½-h.p. Derby belt-driven machines, and W. J. Westfield on a 1½-h.p. Westfield motor-bicycle. Some amusement was caused at the start by the refusal of the pistol, in the hands of Mr. W. Phillips, to do its work, the competitors being eventually got away by a verbal start. Dries proved an easy winner, his time being 10 min. 36 sec. In the second heat the competitors were T. H. Tessier on a 1½-h.p. 1901 Werner, A. Rivett on a 1½-h.p. Blizzard (Minerva), and Bert Yates on a 1½-h.p. chain-driven Humber. This was the fastest race of the series, Tessier finishing the five miles in 9 min. 18 sec. The final was a very exciting race. Dries, on the Derby, got away first, but Tessier on the Werner soon obtained the lead, which he maintained to the end, the time for the five miles being 9 min. 29½ sec. The five miles open scratch race for motor-bicycles, fitted with engines of more than 1½-h.p. and less than 2-h.p., brought out only four competitors—H. W. Stones on a 1½-h.p. Rex, L. S. Watson on a 1½-h.p. Chapelle, E. T. Arnott on a 1½-h.p. chain-driven Princeps, and J. H. Dickinson on a 1½-h.p. chain-driven J.D. Only one rider, Stones, on the 1½-h.p. Rex, finished, his time being 9 min. 40½ sec. In the race for machines of over 2-h.p. there were only two competitors—H. Martin on a 2½-h.p. Excelsior, easily beating A. Westlake on a 3-h.p. Chapelle, the rear tire of which, however, was punctured.

Following the track races came a speed and hill-climbing contest in the grounds. In Class I., for 1½-h.p. bicycles, A. Rivett won on a Blizzard; time, 2 min. 5½ sec. In Class II., for motors between 1½ and 2-h.p., E. T. Arnott, on a 1½-h.p. Princeps, made the best time, 2 min. 13½ sec. In the class for engines over 2-h.p., H. Martin, on a 2½-h.p. Excelsior, covered the course in 2 min. 6½ sec. It should be added that pedalling was allowed in both the track races and the hill-climbing competitions.

FURIOUS DRIVING CASES.

DR. WILLIAM WILSON was summoned at Burnley for driving his motor-car at a furious rate. His defence was that he was hurrying to an urgent case. He was fined 10s. and costs.

THE Dover County Magistrates have fined a young man named Herbert Burton £8 for furiously driving a motor-car to the danger of the public on the Canterbury Road. According to the evidence of the police-constable the defendant was driving the car at a pace which averaged 1,144 yards in 75 seconds. It also transpired that defendant had been fined £10 at Hythe for a similar offence only a few days ago.

WILLIAM EDWARD BATT, thirty-four, Wellington Square, Oxford, was summoned by the police before the Abingdon County Bench for furiously driving a motor-car in the parish of Sunningwell on February 8th. The defendant pleaded "not guilty." Police Constable Ponsford, stationed at South Hinksey, said he saw defendant driving a motor-car on the Oxford Road, near Bagley Wood, at the rate of thirty miles an hour. He called on defendant to stop, but he took no notice. John Stanton deposed to seeing the defendant on the same date, and he was travelling at twenty miles an hour. Henry Goodenough, who was also on the road, said when he saw defendant he was travelling at from twenty-eight to thirty miles an hour. The Bench considered the case proved, and the defendant was fined £5 and 16s. costs.

AN ENGLISH OR IRISH CONTRACT.

In the King's Bench Division (Dublin) Mr. Justice Barton and Mr. Justice Wright delivered judgment in the case of Lane-Joynt v. Hutton and Company, Northallerton, which was a motion by defendants to have an order made on plaintiff's application discharged. The action arose out of the sale of a voiturette for £170. On a previous occasion the Court had made an order giving liberty to serve a writ out of jurisdiction. Defendants now moved to set aside that order.

Mr. Justice Barton said the question in the case was whether the contract was made in England or Ireland. There were two ways in which the plaintiff might allege that the contract was entered into in Ireland. It might possibly appear that the contract had been entered into between plaintiff and defendant through Mrs. M'Taggart, acting as agent for the defendant, or in the alternative that, in the course of the long correspondence, acceptances had been posted in Dublin either by Mr. Joynt or Mr. M'Taggart acting as agent for him. It had originally seemed to him that so much was to be said on both sides that he thought the best thing to be done was to make the order that plaintiff asked, at his risk, with liberty to the defendants to move to discharge the order if so advised. The defendants had now come in asking to have the order discharged, and he (his Lordship) had come to the conclusion that the order should be discharged, as on the correspondence it would appear that the contract was made in England. Mr. Justice Wright concurred.

THE DETENTION OF MR. H. J. LAWSON'S MOTOR-CAR.

THE Under Sheriff of Middlesex (Mr. Freke D. Williams) sat with a jury in the Sheriff's Court of Ealing to assess damages in the matter of Lawson v. Dengill and Co., Limited. The Sheriff said the jury would have to assess damages in regard to the value of a motor-car and damages for detention. The defendants had had notice of the injunction, but were not present or represented. Mr. Goodman, for the plaintiff, Mr. Harry John Lawson, said he lent to the defendants, who were anxious to increase their capital, a motor-car of the description which they (the defendants) wished to build to show to intending subscribers. The plaintiff lent the car free and expected its return in about a week, but instead they had not returned it up to that day, although it was six months ago since it was lent. Repeated application had been made for its return, but no reply was received. Subsequently the writ was issued. What they (the jury) had to do was to assess damages for the detention of the car for six months, and also its value. Evidence having been given, the Under Sheriff summed up, and the jury retired, and on returning, the foreman stated that they assessed the value of the car at £400, and the damages for detention at £100.

EMITTING STEAM.

FRANK BROAD, of Merrow, was summoned at Guildford for driving a locomotive upon the highway at Stoke, at a greater rate than four miles an hour, on January 22nd. Mr. Gould appeared to prosecute on behalf of the police, and Mr. Staplee Firth defended. Defendant pleaded "not guilty." Mr. Firth contended that the summons was issued under an Act which was repealed in 1896. Mr. Gould said that, according to the Light Locomotive Act, under which motor-cars might go at a faster speed than four miles an hour, no steam or visible vapour must be emitted except from a temporary or accidental cause. After the police evidence had been heard Mr. Firth said he really had no case to meet. The construction of the car—of which there were about 600 in England—was such that no steam need be emitted. There were eight previous similar cases against the same kind of car, all of which had been dismissed. Wm. M. Letts, the manager in England for the Locomobile Company, said he was thoroughly familiar with the construction of the car in question, which was a small one, weighing about a quarter of a ton, and it was certainly constructed so as not to emit steam. Petrol was burnt, and that was without smell or vapour. There were three things on the car to prevent any such emission of steam, and he could demonstrate that at any time. He would be pleased to take the car from Guildford to London without showing any steam. By Mr. Gould: He could not swear that everyone of his company's cars had a condenser, but the one in question had. Robert Buttemer, of Shackleford, near Godalming, said he had gone in for motoring as a hobby, and was an amateur engineer. He had a similar car to that of the defendant. He corroborated the evidence of the last witness as to the construction of the car. By Mr. Gould: The car in question could not have emitted steam to the extent that constables had deposed unless it had met with a mishap. The Bench dismissed the case.

MESSRS. SALSBURY AND SON, LIMITED, has been registered with a capital of £22,500 in £1 shares (2,500 preference), to acquire the business carried on at Green Str. et, Blackfriars, S.E., and 124, Long Acre, W.C., as Salsbury and Son. There will be no initial public issue.

CITY GARAGES, LIMITED, is the title of a company registered with a capital of £7 in £1 shares, to carry on the business of motor-car storers, repairers, instructors, hirers, manufacturers, merchants, auctioneers, agents and dealers, etc. There will be no initial public issue. The registered office is at 19, Princes Street, Westminster, S.W.
